13,410 Multiple Choice Questions · 10 Subjects

Subjects Included:

#	Subject	MCQs
1	AI / Machine Learning & Data Analytics	1,530
2	Computer Networks & Cloud Computing	900
3	Cyber Security	1,440
4	Databases	1,530
5	Data Structures & Algorithms	1,080
6	Operating Systems	1,080
7	Problem Solving & Analytical Skills	1,440
8	Programming (C++, Java, Python)	1,440
9	Software Engineering	1,440
10	Web Development	1,530

SUBJECT

AI / Machine Learning & Data Analytics

1,530 Multiple Choice Questions

AI / Machine Learning & Data Analytics — Easy

510 questions

Q1. What does AI stand for?

- A. Advanced Iteration
- B. Artificial Intelligence
- C. Automated Integration
- D. Applied Informatics

Answer: B

Q2. Which of the following is a type of machine learning?

- A. Manual Learning
- B. Supervised Learning
- C. Static Learning
- D. Hardware Learning

Answer: B

Q3. Who is considered the father of Artificial Intelligence?

- A. John McCarthy
- B. Charles Babbage
- C. Alan Turing
- D. Tim Berners-Lee

Answer: A

Q4. What is the primary goal of machine learning?

- A. To design efficient computer hardware
- B. To replace human decision-making entirely
- C. To write self-modifying operating systems
- D. To enable computers to learn from data

Answer: D

Q5. Which of these is an example of AI in daily life?

- A. Saving a file to disk
- B. Using a basic calculator
- C. Printing a text document
- D. Spam email filtering

Answer: D

Q6. Data Analytics primarily deals with:

- A. Building and assembling computer hardware
- B. Writing low-level operating system code
- C. Examining data sets to draw conclusions
- D. Designing graphical user interface layouts

Answer: C

Q7. What does ML stand for in the context of AI?

- A. Machine Learning
- B. Meta Language
- C. Memory Linking
- D. Macro Logic

Answer: A

Q8. Which is NOT a type of machine learning?

- A. Reinforcement Learning
- B. Compiled Learning
- C. Supervised Learning
- D. Unsupervised Learning

Answer: B

Q9. A chatbot is an example of:

- A. Artificial Intelligence
- B. Database Management
- C. Operating System Design
- D. Computer Architecture

Answer: A

Q10. What is a dataset in data analytics?

- A. A sequential optimization algorithm
- B. A hardware peripheral device
- C. A compiled programming language
- D. A collection of related data points

Answer: D

Q11. What is a scalar in linear algebra?

- A. A higher-order tensor
- B. A multi-row data matrix
- C. A single numerical value
- D. A multi-element vector

Answer: C

Q12. What is the mean of the numbers 2, 4, 6, 8, 10?

- A. 7
- B. 8
- C. 5
- D. 6

Answer: D

Q13. A matrix with equal rows and columns is called:

- A. Rectangular matrix
- B. Diagonal matrix
- C. Square matrix
- D. Identity matrix

Answer: C

Q14. What does probability measure?

- A. The computational speed of an algorithm
- B. The overall size of a given dataset
- C. The likelihood of an event occurring
- D. The hardware accuracy of a processor

Answer: D

Q15. The derivative of a constant is:

- A. 1
- B. The constant itself
- C. 0
- D. Infinity

Answer: C

Q16. What is the dot product of vectors [1,2] and [3,4]?

- A. 7
- B. 14
- C. 11
- D. 10

Answer: C

Q17. What is the median of {1, 3, 5, 7, 9}?

- A. 3
- B. 5
- C. 4
- D. 7

Answer: B

Q18. An identity matrix has:

- A. All entries set to the value of zero
- B. Entries filled with random real numbers
- C. 1s on the diagonal and 0s elsewhere
- D. All entries set to the value of one

Answer: C

Q19. The range of a probability value is:

- A. -1 to 1
- B. Negative infinity to positive infinity
- C. 0 to 1
- D. 0 to 100

Answer: C

Q20. What is the transpose of a matrix?

- A. The matrix is numerically inverted
- B. The matrix entries are all squared
- C. The matrix is multiplied by itself
- D. Rows and columns are interchanged

Answer: D

Q21. Which Python library is most commonly used for numerical computations in AI?

- A. Tkinter
- B. Flask
- C. NumPy
- D. Django

Answer: C

Q22. What does pandas primarily provide?

- A. Network socket programming APIs
- B. Data structures for data analysis
- C. Web development framework tools
- D. Game development engine support

Answer: B

Q23. Which library is used for plotting graphs in Python?

- A. Pandas
- B. NumPy
- C. Matplotlib
- D. Scikit-learn

Answer: C

Q24. How do you import NumPy with an alias?

- A. include numpy
- B. import np
- C. import numpy as num
- D. import numpy as np

Answer: D

Q25. What is a Jupyter Notebook?

- A. An interactive computing environment for code and visualizations
- B. A production web server for hosting static site content
- C. A relational database for storing structured table records
- D. A lightweight plain text editor without any execution support

Answer: A

Q26. Which function creates a NumPy array?

- A. np.make()
- B. np.list()
- C. np.array()
- D. np.create()

Answer: C

Q27. What does df.head() do in pandas?

- A. Sorts the DataFrame by column values
- B. Returns the last 5 rows of the frame
- C. Deletes the first row of the DataFrame
- D. Returns the first 5 rows of the DataFrame

Answer: D

Q28. Which library provides machine learning algorithms in Python?

- A. Pillow
- B. Scikit-learn
- C. Seaborn
- D. Matplotlib

Answer: B

Q29. What data type does pandas use for tabular data?

- A. List
- B. Dictionary
- C. DataFrame
- D. Array

Answer: C

Q30. Which operator is used for element-wise multiplication in NumPy?

- A. *
- B. //
- C. &
- D. @

Answer: A

Q31. What is data preprocessing?

- A. Deploying trained models into production systems
- B. Writing detailed summary reports on raw findings
- C. Transforming raw data into a clean and usable format
- D. Creating interactive charts to visualize raw data

Answer: C

Q32. What is a missing value in a dataset?

- A. A data point that equals exactly zero
- B. A data point that is absent or null
- C. An extreme statistical outlier point
- D. A strongly negative numerical value

Answer: B

Q33. What is data normalization?

- A. Duplicating data across tables
- B. Sorting data in alphabetical order
- C. Scaling data to a standard range
- D. Removing all data from storage

Answer: C

Q34. Which of these is a common data format?

- A. SYS
- B. EXE
- C. CSV
- D. DLL

Answer: C

Q35. What does data cleaning involve?

- A. Making the dataset physically larger in size
- B. Adding more synthetic records to the data
- C. Encrypting data columns for secure storage
- D. Removing errors and inconsistencies from data

Answer: D

Q36. What is a categorical variable?

- A. A variable that can only hold binary data
- B. A variable with randomly assigned values
- C. A variable with continuous numerical values
- D. A variable with discrete categories or labels

Answer: D

Q37. What is a data source?

- A. A trained machine learning model file
- B. An interactive data visualization chart
- C. A computational optimization algorithm
- D. The origin from which data is collected

Answer: D

Q38. What is the purpose of removing duplicates?

- A. To add new input features
- B. To change column data types
- C. To eliminate redundant records
- D. To increase the dataset size

Answer: C

Q39. What is a structured dataset?

- A. Continuous raw audio waveforms
- B. Data organized in rows and columns
- C. Unorganized raw free-form text
- D. Unstructured pixel image data

Answer: B

Q40. Which pandas method checks for null values?

- A. fillna()
- B. isnull()
- C. notnull()
- D. dropna()

Answer: B

Q41. What does EDA stand for?

- A. Extended Data Algorithm
- B. External Data Analysis
- C. Effective Data Assessment
- D. Exploratory Data Analysis

Answer: D

Q42. Which chart is used to show the distribution of a single variable?

- A. Line chart
- B. Scatter plot
- C. Histogram
- D. Pie chart

Answer: C

Q43. What does a box plot display?

- A. The five-number summary: min, Q1, median, Q3, max
- B. Only the arithmetic mean of the distribution values
- C. Only the overall range from minimum to maximum
- D. Only the mode or most frequent value observed

Answer: A

Q44. Which pandas method gives summary statistics?

- A. describe()
- B. info()
- C. head()
- D. shape

Answer: A

Q45. A scatter plot shows the relationship between:

- A. Two numerical variables
- B. Categories data only
- C. Time series data only
- D. Textual data only

Answer: D

Q46. What is the purpose of a correlation matrix?

- A. To clean and preprocess the raw input data
- B. To deploy and manage software applications
- C. To train and evaluate machine learning models
- D. To show relationships between multiple variables

Answer: D

Q47. What does df.info() display in pandas?

- A. Only the numerical summary statistics values
- B. Only the count of missing or null values
- C. Column names, data types, and non-null counts
- D. Only the first five rows of the DataFrame

Answer: C

Q48. A bar chart is best used for:

- A. Showing data distributions
- B. Comparing quantities across categories
- C. Displaying feature correlations
- D. Plotting time series trends

Answer: D

Q49. What is the mode of a dataset?

- A. The full range of the values
- B. The most frequently occurring value
- C. The middle value of the data
- D. The average value of the data

Answer: C

Q50. Which plot is best for showing proportions of a whole?

- A. Histogram
- B. Pie chart
- C. Scatter plot
- D. Box plot

Answer: B

Q51. In supervised learning, the model learns from:

- A. Labeled data with known outputs
- B. Randomly generated fake data
- C. Unlabeled unstructured data only
- D. No data of any kind at all

Answer: A

Q52. Linear regression is used for:

- A. Classification tasks only
- B. Reducing dataset dimensionality
- C. Predicting continuous numerical values
- D. Clustering data points

Answer: D

Q53. What is classification in supervised learning?

- A. Grouping similar data together
- B. Predicting a discrete category or class
- C. Predicting a continuous output value
- D. Reducing feature dimensions

Answer: C

Q54. Which algorithm is commonly used for classification?

- A. K-Means method
- B. Decision Tree
- C. DBSCAN method
- D. PCA method

Answer: D

Q55. What is the target variable in supervised learning?

- A. The output the model predicts
- B. An internal training weight
- C. A tunable hyperparameter
- D. An individual input feature

Answer: A

Q56. Logistic regression is used for:

- A. Dimensionality reduction
- B. Linear regression
- C. Binary classification
- D. Clustering

Answer: C

Q57. What is overfitting?

- A. Model performs well on training data but poorly on new data
- B. Model is too simple and has very few learned parameters
- C. Model performs poorly on both training and testing data
- D. Model has absolutely no trainable weight parameters

Answer: A

Q58. K-Nearest Neighbors (KNN) classifies based on:

- A. A low-rank matrix decomposition factorization
- B. The steepest gradient descent optimization step
- C. An entirely random selection of a class label
- D. The majority class among the K nearest data points

Answer: D

Q59. What is a feature in machine learning?

- A. The model architecture itself
- B. The optimization training algorithm
- C. An input variable used for prediction
- D. The output target variable label

Answer: C

Q60. What is underfitting?

- A. Model has an excessive number of parameters
- B. Model has been trained for far too many epochs
- C. Model is too simple to capture patterns in data
- D. Model has memorized all the training data points

Answer: C

Q61. What is ensemble learning?

- A. Using a single standalone model for output
- B. Selecting the most relevant input features
- C. Combining multiple models to improve prediction
- D. Cleaning and preprocessing raw input data

Answer: C

Q62. Random Forest is an ensemble of:

- A. Neural networks
- B. Linear models
- C. Decision trees
- D. SVMs

Answer: C

Q63. What is bagging in ensemble learning?

- A. Training models on random subsets of data with replacement
- B. Cleaning and imputing missing data point values
- C. Training a single model on the complete full dataset
- D. Removing irrelevant features from the training data

Answer: A

Q64. What is boosting?

- A. Sequentially training models where each focuses on previous errors
- B. Reducing the overall size of the training dataset
- C. Engineering new features from the existing raw data
- D. Training all individual models simultaneously in parallel

Answer: A

Q65. The final prediction in a classification ensemble is typically made by:

- A. Using only the first model
- B. Random class selection
- C. Majority voting
- D. Using the weakest model

Answer: C

Q66. Which of these is a popular boosting algorithm?

- A. DBSCAN
- B. K-Means
- C. PCA
- D. XGBoost

Answer: D

Q67. How does Random Forest handle overfitting?

- A. By removing all features from the training input
- B. By using a single very deep decision tree only
- C. By only adding more raw data samples to train
- D. By averaging predictions from many diverse trees

Answer: D

Q68. What is a base learner in ensemble methods?

- A. A tunable model hyperparameter value
- B. An individual model within the ensemble
- C. A data preprocessing pipeline step
- D. The final aggregated combined model output

Answer: B

Q69. AdaBoost stands for:

- A. Automated Boosting
- B. Adaptive Boosting
- C. Advanced Boosting
- D. Additional Boosting

Answer: B

Q70. In Random Forest, what is feature randomness?

- A. Features are randomly generated from scratch each time
- B. Each tree considers a random subset of features at each split
- C. Features are removed permanently from the entire dataset
- D. All decision trees use all available features every time

Answer: A

Q71. Unsupervised learning works with:

- A. Unlabeled data
- B. Numerical data only
- C. Textual data only
- D. Labeled output data

Answer: A

Q72. K-Means is a type of:

- A. Regression algorithm
- B. Clustering algorithm
- C. Classification algorithm
- D. Sorting algorithm

Answer: B

Q73. What does clustering do?

- A. Classifies data with known labels
- B. Generates entirely new data points
- C. Predicts continuous numerical values
- D. Groups similar data points together

Answer: D

Q74. PCA stands for:

- A. Principal Component Analysis
- B. Primary Cluster Algorithm
- C. Probability Calculation Approach
- D. Pattern Classification Analysis

Answer: A

Q75. In K-Means, what is a centroid?

- A. A class target label
- B. An extreme outlier point
- C. The center point of a cluster
- D. A single input feature

Answer: C

Q76. What is dimensionality reduction?

- A. Adding more derived features to expand the feature space
- B. Removing all data from the storage system entirely
- C. Reducing the number of features while preserving important information
- D. Increasing the overall size of the raw training dataset

Answer: C

Q77. Which is an example of unsupervised learning?

- A. Predicting house prices
- B. Labeled image classification
- C. Customer segmentation
- D. Email spam detection

Answer: C

Q78. Association rule mining is used to:

- A. Find relationships between items in transactions
- B. Classify documents into predefined categories
- C. Predict future numerical stock price values
- D. Train multi-layer deep neural network models

Answer: A

Q79. What does the 'K' in K-Means represent?

- A. The number of iterations
- B. The number of features
- C. The learning rate
- D. The number of clusters

Answer: D

Q80. What is an unsupervised learning application?

- A. Labeled prediction
- B. Anomaly detection
- C. Supervised classification
- D. Regression

Answer: B

Q81. Accuracy is defined as:

- A. Number of correct predictions divided by total predictions
- B. Only the count of true negative classification results
- C. The total number of features used in the model
- D. Only the count of true positive classification results

Answer: A

Q82. What is a confusion matrix?

- A. A Python data visualization chart library
- B. A type of multi-layer deep neural network
- C. A preprocessing data cleaning utility tool
- D. A table showing predicted vs actual classifications

Answer: D

Q83. What is precision in classification?

- A. The recall evaluation metric
- B. Overall model accuracy metric
- C. True Positives divided by the total count
- D. $\text{True Positives} / (\text{True Positives} + \text{False Positives})$

Answer: A

Q84. What is recall (sensitivity)?

- A. $\text{True Positives} / (\text{True Positives} + \text{False Positives})$
- B. $\text{True Positives} / (\text{True Positives} + \text{False Negatives})$
- C. The specificity metric
- D. The overall accuracy metric

Answer: D

Q85. Mean Squared Error (MSE) is used to evaluate:

- A. Regression models
- B. Classification models only
- C. Clustering algorithms
- D. Association rule mining

Answer: A

Q86. What is a training set used for?

- A. Deploying the model to production
- B. Training the model to learn patterns
- C. Evaluating the final performance
- D. Tuning the model hyperparameters

Answer: B

Q87. What is a test set used for?

- A. Training the model on labeled training samples
- B. Tuning the model's hyperparameter settings
- C. Cleaning and preprocessing the raw data
- D. Evaluating the model's performance on unseen data

Answer: D

Q88. What is a false positive?

- A. Making a correct and accurate model prediction
- B. Predicting positive when the actual value is negative
- C. Encountering a missing value in the raw data
- D. Predicting negative when the actual value is positive

Answer: B

Q89. R-squared measures:

- A. The proportion of variance in the target explained by the model
- B. The total number of data samples in the dataset
- C. The total number of input features in the training dataset
- D. The total elapsed time required for model training

Answer: A

Q90. What is a validation set?

- A. The same set as the independent held-out test set
- B. The entire full dataset including all partitions
- C. A preprocessing data cleaning utility pipeline
- D. A subset used to tune hyperparameters during training

Answer: D

Q91. What is feature engineering?

- A. Building custom computer hardware for faster processing
- B. Creating new features from existing data to improve model performance
- C. Deleting all features from the dataset before model training
- D. Only using the original raw data without any transformations

Answer: B

Q92. What is a feature?

- A. A specific type of learning algorithm
- B. A particular model training method
- C. An input variable used by the model for prediction
- D. The output produced by a trained model

Answer: A

Q93. What is feature selection?

- A. Training the model on the full dataset
- B. Choosing the most relevant features for the model
- C. Deleting the entire dataset from storage
- D. Creating new derived features from raw data

Answer: B

Q94. What is a binary feature?

- A. A continuous numeric feature
- B. A missing feature value
- C. A feature with many distinct categories
- D. A feature with only two possible values (0 or 1)

Answer: C

Q95. What is a numerical feature?

- A. A feature with categorical text categories
- B. A feature containing image data
- C. A feature containing audio data
- D. A feature with continuous or discrete numeric values

Answer: A

Q96. Feature extraction involves:

- A. Deleting features from a dataset
- B. Deriving new features from raw data
- C. Renaming features in a table
- D. Copying features between datasets

Answer: B

Q97. What does dropping a feature mean?

- A. Removing a feature from the dataset
- B. Transforming a feature with a log
- C. Adding a brand new feature column
- D. Scaling a feature to unit range

Answer: A

Q98. Why might you create interaction features?

- A. To remove extreme outlier values from data
- B. To normalize data to a standard range
- C. To capture relationships between two or more features
- D. To reduce the overall size of the dataset

Answer: C

Q99. What is binning?

- A. Removing selected features from the dataset
- B. Adding new synthetic features to the data
- C. Converting continuous features into discrete intervals
- D. Sorting data records by a column value

Answer: C

Q100. What is a datetime feature?

- A. A feature representing dates and times
- B. A purely categorical feature only
- C. A strictly binary feature only
- D. A purely numerical feature only

Answer: B

Q101. What is a neural network?

- A. A network routing protocol for data packets
- B. A computing system inspired by biological neural networks
- C. A comparison-based sorting algorithm for arrays
- D. A relational database for storing structured records

Answer: B

Q102. What is a neuron (node) in a neural network?

- A. A basic computational unit that receives inputs and produces an output
- B. A physical data storage unit for persisting files on disk
- C. A specific type of input feature used in the dataset
- D. A gradient-based training algorithm for optimization

Answer: A

Q103. What is an activation function?

- A. A technique for initializing random weight parameters
- B. A function that introduces non-linearity into the network
- C. A function for loading data from external file sources
- D. A method for calculating the total loss of the model

Answer: B

Q104. What is a hidden layer?

- A. A data preprocessing transformation layer
- B. The very last output layer of the network
- C. The very first input layer of the network
- D. A layer between the input and output layers

Answer: D

Q105. What is the ReLU activation function?

- A. $f(x) = x^2$
- B. $f(x) = 1/(1+e^{-x})$
- C. $f(x) = \max(0, x)$
- D. $f(x) = \tanh(x)$

Answer: C

Q106. What is backpropagation?

- A. A type of non-linear activation function for neurons
- B. A specific deep neural network architecture design
- C. A data preprocessing technique for cleaning raw inputs
- D. An algorithm for computing gradients to update network weights

Answer: D

Q107. Which framework is commonly used for deep learning?

- A. NumPy only
- B. Flask
- C. TensorFlow
- D. Django

Answer: C

Q108. What is an epoch in training?

- A. A type of non-linear activation function node
- B. A single individual data point in the training set
- C. A single hidden layer within the neural network
- D. One complete pass through the entire training dataset

Answer: D

Q109. What is a loss function?

- A. An individual input feature column used for training
- B. A non-linear activation function applied at hidden layers
- C. A structured collection of labeled data for evaluation
- D. A function measuring how well predictions match actual values

Answer: D

Q110. What is gradient descent?

- A. A type of multi-layer feedforward neural network architecture with connections
- B. An optimization algorithm minimizing loss by updating weights via steepest descent
- C. A tree-based hierarchical data structure for nearest-neighbor lookups
- D. A non-linear activation function that maps inputs to the range zero to one

Answer: B

Q111. What is a Convolutional Neural Network (CNN)?

- A. A neural network designed for processing grid-like data such as images
- B. A relational database system for storing structured records
- C. A recurrent network designed exclusively for text sequence data
- D. A comparison-based sorting algorithm for numerical arrays

Answer: A

Q112. What is a Recurrent Neural Network (RNN)?

- A. A neural network for sequential data with memory of previous inputs
- B. A convolutional network designed exclusively for image pixel data
- C. An unsupervised density-based clustering algorithm for grouping
- D. A static feedforward network with no temporal connections

Answer: A

Q113. What is a GAN?

- A. An unsupervised clustering method based on density estimation
- B. A specialized variant of convolutional neural networks for images
- C. Generative Adversarial Network - two networks competing to generate realistic data
- D. A supervised regression algorithm for predicting numeric values

Answer: C

Q114. What is an autoencoder?

- A. A neural network that learns to compress and reconstruct its input
- B. A comparison-based sorting algorithm for numerical arrays
- C. A data loading utility for reading files into memory
- D. A supervised classifier that predicts categorical labels from data

Answer: A

Q115. What is LSTM?

- A. Long Short-Term Memory - an RNN variant handling long-term dependencies
- B. A cross-entropy loss function for multi-class classification
- C. A specialized type of convolutional neural network for images
- D. A structured data format for storing tabular information

Answer: A

Q116. What is a pooling layer in a CNN?

- A. A data loading layer for reading external files
- B. The final output layer for class predictions
- C. A layer that increases the total number of neurons
- D. A layer that reduces spatial dimensions by down-sampling

Answer: D

Q117. What is the purpose of a convolutional filter (kernel)?

- A. To add random noise for data augmentation purposes
- B. To store training data on disk for later retrieval access
- C. To increase the spatial resolution of the input image
- D. To detect specific features like edges or textures in input data

Answer: D

Q118. What is a pre-trained model?

- A. A randomly initialized model with no learned representations
- B. A model with absolutely no prior training on any data
- C. A model that has been permanently deleted from storage
- D. A model already trained on a large dataset for use on new tasks

Answer: D

Q119. What is a generative model?

- A. A model that only performs supervised categorical classification
- B. A model that only performs numerical regression prediction
- C. A model that learns to generate new data similar to training data
- D. A model that only performs unsupervised data point clustering

Answer: C

Q120. What framework was developed by Facebook (Meta) for deep learning?

- A. Caffe
- B. Keras
- C. PyTorch
- D. TensorFlow

Answer: C

Q121. What does NLP stand for?

- A. Numerical Linear Processing
- B. Network Logic Protocol
- C. Natural Language Processing
- D. Neural Language Programming

Answer: C

Q122. Tokenization in NLP means:

- A. Encrypting text for secure data transmission
- B. Splitting text into individual words or subwords
- C. Deleting text from the data pipeline
- D. Compressing text to reduce storage size

Answer: B

Q123. What is sentiment analysis?

- A. Summarizing long documents into shorter text passages
- B. Translating text from one natural language to another language
- C. Generating entirely new text from a given prompt input
- D. Determining the emotional tone of text (positive, negative, neutral)

Answer: D

Q124. Stop words are:

- A. Important domain-specific keywords carrying high information
- B. Common words like 'the' and 'is' often removed in processing
- C. Rare words that appear only once in the entire corpus
- D. Technical terms from a specialized subject vocabulary

Answer: B

Q125. What is text classification?

- A. Generating entirely new text from a prompt
- B. Translating text between different languages
- C. Editing and correcting text for grammar
- D. Assigning predefined categories to text documents

Answer: D

Q126. What is a corpus in NLP?

- A. A large collection of text documents
- B. A specific grammar rule definition
- C. A single word in a sentence
- D. A type of neural network model

Answer: A

Q127. What is stemming?

- A. Reducing words to their root form by removing suffixes
- B. Adding prefixes to words for morphological expansion
- C. Counting the total frequency of words in text
- D. Translating words between two different languages

Answer: A

Q128. What is lemmatization?

- A. Counting the total characters in a word
- B. Removing all vowels from the input text
- C. Adding suffixes for morphological inflection
- D. Reducing words to their base dictionary form

Answer: D

Q129. Named Entity Recognition (NER) identifies:

- A. Grammar errors found throughout the given text
- B. Spelling mistakes identified within the text body
- C. The overall length of each sentence in the document
- D. Named entities like people, organizations, and locations in text

Answer: A

Q130. What is machine translation?

- A. Performing manual text translation
- B. Generating new text from a prompt
- C. Summarizing text into shorter form
- D. Automatically translating text from one language to another

Answer: C

Q131. Computer vision enables computers to:

- A. Interpret and understand visual information from images and videos
- B. Design and build responsive web page user interfaces
- C. Manage and query relational database table records
- D. Process only natural language text data and documents

Answer: A

Q132. What is image classification?

- A. Segmenting an image into parts
- B. Assigning a label to an entire image
- C. Detecting objects in a given image
- D. Generating an image from scratch

Answer: C

Q133. What is a pixel?

- A. An input feature column name
- B. A gradient training algorithm
- C. A type of deep neural network
- D. The smallest unit of a digital image

Answer: D

Q134. What is object detection?

- A. Removing detected objects from an existing image frame
- B. Classifying the entire image into a single category label
- C. Identifying and locating objects within an image with bounding boxes
- D. Generating entirely new photorealistic synthetic images

Answer: C

Q135. RGB stands for:

- A. Random, Generated, Binary
- B. Recursive, Generative, Base
- C. Real, Gradient, Bias
- D. Red, Green, Blue

Answer: D

Q136. What is image segmentation?

- A. Resizing an image to different specified dimensions
- B. Partitioning an image into meaningful regions at the pixel level
- C. Rotating an image by a specified number of degrees
- D. Cropping an image to a smaller rectangular area

Answer: C

Q137. What does a convolution operation do to an image?

- A. Applies a filter to extract features like edges and textures
- B. Increases the image resolution to a higher pixel count
- C. Changes the file format of the image container file
- D. Deletes the image entirely from disk storage space

Answer: A

Q138. What is a grayscale image?

- A. An image with only shades of gray (single channel)
- B. A volumetric three-dimensional image stack
- C. A binary black and white image with two values
- D. A full-color image with three RGB channels

Answer: A

Q139. What is image resizing?

- A. Rotating the image by a specified angle value
- B. Changing the dimensions (width and height) of an image
- C. Deleting the image from the disk file system
- D. Changing the color space of the image channels

Answer: B

Q140. Face detection is an example of:

- A. Reinforcement learning
- B. Computer vision
- C. Data analytics
- D. Natural language processing

Answer: B

Q141. Big Data is characterized by:

- A. Only the fast speed of arrival
- B. Only the diverse data types
- C. Volume, Velocity, Variety (3 Vs)
- D. Only the large volume of data

Answer: C

Q142. What is Hadoop?

- A. A standalone relational database for transactional queries
- B. A multi-layer deep neural network architecture for AI
- C. An open-source framework for distributed storage and processing of big data
- D. A general-purpose compiled programming language for applications

Answer: C

Q143. What is MapReduce?

- A. A comparison-based sorting algorithm for small arrays
- B. A programming model for processing large datasets in parallel across a cluster
- C. A structured query language for relational database management
- D. A supervised machine learning algorithm for classification

Answer: B

Q144. What is Apache Spark?

- A. A production web server for hosting applications
- B. A standalone relational database management system
- C. A general-purpose programming language runtime
- D. A fast distributed computing engine for big data processing

Answer: D

Q145. What is a data warehouse?

- A. A centralized repository for structured data used for analysis and reporting
- B. A multi-layer deep neural network trained on data
- C. A physical room for storing server hardware equipment
- D. A transactional database used for daily operational queries

Answer: A

Q146. What does ETL stand for?

- A. Edit, Transfer, Link
- B. Extract, Transform, Load
- C. Encrypt, Transmit, Log
- D. Evaluate, Test, Learn

Answer: B

Q147. What is a data lake?

- A. A cleaned and normalized relational database table store
- B. An interactive dashboard for data visualization tools
- C. A storage repository holding raw data in its native format
- D. A small curated dataset for specific model training

Answer: C

Q148. What is distributed computing?

- A. Cloud storage of files without any computation tasks
- B. Spreading computation across multiple machines working together
- C. Using a single powerful dedicated computer for processing
- D. Interactive data visualization and charting tools

Answer: B

Q149. What is HDFS?

- A. A general-purpose interpreted programming language runtime
- B. A desktop operating system for personal computers
- C. A multi-layer deep neural network for classification
- D. Hadoop Distributed File System for storing data across a cluster

Answer: D

Q150. What is batch processing?

- A. Processing data interactively with user input prompts
- B. Processing data manually without any automation
- C. Processing large volumes of data as a group at scheduled intervals
- D. Processing data in real-time as each record arrives

Answer: C

Q151. What is MLOps?

- A. Only the model training phase of the ML lifecycle
- B. Only the data visualization phase of the lifecycle
- C. Practices for deploying and maintaining ML models in production
- D. Only the data collection phase of the ML lifecycle

Answer: C

Q152. What is model deployment?

- A. Collecting and gathering raw data from sources
- B. Making a trained model available for use in production
- C. Training a model on labeled training data samples
- D. Preprocessing and cleaning the raw input data

Answer: B

Q153. What is an API in the context of model deployment?

- A. A gradient-based training algorithm for optimizing model weights
- B. An interactive visualization tool for exploring model results
- C. An interface allowing applications to request predictions from the model
- D. A relational database for storing structured training data

Answer: C

Q154. What is model versioning?

- A. Tracking different versions of a model over time
- B. Deleting old models from the storage system
- C. Reducing model size through weight pruning
- D. Training models to converge significantly faster

Answer: A

Q155. What is a Docker container?

- A. A physical rack-mounted server housed in a data center
- B. A standalone relational database for transactional queries
- C. A multi-layer deep neural network model architecture
- D. A lightweight portable package containing everything to run an application

Answer: D

Q156. What is CI/CD in MLOps?

- A. An interactive data visualization and dashboard charting tool
- B. A standalone relational database management query system
- C. A general-purpose compiled programming language for building apps
- D. Continuous Integration and Continuous Deployment for automating ML pipelines

Answer: D

Q157. What is model monitoring?

- A. Collecting and gathering new raw data from external sources
- B. Training new models from scratch on fresh training data
- C. Building automated data preprocessing pipeline workflows
- D. Tracking model performance and behavior in production over time

Answer: D

Q158. What is a REST API?

- A. A gradient-based model training optimization method
- B. A type of relational database storage engine format
- C. An API architecture using HTTP methods for communication
- D. A general-purpose compiled programming language

Answer: C

Q159. What does reproducibility mean in ML?

- A. Using less training data to save storage and costs
- B. Running trained models faster by using better hardware
- C. The ability to recreate the same results with the same data and code
- D. Making models larger by adding more network layers

Answer: C

Q160. What is a model artifact?

- A. The saved output of training including model weights and configuration
- B. Only the source code used to build and train the model
- C. Only the runtime logs generated during model training
- D. Only the raw training data used during model training

Answer: A

Q161. What is AI bias?

- A. Systematic unfairness in AI predictions due to biased data or algorithms
- B. Slow processing speed during model inference time
- C. Random errors that occur during the model prediction process
- D. Hardware failures that cause incorrect output computations

Answer: A

Q162. What is data privacy?

- A. Encrypting only the physical hardware server equipment
- B. Making all collected data publicly available and open
- C. Deleting all collected data from every storage system
- D. Protecting personal information from unauthorized access and use

Answer: D

Q163. What is informed consent in AI?

- A. Sharing collected data freely with any third party entity
- B. Ignoring user preferences about their data usage rights
- C. Ensuring people understand and agree to how their data will be used
- D. Collecting personal data without any prior user permission

Answer: C

Q164. What is transparency in AI?

- A. Making AI decision-making processes understandable and open
- B. Making AI systems run faster and more efficiently
- C. Hiding how AI systems work from all stakeholders
- D. Using significantly more data for model training

Answer: A

Q165. What is the GDPR?

- A. A European regulation for data protection and privacy
- B. A deep neural network architecture for images
- C. A supervised machine learning training algorithm
- D. A general-purpose compiled programming language

Answer: A

Q166. Why is fairness important in AI?

- A. To use less training data during the model building phase
- B. To ensure AI systems treat all groups equitably without discrimination
- C. To make AI systems process data faster and more efficiently
- D. To reduce the financial costs of developing AI systems

Answer: B

Q167. What is accountability in AI?

- A. Automating every aspect without any human involvement
- B. Ensuring responsible parties can be identified when AI causes harm
- C. Making AI systems completely autonomous without oversight
- D. Removing all human oversight from AI decision processes

Answer: B

Q168. What is an adversarial attack on AI?

- A. Deliberately crafted inputs designed to fool AI systems
- B. A physical attack on the server hardware equipment
- C. A network attack on the communication infrastructure
- D. A SQL injection attack on the database system

Answer: A

Q169. What is algorithmic fairness?

- A. Making algorithms process data faster through hardware optimization
- B. Reducing the overall storage size of trained model files
- C. Using more diverse and larger training datasets for models
- D. Ensuring algorithms make decisions without discrimination on protected attributes

Answer: D

Q170. What is the purpose of AI regulations?

- A. To ensure safe fair and responsible development and use of AI
- B. To make AI systems significantly more expensive to build
- C. To deliberately slow down all AI research and development
- D. To limit all AI capabilities to only narrow simple tasks

Answer: A

Q171. What type of AI is designed to perform a single specific task?

- A. Meta AI
- B. Narrow AI
- C. General AI
- D. Super AI

Answer: B

Q172. Which term describes a machine's ability to imitate human conversation?

- A. Chatbot
- B. Compiler
- C. Web Scraping
- D. Data Mining

Answer: A

Q173. What does the term 'training data' refer to in machine learning?

- A. Data transmitted between two network endpoint nodes
- B. Data stored in a database for backup recovery use
- C. Data used to teach a model to recognize patterns
- D. Data used to evaluate final model accuracy scores

Answer: C

Q174. Which field combines statistics, algorithms, and computing to extract insights?

- A. Data Science
- B. Web Design
- C. Compiling
- D. Networking

Answer: A

Q175. What is reinforcement learning primarily based on?

- A. Clustering of similar items
- B. Labeled training datasets
- C. Manual rule programming
- D. Reward and penalty signals

Answer: D

Q176. Which of the following best describes deep learning?

- A. Learning restricted to tabular structured datasets
- B. Learning without any computational hardware need
- C. Learning from only a single data sample at once
- D. Learning using neural networks with many layers

Answer: D

Q177. What is the Turing Test designed to evaluate?

- A. A machine's intelligent behavior
- B. Memory capacity of a system
- C. Energy efficiency of a chip
- D. Processing speed of hardware

Answer: A

Q178. Which AI application converts spoken language into written text?

- A. Data Warehousing
- B. Image Segmentation
- C. Speech Recognition
- D. Load Balancing

Answer: C

Q179. What does the abbreviation ML stand for in the context of AI?

- A. Machine Learning
- B. Meta Language
- C. Model Linking
- D. Memory Loading

Answer: A

Q180. Which type of learning uses labeled examples to train a model?

- A. Unsupervised learning
- B. Supervised learning
- C. Reinforcement learning
- D. Transfer learning

Answer: B

Q181. What is a scalar in linear algebra?

- A. A vector of values
- B. A tensor of arrays
- C. A matrix of numbers
- D. A single numerical value

Answer: D

Q182. What does the dot product of two vectors produce?

- A. A new tensor
- B. A new matrix
- C. A single scalar
- D. A new vector

Answer: C

Q183. What is the mean of the numbers 2, 4, 6, 8, and 10?

- A. 6
- B. 7
- C. 4
- D. 5

Answer: A

Q184. Which operation flips a matrix over its diagonal?

- A. Transpose
- B. Rotation
- C. Inversion
- D. Reduction

Answer: A

Q185. What does a probability value of zero represent?

- A. A random event
- B. Impossible event
- C. A likely event
- D. A certain event

Answer: B

Q186. What is the derivative of a constant value?

- A. Infinity
- B. Undefined
- C. One
- D. Zero

Answer: D

Q187. Which term describes a rectangular array of numbers in rows and columns?

- A. Scalar
- B. Matrix
- C. Vector
- D. String

Answer: B

Q188. What is the range of a standard probability value?

- A. Negative one to one
- B. Minus ten to ten
- C. Zero to one only
- D. Zero to infinity

Answer: C

Q189. What does the summation symbol sigma represent?

- A. Ratio of values
- B. Product of terms
- C. Limit of terms
- D. Sum of a series

Answer: D

Q190. What is an identity matrix?

- A. A matrix with all zeros in every position
- B. A matrix with all elements equal to two
- C. A square matrix with ones on diagonal only
- D. A rectangular matrix with random entries

Answer: C

Q191. Which Python library is primarily used for numerical array computations?

- A. Flask
- B. NumPy
- C. Django
- D. Tkinter

Answer: B

Q192. What does the pandas function read_csv() do?

- A. Compresses CSV into zip
- B. Writes data to a CSV file
- C. Reads CSV into a DataFrame
- D. Deletes a CSV from disk

Answer: C

Q193. Which library is most commonly used for creating plots in Python?

- A. Logging
- B. Subprocess
- C. Requests
- D. Matplotlib

Answer: D

Q194. What data structure does pandas use to represent tabular data?

- A. Binary Tree
- B. DataFrame
- C. Linked List
- D. Dictionary

Answer: B

Q195. Which keyword is used to define a function in Python?

- A. function
- B. func
- C. def
- D. define

Answer: C

Q196. What does the shape attribute of a NumPy array return?

- A. The dimensions of array
- B. Total memory in bytes
- C. The maximum array value
- D. The data type of elements

Answer: A

Q197. Which Python library provides algorithms like SVM and Random Forest?

- A. Beautiful Soup
- B. SQLAlchemy
- C. Pillow Library
- D. Scikit-learn

Answer: D

Q198. What is a Python list comprehension used for?

- A. Deleting items from dictionary
- B. Creating lists with concise syntax
- C. Handling file system exceptions
- D. Connecting to remote databases

Answer: B

Q199. Which method checks for missing values in a pandas DataFrame?

- A. dropna()
- B. notna()
- C. fillna()
- D. isnull()

Answer: D

Q200. What does pip install do in Python?

- A. Runs Python unit tests
- B. Creates virtual environments
- C. Installs Python packages
- D. Compiles Python source code

Answer: C

Q201. What is data cleaning in the context of data preprocessing?

- A. Compressing data for storage
- B. Adding noise to the data
- C. Encrypting data for security
- D. Fixing errors and removing inconsistencies

Answer: D

Q202. Which technique fills missing values with the column average?

- A. Normalization step
- B. Mode imputation
- C. Deletion method
- D. Mean imputation

Answer: D

Q203. What does one-hot encoding convert?

- A. Categories into binary vectors
- B. Numbers into text labels
- C. Images into pixel arrays
- D. Audio into text transcripts

Answer: A

Q204. What is the purpose of removing duplicate records from a dataset?

- A. To add more noise and improve model robustness
- B. To reduce the number of features in the dataset
- C. To avoid bias from repeated identical observations
- D. To increase the total number of training samples

Answer: C

Q205. Which method scales features to a range between zero and one?

- A. Standardization
- B. Log transformation
- C. Min-max normalization
- D. Binning technique

Answer: C

Q206. What is a common file format for storing tabular datasets?

- A. CSV
- B. PNG
- C. MP3
- D. EXE

Answer: A

Q207. What does the term 'missing data' refer to in a dataset?

- A. Data stored in a different file location
- B. Values that are absent for some observations
- C. Values that are larger than the average value
- D. Data that has been encrypted for privacy

Answer: B

Q208. What is the first step typically performed in any data preprocessing pipeline?

- A. Data collection
- B. Hyperparameter tuning
- C. Model training
- D. Feature selection

Answer: A

Q209. Which type of data contains categories like color or country name?

- A. Numerical data
- B. Sequential data
- C. Continuous data
- D. Categorical data

Answer: D

Q210. What does the term 'outlier' refer to in a dataset?

- A. A value significantly different from others
- B. The average value of all observations
- C. A missing entry in a data column
- D. The most common value in the data

Answer: A

Q211. What does EDA stand for in data science?

- A. Extended Data Algorithm
- B. Extra Data Analysis
- C. External Data Approach
- D. Exploratory Data Analysis

Answer: D

Q212. Which type of chart is best for showing the distribution of a single variable?

- A. Pie chart
- B. Line chart
- C. Histogram
- D. Gantt chart

Answer: C

Q213. What does a scatter plot visualize?

- A. The hierarchical structure of a dataset
- B. The proportion of categories in a dataset
- C. The trend of a variable over time periods
- D. The relationship between two numerical variables

Answer: D

Q214. What is the median of a sorted dataset?

- A. The middle value in order
- B. The range of the data
- C. The arithmetic average
- D. The most frequent value

Answer: A

Q215. Which plot type shows the five-number summary of a dataset?

- A. Bar chart
- B. Area chart
- C. Box plot
- D. Scatter plot

Answer: C

Q216. What does a correlation coefficient of +1 indicate?

- A. No relationship at all
- B. Perfect positive linear
- C. Random relationship
- D. Perfect negative linear

Answer: B

Q217. Which visualization is best for comparing quantities across categories?

- A. Line chart
- B. Bar chart
- C. Heat map
- D. Histogram

Answer: B

Q218. What is the mode of a dataset?

- A. The most frequent value
- B. The largest value
- C. The average value
- D. The middle value

Answer: A

Q219. What does a line chart typically display?

- A. Trends over time
- B. Data distribution
- C. Category proportions
- D. Feature correlations

Answer: A

Q220. What is the purpose of a heatmap in data analysis?

- A. To compress images into smaller sizes
- B. To display magnitude of values using colors
- C. To show geographic locations on a map
- D. To play audio data as visual patterns

Answer: B

Q221. What is the goal of a supervised learning algorithm?

- A. Generate new data from scratch
- B. Learn a mapping from inputs to outputs
- C. Find hidden patterns without labels
- D. Group similar data points together

Answer: B

Q222. Which of these is a classification algorithm?

- A. Principal Component
- B. Linear Regression
- C. K-Means Clustering
- D. Logistic Regression

Answer: D

Q223. What does a decision tree use to split data at each node?

- A. Feature thresholds
- B. Random selection
- C. Output labels only
- D. Time stamps alone

Answer: A

Q224. What type of problem predicts a continuous numerical value?

- A. Clustering task
- B. Association task
- C. Classification task
- D. Regression task

Answer: D

Q225. Which algorithm finds the best-fit line through data points?

- A. Random Forest model
- B. K-Nearest Neighbors
- C. Apriori Algorithm
- D. Linear Regression

Answer: D

Q226. What does KNN stand for in machine learning?

- A. K-Null Notation
- B. K-Nearest Neighbors
- C. K-Node Navigation
- D. K-Normal Networks

Answer: B

Q227. In binary classification, how many possible output classes exist?

- A. Three
- B. Two
- C. One
- D. Four

Answer: B

Q228. What is a label in supervised learning?

- A. An input feature column
- B. The correct output answer
- C. A training epoch count
- D. A model parameter value

Answer: B

Q229. Which algorithm is often used for predicting house prices?

- A. Linear Regression model
- B. Naive Bayes classifier
- C. K-Means algorithm
- D. Apriori association rule

Answer: A

Q230. What does the term 'training' mean in supervised learning?

- A. Visualizing data in chart format
- B. Manually coding rules for predictions
- C. Adjusting model parameters using data
- D. Removing features from the dataset

Answer: C

Q231. What is an ensemble method in machine learning?

- A. Combining multiple models
- B. A data cleaning technique
- C. A single complex model
- D. A visualization approach

Answer: A

Q232. Which ensemble method trains models on random data subsets?

- A. Stacking
- B. Bagging
- C. Pruning
- D. Boosting

Answer: B

Q233. What is Random Forest built upon?

- A. Multiple logistic regression models combined together
- B. Multiple SVM models with different kernel functions
- C. Multiple neural networks of varying layer depths
- D. Multiple decision trees with random feature subsets

Answer: D

Q234. How does a majority voting ensemble make predictions?

- A. Using the most common prediction
- B. Using the maximum prediction
- C. Using the average prediction value
- D. Using the minimum prediction

Answer: A

Q235. What is the main advantage of ensemble methods over single models?

- A. They need less data input
- B. They always train faster
- C. They use less memory
- D. They reduce overall error

Answer: D

Q236. Which technique trains models sequentially to correct prior errors?

- A. Bagging
- B. Boosting
- C. Blending
- D. Stacking

Answer: B

Q237. What does the term 'base learner' mean in ensemble learning?

- A. The evaluation metric used
- B. An individual model in ensemble
- C. The training data subset used
- D. The final combined model

Answer: B

Q238. Which of these is a popular gradient boosting library?

- A. XGBoost
- B. NumPy
- C. Matplotlib
- D. Pandas

Answer: A

Q239. What is the purpose of bootstrap sampling in bagging?

- A. To select the best features
- B. To normalize feature values
- C. To create diverse training sets
- D. To remove outliers from data

Answer: C

Q240. How does Random Forest handle the prediction for classification tasks?

- A. Uses the prediction of the last tree only
- B. Uses the prediction of the first tree only
- C. Takes majority vote from all the trees
- D. Averages all tree predictions numerically

Answer: C

Q241. What is unsupervised learning?

- A. Learning from labeled data
- B. Learning with human feedback
- C. Learning from test data only
- D. Learning without any labels

Answer: D

Q242. What is the goal of clustering in unsupervised learning?

- A. Predicting a target value
- B. Generating synthetic data
- C. Grouping similar data points
- D. Reducing training time

Answer: C

Q243. Which algorithm groups data into K predefined number of clusters?

- A. K-Nearest Neighbors
- B. K-Fold Validation
- C. K-Means Clustering
- D. K-Mode Analysis

Answer: C

Q244. What is dimensionality reduction used for?

- A. Increasing the sample count
- B. Reducing the number of features
- C. Converting data to text format
- D. Adding more features to data

Answer: B

Q245. Which technique is a common dimensionality reduction method?

- A. Principal Component Analysis
- B. Logistic Regression
- C. Random Forest model
- D. Gradient Boosting

Answer: A

Q246. What is the centroid in K-Means clustering?

- A. The smallest value in a cluster
- B. The label assigned to a cluster
- C. The data point farthest from cluster
- D. The center point of a cluster

Answer: D

Q247. Which type of learning is used for customer segmentation?

- A. Supervised learning
- B. Reinforcement learning
- C. Unsupervised learning
- D. Semi-supervised learning

Answer: C

Q248. What does anomaly detection aim to find?

- A. The most common patterns
- B. The best classification model
- C. Unusual or rare data points
- D. The optimal feature weights

Answer: C

Q249. What is a dendrogram used to visualize?

- A. Neural network architecture
- B. Linear regression coefficients
- C. Hierarchical clustering results
- D. Confusion matrix of a model

Answer: C

Q250. Which algorithm does not require specifying the number of clusters beforehand?

- A. Mini-Batch K-Means
- B. K-Medoids
- C. K-Means
- D. DBSCAN

Answer: D

Q251. What is a confusion matrix used for?

- A. Visualizing data distributions
- B. Evaluating classification results
- C. Preprocessing raw data
- D. Training neural networks

Answer: B

Q252. What does accuracy measure in classification?

- A. The number of features used
- B. The proportion of correct predictions
- C. The size of the training data
- D. The speed of model training

Answer: B

Q253. What is the purpose of splitting data into training and test sets?

- A. To remove outliers from the original dataset
- B. To increase the training time of the model
- C. To reduce the total amount of data available
- D. To evaluate how well the model generalizes

Answer: D

Q254. What does precision measure in a classification model?

- A. The overall accuracy of the model on all classes
- B. The speed of prediction for each data sample
- C. The proportion of actual positives correctly identified
- D. The proportion of positive predictions that are correct

Answer: D

Q255. What does recall measure in a classification model?

- A. The proportion of actual positives correctly identified
- B. The number of features used by the trained model
- C. The computational time required for each prediction
- D. The proportion of positive predictions that are correct

Answer: A

Q256. What is cross-validation used for?

- A. Generating synthetic data
- B. Reducing the number of features
- C. Assessing model performance robustly
- D. Training the final production model

Answer: C

Q257. What is overfitting in the context of model evaluation?

- A. The model performs well on training but poorly on test data
- B. The model performs poorly on training data
- C. The model has too few parameters
- D. The model takes too long to train

Answer: A

Q258. What does the F1 score combine?

- A. Bias and variance
- B. Training and test error
- C. Precision and recall
- D. Accuracy and speed

Answer: C

Q259. What is a validation set used for?

- A. Testing the final model performance
- B. Training the model parameters
- C. Cleaning and preprocessing the data
- D. Tuning hyperparameters during development

Answer: D

Q260. What does underfitting indicate about a model?

- A. The model is too simple to capture patterns
- B. The model uses too many features
- C. The model has been trained too long
- D. The model is too complex for the data

Answer: A

Q261. What is feature engineering in machine learning?

- A. Evaluating model performance
- B. Training a model automatically
- C. Creating informative input variables
- D. Deploying models to production

Answer: C

Q262. What is feature selection?

- A. Adding all available features to the model without any filtering
- B. Converting feature names from one language to another one
- C. Generating entirely new features from random noise data
- D. Choosing the most relevant features for model training use

Answer: D

Q263. What does one-hot encoding create from a categorical feature?

- A. A single numerical column
- B. A text description field
- C. Multiple binary columns
- D. A sorted ordinal value

Answer: C

Q264. What is the purpose of scaling numerical features?

- A. To add missing value indicators
- B. To bring features to a similar range
- C. To change the data type of features
- D. To remove features from the data

Answer: B

Q265. Which technique creates new features by combining existing ones?

- A. Feature deletion
- B. Feature encryption
- C. Feature interaction
- D. Feature imputation

Answer: C

Q266. What is binning used for in feature engineering?

- A. Encrypting sensitive data for privacy
- B. Converting categories into continuous values
- C. Removing duplicate values from dataset
- D. Converting continuous variables into categories

Answer: D

Q267. What does a polynomial feature transformation create?

- A. Compressed versions of original data
- B. Lower dimensional representations
- C. Higher order combinations of features
- D. Random noise features for testing

Answer: C

Q268. What is the difference between ordinal and nominal encoding?

- A. Ordinal preserves category order while nominal treats categories as equal
- B. Ordinal only works with numbers while nominal only works with strings
- C. Both encodings are identical and always produce the same output values
- D. Ordinal treats categories as equal while nominal preserves their ordering

Answer: A

Q269. What is a derived feature?

- A. An original feature from raw data
- B. A new feature created from existing ones
- C. A feature with many missing values
- D. A feature removed during cleaning

Answer: B

Q270. Why is feature engineering important for model performance?

- A. It always makes models train faster
- B. It removes the requirement for training data
- C. It eliminates the need for model tuning
- D. Good features can significantly improve accuracy

Answer: D

Q271. What is a neural network inspired by?

- A. Database systems
- B. Computer circuits
- C. The human brain
- D. Mathematical proofs

Answer: C

Q272. What is an activation function in a neural network?

- A. A function that loads training data
- B. A function that saves the model
- C. A function that introduces non-linearity
- D. A function that cleans input data

Answer: C

Q273. What is a hidden layer in a neural network?

- A. A layer between input and output
- B. The output layer of the network
- C. The first layer receiving raw data
- D. The layer that stores data on disk

Answer: A

Q274. Which activation function outputs values between 0 and 1?

- A. Linear function
- B. Tanh function
- C. ReLU function
- D. Sigmoid function

Answer: D

Q275. What does the term 'epoch' mean in deep learning training?

- A. The initialization of model weight values
- B. One complete pass through all training data
- C. A single forward pass of one sample
- D. The final test evaluation of the model

Answer: B

Q276. What is the purpose of backpropagation in neural networks?

- A. To calculate and propagate error gradients
- B. To make forward predictions on data
- C. To load training data into memory
- D. To visualize the network architecture

Answer: A

Q277. What is a weight in a neural network?

- A. The number of layers in the network
- B. The learning rate of the optimizer
- C. A learnable parameter connecting neurons
- D. The size of the training dataset

Answer: C

Q278. What is the most commonly used activation function in hidden layers today?

- A. Sigmoid
- B. Softmax
- C. Linear
- D. ReLU

Answer: D

Q279. What does the output layer of a classification network produce?

- A. Hidden representations
- B. Class probability scores
- C. Gradient computations
- D. Raw pixel values

Answer: B

Q280. What is a bias term in a neural network?

- A. The rate at which the model learns from training data
- B. The preference of the model for certain training samples
- C. The error in predictions caused by insufficient data size
- D. An additional learnable parameter added to weighted sums

Answer: D

Q281. What does CNN stand for in deep learning?

- A. Central Neural Network
- B. Circular Neuron Network
- C. Convolutional Neural Network
- D. Connected Node Network

Answer: C

Q282. What does RNN stand for in deep learning?

- A. Recursive Node Network
- B. Recurrent Neural Network
- C. Regional Neuron Network
- D. Random Neural Network

Answer: B

Q283. What is a convolutional filter used for in CNNs?

- A. Storing training labels
- B. Detecting patterns in input
- C. Compressing the model size
- D. Removing noise from data

Answer: B

Q284. What is the purpose of a pooling layer in a CNN?

- A. To add more features to data
- B. To increase image resolution
- C. To reduce spatial dimensions
- D. To convert images to text

Answer: C

Q285. What type of data are RNNs primarily designed to handle?

- A. Tabular data
- B. Image data
- C. Graph data
- D. Sequential data

Answer: D

Q286. What is a GAN in deep learning?

- A. Grouped Attention Network
- B. Gradient Adjusted Network
- C. General Analysis Network
- D. Generative Adversarial Network

Answer: D

Q287. What is max pooling in a CNN?

- A. Taking the average value from a region
- B. Taking the median value from a region
- C. Taking the maximum value from a region
- D. Taking the minimum value from a region

Answer: C

Q288. What is an autoencoder used for?

- A. Generating adversarial examples
- B. Learning compressed data representations
- C. Tuning model hyperparameters
- D. Supervised classification tasks

Answer: B

Q289. What does LSTM stand for?

- A. Layered Spatial Tensor Model
- B. Local Statistical Testing Method
- C. Long Short-Term Memory
- D. Linear Sequential Training Model

Answer: C

Q290. What is the Transformer architecture primarily known for?

- A. Reinforcement learning games
- B. Image classification tasks
- C. Self-attention mechanism for sequences
- D. Database query optimization

Answer: C

Q291. What does NLP stand for?

- A. Neural Logic Processing
- B. Numerical Linear Programming
- C. Natural Language Processing
- D. Network Layer Protocol

Answer: C

Q292. What is tokenization in NLP?

- A. Encrypting text for security use
- B. Compressing text to save space
- C. Splitting text into smaller units
- D. Translating text between languages

Answer: C

Q293. What is sentiment analysis used for?

- A. Detecting the emotion or opinion in text
- B. Counting the words in a document
- C. Correcting grammar errors in writing
- D. Translating text to other languages

Answer: A

Q294. What is a stop word in natural language processing?

- A. A common word often removed in preprocessing
- B. A word that stops program execution
- C. A word that contains a typing error
- D. A word used only in technical documents

Answer: A

Q295. What is named entity recognition?

- A. Identifying names of programming functions in code
- B. Identifying proper nouns like people and places in text
- C. Identifying the most frequent word in a paragraph text
- D. Identifying syntax errors in written documents for fixes

Answer: B

Q296. What is stemming in text preprocessing?

- A. Reducing words to their root or base form
- B. Sorting words in alphabetical sequence
- C. Adding prefixes to expand word meanings
- D. Translating words to another language

Answer: A

Q297. What is a corpus in NLP?

- A. A neural network architecture
- B. A large collection of text data
- C. A visualization chart format
- D. A machine learning algorithm type

Answer: B

Q298. What does a language model predict?

- A. The next word in a sequence
- B. Hardware specifications
- C. Database query results
- D. Image classification labels

Answer: A

Q299. What is text classification in NLP?

- A. Translating text between two languages
- B. Converting speech to written text
- C. Generating images from descriptions
- D. Assigning categories to text documents

Answer: D

Q300. What is a word embedding?

- A. A word encrypted for secure storage
- B. A word stored in a database table
- C. A word highlighted in a text editor
- D. A dense vector representation of a word

Answer: D

Q301. What is computer vision?

- A. A computer's screen resolution settings
- B. AI field enabling machines to interpret images
- C. A method for compressing video file data
- D. A type of display monitor hardware

Answer: B

Q302. What is image classification?

- A. Converting images to text format
- B. Sorting images by file size on disk
- C. Assigning a label to an entire image
- D. Splitting an image into two halves

Answer: C

Q303. What does object detection identify in an image?

- A. The resolution of the image file
- B. The file format of the image data
- C. The color profile of the image data
- D. Objects and their bounding box locations

Answer: D

Q304. What is a pixel in digital image processing?

- A. The smallest unit of a digital image
- B. A color space conversion algorithm
- C. A type of image compression format
- D. A filter used to sharpen images

Answer: A

Q305. What does image segmentation do?

- A. Converts color images to grayscale
- B. Increases image resolution quality
- C. Divides image into meaningful regions
- D. Reduces the file size of images

Answer: C

Q306. What is data augmentation in computer vision?

- A. Reducing the resolution of all images
- B. Converting all images to black and white
- C. Deleting duplicate images from dataset
- D. Creating modified copies of training images

Answer: D

Q307. Which deep learning architecture is most associated with image processing?

- A. Long Short-Term Memory
- B. Generative Adversarial Network
- C. Recurrent Neural Network
- D. Convolutional Neural Network

Answer: D

Q308. What is face recognition technology used for?

- A. Converting faces into cartoon drawings
- B. Identifying or verifying a person's identity
- C. Compressing facial images to save space
- D. Measuring the resolution of face images

Answer: B

Q309. What is optical character recognition?

- A. Recognizing and extracting text from images
- B. Compressing text before saving to disk
- C. Converting text files to images
- D. Encrypting text within image files

Answer: A

Q310. What does RGB stand for in digital images?

- A. Random Generated Bits
- B. Red Green Blue
- C. Regular Grid Base
- D. Rapid Graphics Buffer

Answer: B

Q311. What are the three Vs of big data?

- A. Vector, Variable, Vault
- B. Version, Vendor, Virtue
- C. Vision, Value, Validity
- D. Volume, Velocity, Variety

Answer: D

Q312. What is Apache Hadoop used for?

- A. Building web applications
- B. Distributed storage and processing
- C. Designing user interfaces
- D. Creating mobile applications

Answer: B**Q313. What is Apache Spark?**

- A. A database management system
- B. A fast distributed computing engine
- C. A web development framework
- D. A machine learning algorithm

Answer: B**Q314. What does HDFS stand for in big data?**

- A. High Data File System
- B. Hardware Distribution Framework
- C. Hybrid Data Format Standard
- D. Hadoop Distributed File System

Answer: D**Q315. What is a data lake?**

- A. A small SQL database
- B. A machine learning algorithm
- C. A centralized repository for raw data
- D. A data visualization tool

Answer: C**Q316. What is MapReduce in big data processing?**

- A. A database query language
- B. A machine learning framework
- C. A parallel processing programming model
- D. A data visualization library

Answer: C**Q317. What is streaming data?**

- A. Data generated and processed continuously
- B. Data archived for long-term storage
- C. Data stored in static files
- D. Data compressed for efficient transfer

Answer: A**Q318. What is a data warehouse?**

- A. An unstructured data lake for raw files
- B. A tool for creating data visualizations
- C. A physical storage building for servers
- D. A structured repository for analyzed data

Answer: D**Q319. What is the purpose of data partitioning in big data systems?**

- A. To convert data from one format to another
- B. To divide data across nodes for parallel processing
- C. To encrypt data for security purposes
- D. To delete old data from the storage system

Answer: B

Q320. What is Apache Kafka primarily used for?

- A. Real-time data streaming and messaging
- B. Image processing tasks
- C. Creating web applications
- D. Training deep learning models

Answer: A

Q321. What does MLOps stand for?

- A. Machine Learning Operations
- B. Multi-Layer Optimization
- C. Machine Logic Operations
- D. Model Linear Operations

Answer: A

Q322. What is model deployment in machine learning?

- A. Training a model on data
- B. Collecting new training data
- C. Making a trained model available for use
- D. Deleting an old model version

Answer: C

Q323. What is a REST API commonly used for in ML deployment?

- A. Storing training data in databases
- B. Serving model predictions over HTTP
- C. Training models faster
- D. Visualizing model architecture

Answer: B

Q324. What is model versioning?

- A. Converting models between different formats
- B. Deleting older models from storage
- C. Tracking different versions of a trained model
- D. Training multiple models simultaneously

Answer: C

Q325. What is CI/CD in the context of MLOps?

- A. Calculated Input and Computed Derivation
- B. Continuous Integration and Continuous Deployment
- C. Computer Intelligence and Cloud Delivery
- D. Central Interface and Core Distribution

Answer: B

Q326. What is model monitoring in production?

- A. Training the model with new data
- B. Deleting unused model files from disk
- C. Tracking model performance after deployment
- D. Creating documentation for the model

Answer: C

Q327. What is a Docker container used for in MLOps?

- A. Storing large datasets for training
- B. Visualizing model predictions on charts
- C. Packaging applications with all dependencies
- D. Training deep learning models faster

Answer: C

Q328. What is an ML pipeline?

- A. A visualization of model accuracy metrics
- B. A single model training step
- C. A database for storing predictions
- D. An automated sequence of ML workflow steps

Answer: D

Q329. What is A/B testing used for in model deployment?

- A. Training two models at the same time
- B. Splitting data into training and test sets
- C. Merging two models into a single model
- D. Comparing two model versions with real users

Answer: D

Q330. What is a feature store in MLOps?

- A. A retail store that sells ML hardware
- B. A centralized repository for ML features
- C. A visualization tool for model features
- D. A database for storing raw training data

Answer: B

Q331. What is AI bias?

- A. A technique for improving model accuracy
- B. A type of neural network optimization method
- C. A method for collecting training data faster
- D. Systematic unfairness in AI system outputs

Answer: D

Q332. What is data privacy in the context of AI?

- A. Making all data publicly available online
- B. Sharing data freely between all companies
- C. Protecting personal information in AI systems
- D. Storing data without any encryption method

Answer: C

Q333. What does explainable AI aim to provide?

- A. Larger training datasets for models
- B. More complex model architectures
- C. Faster model training speeds
- D. Understandable AI decision reasoning

Answer: D

Q334. What is fairness in AI systems?

- A. Making AI models run on all hardware
- B. Minimizing the size of the trained model
- C. Ensuring equal treatment across different groups
- D. Maximizing accuracy on the training dataset

Answer: C

Q335. What is the GDPR in relation to AI and data?

- A. A European data protection regulation
- B. A programming language for AI development
- C. A type of neural network architecture
- D. A machine learning algorithm for privacy

Answer: A

Q336. What is an adversarial attack on an AI system?

- A. A method for training models faster now
- B. A technique for compressing model size
- C. Deliberately manipulating input to fool AI
- D. Improving model accuracy by adding data

Answer: C

Q337. What does transparency mean in AI ethics?

- A. Making AI code run more efficiently
- B. Reducing the size of AI model files
- C. Hiding model details from all users
- D. Being open about how AI systems work

Answer: D

Q338. What is informed consent in AI data collection?

- A. Automatically opting in all users to data sharing
- B. Getting user agreement before collecting data
- C. Collecting data without user knowledge
- D. Deleting all collected data after processing

Answer: B

Q339. What is the purpose of AI regulation?

- A. To prevent all AI research and development
- B. To restrict AI use to government agencies only
- C. To ensure AI systems are safe and responsible
- D. To make AI technology more expensive to build

Answer: C

Q340. What is algorithmic transparency?

- A. Making algorithms run faster on hardware
- B. Using transparent display screens for output
- C. Making AI decision processes understandable
- D. Hiding algorithm details from competitors

Answer: C

Q341. Which branch of AI focuses on enabling machines to learn from data?

- A. Robotics
- B. Machine Learning
- C. Computer Graphics
- D. Database Management

Answer: B

Q342. What is a robot in the context of AI?

- A. A software virus
- B. A physical or virtual agent that can perform tasks autonomously
- C. A type of database
- D. A programming language

Answer: B

Q343. Which of the following is an application of natural language processing?

- A. Image compression
- B. Voice assistants like Siri
- C. Video rendering
- D. Battery management

Answer: B

Q344. What does the term 'intelligent agent' mean in AI?

- A. A human expert
- B. An entity that perceives its environment and takes actions to achieve goals
- C. A computer virus
- D. A data table

Answer: B

Q345. Which of the following is NOT an AI application?

- A. Spam email filtering
- B. Self-driving cars
- C. Manual data entry on paper
- D. Recommendation systems

Answer: C

Q346. What is computer vision in AI?

- A. A way to improve monitor resolution
- B. The field enabling computers to interpret visual information from the world
- C. A type of encryption
- D. A database query language

Answer: B

Q347. What type of data does a supervised learning algorithm require?

- A. Only images
- B. Labeled data with input-output pairs
- C. Random noise
- D. Encrypted data

Answer: B

Q348. What is an AI model?

- A. A physical robot
- B. A mathematical representation learned from data to make predictions
- C. A type of hard drive
- D. A monitor display

Answer: B

Q349. Which industry commonly uses AI for fraud detection?

- A. Agriculture
- B. Banking and Finance
- C. Construction
- D. Textile manufacturing

Answer: B

Q350. What is the purpose of a recommendation system?

- A. To delete user accounts
- B. To suggest relevant items to users based on their preferences
- C. To compress files
- D. To format documents

Answer: B

Q351. What is a vector in mathematics?

- A. A single number
- B. An ordered list of numbers with magnitude and direction
- C. A type of graph
- D. A random variable

Answer: B

Q352. What does the term 'dimension' refer to in a dataset?

- A. The physical size of a hard drive
- B. The number of features or variables in the data
- C. The color depth of images
- D. The speed of computation

Answer: B

Q353. What is the formula for calculating the mean?

- A. Sum of values divided by count of values
- B. Product of all values
- C. Largest value minus smallest value
- D. Square root of variance

Answer: A

Q354. What is variance in statistics?

- A. The middle value of a dataset
- B. A measure of how spread out data points are from the mean
- C. The most common value
- D. The total count of data points

Answer: B

Q355. What is a function in mathematics?

- A. A random process
- B. A rule that assigns each input exactly one output
- C. A type of matrix
- D. A data storage format

Answer: B

Q356. What does the slope of a line represent?

- A. The y-intercept
- B. The rate of change between two variables
- C. The color of the line
- D. The length of the line

Answer: B

Q357. What is the difference between a row vector and a column vector?

- A. There is no difference
- B. A row vector is horizontal while a column vector is vertical
- C. Row vectors are larger
- D. Column vectors cannot be used in calculations

Answer: B

Q358. What is a conditional probability?

- A. The probability of an impossible event
- B. The probability of an event occurring given that another event has already occurred
- C. A probability greater than one
- D. The total probability of all events

Answer: B

Q359. What is an exponent in mathematics?

- A. A subtraction operation
- B. The number of times a base number is multiplied by itself
- C. A type of average
- D. A statistical test

Answer: B

Q360. What is a dictionary in Python?

- A. An ordered list of elements
- B. A collection of key-value pairs
- C. A type of loop
- D. A mathematical function

Answer: B

Q361. What does the len() function return in Python?

- A. The data type of an object
- B. The number of items in an object
- C. The memory size in bytes
- D. The last element of a list

Answer: B

Q362. Which Python library is used for deep learning with dynamic computation graphs?

- A. pandas
- B. matplotlib
- C. PyTorch
- D. scikit-learn

Answer: C

Q363. What does the range() function generate in Python?

- A. Random numbers
- B. A sequence of numbers
- C. A list of strings
- D. Boolean values

Answer: B

Q364. What is a tuple in Python?

- A. A mutable list
- B. An immutable ordered sequence of elements
- C. A type of dictionary
- D. A function definition

Answer: B

Q365. What does the type() function do in Python?

- A. Converts data types
- B. Returns the data type of an object
- C. Creates a new variable
- D. Deletes an object

Answer: B

Q366. What is the purpose of the import statement in Python?

- A. To export data to files
- B. To bring external modules and libraries into the current script
- C. To delete variables
- D. To create loops

Answer: B

Q367. What does df.describe() do in pandas?

- A. Deletes the DataFrame
- B. Generates descriptive statistics like mean, std, min, max for numerical columns
- C. Sorts the DataFrame
- D. Renames columns

Answer: B

Q368. What is a for loop used for in Python?

- A. Defining functions
- B. Iterating over a sequence of elements
- C. Importing libraries
- D. Handling exceptions

Answer: B

Q369. What does np.zeros() create in NumPy?

- A. An array filled with ones
- B. An array filled with zeros
- C. An empty array
- D. A random array

Answer: B

Q370. What is data transformation in preprocessing?

- A. Deleting all data
- B. Converting data from one format or structure to another suitable for analysis
- C. Printing data on paper
- D. Sending data over the internet

Answer: B

Q371. What is the purpose of splitting data into training and testing sets?

- A. To reduce dataset size
- B. To evaluate model performance on unseen data and detect overfitting
- C. To make training faster
- D. To remove missing values

Answer: B

Q372. What is a numerical feature in a dataset?

- A. A feature containing text labels
- B. A feature represented by numbers that can be measured or counted
- C. A feature with only two values
- D. A feature with missing values

Answer: B

Q373. What does it mean to drop a column in data preprocessing?

- A. Moving a column to a different table
- B. Removing an entire feature from the dataset
- C. Adding new data to a column
- D. Sorting a column in descending order

Answer: B

Q374. What is label encoding used for?

- A. Adding labels to charts
- B. Converting categorical text values into numerical codes
- C. Encrypting data for security
- D. Splitting data into training sets

Answer: B

Q375. What is the purpose of data validation in preprocessing?

- A. Making data look prettier
- B. Checking that data meets expected quality standards and constraints before processing
- C. Encrypting sensitive data
- D. Compressing data files

Answer: B

Q376. What is a feature vector?

- A. A type of virus
- B. A numerical representation of an object's features used as input to an ML model
- C. A graph showing feature importance
- D. A physical measurement tool

Answer: B

Q377. What does data integration involve in preprocessing?

- A. Splitting data into smaller pieces
- B. Combining data from multiple sources into a unified dataset
- C. Deleting duplicate records only
- D. Changing data types

Answer: B

Q378. Why might you convert text to lowercase during preprocessing?

- A. To save storage space
- B. To ensure consistent treatment of words regardless of capitalization
- C. To make text unreadable
- D. To increase processing speed

Answer: B

Q379. What is the purpose of exploratory data analysis?

- A. To deploy models to production
- B. To understand data patterns, distributions, and relationships before modeling
- C. To encrypt sensitive data
- D. To compress data files

Answer: B

Q380. What does a histogram display?

- A. The relationship between two variables
- B. The frequency distribution of a single variable
- C. A geographical map
- D. A network diagram

Answer: B

Q381. What is the range of a dataset?

- A. The average value
- B. The difference between the maximum and minimum values
- C. The most frequent value
- D. The middle value

Answer: B

Q382. What does a negative correlation between two variables mean?

- A. Both variables increase together
- B. As one variable increases the other tends to decrease
- C. The variables are identical
- D. There is no relationship

Answer: B

Q383. What is the purpose of a count plot?

- A. To show the count of numerical values
- B. To show the frequency of each category in a categorical variable
- C. To display time series data
- D. To plot mathematical functions

Answer: B

Q384. What does df.shape return in pandas?

- A. The data types of columns
- B. A tuple showing the number of rows and columns in the DataFrame
- C. The column names
- D. The sum of all values

Answer: B

Q385. What is a missing value indicator in EDA?

- A. A value of zero
- B. A marker like NaN or null that indicates data was not recorded
- C. A negative number
- D. The most frequent value

Answer: B

Q386. What is a stacked bar chart used for?

- A. Showing 3D data
- B. Comparing the composition of categories across different groups
- C. Displaying continuous distributions
- D. Plotting geographic data

Answer: B

Q387. What is the mean absolute deviation?

- A. The square of variance
- B. The average of the absolute differences between each value and the mean
- C. The maximum deviation from the mean
- D. The standard deviation squared

Answer: B

Q388. Why is it important to check the data types of columns during EDA?

- A. Data types affect font size in visualizations
- B. Incorrect data types can cause errors in computations and analysis, such as numbers stored as strings
- C. Data types are irrelevant for analysis
- D. All columns should always be strings

Answer: B

Q389. What is the difference between classification and regression?

- A. They are the same thing
- B. Classification predicts categories while regression predicts continuous numerical values
- C. Regression predicts categories while classification predicts numbers
- D. Neither involves prediction

Answer: B

Q390. What is a decision boundary in classification?

- A. The edge of a dataset
- B. The boundary separating different class regions in feature space
- C. A programming error
- D. The maximum number of features allowed

Answer: B

Q391. What does the term 'prediction' mean in supervised learning?

- A. Guessing without any basis
- B. The output generated by a trained model for a given input
- C. Storing data in a database
- D. Visualizing data

Answer: B

Q392. What is a hyperparameter in a machine learning model?

- A. A parameter learned from training data
- B. A configuration set before training that controls the learning process
- C. A type of feature in the dataset
- D. The model's final prediction

Answer: B

Q393. What is the goal of minimizing a loss function?

- A. To increase errors
- B. To find model parameters that produce predictions closest to actual values
- C. To maximize data size
- D. To remove features

Answer: B

Q394. What is a leaf node in a decision tree?

- A. The root of the tree
- B. A node at the bottom that contains the final prediction or class label
- C. An intermediate splitting node
- D. The input layer

Answer: B

Q395. What is gradient descent used for in supervised learning?

- A. Sorting data
- B. Optimizing model parameters by iteratively moving in the direction of steepest decrease in the loss function
- C. Creating visualizations
- D. Splitting datasets

Answer: B

Q396. What is multiclass classification?

- A. A problem with exactly two output classes
- B. A classification task where the model predicts one of three or more possible classes
- C. A regression problem
- D. An unsupervised learning task

Answer: B

Q397. What is the purpose of the intercept term in linear regression?

- A. To multiply features together
- B. To represent the predicted value when all features are zero
- C. To remove outliers
- D. To normalize the data

Answer: B

Q398. What is a training error?

- A. An error in the code
- B. The difference between the model's predictions and actual values on the training data
- C. A hardware malfunction
- D. A missing value in the dataset

Answer: B

Q399. What is the wisdom of crowds principle in ensemble learning?

- A. Only the best model matters
- B. Combining multiple diverse models often produces better predictions than any single model alone
- C. Crowds always make wrong decisions
- D. Ensembles use only one model

Answer: B

Q400. What does the term 'weak learner' mean in boosting?

- A. A model that never makes predictions
- B. A model that performs only slightly better than random guessing
- C. A model with perfect accuracy
- D. A model that uses no data

Answer: B

Q401. What is the primary purpose of averaging predictions in a regression ensemble?

- A. To increase variance
- B. To reduce prediction errors by smoothing out individual model mistakes
- C. To make predictions more extreme
- D. To delete outlier predictions

Answer: B

Q402. Which of the following is an example of a bagging algorithm?

- A. AdaBoost
- B. XGBoost
- C. Random Forest
- D. Logistic Regression

Answer: C

Q403. What happens to overfitting when you add more trees to a Random Forest?

- A. Overfitting always increases dramatically
- B. Adding more trees generally does not increase overfitting, it tends to stabilize performance
- C. The model becomes simpler
- D. All trees become identical

Answer: B

Q404. What is the role of the number of estimators hyperparameter in ensemble methods?

- A. It controls the number of features used
- B. It specifies how many base models are combined in the ensemble
- C. It determines the learning rate
- D. It sets the maximum depth of trees

Answer: B

Q405. What is a simple averaging ensemble?

- A. A single model that averages features
- B. An ensemble that takes the arithmetic mean of predictions from multiple models
- C. A feature engineering technique
- D. A data preprocessing step

Answer: B

Q406. Why are decision trees commonly used as base learners in ensemble methods?

- A. They are the only algorithm available
- B. They are fast to train, can model nonlinear relationships, and their high variance is reduced by ensemble aggregation
- C. They never overfit
- D. They always produce identical results

Answer: B

Q407. What is weighted voting in ensemble classification?

- A. All models have equal influence
- B. Each model's vote is weighted by its estimated quality or confidence
- C. Only the best model votes
- D. Weights are applied to features

Answer: B

Q408. What is gradient boosting?

- A. An algorithm that uses random sampling like bagging
- B. A boosting method that sequentially fits models to the residual errors of previous models
- C. A single decision tree algorithm
- D. An unsupervised clustering method

Answer: B

Q409. What is the difference between clustering and classification?

- A. They are the same task
- B. Clustering groups data without predefined labels while classification assigns predefined class labels
- C. Classification does not use labels
- D. Clustering requires labeled data

Answer: B

Q410. What is the purpose of K-Means initialization?

- A. To normalize the data
- B. To set the initial positions of cluster centroids before the iterative algorithm begins
- C. To determine the number of features
- D. To clean the data

Answer: B

Q411. What is market basket analysis?

- A. Analyzing shopping cart designs
- B. Using association rules to find products frequently purchased together
- C. A type of regression
- D. A supervised learning technique

Answer: B

Q412. What is the objective of PCA?

- A. To increase data dimensions
- B. To find directions of maximum variance and reduce dimensionality while preserving information
- C. To classify data into groups
- D. To remove outliers

Answer: B

Q413. What is the elbow in the elbow method for K-Means?

- A. The first cluster
- B. The point on the inertia curve where adding more clusters gives diminishing improvement, resembling an elbow shape
- C. The last data point
- D. The maximum number of features

Answer: B

Q414. What is feature reduction?

- A. Adding more features to a dataset
- B. Decreasing the number of features while retaining important information
- C. Deleting all features
- D. Normalizing feature values

Answer: B

Q415. What is a cluster center?

- A. The first data point in a cluster
- B. The representative point of a cluster, often the mean of all points in the cluster
- C. The farthest point from other clusters
- D. A data point that belongs to no cluster

Answer: B

Q416. What is the difference between PCA and feature selection?

- A. They are identical techniques
- B. PCA creates new composite features from original features while feature selection chooses a subset of original features
- C. PCA only removes features
- D. Feature selection creates new features

Answer: B

Q417. What is an autoencoder's bottleneck layer?

- A. The output layer
- B. A hidden layer with fewer neurons that forces the network to learn compressed representations of the input
- C. The input layer
- D. A dropout layer

Answer: B

Q418. What is the purpose of the MiniBatchKMeans algorithm?

- A. To increase clustering accuracy
- B. To provide a faster approximation of K-Means by using random subsets of data for each iteration
- C. To handle text data only
- D. To replace DBSCAN

Answer: B

Q419. What is a true positive in classification?

- A. The model incorrectly predicts the positive class
- B. The model correctly predicts the positive class
- C. The model correctly predicts the negative class
- D. The model incorrectly predicts the negative class

Answer: B

Q420. What is a true negative in classification?

- A. The model correctly predicts the positive class
- B. The model incorrectly predicts the positive class
- C. The model correctly predicts the negative class
- D. The model incorrectly predicts the negative class

Answer: C

Q421. What is a false negative in classification?

- A. The model correctly predicts positive
- B. The model correctly predicts negative
- C. The model incorrectly predicts negative when the actual class is positive
- D. The model incorrectly predicts positive when the actual class is negative

Answer: C

Q422. What is the purpose of a holdout test set?

- A. To train the model
- B. To provide a final unbiased evaluation of the model's performance on unseen data
- C. To tune hyperparameters
- D. To clean the data

Answer: B

Q423. What does a higher accuracy mean for a classification model?

- A. The model makes more errors
- B. A larger proportion of all predictions are correct
- C. The model is more complex
- D. The model trains faster

Answer: B

Q424. What is root mean squared error?

- A. The mean of errors
- B. The square root of the average of squared differences between predicted and actual values
- C. The maximum error
- D. The median error

Answer: B

Q425. What does the R-squared value tell us about a regression model?

- A. The number of features used
- B. The proportion of variance in the target variable explained by the model
- C. The training time
- D. The number of data points

Answer: B

Q426. Why is it important to evaluate a model on data it has not been trained on?

- A. It is not important
- B. To check if the model generalizes to new data rather than just memorizing the training data
- C. To make training faster
- D. To increase the dataset size

Answer: B

Q427. What is a baseline model in model evaluation?

- A. The most complex model possible
- B. A simple reference model used as a minimum performance benchmark for comparison
- C. A model with zero accuracy
- D. The final deployed model

Answer: B

Q428. What is the specificity of a classifier?

- A. The same as recall
- B. The proportion of actual negatives that are correctly identified as negative
- C. The total number of predictions
- D. The model's complexity level

Answer: B

Q429. What is an interaction feature?

- A. A feature from user interactions with a website
- B. A new feature created by combining two or more existing features, such as multiplying them together
- C. A feature that interacts with the model
- D. A type of categorical feature

Answer: B

Q430. What is feature extraction?

- A. Removing all features from data
- B. Creating new informative features from raw data like extracting day of week from a date
- C. A type of model training
- D. Deleting columns from a dataset

Answer: B

Q431. Why is domain knowledge valuable in feature engineering?

- A. It is not valuable at all
- B. Experts can identify meaningful transformations and combinations that algorithms alone might miss
- C. Domain knowledge slows down the process
- D. It only helps with data collection

Answer: B

Q432. What is a ratio feature?

- A. A feature with a fixed ratio
- B. A new feature created by dividing one feature by another to capture proportional relationships
- C. A feature that counts occurrences
- D. A binary feature

Answer: B

Q433. What is the purpose of extracting date components as features?

- A. To encrypt date information
- B. To create separate features like year, month, day, and day of week that capture temporal patterns
- C. To delete date columns
- D. To format dates for display

Answer: B

Q434. What is text vectorization?

- A. Converting vectors to text
- B. Converting text data into numerical feature vectors that ML algorithms can process
- C. A text editing operation
- D. A type of font transformation

Answer: B

Q435. What is the purpose of indicator (dummy) variables?

- A. To indicate errors in data
- B. To represent categorical variables as binary columns where each category gets its own column
- C. To point to other datasets
- D. To indicate missing values only

Answer: B

Q436. What is feature aggregation?

- A. Splitting features into smaller parts
- B. Summarizing multiple values into a single statistic like count, mean, or sum for grouped data
- C. Deleting aggregated data
- D. A type of normalization

Answer: B

Q437. What is a count feature?

- A. A feature that counts model parameters
- B. A feature representing the frequency or count of occurrences of a particular event or category
- C. A feature with only integer values
- D. The total number of features

Answer: B

Q438. What is the benefit of creating squared features?

- A. They reduce all values to zero
- B. They allow linear models to capture quadratic (U-shaped or inverted-U) relationships between features and the target
- C. They make features easier to read
- D. They always improve accuracy

Answer: B

Q439. What is a perceptron in deep learning?

- A. A type of dataset
- B. The simplest form of neural network with a single neuron that computes a weighted sum of inputs
- C. A loss function
- D. A type of optimizer

Answer: B

Q440. What is the purpose of the input layer in a neural network?

- A. To process data through complex computations
- B. To receive and pass the raw input features to the next layer
- C. To produce final predictions
- D. To apply activation functions

Answer: B

Q441. What is the difference between a deep and a shallow neural network?

- A. Deep networks use more data
- B. Deep networks have many hidden layers while shallow networks have one or two hidden layers
- C. Shallow networks are more accurate
- D. There is no difference

Answer: B

Q442. What is the tanh activation function?

- A. A linear function
- B. A function that outputs values between -1 and 1, shaped like a stretched sigmoid
- C. A function that outputs only 0 or 1
- D. A function that outputs only positive values

Answer: B

Q443. What is a batch size in neural network training?

- A. The total dataset size
- B. The number of training samples processed before the model's weights are updated
- C. The number of layers in the network
- D. The number of output classes

Answer: B

Q444. What is a dense layer in a neural network?

- A. A layer with no connections
- B. A fully connected layer where every neuron is connected to every neuron in the previous layer
- C. A layer that reduces dimensions
- D. A layer that only processes images

Answer: B

Q445. What is the purpose of a learning rate schedule?

- A. To set a fixed learning rate
- B. To adjust the learning rate during training, typically decreasing it to allow finer convergence
- C. To increase the learning rate continuously
- D. To determine the batch size

Answer: B

Q446. What is the output layer of a neural network?

- A. The first layer that receives input
- B. The final layer that produces the network's prediction or output
- C. Any hidden layer
- D. The layer that stores training data

Answer: B

Q447. What is the role of a GPU in deep learning?

- A. It stores the training data
- B. It accelerates matrix computations needed for training neural networks through parallel processing
- C. It provides internet connectivity
- D. It manages the operating system

Answer: B

Q448. What is model inference in deep learning?

- A. The process of training a model
- B. Using a trained model to make predictions on new data
- C. Designing the model architecture
- D. Cleaning the training data

Answer: B

Q449. What is a stride in CNN convolution?

- A. The size of the filter
- B. The number of pixels the filter moves across the input for each step
- C. The depth of the network
- D. The number of filters used

Answer: B

Q450. What is padding in CNNs?

- A. Adding noise to images
- B. Adding extra pixels around the input borders to control the spatial dimensions of the output
- C. Removing pixels from images
- D. A type of activation function

Answer: B

Q451. What is average pooling?

- A. Computing the average of all network weights
- B. Taking the average of values in each pooling window to reduce spatial dimensions
- C. Averaging predictions from multiple models
- D. Computing the average loss

Answer: B

Q452. What is the vanishing gradient problem specifically in RNNs?

- A. Gradients become too large
- B. Gradients diminish exponentially over long sequences, making it hard for the network to learn long-range dependencies
- C. RNNs do not have gradients
- D. Gradients are always stable in RNNs

Answer: B

Q453. What is the generator in a GAN?

- A. The part that classifies real from fake
- B. The neural network that creates synthetic data samples from random noise
- C. A data preprocessing tool
- D. The loss function

Answer: B

Q454. What is the purpose of flattening in a CNN?

- A. Making images flat
- B. Converting multi-dimensional feature maps into a one-dimensional vector to feed into fully connected layers
- C. Reducing the number of filters
- D. Removing padding from feature maps

Answer: B

Q455. What is global average pooling?

- A. Averaging all model parameters
- B. Taking the average of each entire feature map to produce a single value per map, replacing fully connected layers
- C. A global training strategy
- D. Averaging across all training epochs

Answer: B

Q456. What is a feature map in a CNN?

- A. A geographical map of features
- B. The output produced when a convolutional filter is applied to the input, showing where patterns are detected
- C. A list of feature names
- D. The model architecture diagram

Answer: B

Q457. What is sequence-to-sequence learning?

- A. Learning from one data point to another
- B. A framework where the model reads an input sequence and produces an output sequence, used in translation and summarization
- C. A type of sorting algorithm
- D. Learning sequences in random order

Answer: B

Q458. What is fine-tuning a pre-trained model?

- A. Training from scratch on new data
- B. Taking a model trained on one task and continuing training on a new related task with a smaller learning rate
- C. Removing all layers of a model
- D. Only using the model for inference

Answer: B

Q459. What is a vocabulary in NLP?

- A. A grammar textbook
- B. The set of all unique words or tokens recognized by an NLP model
- C. A list of synonyms
- D. A type of neural network

Answer: B

Q460. What is text preprocessing in NLP?

- A. Writing text for a publication
- B. Cleaning and transforming raw text into a format suitable for analysis, including lowercasing, removing punctuation, and tokenizing
- C. Compressing text files
- D. Printing text documents

Answer: B

Q461. What is a bigram in NLP?

- A. A type of neural network
- B. A sequence of two consecutive words or characters in text
- C. A binary encoding scheme
- D. A grammatical rule

Answer: B

Q462. What is the bag-of-words representation?

- A. A physical bag containing word cards
- B. A text representation that counts word occurrences regardless of order or grammar
- C. A neural network for word generation
- D. A method for sorting words alphabetically

Answer: B

Q463. What is question answering in NLP?

- A. A quiz game format
- B. The task of automatically finding or generating answers to questions posed in natural language
- C. A type of data collection
- D. A text formatting technique

Answer: B

Q464. What is text summarization?

- A. Making text longer and more detailed
- B. Automatically creating a shorter version of text that retains the key information
- C. Translating text to another language
- D. Correcting grammar errors

Answer: B

Q465. What is a token in NLP?

- A. A coin-like object
- B. A basic unit of text such as a word, subword, or character that the model processes
- C. A model parameter
- D. A type of loss function

Answer: B

Q466. What is spam detection in NLP?

- A. Finding physical spam mail
- B. Using text classification to automatically identify unwanted or unsolicited messages
- C. A network security tool
- D. A data cleaning technique

Answer: B

Q467. What is text generation in NLP?

- A. Manually typing text
- B. Automatically producing coherent and contextually appropriate text using language models
- C. Copying text from one file to another
- D. Formatting text for printing

Answer: B

Q468. What is image preprocessing in computer vision?

- A. Taking photographs
- B. Preparing images for analysis through operations like resizing, normalization, and color conversion
- C. Printing images
- D. Compressing image file sizes only

Answer: B

Q469. What is a bounding box in object detection?

- A. A box used for shipping
- B. A rectangle drawn around a detected object specifying its location in the image
- C. A type of convolutional filter
- D. A border around the entire image

Answer: B

Q470. What is the difference between a color image and a grayscale image?

- A. They have the same number of channels
- B. Color images have three channels (RGB) while grayscale images have a single channel representing brightness
- C. Grayscale images are larger in file size
- D. Color images have only one channel

Answer: B

Q471. What is image annotation in computer vision?

- A. Writing captions for social media
- B. Labeling images with class labels, bounding boxes, or pixel masks to create training data for CV models
- C. Editing image colors
- D. Compressing images

Answer: B

Q472. What is transfer learning commonly used for in computer vision?

- A. Transferring images between devices
- B. Using a model pre-trained on a large dataset and adapting it to a new visual task with less data
- C. Transferring data between databases
- D. Moving files between folders

Answer: B

Q473. What does image normalization do?

- A. Makes all images the same size
- B. Scales pixel values to a standard range like 0 to 1 or standardizes them using mean and standard deviation
- C. Removes noise from images
- D. Converts images to text

Answer: B

Q474. What is edge detection in image processing?

- A. Detecting the physical edges of a monitor
- B. Identifying boundaries between different regions in an image where pixel intensity changes sharply
- C. Finding the borders of the image file
- D. A type of data augmentation

Answer: B

Q475. What is image cropping in computer vision?

- A. Growing images like crops
- B. Selecting and extracting a rectangular region of interest from an image
- C. Deleting all images
- D. Rotating images

Answer: B

Q476. What is image flipping as a data augmentation technique?

- A. Inverting pixel values
- B. Mirroring an image horizontally or vertically to create new training samples
- C. Converting the image format
- D. Changing image resolution

Answer: B

Q477. What is a pre-trained model like ResNet or VGG used for?

- A. Only for the task it was originally trained on
- B. As a feature extractor or starting point for transfer learning on new visual tasks
- C. It cannot be reused
- D. Only for generating images

Answer: B

Q478. What is a cluster in distributed computing?

- A. A group of similar data points
- B. A collection of interconnected computers working together to process data
- C. A type of database index
- D. A sorting algorithm

Answer: B

Q479. What is the Map phase in MapReduce?

- A. Creating geographic maps
- B. Processing input data and emitting key-value pairs for each record
- C. Reducing data to a single value
- D. Storing data in memory

Answer: B

Q480. What is the Reduce phase in MapReduce?

- A. Deleting unnecessary data
- B. Aggregating all intermediate values associated with the same key to produce final results
- C. Creating new data points
- D. Mapping data to categories

Answer: B

Q481. What is a NoSQL database?

- A. A database that does not store data
- B. A non-relational database designed for flexible schemas, horizontal scaling, and specific data models like document, key-value, or graph
- C. A SQL database with extra features
- D. A database only for numerical data

Answer: B

Q482. What is real-time data processing?

- A. Processing data once a year
- B. Processing data immediately or within milliseconds as it arrives, enabling instant insights and actions
- C. Processing data in monthly batches
- D. Storing data for future processing

Answer: B

Q483. What is data replication in distributed systems?

- A. Deleting duplicate data
- B. Storing copies of data on multiple nodes to ensure availability and fault tolerance
- C. Compressing data to save space
- D. Encrypting data for security

Answer: B

Q484. What is a data pipeline?

- A. A physical pipe for data cables
- B. A series of automated steps that move and transform data from source systems to destination systems
- C. A single database query
- D. A type of network cable

Answer: B

Q485. What is horizontal scaling?

- A. Making a single server larger
- B. Adding more machines to a system to distribute the workload across multiple nodes
- C. Increasing CPU speed
- D. Adding more RAM to one server

Answer: B

Q486. What is a Spark RDD?

- A. A type of hard drive
- B. A Resilient Distributed Dataset, an immutable distributed collection of objects that can be processed in parallel
- C. A relational database design
- D. A random data distribution

Answer: B

Q487. What is cloud computing in the context of big data?

- A. Computing in cloudy weather
- B. Using remote servers hosted on the internet to store, manage, and process data instead of local infrastructure
- C. A type of encryption
- D. A programming language

Answer: B

Q488. What is the goal of MLOps?

- A. To replace data scientists
- B. To streamline the process of deploying, monitoring, and maintaining ML models in production
- C. To eliminate the need for testing
- D. To make models train faster only

Answer: B

Q489. What is a model endpoint in deployment?

- A. The end of model training
- B. A URL or API where a deployed model receives input data and returns predictions
- C. The last layer of a neural network
- D. The final evaluation metric

Answer: B

Q490. What is containerization in MLOps?

- A. Putting computers in containers
- B. Packaging a model with its dependencies and environment into a container for consistent deployment across different platforms
- C. A type of data storage
- D. A compression technique

Answer: B

Q491. What is the purpose of logging in ML systems?

- A. Cutting trees for lumber
- B. Recording system events, predictions, inputs, and errors to enable debugging, monitoring, and auditing of ML systems
- C. Slowing down the system
- D. Only tracking training loss

Answer: B

Q492. What is batch inference?

- A. Training in batches
- B. Running predictions on a large collection of data at once, typically on a schedule, rather than one at a time
- C. Real-time prediction for each request
- D. A type of model training

Answer: B

Q493. What is the purpose of health checks for deployed ML models?

- A. Checking the health of data scientists
- B. Automated checks that verify the model service is running, responsive, and functioning correctly
- C. Only checking hardware temperature
- D. Measuring model accuracy once

Answer: B

Q494. What is a rollback in model deployment?

- A. Rolling the model forward
- B. Reverting to a previous model version when the new version performs poorly or causes issues
- C. Restarting the entire system
- D. Deleting all model versions

Answer: B

Q495. What is an ML experiment?

- A. A chemistry lab experiment
- B. A specific model training run with defined hyperparameters, data, and code that produces measurable results
- C. A random guess
- D. A data collection process

Answer: B

Q496. What is latency in the context of model serving?

- A. The accuracy of the model
- B. The time it takes from receiving an input to returning a prediction
- C. The size of the model
- D. The training time

Answer: B

Q497. What is the purpose of automated testing in MLOps?

- A. To test hardware components
- B. To automatically verify that ML code, data, and models meet quality standards before deployment
- C. Testing is not important for ML
- D. To slow down the deployment process

Answer: B

Q498. What is responsible AI?

- A. AI that responds quickly
- B. The practice of developing and deploying AI systems that are fair, transparent, accountable, and safe
- C. AI that costs less money
- D. AI that only works for governments

Answer: B

Q499. What is an example of AI bias in hiring?

- A. AI that works faster than humans
- B. An AI system that unfairly favors candidates of a particular gender or race based on biased training data
- C. AI that processes more applications
- D. AI that costs less than human recruiters

Answer: B

Q500. Why is human oversight important in AI decision-making?

- A. Humans are always faster than AI
- B. To ensure AI decisions are reviewed, correctable, and accountable, especially in high-stakes situations
- C. Human oversight is not necessary
- D. AI should make all decisions independently

Answer: B

Q501. What is data consent in AI ethics?

- A. Agreeing to pay for data
- B. Obtaining permission from individuals before collecting, using, or sharing their personal data for AI systems
- C. Data consent is not required
- D. Only companies need to give consent

Answer: B

Q502. What is the digital divide in the context of AI?

- A. A type of data splitting technique
- B. The gap between those who have access to AI technology and those who do not, often along socioeconomic or geographic lines
- C. A coding technique
- D. A security vulnerability

Answer: B

Q503. What does the term 'black box' mean in AI ethics?

- A. A physical black box device
- B. An AI system whose internal decision-making process is not understandable or explainable to users
- C. A box for storing AI hardware
- D. A type of test environment

Answer: B

Q504. What is the potential impact of AI on employment?

- A. AI has no effect on jobs
- B. AI can automate certain tasks, potentially displacing some jobs while creating new roles that require human-AI collaboration skills
- C. AI will eliminate all human jobs
- D. AI only creates new jobs

Answer: B

Q505. What is the purpose of AI ethics guidelines?

- A. To slow down AI development
- B. To provide principles and frameworks for developing AI systems that are beneficial, fair, and minimize harm to society
- C. To make AI more expensive
- D. To prevent all AI research

Answer: B

Q506. What is surveillance using AI technology?

- A. AI monitoring computer performance
- B. Using AI systems to monitor, track, or analyze people's activities, raising privacy and civil liberties concerns
- C. A type of AI training method
- D. A data backup process

Answer: B

Q507. Why is diversity important in AI development teams?

- A. It has no impact on AI quality
- B. Diverse teams are more likely to identify potential biases, consider varied perspectives, and build AI systems that work fairly for all populations
- C. Only technical skills matter
- D. Diversity slows down development

Answer: B

Q508. What is the absolute value of a number?

- A. The number multiplied by itself
- B. The non-negative distance of a number from zero on the number line
- C. The reciprocal of the number
- D. The square root of the number

Answer: B

Q509. What is the purpose of data type conversion in preprocessing?

- A. To delete data
- B. To change values from one data type to another so they can be processed correctly by algorithms
- C. To increase file size
- D. To add new columns

Answer: B

Q510. What is a chatbot in NLP?

- A. A physical robot that chats
- B. A software application that simulates human conversation using natural language processing
- C. A chat room for programmers
- D. A tool for compressing text files

Answer: B

AI / Machine Learning & Data Analytics — Medium

510 questions

Q511. The Turing Test is used to evaluate:

- A. Whether a machine can exhibit intelligent behavior
- B. The total memory capacity of a given system
- C. How quickly a processor handles computations
- D. How much bandwidth a network can support

Answer: A

Q512. Which of the following best describes Deep Learning?

- A. A relational system for storing structured data
- B. A paradigm for writing event-driven programs
- C. A subset of ML using multi-layer neural networks
- D. A protocol for routing data between networks

Answer: C

Q513. In reinforcement learning, an agent learns by:

- A. Memorizing all possible training inputs
- B. Receiving rewards or penalties for actions
- C. Reading through a set of labeled data points
- D. Clustering together groups of similar data

Answer: B

Q514. Which of the following is a descriptive analytics technique?

- A. Predicting future trends
- B. Real-time optimization
- C. Prescribing actions
- D. Summarizing historical data

Answer: D

Q515. What is the difference between AI and ML?

- A. AI is a subset of ML
- B. They are the same thing
- C. They are unrelated fields
- D. ML is a subset of AI

Answer: D

Q516. Which type of analytics answers 'What will happen?'

- A. Prescriptive Analytics
- B. Descriptive Analytics
- C. Predictive Analytics
- D. Diagnostic Analytics

Answer: C

Q517. An expert system in AI uses:

- A. A knowledge base and inference engine
- B. Only probabilistic fuzzy logic rules
- C. Only evolutionary genetic algorithms
- D. Only deep artificial neural networks

Answer: A

Q518. Which of these is a weak AI system?

- A. A chess-playing program
- B. A general-purpose intellect
- C. A conscious thinking machine
- D. A fully self-aware robot

Answer: A

Q519. What is the role of a training set in ML?

- A. To deploy the model into production
- B. To visualize the model's final results
- C. To test the final trained model output
- D. To train the model to learn patterns

Answer: D

Q520. Prescriptive analytics is used to:

- A. Describe past events only
- B. Store data more efficiently
- C. Recommend actions to take
- D. Detect anomalies in data

Answer: C

Q521. The gradient of a function points in the direction of:

- A. Steepest descent
- B. Random direction
- C. Steepest ascent
- D. Zero change

Answer: C

Q522. Bayes' theorem relates:

- A. Prior and posterior probabilities
- B. Only matrix decompositions
- C. Only the mean and variance
- D. Only derivative computations

Answer: A

Q523. The eigenvalue equation is $Av = \lambda v$. What is λ ?

- A. Eigenvector
- B. Trace
- C. Determinant
- D. Eigenvalue

Answer: D

Q524. What is the chain rule used for in calculus?

- A. Computing joint probabilities
- B. Adding matrices element-wise
- C. Differentiating composite functions
- D. Sorting data sequentially

Answer: C

Q525. Standard deviation measures:

- A. Spread of data around the mean
- B. The central tendency of values
- C. The minimum observed value
- D. The maximum observed value

Answer: A

Q526. A positive definite matrix has:

- A. All negative eigenvalues
- B. Mixed sign eigenvalues
- C. All zero eigenvalues
- D. All positive eigenvalues

Answer: D

Q527. In probability, two events are independent if:

- A. $P(A|B) = P(B)$
- B. $P(A \cap B) = P(A) * P(B)$
- C. $P(A \cup B) = P(A) + P(B)$
- D. $P(A \cap B) = 0$

Answer: B

Q528. The determinant of a 2x2 matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$ is:

- A. $ab + cd$
- B. $ab - cd$
- C. $ad - bc$
- D. $ad + bc$

Answer: C

Q529. A convex function has the property that:

- A. It is always an increasing function
- B. It has no minimum point at all
- C. Any local minimum is also a global minimum
- D. It has many distinct local minima

Answer: C

Q530. The covariance between two identical variables equals:

- A. A value of exactly zero
- B. The variance of that variable
- C. A value of negative one
- D. A value of exactly one

Answer: B

Q531. What is broadcasting in NumPy?

- A. A networking feature for sending data to multiple receivers
- B. Automatic expansion of arrays with different shapes for arithmetic
- C. A type of sorting algorithm for ordering array elements
- D. A logging mechanism for recording runtime error messages

Answer: B

Q532. Which scikit-learn class is used for train-test splitting?

- A. SplitData
- B. DataSplitter
- C. train_test_split
- D. TestTrainDivide

Answer: C

Q533. What does `df.groupby()` do in pandas?

- A. Renames columns using a provided mapping dict
- B. Sorts the DataFrame by index values in order
- C. Filters rows based on a boolean condition mask
- D. Groups data by one or more columns for aggregation

Answer: D

Q534. Which pandas method fills missing values?

- A. fillna()
- B. isna()
- C. notna()
- D. dropna()

Answer: A

Q535. What is a Python generator?

- A. A built-in immutable data type like a list
- B. A function that yields values lazily using yield
- C. A special class constructor for initialization
- D. A comparison-based sorting algorithm method

Answer: B

Q536. How do you perform matrix multiplication in NumPy?

- A. np.multiply(A, B) function
- B. A + B element-wise addition
- C. A * B element-wise product
- D. np.dot(A, B) or A @ B operator

Answer: A

Q537. What does the pandas method .apply() do?

- A. Deletes specified rows from the DataFrame index
- B. Merges two DataFrames on a common column key
- C. Adds a new column to the end of a DataFrame
- D. Applies a function along an axis of a DataFrame

Answer: D

Q538. Which visualization library is built on top of Matplotlib?

- A. Pygal
- B. Bokeh
- C. Seaborn
- D. Plotly

Answer: C

Q539. What is the purpose of np.reshape()?

- A. To sort the elements of an array in ascending order
- B. To change the shape of an array without changing its data
- C. To filter elements of an array by a condition mask
- D. To delete selected elements from an existing array

Answer: B

Q540. What does pickle do in Python?

- A. Manages relational database connections
- B. Performs numerical matrix calculations
- C. Creates interactive charts and plots
- D. Serializes and deserializes Python objects

Answer: D

Q541. What is one-hot encoding?

- A. Encrypting data columns for secure transmission
- B. Compressing data files for reduced disk usage
- C. Converting categorical variables into binary vectors
- D. Normalizing continuous numerical data columns

Answer: C

Q542. What is the difference between normalization and standardization?

- A. Normalization scales to [0,1], standardization scales to zero mean and unit variance
- B. Normalization is always the superior approach for every ML algorithm
- C. They are identical processes producing the exact same transformed outputs
- D. Standardization is only applicable to integer-valued feature columns

Answer: A

Q543. What is label encoding?

- A. Assigning numerical values to categorical labels
- B. Encrypting labels for secure data storage
- C. Adding new labels to the feature space
- D. Removing labels from a dataset entirely

Answer: A

Q544. What is imputation?

- A. Adding new columns to expand the feature set
- B. Replacing missing values with estimated values
- C. Deleting every row containing missing values
- D. Sorting data by ascending numerical order

Answer: B

Q545. Why is feature scaling important for ML algorithms?

- A. It automatically removes all outlier data point values
- B. It adds new synthetic features to expand the model
- C. It makes the overall dataset physically larger in storage
- D. It ensures all features contribute equally regardless of their scale

Answer: D

Q546. What is data augmentation?

- A. Encrypting data columns for privacy and security
- B. Deleting redundant records from the training set
- C. Compressing data files to reduce storage overhead
- D. Creating new training data by modifying existing data

Answer: D

Q547. What is the purpose of the train-test split?

- A. To evaluate model performance on unseen data
- B. To increase the total size of the full dataset
- C. To clean and preprocess the raw input data
- D. To visualize the distribution of data points

Answer: A

Q548. What is an outlier?

- A. A value that is completely missing or absent
- B. A feature that stores categorical text labels
- C. A data point significantly different from others
- D. A record that has been duplicated in error

Answer: C

Q549. What does the z-score standardization formula compute?

- A. $(x - \min) / (\max - \min)$ range
- B. x divided by the max value
- C. $(x - \text{mean}) / \text{standard deviation}$
- D. log of the value x

Answer: C

Q550. What is web scraping in data collection?

- A. Designing interactive web page layouts
- B. Testing web application load performance
- C. Building responsive websites from scratch
- D. Extracting data from websites programmatically

Answer: D

Q551. What is a heatmap used for in EDA?

- A. Showing temperature measurements from a sensor only
- B. Visualizing the magnitude of values in a matrix using colors
- C. Building multi-layer neural network architectures
- D. Creating three-dimensional surface projection plots

Answer: B

Q552. Skewness in a distribution refers to:

- A. Asymmetry of the distribution around the mean
- B. The total number of distribution peaks
- C. The height of the data distribution
- D. The overall width of the distribution

Answer: C

Q553. What is a pair plot (pairplot) in Seaborn?

- A. A single scatter plot between exactly two variables
- B. A grid of plots showing pairwise relationships between variables
- C. A grouped bar chart comparing category counts
- D. A circular pie chart showing value proportions

Answer: B

Q554. Kurtosis measures:

- A. The arithmetic mean
- B. The tailedness of a distribution
- C. The center of the distribution
- D. The measure of skewness

Answer: C

Q555. What is the Interquartile Range (IQR)?

- A. Mean minus Median
- B. Max - Min range
- C. Standard deviation * 2
- D. Q3 - Q1 difference

Answer: C

Q556. A violin plot combines which two visualizations?

- A. Box plot and KDE plot
- B. Pie chart and histogram
- C. Scatter plot and bar chart
- D. Line chart and area chart

Answer: A

Q557. What does the value_counts() method do in pandas?

- A. Returns the frequency of unique values in a Series
- B. Sums together all values stored in a Series
- C. Counts the total number of rows in a Series
- D. Counts the number of null values in a Series

Answer: B

Q558. A QQ plot is used to:

- A. Build linear regression prediction models
- B. Plot quarterly financial data over time
- C. Create grouped and stacked bar charts
- D. Check if data follows a particular distribution

Answer: D

Q559. What is a kernel density estimation (KDE) plot?

- A. A circular chart showing proportions
- B. A variant of the standard scatter plot
- C. A smoothed continuous version of a histogram
- D. A type of stacked or grouped bar chart

Answer: C

Q560. What is the purpose of a log transformation in EDA?

- A. To reduce skewness and make data more normally distributed
- B. To change the data types of columns in the table
- C. To encrypt data columns for compliance and security
- D. To completely delete all outlier values from data

Answer: A

Q561. What is the cost function in linear regression?

- A. Hinge loss function
- B. Log loss function
- C. Cross-entropy loss
- D. Mean Squared Error (MSE)

Answer: B

Q562. The sigmoid function maps values to:

- A. Range between 0 and 1
- B. Only integers
- C. Range between -1 and 1
- D. Any real number

Answer: A

Q563. What is regularization in supervised learning?

- A. Increasing overall model complexity further
- B. Adding more training data to the model
- C. Adding a penalty term to prevent overfitting
- D. Removing unnecessary features from the model

Answer: C

Q564. What is the difference between L1 and L2 regularization?

- A. L1 uses absolute values and can produce sparse models; L2 uses squared values
- B. L1 and L2 are completely identical techniques
- C. L2 regularization always produces sparse model weights
- D. L1 regularization is always the better choice overall

Answer: D

Q565. What is a Support Vector Machine (SVM)?

- A. An algorithm that finds the optimal hyperplane to separate classes
- B. A linear dimensionality reduction projection method
- C. A type of deep feedforward artificial neural network
- D. An unsupervised density-based clustering algorithm

Answer: A

Q566. What is the bias-variance tradeoff?

- A. Balancing model simplicity (bias) against sensitivity to training data (variance)
- B. Choosing between running computation on a CPU versus a GPU device
- C. Selecting the right proportions for training and test data splits
- D. Choosing an appropriate learning rate for gradient optimization

Answer: A

Q567. In decision trees, what is information gain?

- A. The reduction in entropy after splitting on a feature
- B. The overall accuracy of the trained model
- C. The total number of leaf nodes in the tree
- D. The current depth of the decision tree

Answer: B

Q568. What is cross-validation?

- A. Evaluating using only the training data subset
- B. Splitting data into multiple folds to train and validate the model
- C. Training the model on all available data at once
- D. Evaluating using only the test data subset

Answer: D

Q569. What is the purpose of the softmax function?

- A. Converting raw scores into probabilities for multi-class classification
- B. Performing binary classification tasks on labeled data only
- C. Performing unsupervised clustering of unlabeled data points
- D. Performing regression to predict continuous numeric values

Answer: A

Q570. What is Naive Bayes based on?

- A. A deep learning based neural network model
- B. Bayes' theorem with an assumption of feature independence
- C. An iterative gradient descent optimization method
- D. An ensemble of many decision tree classifiers

Answer: B

Q571. What is the difference between bagging and boosting?

- A. Bagging and boosting are completely identical approaches
- B. Boosting is always faster than bagging in every scenario
- C. Bagging always performs better than boosting overall
- D. Bagging trains models independently in parallel; boosting trains them sequentially on errors

Answer: C

Q572. In AdaBoost, how are misclassified samples handled?

- A. They are completely removed from the data
- B. Their weights are increased for the next iteration
- C. Their weights are decreased in the next round
- D. They are duplicated in the training dataset

Answer: C

Q573. What is stacking in ensemble learning?

- A. Using only a single standalone model for all predictions
- B. Random feature selection from the available input columns
- C. Using a meta-model to combine predictions from multiple base models
- D. Data augmentation to increase the training set size

Answer: C

Q574. What is the out-of-bag (OOB) error in Random Forest?

- A. The overall training error computed on the full training dataset
- B. The test error computed on a held-out independent test set
- C. The validation error from a separate cross-validation fold
- D. Error estimated using samples not included in each tree's bootstrap sample

Answer: D

Q575. Gradient Boosting minimizes the loss function by:

- A. Removing the least informative features iteratively
- B. Increasing the overall size of the training dataset
- C. Adding trees that fit the negative gradient of the loss
- D. Random bootstrap sampling of the original dataset

Answer: C

Q576. What is the max_features parameter in Random Forest?

- A. The minimum number of samples per leaf node
- B. The number of features to consider at each split
- C. The maximum depth of each individual tree
- D. The maximum total number of trees in the forest

Answer: C

Q577. Why does ensemble learning generally outperform single models?

- A. It reduces variance and/or bias by combining diverse models
- B. It always uses significantly less training data overall
- C. It is always computationally faster than a single model
- D. It always requires fewer input features to train on

Answer: A

Q578. What is a weak learner?

- A. A model that performs slightly better than random guessing
- B. A model that consistently achieves 100% accuracy
- C. A model that never makes any classification errors
- D. A model with absolutely no trainable parameters

Answer: A

Q579. In XGBoost, what is the purpose of the learning rate?

- A. It controls the contribution of each tree to shrink step size
- B. It directly determines the maximum depth of each tree
- C. It selects which features are used at each tree split
- D. It explicitly sets the total number of trees in the forest

Answer: A

Q580. What is voting in ensemble methods?

- A. Training a single standalone model on the complete dataset
- B. Engineering new derived features from the raw input data
- C. Combining predictions by having each model vote on the outcome
- D. Removing outlier data points from the training samples

Answer: C

Q581. How does the elbow method work for K-Means?

- A. Select the value of K completely at random from a uniform range
- B. Use the largest possible K equal to the number of data points
- C. Plot inertia vs K and find where adding clusters gives diminishing returns
- D. Always use K equal to three regardless of the dataset size

Answer: C

Q582. What is the silhouette score?

- A. The Euclidean distance between every pair of cluster centroids
- B. A measure of how similar a point is to its own cluster vs neighboring clusters
- C. The total number of clusters found by the clustering algorithm
- D. The total number of iterations before the algorithm converges

Answer: B

Q583. DBSCAN stands for:

- A. Data-Based Statistical Clustering Algorithm
- B. Database Scan Algorithm Notation
- C. Density-Based Spatial Clustering of Applications with Noise
- D. Deep Binary Sorting Classification Algorithm

Answer: D

Q584. What advantage does DBSCAN have over K-Means?

- A. It only works with fully labeled and supervised training data
- B. It can find arbitrarily shaped clusters and doesn't require specifying K
- C. It always gives strictly better results than all alternatives
- D. It is always computationally faster than every other algorithm

Answer: B

Q585. In PCA, principal components are:

- A. Orthogonal directions of maximum variance
- B. Cluster center points
- C. Randomly chosen directions
- D. Features that contain missing values

Answer: B

Q586. What is hierarchical clustering?

- A. A supervised regression technique for numerical prediction
- B. A deep neural network architecture for image recognition
- C. Building a tree of clusters by merging or splitting iteratively
- D. Using K-Means clustering multiple times in succession

Answer: C

Q587. What is the Apriori algorithm used for?

- A. Frequent itemset mining and association rules
- B. Dimensionality reduction projections
- C. Numerical regression for predictions
- D. Supervised classification with labeled data

Answer: A

Q588. What is t-SNE used for?

- A. Visualizing high-dimensional data in 2D or 3D
- B. Imputing missing data point values
- C. Training deep neural network models
- D. Selecting the most relevant features

Answer: A

Q589. In association rules, what does 'support' measure?

- A. The conditional confidence level of the rule
- B. The overall predictive accuracy of the rule
- C. The proportion of transactions containing an itemset
- D. The total number of features in the dataset

Answer: C

Q590. What is the difference between agglomerative and divisive hierarchical clustering?

- A. Neither method uses a hierarchy
- B. Agglomerative is bottom-up; divisive is top-down
- C. Agglomerative is top-down; divisive is bottom-up
- D. The two methods are completely identical

Answer: C

Q591. What is the F1-score?

- A. The arithmetic mean of precision and recall
- B. The product of precision and recall values
- C. The harmonic mean of precision and recall
- D. The square of the model accuracy

Answer: A

Q592. What does the ROC curve plot?

- A. Training error values plotted against validation error values
- B. True Positive Rate vs False Positive Rate at various thresholds
- C. Precision values plotted against corresponding recall values
- D. Training accuracy values plotted against the loss values

Answer: B

Q593. What does AUC-ROC measure?

- A. Only the precision metric of the trained classification model
- B. Only the accuracy metric of the trained classification model
- C. Only the recall metric of the trained classification model
- D. The overall ability of the model to discriminate between classes

Answer: A

Q594. What is K-fold cross-validation?

- A. Dividing data into K folds and using each fold as validation once
- B. Training the model completely without any validation step
- C. Using all available data solely for the training process
- D. Using only two simple train-test splits for evaluation

Answer: B

Q595. When is recall more important than precision?

- A. When simple accuracy alone is a sufficient metric
- B. When the dataset classes are perfectly balanced overall
- C. When false positives are very costly to the outcome
- D. When missing positive cases is costly, like disease detection

Answer: C

Q596. What is stratified cross-validation?

- A. Performing completely random splitting of the data
- B. Ignoring overall class balance during data splitting
- C. Using only the majority class for model training purposes
- D. K-fold CV that preserves the class distribution in each fold

Answer: B

Q597. What is the log loss (cross-entropy loss)?

- A. A feature selection method based on mutual information scores
- B. The exact same metric as mean squared error for regression
- C. A metric specifically designed for evaluating cluster quality
- D. A loss function that penalizes confident wrong predictions heavily

Answer: D

Q598. What is the purpose of a learning curve?

- A. To select the most important features from the training data
- B. To diagnose overfitting or underfitting by plotting performance vs training size
- C. To clean and preprocess the raw input data before training
- D. To learn about new machine learning algorithms from documentation

Answer: B

Q599. What is the difference between micro and macro averaging?

- A. Micro averaging is always a better choice than macro averaging
- B. Micro aggregates all instances globally; macro averages per-class metrics equally
- C. Micro and macro averaging are completely identical approaches
- D. Macro averaging ignores the overall class distribution entirely

Answer: A

Q600. What is Mean Absolute Error (MAE)?

- A. The single maximum prediction error value
- B. The median of all prediction errors
- C. The average of absolute differences between predicted and actual values
- D. The average of all squared differences between predictions

Answer: A

Q601. What is the purpose of polynomial features?

- A. To remove unnecessary features
- B. To normalize the data values
- C. To handle all missing values
- D. To capture non-linear relationships by creating powers and interactions of features

Answer: A

Q602. What is the Variance Inflation Factor (VIF)?

- A. An indicator for missing feature values
- B. A measure of multicollinearity between features
- C. A metric for overall model accuracy
- D. A particular feature scaling method

Answer: D

Q603. What is target encoding?

- A. Encoding categories using one-hot vector representation
- B. Replacing categories with the mean of the target variable for that category
- C. Removing all categorical features from dataset
- D. Encoding using binary representation of categories

Answer: A

Q604. Why is feature scaling important for KNN?

- A. KNN only works well with categorical type features
- B. KNN uses distance calculations that are affected by feature magnitudes
- C. Feature scaling actually slows down KNN
- D. KNN actually ignores all feature scales

Answer: A

Q605. What is a lag feature in time series?

- A. A feature with all of its values missing
- B. A feature created from previous time steps' values
- C. A feature that holds only binary zero-one
- D. A feature that is computationally slow to run

Answer: B

Q606. What is the purpose of log transformation on features?

- A. To deliberately add more noise to features
- B. To reduce skewness and handle multiplicative relationships
- C. To intentionally increase the skewness of data
- D. To remove all features entirely from the dataset

Answer: B

Q607. What is feature hashing?

- A. Encrypting feature values for secure storage and privacy compliance
- B. Mapping high-dimensional features to a fixed-size vector using a hash function
- C. Sorting features in the dataset by their statistical importance
- D. Removing duplicate feature entries from the data table columns

Answer: B

Q608. What are rolling window features?

- A. Features that are created without any time component at all
- B. Simple binary indicator features only
- C. Static features with no temporal aspect
- D. Features computed from a sliding window over time series data like rolling mean

Answer: C

Q609. What is the purpose of the chi-squared test in feature selection?

- A. To test the independence between categorical features and the target
- B. To normalize all features to a common range
- C. To impute missing values in the features
- D. To create entirely new features from scratch

Answer: B

Q610. What is domain knowledge in feature engineering?

- A. Using only fully automated feature methods
- B. Deliberately ignoring the problem context entirely
- C. Creating features completely at random each time
- D. Using expertise about the problem area to create meaningful features

Answer: C

Q611. What is the vanishing gradient problem?

- A. Gradients become very small in early layers, making training slow
- B. Gradients become extremely large causing numerical overflow
- C. The model has far too many hidden layers to train
- D. The training process converges far too quickly to minimum

Answer: A

Q612. What is dropout?

- A. Deleting training data samples to reduce dataset size
- B. Randomly deactivating neurons during training to prevent overfitting
- C. Reducing the learning rate schedule over the epochs
- D. Removing network layers permanently from the architecture

Answer: B

Q613. What is batch normalization?

- A. A loss function for measuring classification prediction error
- B. A preprocessing step applied only to the raw input data
- C. Normalizing the inputs of each layer to stabilize and accelerate training
- D. A type of non-linear activation function for hidden layers

Answer: C

Q614. What is the difference between a batch and a mini-batch?

- A. Batch and mini-batch gradient descent are completely identical
- B. A batch is the full dataset; a mini-batch is a subset used per iteration
- C. A mini-batch is always larger than a full batch of data
- D. A batch always contains exactly one single data sample only

Answer: A

Q615. What is transfer learning?

- A. Moving files between different computer file systems
- B. Transferring data records between separate databases
- C. Using a pre-trained model on a new but related task
- D. Training every model from scratch on random weights

Answer: C

Q616. What is the purpose of the learning rate?

- A. It determines the total number of hidden layers in the model
- B. It explicitly sets the mini-batch size during each epoch
- C. It defines the specific neural network architecture layout
- D. It controls the step size of weight updates during optimization

Answer: D

Q617. What is the exploding gradient problem?

- A. The overall training process runs far too slowly
- B. Gradients become extremely small, causing no weight changes
- C. The model severely underfits the training data distribution
- D. Gradients become extremely large, causing unstable weight updates

Answer: D

Q618. What is weight initialization and why is it important?

- A. Setting initial weights to enable effective training and avoid gradient problems
- B. Weights are assigned their final values only after training
- C. Weights are always initialized to exactly zero for every neuron
- D. The initialization strategy has no effect on the training process

Answer: A

Q619. What is the Adam optimizer?

- A. A non-linear activation function like sigmoid or ReLU
- B. An adaptive learning rate optimizer combining momentum and RMSProp
- C. A cross-entropy loss function for classification training
- D. A type of multi-layer feedforward neural network architecture

Answer: B

Q620. What is a softmax output layer used for?

- A. Feature extraction from the input data
- B. Binary classification with only two output classes
- C. Regression for continuous value prediction
- D. Multi-class classification producing a probability distribution

Answer: D

Q621. What is the Transformer architecture?

- A. A model based on self-attention mechanisms without recurrence
- B. A generative adversarial network for data synthesis
- C. A density-based clustering algorithm for grouping
- D. A standard convolutional neural network for image tasks

Answer: A

Q622. What is self-attention?

- A. A cross-entropy loss function that measures classification prediction error
- B. A type of spatial pooling operation that reduces feature map dimensions
- C. A mechanism relating different positions within a sequence to compute representations
- D. A data augmentation method that generates synthetic training examples

Answer: C

Q623. What is a Variational Autoencoder (VAE)?

- A. A linear regression model for numeric outputs
- B. A generative model that learns a probabilistic latent space
- C. A standard deterministic autoencoder without sampling
- D. A supervised classifier for categorical prediction

Answer: B

Q624. What is the difference between GRU and LSTM?

- A. GRU is always more accurate than LSTM on all tasks
- B. GRU and LSTM are completely identical architectures
- C. GRU has fewer gates (2 vs 3) and is computationally simpler
- D. LSTM has fewer learnable parameters than the GRU

Answer: D

Q625. What is 1x1 convolution used for?

- A. Increasing the spatial dimensions of the feature maps in the network
- B. Changing the number of channels and adding non-linearity without changing spatial dimensions
- C. Performing spatial pooling to reduce the feature map dimensions
- D. Applying batch normalization across all the feature map channels

Answer: A

Q626. What is depthwise separable convolution?

- A. Performing a pooling operation to reduce the spatial feature dimensions
- B. Splitting convolution into depthwise and pointwise operations to reduce computation
- C. Applying a normalization technique to stabilize the training process
- D. Performing a standard full convolution operation on the input feature maps

Answer: A

Q627. What is the encoder-decoder architecture?

- A. A cross-entropy loss function for measuring prediction quality
- B. A type of generative adversarial network with two competing agents
- C. A structured data format for storing model configuration files
- D. A structure where an encoder compresses input and a decoder generates output

Answer: D

Q628. What is data parallelism in deep learning?

- A. A type of batch normalization applied across distributed nodes
- B. Distributing training data across multiple GPUs, each running a model copy
- C. Reducing the overall size of the training data by sampling
- D. Using a single GPU for all training and inference computation

Answer: B

Q629. What is a residual network (ResNet)?

- A. A very shallow network with only a single hidden layer
- B. A standard recurrent neural network for sequences
- C. A deep network using skip connections that add input to output of layers
- D. A network architecture with no inter-layer connections

Answer: C

Q630. What is the purpose of attention mechanisms?

- A. To allow models to focus on relevant parts of the input
- B. To increase the mini-batch size during training
- C. To initialize the network weights before training
- D. To reduce the learning rate over training epochs

Answer: A

Q631. What is TF-IDF?

- A. A recurrent neural network variant designed for sequential text modeling
- B. A structured query language for relational database data retrieval
- C. A multi-layer deep feedforward neural network architecture for classification
- D. A weighting scheme reflecting word importance in a document relative to a corpus

Answer: D

Q632. What is Word2Vec?

- A. A simple word frequency counter for bag-of-words features
- B. A technique learning dense vector representations of words from context
- C. A language dictionary for looking up word definitions
- D. A rule-based grammar checker for text correction

Answer: B

Q633. What is the bag-of-words model?

- A. Representing text with full word order preserved
- B. A syntactic parsing technique for sentences
- C. Representing text as the frequency of words, ignoring order
- D. A neural language model using word embeddings

Answer: C

Q634. What is BERT?

- A. A rule-based expert system for language processing
- B. A generative adversarial network designed for text data
- C. A pre-trained transformer for bidirectional language understanding
- D. A type of recurrent neural network for sequential processing

Answer: C

Q635. What is attention in sequence-to-sequence models?

- A. A data augmentation method for creating synthetic text training data
- B. A mechanism allowing the decoder to focus on relevant parts of the input sequence
- C. A cross-entropy loss function for measuring sequence prediction accuracy
- D. A regularization technique for preventing overfitting in sequence models

Answer: B

Q636. What is text embedding?

- A. Converting text into dense numerical vectors
- B. Removing text from the raw dataset
- C. Encrypting text for secure storage
- D. Converting numbers into readable text

Answer: A

Q637. What is part-of-speech (POS) tagging?

- A. Removing individual words from the input text sequence
- B. Translating text between two different natural languages
- C. Assigning grammatical categories (noun, verb, etc.) to each word
- D. Counting the number of syllables in each word

Answer: C

Q638. What is sequence-to-sequence (Seq2Seq) modeling?

- A. Mapping a single input word to a single corresponding output word
- B. Sorting input sequences into a predefined correct order
- C. Clustering multiple sequences into meaningful related groups
- D. Mapping an input sequence to an output sequence of potentially different length

Answer: C

Q639. What is cosine similarity used for in NLP?

- A. Counting the total frequency of words in text
- B. Parsing sentences into syntax tree structures
- C. Generating new text from a trained model
- D. Measuring the similarity between two text vectors

Answer: D

Q640. What is a language model?

- A. A static vocabulary dictionary for word lookup
- B. A rule-based grammar checker for syntax only
- C. A database of aligned translation memory pairs
- D. A model that predicts the probability of a sequence of words

Answer: D

Q641. What is the difference between semantic and instance segmentation?

- A. Instance segmentation completely ignores the object class labels
- B. Semantic segmentation is always the better approach overall
- C. Semantic labels every pixel by class; instance distinguishes individual objects of the same class
- D. Semantic and instance segmentation are completely identical approaches

Answer: B

Q642. What is data augmentation in computer vision?

- A. Deleting images from the dataset to make it smaller and more manageable
- B. Reducing the overall image quality to speed up the training process
- C. Applying transformations like rotation, flipping, and cropping to increase training data
- D. Converting all images to grayscale only without any other transformation

Answer: D

Q643. What is the YOLO algorithm?

- A. A pixel-level semantic image segmentation algorithm
- B. A supervised multi-class image classification algorithm
- C. You Only Look Once - a real-time object detection algorithm
- D. An unsupervised K-means image clustering algorithm

Answer: C

Q644. What is image feature extraction?

- A. Adding textual annotation overlays onto the image pixels
- B. Compressing images into smaller file archive formats
- C. Identifying and representing distinctive visual patterns in images
- D. Deleting specific features or layers from the image data

Answer: C

Q645. What is the purpose of max pooling?

- A. Adding random noise to the feature map pixel values
- B. Changing the color representation of the image data
- C. Reducing spatial dimensions while retaining the most prominent features
- D. Increasing the spatial size of the feature map dimensions

Answer: C

Q646. What is optical flow?

- A. A type of spatial convolutional image filter kernel operation
- B. A standard color model representation for digital images
- C. The pattern of apparent motion of objects between consecutive frames
- D. A container file format for storing compressed video data

Answer: C

Q647. What is the IoU (Intersection over Union) metric?

- A. A metric measuring overlap between predicted and ground truth bounding boxes
- B. A metric that measures overall image quality and clarity
- C. A metric that assesses the overall color accuracy of images
- D. A metric for evaluating the spatial resolution of images

Answer: C

Q648. What are anchor boxes in object detection?

- A. The pixel coordinate system used for image representation
- B. The individual color channels within the input image data
- C. The border regions around the edges of an input image
- D. Predefined bounding box shapes that help detect objects of various sizes and ratios

Answer: C

Q649. What is non-maximum suppression (NMS)?

- A. A batch normalization method for stabilizing training
- B. A post-processing step that removes overlapping duplicate detections
- C. A gradient-based model training optimization technique
- D. A non-linear activation function for hidden layers

Answer: B

Q650. What is the difference between object detection and image classification?

- A. Image classification actually locates and draws bounding boxes around objects
- B. Detection locates multiple objects with bounding boxes; classification assigns one label to the whole image
- C. Object detection assigns a single label to the entire image without any localization
- D. Object detection and image classification are completely identical tasks

Answer: B

Q651. What is stream processing?

- A. Only storing data without processing it
- B. Processing data in real-time as it arrives
- C. Processing data in large scheduled batches
- D. Only visualizing data without analysis

Answer: B

Q652. What is Apache Kafka?

- A. A distributed event streaming platform for real-time data pipelines
- B. A standalone relational database for transactional workloads
- C. A supervised machine learning framework for model training
- D. An interactive data visualization and charting dashboard

Answer: A

Q653. What is the difference between Spark and Hadoop MapReduce?

- A. They are completely identical technologies with no performance differences
- B. Spark only works effectively on small datasets under one gigabyte
- C. MapReduce is significantly faster than Spark for all data workloads
- D. Spark processes in-memory making it faster; MapReduce writes to disk between steps

Answer: D

Q654. What is NoSQL?

- A. An interactive data visualization and charting dashboard
- B. Non-relational databases designed for flexible schemas and horizontal scaling
- C. A general-purpose compiled programming language for apps
- D. A newer version of the standard SQL query language syntax

Answer: B

Q655. What is data partitioning?

- A. Encrypting data at rest for privacy and compliance
- B. Dividing data into smaller pieces distributed across multiple nodes
- C. Merging all distributed data together into a single node
- D. Deleting old data records to free up storage space

Answer: B

Q656. What is Apache Hive?

- A. A distributed event streaming platform for real-time pipelines
- B. A graph database for storing relationship network data
- C. A data warehouse tool providing SQL-like queries over Hadoop data
- D. A supervised machine learning library for model training

Answer: C

Q657. What is a Spark DataFrame?

- A. A simple NumPy array structure
- B. A distributed collection of data organized into named columns
- C. A Python pandas DataFrame structure only
- D. A traditional database table structure only

Answer: A

Q658. What is the CAP theorem?

- A. It is primarily about effective data visualization techniques
- B. It applies only to single standalone machines and servers
- C. All three properties can always be fully achieved simultaneously
- D. A distributed system can guarantee at most two of: Consistency, Availability, and Partition tolerance

Answer: B

Q659. What is data sharding?

- A. Encrypting data at rest for privacy regulation compliance
- B. Copying the entire database to every single server node
- C. Splitting a database into smaller pieces across multiple servers
- D. Deleting old data records to reclaim disk storage space

Answer: C

Q660. What is the role of a scheduler in big data systems?

- A. Training supervised machine learning classification models
- B. Visualizing data trends using interactive chart dashboards
- C. Managing and coordinating the execution of distributed tasks
- D. Storing and persisting data on distributed file systems

Answer: C

Q661. What is model drift?

- A. Model training getting significantly faster with each iteration
- B. Degradation in model performance over time due to changes in data
- C. Model file size increasing automatically without configuration
- D. Model accuracy consistently increasing without retraining

Answer: B

Q662. What is A/B testing in model deployment?

- A. Comparing two model versions by serving them to different user groups
- B. Running computations on two GPUs for faster processing speed
- C. Training two different models simultaneously on the same data
- D. Using two separate datasets for training and evaluation only

Answer: A

Q663. What is a feature store?

- A. A model registry for tracking model versions and status
- B. A code repository for managing source version control
- C. A centralized repository for storing managing and serving ML features
- D. A data warehouse for storing raw analytical data records

Answer: C

Q664. What is model serialization?

- A. Deploying a model to a production serving endpoint
- B. Saving a trained model to a file format that can be loaded later
- C. Training a model on a labeled dataset from scratch
- D. Evaluating a model's accuracy on a held-out test set

Answer: B

Q665. What is canary deployment?

- A. Rolling back a deployed model to an earlier stable version
- B. Gradually rolling out a new model to a small percentage of users first
- C. Deploying the new model to all users immediately without rollout
- D. Training a brand new model from scratch on latest data

Answer: B

Q666. What is the purpose of a model registry?

- A. Storing and managing raw training data in a data lake
- B. Centrally managing model versions metadata and deployment status
- C. Visualizing model performance results on a dashboard
- D. Writing and version-controlling source code for models

Answer: B

Q667. What is data drift?

- A. Changes in the statistical distribution of input data over time
- B. Changes in the source code of the training pipeline
- C. Hardware failures in the production serving cluster
- D. Changes in the internal model architecture configuration

Answer: A

Q668. What is the ONNX format?

- A. A markup text file format for web page content
- B. An open format for ML models enabling interoperability between frameworks
- C. A proprietary relational database file storage format
- D. A compressed video streaming container file format

Answer: B

Q669. What is a ML pipeline?

- A. A database query for extracting records from tables
- B. An automated sequence of steps from data processing to model deployment
- C. An interactive data visualization charting dashboard
- D. A single isolated model training step without automation

Answer: B

Q670. What is the role of Kubernetes in MLOps?

- A. Visualizing model performance on dashboard charts
- B. Orchestrating containerized ML services for scaling and management
- C. Storing raw data files on a distributed file system
- D. Training machine learning models on training data

Answer: B

Q671. What is the difference between individual and group fairness?

- A. Group fairness ignores the outcomes of demographic groups
- B. Individual fairness treats similar people similarly; group fairness ensures equal outcomes
- C. They are completely identical fairness concepts with no differences
- D. Individual fairness ignores the treatment of specific individuals

Answer: B

Q672. What is differential privacy?

- A. A firewall system for blocking unauthorized network access
- B. A process of permanently deleting all personal data records
- C. A mathematical framework providing privacy guarantees when analyzing data
- D. A standard encryption method for securing data files at rest

Answer: C

Q673. What is explainable AI (XAI)?

- A. AI systems that require significantly less training data
- B. AI systems that use significantly larger model architectures
- C. AI systems that process data at significantly faster speeds
- D. AI systems that provide interpretable explanations for their decisions

Answer: D

Q674. What is model interpretability?

- A. The total file size in megabytes of the serialized model
- B. The inference speed at which the model generates predictions
- C. The overall accuracy metric of the trained classification model
- D. The degree to which humans can understand a model's predictions

Answer: D

Q675. What is the black box problem in AI?

- A. A hardware issue where the server casing is colored black
- B. A storage problem where disk capacity runs out unexpectedly
- C. Complex models making decisions that cannot be easily understood or explained
- D. A networking error where connections time out intermittently

Answer: C

Q676. What are deepfakes?

- A. Corrupted files that cannot be opened or processed
- B. AI-generated synthetic media that convincingly replaces a person's likeness
- C. Encrypted videos that require a decryption key to play
- D. Low-quality images with significant compression artifacts

Answer: B

Q677. What is federated learning?

- A. Sharing all raw training data openly across all participants
- B. Training ML models across decentralized devices without sharing raw data
- C. Training models exclusively on a single centralized server machine
- D. Using only publicly available open-source datasets for training

Answer: B

Q678. What is the right to explanation under GDPR?

- A. Individuals have the right to receive explanations for automated decisions
- B. AI companies can keep their algorithms and models completely secret
- C. No explanation is ever needed for any automated AI decisions
- D. Only government agencies can request explanations of AI systems

Answer: A

Q679. What is data anonymization?

- A. Making all personal data publicly available and fully open
- B. Encrypting data with standard symmetric encryption only
- C. Deleting all data from every storage system permanently
- D. Removing or modifying personal identifiers so individuals cannot be identified

Answer: D

Q680. What is the trolley problem in AI ethics?

- A. A moral dilemma about how autonomous systems should handle potential harm
- B. A transportation route optimization problem for logistics planning
- C. A data storage capacity issue for managing large files
- D. A network routing problem for directing data packets

Answer: A

Q681. Which concept refers to an AI that can learn any intellectual task a human can?

- A. Artificial Narrow Intelligence
- B. Artificial Specific Intelligence
- C. Artificial General Intelligence
- D. Artificial Basic Intelligence

Answer: C

Q682. What distinguishes descriptive analytics from predictive analytics?

- A. Descriptive forecasts future events while predictive summarizes past data
- B. Descriptive needs real-time data while predictive works with batch data only
- C. Descriptive uses deep learning while predictive relies on simple statistics
- D. Descriptive summarizes past data while predictive forecasts future outcomes

Answer: D

Q683. In machine learning, what does the term 'generalization' mean?

- A. Converting categorical variables into numerical representation
- B. Memorizing every training sample exactly as it is provided
- C. Performing well on new and previously unseen data points
- D. Reducing the total number of features in a given dataset

Answer: C

Q684. Which of the following is an example of unsupervised learning?

- A. Stock price prediction model
- B. Customer segmentation clustering
- C. Spam email classification
- D. Handwriting digit recognition

Answer: B

Q685. What role does a loss function play in training a machine learning model?

- A. It measures how far predictions deviate from actual values
- B. It specifies the data format used for input preprocessing step
- C. It determines the total memory required for model storage
- D. It controls the number of features selected for training data

Answer: A

Q686. What is the difference between structured and unstructured data?

- A. Structured data is always larger in file size than unstructured data is
- B. Structured data requires GPUs while unstructured data uses only CPU cores
- C. Structured data is only images while unstructured data is found in tables
- D. Structured data uses rows and columns while unstructured data does not

Answer: D

Q687. Which concept describes a model that learns noise instead of true patterns?

- A. Underfitting the training dataset
- B. Overfitting the training data
- C. Normalizing input features
- D. Standardizing output labels

Answer: B

Q688. What is transfer learning in modern AI systems?

- A. Transferring model weights from GPU memory to CPU memory
- B. Converting one programming language into a different language
- C. Moving data between two different storage systems for backup
- D. Reusing a pre-trained model on a new but related task domain

Answer: D

Q689. Which metric is commonly used to evaluate classification model performance?

- A. Mean Squared Error
- B. Root Mean Absolute
- C. Adjusted R-squared
- D. Accuracy and F1-score

Answer: D

Q690. What is a 'feature' in machine learning terminology?

- A. A visualization analysis tool
- B. An individual measurable property
- C. A type of network architecture
- D. A bug found in software testing

Answer: B

Q691. What does the gradient of a function represent in optimization?

- A. The maximum value the function can possibly achieve overall
- B. The direction of steepest ascent at a given point in space
- C. The total area under the curve of the function on a plot
- D. The number of local minima in the function search space

Answer: B

Q692. What does Bayes' theorem allow us to compute?

- A. The posterior probability given prior and likelihood
- B. The determinant of any square matrix efficiently
- C. The exact maximum value of a continuous function
- D. The shortest path between nodes in a graph

Answer: A

Q693. What is the purpose of the chain rule in calculus for neural networks?

- A. It selects which activation function to use in each layer
- B. It determines the optimal number of hidden layers needed
- C. It controls the learning rate during the training process
- D. It enables gradient computation through composed functions

Answer: D

Q694. What does the covariance between two variables measure?

- A. The exact ratio of one variable value to another variable
- B. The causal relationship from one variable to the other one
- C. The joint variability and direction of relationship between them
- D. The maximum possible value either variable can take at all

Answer: C

Q695. What is the role of eigenvalues in Principal Component Analysis?

- A. They determine the optimal number of training epochs to use
- B. They specify the learning rate for gradient descent processes
- C. They represent the variance amount captured by each component
- D. They control the dropout probability in neural network layers

Answer: C

Q696. What property must a matrix have to be invertible?

- A. All its elements must be positive real numbers
- B. It must have more rows than total columns
- C. Its determinant must be non-zero valued
- D. All diagonal elements must equal exactly one

Answer: C

Q697. What does the standard deviation tell us about a dataset?

- A. The spread of values around the mean value
- B. The difference between maximum and minimum
- C. The middle value when data is sorted in order
- D. The most frequently occurring value in the data

Answer: A

Q698. In ML, what is a convex function?

- A. A function that always produces negative output values only
- B. A function with exactly two critical points at most always
- C. A function only defined on integer input values overall
- D. A function where any local minimum is also a global minimum

Answer: D

Q699. What does the L2 norm of a vector measure?

- A. The Euclidean length or magnitude of vector
- B. The largest absolute element in entire vector
- C. The sum of all elements without absolute value
- D. The count of non-zero elements in the vector

Answer: A

Q700. What is a probability distribution function?

- A. A function describing likelihood of possible outcome values
- B. A function that sorts data points in descending order value
- C. A function removing outlier values from a given data set
- D. A function converting categorical data into numerical codes

Answer: A

Q701. What is the difference between a shallow copy and a deep copy of a Python list?

- A. Shallow copy works only with integers while deep copy handles all data types
- B. Shallow copy duplicates all nested objects while deep copy copies references only
- C. Shallow copy copies references to nested objects while deep copy duplicates all
- D. Shallow copy is faster because it uses more memory than a deep copy overall

Answer: C

Q702. How does NumPy broadcasting work for arrays of different shapes?

- A. It stretches smaller arrays to match larger ones following compatibility rules
- B. It pads smaller arrays with zeros until both arrays have identical dimensions
- C. It randomly samples elements from larger arrays to reduce them to smaller size
- D. It raises an error whenever array shapes do not match exactly in all dimensions

Answer: A

Q703. What advantage does vectorized NumPy code have over standard Python loops?

- A. Vectorized code uses more memory but produces more accurate results overall
- B. Vectorized code executes in optimized C making it significantly much faster
- C. Vectorized code only works with integer data types unlike Python loop code
- D. Vectorized code automatically parallelizes across multiple machine clusters

Answer: B

Q704. What does the pandas groupby() method enable you to do?

- A. Remove duplicate rows based on all column values in the frame
- B. Sort DataFrame rows in ascending order by their index value names
- C. Split data into groups and apply aggregate functions to each one
- D. Merge two DataFrames horizontally using a common column as key

Answer: C

Q705. What is the purpose of Python's yield keyword in generator functions?

- A. It terminates the function and returns the final value permanently
- B. It creates a new thread for parallel function execution runs
- C. It imports external modules required by function at call time
- D. It pauses execution and produces a value without losing state

Answer: D

Q706. How do you create a virtual environment in Python for project isolation?

- A. Using the command `python -m venv env_name` in the terminal window
- B. Using the command `pip create environment env_name` from terminal
- C. Using the command `python --create-env env_name` in the settings
- D. Using the command `python --isolate project env_name` from shell

Answer: A

Q707. What is the role of the fit_transform() method in scikit-learn preprocessing?

- A. It only transforms data using previously learned parameters from data
- B. It fits preprocessor to data and transforms it in a single step
- C. It evaluates model performance on the validation set after train
- D. It splits the dataset into separate training and testing subsets

Answer: B

Q708. What does the lambda keyword create in Python?

- A. A small anonymous function with a single expression body
- B. A new class definition with automatic initialization method
- C. A named function stored permanently in the global namespace
- D. A decorator that modifies behavior of existing functions

Answer: A

Q709. What is the purpose of the pickle module in Python for ML workflows?

- A. It provides functions for creating interactive data visualizations
- B. It serializes Python objects to save and load trained ML models
- C. It manages database connections for storing large training data
- D. It handles HTTP requests for downloading datasets from the web

Answer: B

Q710. How does pandas merge() differ from concat() for combining DataFrames?

- A. merge always produces fewer rows while concat always produces more rows
- B. merge requires sorted data while concat works only with unsorted frames
- C. merge joins on common columns while concat stacks along an axis direction
- D. merge only works with numeric data while concat handles all data types

Answer: C

Q711. What is the difference between normalization and standardization?

- A. Normalization works only with text while standardization works only with numeric data
- B. Normalization removes outliers while standardization only handles missing values in data
- C. Normalization scales to 0-1 range while standardization centers with zero mean unit variance
- D. Normalization increases feature count while standardization decreases feature count total

Answer: C

Q712. Why might you use stratified sampling instead of simple random sampling?

- A. It guarantees that the sample will be larger than simple random samples
- B. It preserves the proportion of each class in the sample matching population
- C. Stratified sampling is always faster than simple random sampling methods
- D. Stratified sampling eliminates the need for any data cleaning steps after

Answer: B

Q713. What is the purpose of applying a log transformation to skewed data?

- A. It converts categorical variables into numerical features for models
- B. It reduces skewness making the distribution closer to normal shape
- C. It removes all outliers automatically from the dataset completely
- D. It increases the total number of samples available for training

Answer: B

Q714. When should you use label encoding versus one-hot encoding for categories?

- A. Label encoding is used for numerical features while one-hot is for text only
- B. One-hot encoding should be used only when the dataset has fewer than ten rows
- C. Label encoding for ordinal categories and one-hot encoding for nominal ones
- D. Label encoding is always superior to one-hot encoding in every scenario

Answer: C

Q715. What problem does the SMOTE technique address in preprocessing?

- A. It handles missing values by predicting them using regression models
- B. It removes highly correlated features from the dataset efficiently
- C. It standardizes all features to have the same scale and distribution
- D. It generates synthetic minority class samples to balance class distribution

Answer: D

Q716. What is the purpose of binning continuous variables into discrete groups?

- A. To increase the total number of features in the dataset significantly
- B. To convert numerical data into completely random categorical labels
- C. To remove all missing values from the continuous variable columns
- D. To reduce noise and capture non-linear patterns in the data values

Answer: D

Q717. How does the Interquartile Range method detect outliers in a dataset?

- A. Values above the mean are always considered outliers by the IQR method
- B. Only the single maximum and minimum values are considered outliers here
- C. Values outside 1.5 times the IQR from Q1 and Q3 are flagged as outliers
- D. Values within one standard deviation of median are flagged as outlier

Answer: C

Q718. What is data augmentation and when is it commonly used?

- A. Encrypting sensitive data fields before storing them in the database
- B. Removing features to reduce dimensionality in high-dimensional datasets
- C. Converting unstructured data into structured tabular format for use
- D. Creating modified copies of existing data to increase training set size

Answer: D

Q719. Why is it important to handle missing values before training a model?

- A. Missing values always indicate that the entire dataset is unreliable here
- B. Missing values only affect visualization and have no impact on models
- C. Most ML algorithms cannot process datasets that contain any missing values
- D. Handling missing values is optional since models automatically ignore them

Answer: C

Q720. What is feature scaling and why is it important for distance-based algorithms?

- A. It converts all features to categorical type for better model interpretability
- B. It duplicates important features to give them more weight during training
- C. It ensures features contribute equally so larger-scale features do not dominate
- D. It removes features with low variance to reduce the dimensionality of data

Answer: C

Q721. What does a right-skewed distribution indicate about the data?

- A. Most values are clustered on the left with a long tail extending right
- B. Most values are clustered on the right with a long tail extending left
- C. The distribution has exactly two peaks at equal distances from center
- D. Values are perfectly symmetrically distributed around the central mean

Answer: A

Q722. How does the Pearson correlation differ from the Spearman correlation?

- A. Pearson requires sorted data while Spearman works with unsorted data only
- B. Pearson only works with categorical data while Spearman works with numbers
- C. Pearson measures linear relationships while Spearman measures monotonic ones
- D. Pearson is always larger than Spearman for any given pair of variables

Answer: C

Q723. What is a pair plot used for in exploratory data analysis?

- A. Visualizing the decision boundary of a trained classification model
- B. Displaying all pairwise feature relationships and distributions simultaneously
- C. Comparing model performance metrics across different algorithm choices
- D. Showing only the relationship between the target variable and one feature

Answer: B

Q724. Why is it important to check for multicollinearity during EDA?

- A. Checking for multicollinearity is optional and never affects final results
- B. Multicollinearity only affects visualization and has no impact on any model
- C. Multicollinearity always improves model accuracy and prediction performance
- D. Highly correlated features can cause instability in regression model coefficients

Answer: D

Q725. What information does a Variance Inflation Factor provide?

- A. The optimal number of clusters for a K-means clustering algorithm
- B. The degree to which a feature is explained by other features in model
- C. The total number of missing values in each feature of the dataset
- D. The probability that a feature follows a normal distribution pattern

Answer: B

Q726. What is the purpose of a QQ plot in statistical analysis?

- A. To compare model predictions against actual observed target values
- B. To display the learning curve of a model during training process
- C. To visualize the decision boundary of a classification model used
- D. To assess whether data follows a specific theoretical distribution

Answer: D

Q727. How do violin plots improve upon standard box plots?

- A. They only display the mean and are simpler to interpret than box plots
- B. They show the actual probability density distribution shape of the data
- C. They remove all outlier information to simplify the visualization look
- D. They work only with categorical data unlike box plots which need numbers

Answer: B

Q728. What does the kurtosis of a distribution describe?

- A. The asymmetry of the distribution around its mean value point
- B. The tailedness and peakedness of the distribution compared to normal
- C. The number of distinct modes or peaks present in the distribution
- D. The total range between the minimum and maximum values observed

Answer: B

Q729. Why is it important to visualize data before applying machine learning algorithms?

- A. Visualization is only for presentation and does not affect modeling choices
- B. It is a mandatory step that all ML frameworks enforce before model training
- C. Visualization automatically selects the best algorithm for the given dataset
- D. It reveals patterns, outliers, and distributions that guide preprocessing decisions

Answer: D

Q730. What does a correlation matrix heatmap help identify?

- A. The exact prediction accuracy of a trained machine learning model
- B. Pairs of features with strong positive or negative linear relationships
- C. The best train-test split ratio for the given dataset size overall
- D. The optimal hyperparameters for a gradient boosting model training

Answer: B

Q731. How does regularization help prevent overfitting in linear regression models?

- A. It adds a penalty term for large coefficients constraining model complexity
- B. It increases the number of features to capture more complex data patterns
- C. It multiplies all input features by a constant scaling factor for balance
- D. It removes the least important training samples from the dataset entirely

Answer: A

Q732. What is the key assumption of Naive Bayes classification?

- A. The decision boundary must be linear in the original feature space always
- B. All features must be continuous numerical values with normal distribution
- C. The dataset must have exactly equal numbers of samples in every class
- D. Features are conditionally independent given the class label of the sample

Answer: D

Q733. How does the C parameter in SVM affect the decision boundary?

- A. C determines the number of support vectors regardless of the data layout
- B. Higher C creates a tighter margin penalizing misclassification more strictly
- C. C only affects the kernel type used and has no impact on the margin width
- D. Higher C creates a wider margin allowing more misclassification of points

Answer: B

Q734. What advantage does a decision tree have over logistic regression for certain tasks?

- A. Decision trees always achieve higher accuracy than logistic regression models
- B. Decision trees can capture non-linear relationships without feature engineering
- C. Decision trees require less training data than logistic regression to converge
- D. Decision trees never overfit regardless of the depth or number of features

Answer: B

Q735. What is the difference between hard and soft margin classification in SVM?

- A. Hard margin is faster to train while soft margin requires exponentially more time
- B. Hard margin uses linear kernels while soft margin always uses non-linear kernels
- C. Hard margin allows no violations while soft margin permits some misclassification
- D. Hard margin permits misclassification while soft margin requires perfect separation

Answer: C

Q736. Why might logistic regression outperform complex models on small datasets?

- A. Its simplicity and fewer parameters make it less prone to overfitting on small data
- B. Logistic regression always converges in fewer epochs than any other algorithm does
- C. It automatically augments small datasets to increase the number of training samples
- D. Logistic regression ignores the training data and uses only prior knowledge

Answer: A

Q737. What does the kernel trick enable SVM to do?

- A. Map data to a higher-dimensional space to find non-linear decision boundaries
- B. Reduce training time by eliminating the need for any optimization process
- C. Convert regression problems into classification problems without data changes
- D. Automatically select the best features from the dataset for classification

Answer: A

Q738. How does K in KNN affect the bias-variance tradeoff of the classifier?

- A. Both small and large K always produce identical bias and variance values here
- B. K has no effect on the bias-variance tradeoff of the KNN classifier at all
- C. Small K has low bias and high variance while large K has high bias low variance
- D. Small K has high bias and low variance while large K has low bias high variance

Answer: C

Q739. What is the purpose of the sigmoid function in logistic regression?

- A. It normalizes input features to have zero mean and unit variance values
- B. It maps raw output values to probabilities between zero and one range
- C. It determines the optimal learning rate for gradient descent optimization
- D. It selects the most important features for the model automatically here

Answer: B

Q740. Why is feature importance a useful output of tree-based models?

- A. It guarantees that the model will achieve the highest possible accuracy
- B. It automatically removes unimportant features from the training dataset
- C. It converts categorical features into numerical features for processing
- D. It reveals which features contribute most to the model prediction decisions

Answer: D

Q741. How does feature randomness in Random Forest improve model performance?

- A. It guarantees each tree will have identical accuracy on test data set
- B. It eliminates the need for any hyperparameter tuning in the model
- C. It automatically removes all irrelevant features from the dataset used
- D. It reduces correlation between trees leading to better ensemble diversity

Answer: D

Q742. What is the key difference between bagging and boosting ensemble techniques?

- A. Bagging trains models sequentially while boosting trains all models in parallel
- B. Bagging trains models in parallel independently while boosting trains sequentially
- C. Bagging always outperforms boosting on every possible dataset and problem type
- D. Bagging only works with neural networks while boosting only works with trees

Answer: B

Q743. What does the learning rate parameter control in gradient boosting?

- A. The contribution of each tree to the final ensemble prediction output
- B. The percentage of features randomly selected at each tree split
- C. The number of trees to include in the final ensemble model overall
- D. The maximum depth allowed for each individual decision tree used

Answer: A

Q744. What is stacking in the context of ensemble methods?

- A. Using a meta-learner to combine predictions from diverse base models
- B. Removing the worst-performing model from the ensemble iteratively
- C. Training the same model architecture on different random data subsets
- D. Simply averaging the predictions from all models in the ensemble

Answer: A

Q745. Why might an ensemble of weak learners outperform a single strong learner?

- A. Combining diverse weak learners reduces variance without increasing bias much
- B. Weak learners always have lower bias than any single strong learner model
- C. Weak learners are always faster to train than any single strong learner is
- D. An ensemble of weak learners never overfits regardless of ensemble size used

Answer: A

Q746. How does AdaBoost assign weights to training samples?

- A. All samples receive equal weights throughout the entire training process
- B. Misclassified samples receive higher weights so subsequent models focus on them
- C. Weights are randomly assigned at each iteration without considering any errors
- D. Correctly classified samples receive higher weights for reinforcement purposes

Answer: B

Q747. What is out-of-bag error estimation in Random Forest?

- A. Evaluating each tree on samples not included in its bootstrap training set
- B. Using a separate test set that was manually created before model training
- C. Measuring training error on the full dataset after all trees are built
- D. Running cross-validation with exactly five folds on the entire dataset used

Answer: A

Q748. What is the purpose of subsampling in Stochastic Gradient Boosting?

- A. To convert the boosting algorithm into a bagging algorithm automatically
- B. To ensure every sample is used exactly once across all trees in ensemble
- C. To increase training time by processing every sample multiple times each
- D. To reduce overfitting and training time by using random data subsets per tree

Answer: D

Q749. How does the max_depth parameter affect individual trees in an ensemble?

- A. Deeper trees always improve ensemble accuracy without any risk of overfitting
- B. Max depth has no effect on individual tree complexity or ensemble performance
- C. Deeper trees have lower bias and higher variance capturing more complex splits
- D. Deeper trees have higher bias and lower variance across ensemble predictions

Answer: C

Q750. Why is diversity important among base learners in an ensemble?

- A. Diversity ensures all models make exactly the same predictions on every input
- B. Diversity is irrelevant since all models should be identical for best results
- C. Diverse models make different errors that can cancel out when combined together
- D. Diverse models always have individually higher accuracy than identical models

Answer: C

Q751. How does DBSCAN determine cluster membership compared to K-Means?

- A. DBSCAN requires the number of clusters while K-Means determines it automatically
- B. DBSCAN groups points by density connectivity while K-Means uses centroid distance
- C. DBSCAN uses distance to centroids while K-Means uses density-based grouping
- D. Both algorithms use identical methods to determine cluster membership always

Answer: B

Q752. What is the elbow method used for in K-Means clustering?

- A. To decide the maximum number of iterations for the K-Means convergence
- B. To determine the optimal number of features to use for the clustering task
- C. To evaluate whether K-Means or DBSCAN is the better algorithm for the data
- D. To select the optimal K by finding the point where inertia reduction slows

Answer: D

Q753. What does the silhouette score measure in clustering evaluation?

- A. How well each point fits its cluster versus the nearest neighboring cluster
- B. The accuracy of cluster labels compared to true class labels in dataset
- C. The total computational time required to train the clustering algorithm
- D. The number of outliers present in each cluster after model convergence

Answer: A

Q754. How does hierarchical clustering differ from K-Means in its approach?

- A. Hierarchical builds a tree of nested clusters while K-Means uses flat partitions
- B. Hierarchical requires specifying K while K-Means does not need any parameters
- C. Hierarchical only works with text data while K-Means works with numbers only
- D. Hierarchical always produces fewer clusters than K-Means on the same data set

Answer: A

Q755. What is the role of the epsilon parameter in DBSCAN?

- A. It defines the minimum number of clusters the algorithm must discover
- B. It sets the maximum distance for two points to be considered neighbors
- C. It controls the learning rate for optimizing the cluster assignments
- D. It specifies the dimensionality reduction ratio before clustering starts

Answer: B

Q756. Why might PCA lose important information during dimensionality reduction?

- A. PCA always preserves all information regardless of components selected count
- B. It projects onto directions of maximum variance and may discard informative ones
- C. PCA can only reduce to exactly two dimensions and no other number of them
- D. It requires labeled data and fails when applied to unsupervised datasets

Answer: B

Q757. What is the difference between agglomerative and divisive hierarchical clustering?

- A. Agglomerative starts with individual points and merges while divisive starts whole and splits
- B. Both approaches always produce identical clustering results on any dataset given to them
- C. Agglomerative only works with numerical data while divisive handles categorical data only
- D. Agglomerative starts with one cluster and splits while divisive starts with individual points

Answer: A

Q758. How does t-SNE differ from PCA for dimensionality reduction?

- A. Both methods produce identical visualizations on any dataset given to them always
- B. PCA is non-linear while t-SNE is a purely linear dimensionality reduction method
- C. PCA preserves global linear structure while t-SNE preserves local non-linear structure
- D. PCA can only reduce to two dimensions while t-SNE works with any target dimension

Answer: C

Q759. What challenge does the curse of dimensionality pose for clustering algorithms?

- A. High-dimensional data always forms perfectly separated clusters automatically here
- B. It makes clustering faster because more dimensions provide more information now
- C. The curse of dimensionality only affects supervised learning and never clustering
- D. In high dimensions distance metrics become less meaningful reducing cluster quality

Answer: D

Q760. What is Gaussian Mixture Model clustering based on?

- A. A density-based approach identical to DBSCAN using epsilon neighborhoods
- B. Probabilistic assignment assuming data comes from a mixture of Gaussian distributions
- C. Hard assignment of each point to exactly one cluster using closest centroid
- D. A hierarchical approach that builds a dendrogram of cluster relationships

Answer: B

Q761. Why is accuracy a poor metric for imbalanced classification problems?

- A. Accuracy requires balanced classes and cannot be computed on imbalanced data sets
- B. Accuracy is only defined for regression problems and not for classification tasks
- C. A model predicting only the majority class achieves high accuracy despite being useless
- D. Accuracy always gives a value of zero when classes are imbalanced in the dataset

Answer: C

Q762. What is the ROC curve and what does it visualize?

- A. A plot of training loss versus validation loss over each training epoch number
- B. A plot of precision versus recall for different classification threshold values
- C. A plot of model complexity versus generalization error for model selection use
- D. A plot of true positive rate versus false positive rate at different thresholds

Answer: D

Q763. How does K-fold cross-validation improve upon a simple train-test split?

- A. It randomly assigns labels to the test set to simulate real-world data distribution
- B. It always uses exactly two folds regardless of the K value specified by the user
- C. It uses all data for both training and testing reducing variance of performance estimate
- D. It eliminates the need for any test data by using only training data for evaluation

Answer: C

Q764. What is the difference between micro and macro averaging for multi-class metrics?

- A. Micro averages per class then takes mean while macro aggregates all predictions globally
- B. Micro aggregates predictions globally while macro averages per class metrics equally
- C. Micro averaging is used for binary classification while macro is for multi-class only
- D. Both micro and macro averaging always produce exactly identical metric values here

Answer: B

Q765. What does the Area Under the ROC Curve represent?

- A. The probability a random positive sample is ranked higher than a random negative one
- B. The exact accuracy of the model at the optimal classification threshold selected
- C. The maximum number of features the model can effectively use for prediction
- D. The total training time required to achieve the best validation set performance

Answer: A

Q766. When should you use stratified K-fold cross-validation instead of standard K-fold?

- A. When class distributions are imbalanced to ensure each fold represents all classes
- B. When all features are categorical and need special handling during evaluation
- C. When the dataset is very large and standard K-fold is computationally too expensive
- D. When the dataset has perfectly balanced class proportions across all groups

Answer: A

Q767. What is the bias-variance tradeoff in model evaluation?

- A. Bias and variance are independent and changing one has no effect on the other one
- B. Higher bias always leads to higher variance and both increase simultaneously always
- C. The tradeoff only applies to neural networks and not to any traditional ML algorithms
- D. Simpler models have high bias low variance while complex models have low bias high variance

Answer: D

Q768. What is the purpose of a learning curve in model evaluation?

- A. To visualize the feature importance rankings from a trained random forest model
- B. To display the optimal hyperparameters found during grid search tuning process
- C. To show how training and validation performance change with training set size
- D. To plot the distribution of prediction errors across all test set observations

Answer: C

Q769. How does the log loss metric differ from accuracy for evaluation?

- A. Log loss and accuracy always produce identical rankings of model performance
- B. Log loss can only be used with regression models while accuracy is for classifiers
- C. Log loss measures prediction speed while accuracy measures correctness of results
- D. Log loss penalizes confident wrong predictions more heavily than accuracy does

Answer: D

Q770. What is the purpose of a calibration curve in model evaluation?

- A. To assess whether predicted probabilities match actual observed frequencies
- B. To determine the optimal number of features to include in the final model
- C. To measure how fast the model makes predictions on new test data samples
- D. To visualize the convergence of the training loss during model optimization

Answer: A

Q771. What is the wrapper method for feature selection?

- A. Selecting features alphabetically by their column name in the original data frame
- B. Using a model to evaluate different feature subsets and selecting the best one found
- C. Selecting features based only on their individual correlation with the target variable
- D. Removing all features with missing values regardless of their predictive importance

Answer: B

Q772. How does target encoding work for high-cardinality categorical features?

- A. It replaces each category with the mean of the target variable for that group
- B. It replaces each category with a randomly assigned numerical identifier value
- C. It creates one binary column for each unique category in the feature column
- D. It removes all categories that appear fewer than ten times in the dataset

Answer: A

Q773. What is the purpose of creating interaction features between variables?

- A. To convert all numerical features into categorical features for tree models
- B. To reduce the total number of features in the dataset to save memory space
- C. To capture combined effects that individual features alone cannot represent
- D. To remove multicollinearity between features by merging them into one column

Answer: C

Q774. Why is the filter method for feature selection computationally efficient?

- A. It requires training the model multiple times with different feature subsets each
- B. It evaluates features independently of any model using statistical measures only
- C. It uses a complex model to evaluate every possible subset of feature combinations
- D. It only works with datasets that have fewer than one hundred features total

Answer: B

Q775. What is the benefit of creating date-based features from timestamps?

- A. Machine learning algorithms automatically extract date features without engineering
- B. Date-based features always decrease model accuracy compared to raw timestamps
- C. Extracting components like day of week and month reveals cyclical patterns in data
- D. Timestamps are already in the optimal format for all machine learning algorithms

Answer: C

Q776. How does the Variance Threshold method work for feature selection?

- A. It increases the variance of low-variance features through data augmentation
- B. It selects features with the highest variance above the target variable mean
- C. It calculates the variance between features to detect multicollinearity issues
- D. It removes features with variance below a specified threshold as uninformative

Answer: D

Q777. What is feature hashing and when is it useful?

- A. It sorts features by importance and removes the least important ones from data
- B. It encrypts feature values for security during model training in production use
- C. It maps high-dimensional categorical features to fixed-size vectors using a hash
- D. It creates polynomial features from the original feature set for better models

Answer: C

Q778. Why might you apply a log transformation to a highly skewed feature?

- A. It removes all outliers from the feature by compressing them to zero values
- B. Log transformation converts categorical features to numerical features directly
- C. Log transformation always improves model accuracy regardless of distribution shape
- D. It reduces skewness and helps satisfy normality assumptions of some algorithms

Answer: D

Q779. What is the embedded method for feature selection?

- A. Selecting features by running the model on every possible subset combination
- B. Selecting features before training any model using only statistical measures
- C. Feature selection performed as part of the model training process itself directly
- D. Removing all features except the one with the highest correlation to target

Answer: C

Q780. How do you handle cyclical features like hour of day or day of week?

- A. Treat them as regular continuous numerical features without any transformation
- B. Simply remove cyclical features since they do not contain useful information
- C. Encode them using sine and cosine transformations to preserve cyclic continuity
- D. Convert them to categorical features and apply one-hot encoding to each value

Answer: C

Q781. Why does the vanishing gradient problem occur in deep networks?

- A. Because the learning rate is always set too high for deep architectures
- B. The problem only occurs in shallow networks and never in deep architectures
- C. Deep networks always have too few parameters to compute meaningful gradients
- D. Gradients shrink exponentially through many layers making early layers learn slowly

Answer: D

Q782. How does batch normalization improve deep neural network training?

- A. It normalizes layer inputs reducing internal covariate shift for faster training
- B. It removes the need for any activation functions in the neural network layers
- C. It replaces the optimizer and directly updates weights without gradient descent
- D. It increases the batch size automatically to improve training speed for models

Answer: A

Q783. What is the purpose of dropout regularization in neural networks?

- A. It increases the number of neurons in each layer to improve model capacity
- B. It drops entire training samples that the model already classifies correctly
- C. It randomly deactivates neurons during training to prevent co-adaptation of features
- D. It permanently removes neurons that have zero weight values in the network

Answer: C

Q784. How does the Adam optimizer combine momentum and adaptive learning rates?

- A. Adam uses only momentum without any adaptive learning rate adjustment at all
- B. It maintains running averages of both gradients and squared gradients for updates
- C. It uses a fixed learning rate that never changes throughout the training process
- D. Adam ignores gradient history and uses only the current gradient for each update

Answer: B

Q785. What is the difference between a dense layer and a convolutional layer?

- A. Dense layers connect every neuron while convolutional layers use local receptive fields
- B. Dense layers only work with images while convolutional layers work with tabular data
- C. Dense layers use local connections while convolutional layers connect every neuron pair
- D. Both layer types are identical and can be used interchangeably in any architecture

Answer: A

Q786. Why is the learning rate one of the most important hyperparameters?

- A. The learning rate only affects the final accuracy and not the training speed at all
- B. It only matters for the first epoch and is automatically adjusted after that point
- C. The learning rate has no effect on training dynamics and can be set to any value
- D. Too high causes divergence and too low causes extremely slow convergence of loss

Answer: D

Q787. What is transfer learning in the context of deep learning?

- A. Transferring data from one storage system to another for model training use
- B. Using a pre-trained network and fine-tuning it for a different related task
- C. Training a model from random initialization on a completely new dataset only
- D. Converting a classification model into a regression model without retraining

Answer: B

Q788. How does gradient clipping prevent training instability in deep networks?

- A. It caps gradient values at a maximum threshold preventing exploding gradients
- B. It removes all gradients entirely preventing any weight updates from occurring
- C. It increases gradient values when they are too small to accelerate convergence
- D. It replaces all negative gradients with zero to ensure only positive updates

Answer: A

Q789. What is the purpose of an embedding layer in deep learning?

- A. To reduce the learning rate during training to prevent overfitting of model
- B. To map discrete tokens to dense continuous vector representations efficiently
- C. To normalize the input data before it enters the first hidden layer values
- D. To compute the final loss value at the output of the neural network model

Answer: B

Q790. Why do deep learning models typically require GPU acceleration?

- A. GPUs have more storage space than CPUs for holding the training dataset files
- B. GPUs excel at parallel matrix operations which dominate deep learning computation
- C. GPUs are required by all deep learning frameworks and cannot use CPU at all
- D. GPUs automatically optimize hyperparameters while CPUs cannot perform this task

Answer: B

Q791. How does the LSTM cell solve the vanishing gradient problem of standard RNNs?

- A. It processes sequences in reverse order to reduce the effective sequence length
- B. It uses a much larger learning rate than standard RNN implementations typically use
- C. It uses gates to control information flow allowing gradients to persist long-term
- D. It removes all activation functions to ensure gradients never shrink in magnitude

Answer: C

Q792. What is the purpose of the discriminator in a GAN?

- A. To distinguish between real data samples and generated fake data samples
- B. To preprocess input data before it is fed to the generator network model
- C. To generate realistic synthetic data samples from random noise input vectors
- D. To evaluate the final quality of the trained model on a held-out test set

Answer: A

Q793. How does dilated convolution differ from standard convolution in CNNs?

- A. Dilated convolution uses smaller filters than standard convolution always does
- B. Standard convolution has larger receptive fields than dilated convolution does
- C. Dilated convolution inserts gaps between filter elements expanding receptive field
- D. Dilated convolution only works with one-dimensional input data like text only

Answer: C

Q794. What is the key innovation of the self-attention mechanism in Transformers?

- A. It eliminates the need for any training data by using pre-defined attention maps
- B. It requires data to be processed in strict sequential order one step at a time
- C. It only attends to the immediately preceding element in the input sequence
- D. It computes relationships between all positions in a sequence simultaneously

Answer: D

Q795. What problem does mode collapse cause in GAN training?

- A. The discriminator becomes too weak to provide any useful training signal at all
- B. The generator produces diverse outputs but none of them look like real data
- C. The generator produces realistic but limited variety of outputs ignoring modes
- D. The training process converges too slowly requiring excessive computation time

Answer: C

Q796. How do 1x1 convolutions serve as a dimensionality reduction technique in deep networks?

- A. They only work with one-dimensional data and cannot be applied to image features
- B. They remove the need for any pooling layers in the convolutional neural network
- C. They increase the spatial dimensions of the feature maps while reducing channels
- D. They reduce the number of channels by combining feature maps with learned weights

Answer: D

Q797. What is the purpose of positional encoding in Transformer architectures?

- A. It replaces the need for any attention mechanism in the Transformer model
- B. It determines the optimal position for inserting new layers during training
- C. It encodes the position of the model parameters in memory for faster access
- D. It injects sequence position information since self-attention has no order notion

Answer: D

Q798. How does depthwise separable convolution reduce computational cost?

- A. It removes all bias terms from the convolutional layers to reduce parameters
- B. It skips every other spatial position during convolution to halve computation
- C. It uses only the first channel of input and ignores all other channels entirely
- D. It separates spatial and channel-wise filtering reducing multiply-add operations

Answer: D

Q799. What is the role of the encoder and decoder in a sequence-to-sequence model?

- A. The encoder handles training while the decoder is only used during evaluation
- B. The encoder generates output and decoder processes the raw input sequence data
- C. Both encoder and decoder perform identical operations on the same input data set
- D. The encoder compresses input to a representation and decoder generates the output

Answer: D

Q800. What advantage does the GRU have over the standard LSTM architecture?

- A. GRU uses fewer gates and parameters achieving similar performance more efficiently
- B. GRU can process images while LSTM is limited to only text and audio data types
- C. GRU does not use any gating mechanism unlike LSTM which uses three gates total
- D. GRU always achieves higher accuracy than LSTM on every sequential task given

Answer: A

Q801. How does TF-IDF improve upon simple bag-of-words representation?

- A. It counts words more quickly than bag-of-words without changing the representation
- B. It weights words by importance reducing the influence of common uninformative terms
- C. It only considers the first and last words in each document ignoring all others
- D. TF-IDF and bag-of-words produce identical representations for all text documents

Answer: B

Q802. What is the key innovation of Word2Vec compared to one-hot encoding?

- A. Word2Vec only works with very small vocabularies of less than one hundred words total
- B. Word2Vec produces identical representations as one-hot encoding for all vocabulary items
- C. Word2Vec requires labeled data for every word pair relationship in the corpus used
- D. Word2Vec creates dense vectors capturing semantic relationships between words efficiently

Answer: D

Q803. What is the difference between stemming and lemmatization?

- A. Stemming applies crude rules while lemmatization uses vocabulary and morphological analysis
- B. Stemming uses dictionary-based root finding while lemmatization uses rule-based cutting
- C. Stemming is more accurate than lemmatization for all natural language processing tasks
- D. Both methods always produce identical output for every word in all languages used

Answer: A

Q804. How does the attention mechanism in seq2seq models improve machine translation?

- A. It allows the decoder to focus on relevant source words for each output word generated
- B. Attention removes the need for both encoder and decoder in the translation pipeline
- C. It forces the decoder to translate each word independently without any context used
- D. It limits the model to translating only between English and one other target language

Answer: A

Q805. What is the purpose of byte-pair encoding in modern NLP tokenizers?

- A. It encrypts text using byte-level operations for secure communication purposes
- B. It splits every word into individual characters without any merging of subwords
- C. It converts all text to lowercase and removes all punctuation marks from strings
- D. It iteratively merges frequent character pairs creating a subword vocabulary set

Answer: D

Q806. How does the BERT model differ from earlier language models in its training approach?

- A. BERT uses bidirectional context by masking random tokens and predicting them
- B. BERT uses left-to-right unidirectional context like all previous language models did
- C. BERT processes text character by character unlike word-level previous models
- D. BERT requires no pre-training and is trained only on downstream task data sets

Answer: A

Q807. What is the purpose of the CLS token in BERT?

- A. It separates individual characters within each word of the input sequence
- B. It indicates missing or unknown words in the vocabulary of the tokenizer
- C. It provides a pooled representation for classification tasks using the model
- D. It marks the end of every sentence in the input text sequence provided

Answer: C

Q808. What is perplexity and how is it used to evaluate language models?

- A. It measures the vocabulary size of the language model's training corpus data
- B. It measures the training time required to converge to the optimal solution found
- C. It counts the number of parameters in the language model architecture structure
- D. It measures how well the model predicts text with lower values being better scores

Answer: D

Q809. How does transfer learning with pre-trained models benefit NLP tasks with limited data?

- A. Transfer learning only works when the new task has more data than the pre-training set
- B. Pre-trained models must always be retrained from scratch on new task specific data
- C. Pre-trained models provide rich language understanding that transfers to new tasks well
- D. Pre-trained models can only be used for the exact task they were originally trained on

Answer: C

Q810. What is the difference between extractive and abstractive text summarization?

- A. Extractive selects existing sentences while abstractive generates new sentences from scratch
- B. Extractive only works with short texts while abstractive only works with long documents
- C. Both methods always produce identical summaries for any given input document provided
- D. Extractive generates new sentences while abstractive selects existing sentences from input

Answer: A

Q811. How does transfer learning with pre-trained CNNs benefit computer vision tasks with limited data?

- A. Transfer learning only works for text classification and not for any image-based tasks
- B. Early layers learn general features that transfer well reducing data needs for new tasks
- C. Pre-trained models always perform worse than randomly initialized models on new tasks
- D. Pre-trained models must be completely retrained from scratch for every new CV task

Answer: B

Q812. What is the difference between semantic and instance segmentation?

- A. Semantic segmentation only works on grayscale images while instance works on color
- B. Semantic labels each pixel by class while instance distinguishes individual objects too
- C. Both segmentation types always produce identical pixel-level output maps on images
- D. Instance labels each pixel by class while semantic distinguishes individual objects only

Answer: B

Q813. How does the YOLO architecture achieve real-time object detection?

- A. It only detects objects in the center of the image ignoring all border regions always
- B. It frames detection as a single regression problem processing the entire image at once
- C. It processes each potential object region separately using a sliding window approach
- D. YOLO requires multiple passes through the image increasing detection time significantly

Answer: B

Q814. What is the purpose of non-maximum suppression in object detection?

- A. To maximize the size of all bounding boxes to ensure objects are fully contained
- B. To increase the number of detected bounding boxes for better detection coverage
- C. To remove redundant overlapping bounding boxes keeping only the best predictions
- D. To suppress all detections with confidence scores above a certain threshold level

Answer: C

Q815. How does image augmentation help prevent overfitting in computer vision models?

- A. It creates diverse variations forcing the model to learn invariant features robustly
- B. It reduces the training set size to prevent the model from memorizing all samples
- C. Augmentation always causes more overfitting because it adds artificial noise to data
- D. It only works with very large datasets and has no benefit for small training sets

Answer: A

Q816. What is the Intersection over Union metric used for in object detection?

- A. Measuring the total number of pixels in the input image being processed by model
- B. Determining the optimal learning rate for the detection model training run
- C. Measuring the overlap between predicted and ground truth bounding box regions
- D. Calculating the training time for the object detection model on GPU hardware

Answer: C

Q817. How do feature pyramid networks improve multi-scale object detection?

- A. They only detect objects at a single fixed scale ignoring all other size variations
- B. They reduce all objects to the same size before detection to simplify the algorithm
- C. They build a pyramid of feature maps at different scales for detecting objects of various sizes
- D. Feature pyramids increase detection time without improving accuracy at any scale value

Answer: C

Q818. What is the role of anchor boxes in modern object detection architectures?

- A. Anchor boxes are only used during evaluation and have no effect during training
- B. They provide predefined reference boxes of various sizes and ratios for detection
- C. They replace the non-maximum suppression step with a simpler averaging method
- D. They fix the position of all detected objects to the center of the input image always

Answer: B

Q819. How does a U-Net architecture achieve precise segmentation of medical images?

- A. It uses skip connections between encoder and decoder to preserve spatial details
- B. U-Net only works with natural images and cannot process medical imaging data well
- C. It requires pixel-level annotations for only ten percent of the training images used
- D. It only uses downsampling layers without any upsampling to produce segmentation maps

Answer: A

Q820. What is the purpose of batch normalization in deep CNN architectures?

- A. It normalizes layer activations stabilizing training and allowing higher learning rates
- B. Batch normalization increases training time without providing any accuracy benefit
- C. It only works with fully connected layers and cannot be used in convolutional layers
- D. It removes all color information from input images before processing them further

Answer: A

Q821. How does Apache Spark improve upon Hadoop MapReduce for iterative ML algorithms?

- A. Spark only works with small datasets while MapReduce handles large-scale data
- B. Spark is always slower than MapReduce but provides better fault tolerance here
- C. Spark writes intermediate results to disk just like MapReduce for reliability
- D. Spark keeps data in-memory across iterations avoiding costly disk read-write cycles

Answer: D

Q822. What is the difference between batch processing and stream processing?

- A. Both approaches process data identically and the terms are completely interchangeable here
- B. Batch processing is always faster than stream processing for all data processing workloads
- C. Batch processes data one item at a time while streaming processes all data at once together
- D. Batch processes all data at once while streaming processes data as it arrives continuously

Answer: D

Q823. What is data sharding and why is it used in distributed databases?

- A. It encrypts data using a shared key distributed across all machines in cluster
- B. It horizontally partitions data across machines enabling scalability and performance
- C. It compresses data into smaller files to reduce storage costs on each machine
- D. It creates backup copies of all data on a single machine for redundancy purposes

Answer: B

Q824. How does Apache Spark SQL enable big data analytics for users familiar with SQL?

- A. It converts all SQL queries into Python code before executing them on the cluster
- B. It replaces Apache Spark entirely with a traditional database management system
- C. Spark SQL only works with small datasets that fit in a single machine memory
- D. It provides a SQL interface over distributed DataFrames for familiar query syntax

Answer: D

Q825. What is the CAP theorem and why is it relevant to distributed data systems?

- A. It states distributed systems can have consistency, availability, and partition tolerance all at once
- B. CAP theorem only applies to single-machine databases and not to distributed systems at all
- C. It guarantees all distributed databases will always be faster than centralized database systems
- D. It states only two of consistency, availability, and partition tolerance can be guaranteed together

Answer: D

Q826. What role does Apache Airflow play in big data engineering workflows?

- A. It orchestrates and schedules complex data pipeline workflows as directed acyclic graphs
- B. It trains machine learning models on big data using distributed gradient descent
- C. It provides real-time stream processing capabilities for high-velocity data sources
- D. It stores large datasets in distributed file systems across multiple cluster nodes

Answer: A

Q827. How does data replication improve fault tolerance in distributed systems?

- A. Replication always degrades read performance to improve write speed of the system
- B. It compresses data before storing to reduce the total storage space required
- C. It copies data across multiple nodes so the system survives individual node failures
- D. Replication stores data on a single machine to reduce network overhead costs

Answer: C

Q828. What is the difference between a data lake and a data warehouse?

- A. Data lakes only support SQL queries while warehouses support all query languages used
- B. Data lakes store raw multi-format data while warehouses store structured processed data
- C. Data lakes store structured processed data while warehouses store raw unprocessed data
- D. Both store data identically and the terms are completely interchangeable in practice

Answer: B

Q829. How does columnar storage format benefit analytical queries on big data?

- A. Columnar storage is slower than row storage for all types of queries without exception
- B. It stores data row by row which is optimal for reading entire records efficiently
- C. It stores data column by column enabling efficient reads of only needed columns quickly
- D. It only works with numerical data and cannot handle text or categorical columns well

Answer: C

Q830. What is the role of a cluster manager like YARN in distributed computing?

- A. It converts distributed queries into single-machine queries for faster processing
- B. It allocates resources and schedules tasks across nodes in the computing cluster
- C. It handles data encryption and security for all files in the distributed system
- D. It manages the final output visualization of processed big data results on screen

Answer: B

Q831. What is model drift and why does it require monitoring?

- A. Model drift means the model is getting faster over time needing no intervention at all
- B. Model performance degrades over time as data distributions change requiring retraining
- C. Model drift only affects models deployed for less than one week in production systems
- D. It refers to the physical movement of servers causing hardware failures in the system

Answer: B

Q832. How does canary deployment reduce risk when releasing new ML models?

- A. It deploys the new model to all users simultaneously without any gradual rollout plan
- B. It routes a small percentage of traffic to the new model while monitoring for issues
- C. It only works for web applications and cannot be used with machine learning models
- D. Canary deployment prevents any model from being deployed to production at all ever

Answer: B

Q833. What is the purpose of model serialization in deployment?

- A. It deletes model weights that are no longer needed after training is completed
- B. It visualizes the model architecture as a diagram for documentation purposes only
- C. It converts trained models into a portable format for loading in production systems
- D. It trains multiple models in sequence one after another on the same training data

Answer: C

Q834. How does infrastructure as code benefit MLOps workflows?

- A. It eliminates the need for any cloud computing resources for ML model deployment
- B. It requires all infrastructure to be manually configured through web interfaces only
- C. It defines infrastructure in version-controlled code enabling reproducible environments
- D. Infrastructure as code only applies to web development and not to ML workflows

Answer: C

Q835. What is the role of experiment tracking in the ML development lifecycle?

- A. Experiment tracking is optional and provides no value to the ML development process
- B. It logs parameters, metrics, and artifacts enabling comparison and reproducibility
- C. It only tracks the final model and ignores all intermediate experiments and results
- D. It automatically selects the best model without any human review or intervention

Answer: B

Q836. What is the shadow deployment pattern for ML models?

- A. Shadow deployment completely ignores the old model predictions for all decisions
- B. The new model replaces the old model immediately without any parallel operation
- C. It deploys models only during nighttime hours when user traffic is at its lowest
- D. The new model runs alongside the old one comparing outputs without serving users

Answer: D

Q837. How does model compression benefit edge deployment scenarios?

- A. Model compression always improves accuracy while reducing the model size significantly
- B. It reduces model size and latency enabling deployment on resource-constrained devices
- C. Compression eliminates the need for any preprocessing of input data at inference
- D. It only works with linear models and cannot be applied to deep neural networks

Answer: B

Q838. What is the purpose of data validation in an ML pipeline?

- A. Data validation is unnecessary since all incoming data is always perfectly clean
- B. To verify data quality and schema consistency before model training or inference
- C. To train the model faster by removing data that takes long to process in pipeline
- D. To convert all data types to strings for uniform processing in the ML pipeline

Answer: B

Q839. How does blue-green deployment work for ML model updates?

- A. It trains the model in the blue environment and evaluates in the green one only
- B. It gradually increases traffic to the new model over several weeks of monitoring
- C. It maintains two identical environments and switches traffic between them instantly
- D. Blue-green deployment only works with batch processing and not real-time serving

Answer: C

Q840. What is the benefit of using ONNX format for ML model interoperability?

- A. ONNX always increases model inference time compared to native framework formats
- B. ONNX only supports models trained with PyTorch and no other ML framework at all
- C. ONNX provides a standard format allowing models to run across different frameworks
- D. ONNX can only represent simple linear models and not complex neural networks

Answer: C

Q841. How can training data bias lead to discriminatory AI outcomes?

- A. Training data bias always improves model performance and never causes discrimination
- B. Bias in training data is automatically detected and removed by all ML algorithms used
- C. If training data reflects historical discrimination the model learns and perpetuates it
- D. Training data bias only affects model speed and has no impact on fairness of outputs

Answer: C

Q842. What is the difference between individual fairness and group fairness in AI?

- A. Individual fairness focuses on groups while group fairness focuses on each individual person specifically
- B. Both concepts are identical and always produce the same fairness outcomes for all situations
- C. Individual fairness only applies to classification while group fairness only applies to regression
- D. Individual fairness treats similar individuals similarly while group fairness ensures equal outcomes across groups

Answer: D

Q843. What is the right to explanation under GDPR for automated decision-making?

- A. It requires companies to share all source code of their AI models publicly with everyone
- B. Individuals have the right to obtain meaningful information about the logic of automated decisions
- C. The right to explanation only applies to decisions made by human workers not AI systems
- D. GDPR does not address automated decision-making at all and has no such requirement

Answer: B

Q844. How does differential privacy protect individual data in ML training?

- A. Differential privacy removes all privacy protections to improve model accuracy scores
- B. It adds calibrated noise to queries or gradients making individual data points unidentifiable
- C. It requires all training data to be publicly available for anyone to inspect at any time
- D. It encrypts the entire training dataset using standard encryption algorithms for security

Answer: B

Q845. What is the problem of automation bias in AI-assisted decision-making?

- A. It refers to the bias introduced by automating the data collection process for ML
- B. Automation bias only occurs in fully autonomous systems and never in AI-assisted ones
- C. Users tend to over-rely on AI recommendations even when the AI may be incorrect here
- D. Users never trust AI recommendations and always override them with their own judgment

Answer: C

Q846. How can AI systems inadvertently create feedback loops that amplify bias?

- A. AI feedback loops always reduce bias over time through self-correcting learning loops
- B. Biased predictions influence future data collection which further reinforces the bias
- C. Feedback loops only occur in recommendation systems and never in other AI applications
- D. AI systems never create feedback loops because they process each prediction independently

Answer: B

Q847. What is the dual-use dilemma in AI technology development?

- A. AI technology can only be used for beneficial purposes and never for harmful applications
- B. Dual-use only refers to AI running on two different hardware platforms simultaneously here
- C. AI technology developed for harmful purposes can never be repurposed for beneficial uses
- D. The same AI technology can be used for both beneficial and harmful purposes creating tension

Answer: D

Q848. What role does model interpretability play in building trust with AI stakeholders?

- A. Model interpretability is only relevant for developers and has no value for end users
- B. Interpretability reduces model accuracy so it should be avoided for all production models
- C. All AI models are inherently interpretable and no additional effort is needed for trust
- D. It enables stakeholders to understand and verify AI reasoning building confidence in system

Answer: D

Q849. How does the concept of AI safety differ from AI ethics?

- A. AI safety is relevant only for AGI systems while AI ethics applies only to narrow AI systems
- B. AI safety focuses on preventing AI from causing harm while ethics addresses broader societal values
- C. AI safety and AI ethics are identical concepts with no meaningful difference between them
- D. AI safety only concerns physical robots while AI ethics only concerns software applications

Answer: B

Q850. What is the challenge of measuring fairness across multiple protected attributes simultaneously?

- A. Intersectional groups create complexity where satisfying fairness for one may violate another
- B. Only one protected attribute can be considered at a time and others must be fully ignored
- C. Multiple protected attributes have no interaction and can be handled completely independently
- D. Fairness across multiple attributes is trivial to achieve by optimizing for single attribute

Answer: A

Q851. What is the difference between narrow AI and general AI?

- A. Narrow AI is cheaper while general AI is expensive
- B. Narrow AI handles specific tasks while general AI can handle any intellectual task
- C. Narrow AI uses more data than general AI
- D. There is no difference between them

Answer: B

Q852. What role does a reward signal play in reinforcement learning?

- A. It provides labeled examples for classification
- B. It tells the agent how good or bad its action was
- C. It compresses the training data
- D. It removes outliers from data

Answer: B

Q853. Which type of machine learning discovers hidden patterns in data without labels?

- A. Supervised learning
- B. Reinforcement learning
- C. Unsupervised learning
- D. Semi-supervised learning

Answer: C

Q854. What is the role of a validation set in the machine learning workflow?

- A. To train the model parameters
- B. To tune hyperparameters and prevent overfitting during development
- C. To collect new data from users
- D. To deploy the model to production

Answer: B

Q855. What is semi-supervised learning?

- A. A method that uses only unlabeled data
- B. A method that combines a small amount of labeled data with a large amount of unlabeled data
- C. A method that only uses reinforcement signals
- D. A method that does not use any data

Answer: B

Q856. What is the explore-exploit tradeoff in reinforcement learning?

- A. Choosing between training and testing
- B. Balancing trying new actions versus using known rewarding actions
- C. Deciding between CPU and GPU usage
- D. Selecting between classification and regression

Answer: B

Q857. What is a knowledge graph in the context of AI?

- A. A chart showing training loss
- B. A structured representation of real-world entities and their relationships
- C. A neural network architecture
- D. A type of decision tree

Answer: B

Q858. Why is data quality important for machine learning models?

- A. Models always work regardless of data quality
- B. Poor data quality leads to inaccurate or biased model predictions
- C. Data quality only matters for image data
- D. High quality data slows down training

Answer: B

Q859. What is an AI pipeline?

- A. A physical pipe used in factories
- B. A sequence of data processing and modeling steps from raw data to predictions
- C. A single algorithm that solves all problems
- D. A hardware component in computers

Answer: B

Q860. What is the difference between a parametric and non-parametric model?

- A. Parametric models are always more accurate
- B. Parametric models have a fixed number of parameters while non-parametric models grow with data
- C. Non-parametric models cannot make predictions
- D. There is no practical difference

Answer: B

Q861. What is the purpose of partial derivatives in machine learning?

- A. To sort data alphabetically
- B. To measure the rate of change of a function with respect to one variable while holding others constant
- C. To create random numbers
- D. To delete features from a dataset

Answer: B

Q862. What is a probability distribution?

- A. A sorted list of numbers
- B. A function that describes the likelihood of different outcomes for a random variable
- C. A type of neural network
- D. A data storage method

Answer: B

Q863. What is matrix multiplication and when is it defined?

- A. Element-wise multiplication of any two matrices
- B. Multiplying rows of the first matrix by columns of the second, defined when the first matrix's columns equal the second's rows
- C. Always defined for any two matrices
- D. Adding corresponding elements of two matrices

Answer: B

Q864. What is the normal distribution and why is it important in ML?

- A. A distribution where all values are equal
- B. A bell-shaped symmetric distribution that naturally arises in many real-world phenomena due to the central limit theorem
- C. A uniform distribution over integers
- D. A distribution only used in physics

Answer: B

Q865. What is the inverse of a matrix used for?

- A. Transposing the matrix
- B. Solving systems of linear equations and computing certain ML closed-form solutions
- C. Increasing matrix dimensions
- D. Sorting matrix elements

Answer: B

Q866. What is the central limit theorem?

- A. A theorem about the center of a dataset
- B. The sampling distribution of the mean approaches a normal distribution as sample size increases, regardless of the population distribution
- C. All distributions are normal
- D. Larger samples are always biased

Answer: B

Q867. What is the Euclidean distance between two points?

- A. The Manhattan distance
- B. The straight-line distance computed as the square root of the sum of squared differences
- C. The cosine of the angle between them
- D. The absolute difference of their means

Answer: B

Q868. What is the difference between a discrete and continuous random variable?

- A. They are the same thing
- B. A discrete variable takes countable values while a continuous variable can take any value in a range
- C. Discrete variables are always larger
- D. Continuous variables can only be integers

Answer: B

Q869. Why is the logarithm function commonly used in machine learning?

- A. It makes all values negative
- B. It converts multiplicative relationships to additive ones and helps with numerical stability
- C. It is only used for display purposes
- D. Logarithms are not used in ML

Answer: B

Q870. What is a correlation coefficient?

- A. A measure of causation between variables
- B. A value between -1 and 1 that measures the linear relationship strength between two variables
- C. The mean of two variables
- D. The number of data points

Answer: B

Q871. What is the difference between `append()` and `extend()` for Python lists?

- A. They are identical
- B. `append()` adds a single element while `extend()` adds all elements from an iterable individually
- C. `extend()` adds a single element while `append()` adds multiple
- D. Neither modifies the original list

Answer: B

Q872. What is the purpose of the `with` statement in Python?

- A. Defining classes
- B. Managing resources with automatic cleanup via context managers
- C. Creating loops
- D. Importing modules

Answer: B

Q873. How does pandas handle missing data by default?

- A. It deletes the entire dataset
- B. It represents missing values as NaN and provides methods like fillna() and dropna() to handle them
- C. It replaces missing values with zeros automatically
- D. It crashes when encountering missing data

Answer: B

Q874. What is slicing in NumPy arrays?

- A. Deleting arrays
- B. Extracting subarrays using index ranges with start:stop:step syntax
- C. Sorting arrays
- D. Concatenating arrays

Answer: B

Q875. What is the purpose of sklearn.preprocessing.StandardScaler?

- A. It creates standard Python variables
- B. It standardizes features by removing the mean and scaling to unit variance
- C. It sorts data in standard order
- D. It converts data to string format

Answer: B

Q876. What does the map() function do in Python?

- A. Creates geographic maps
- B. Applies a given function to each item of an iterable and returns the results
- C. Maps keys to values in a dictionary
- D. Measures memory allocation

Answer: B

Q877. How do you handle exceptions in Python?

- A. Using if-else statements only
- B. Using try-except blocks to catch and handle errors gracefully
- C. Exceptions cannot be handled in Python
- D. Using import statements

Answer: B

Q878. What is the difference between loc and iloc in pandas?

- A. They are identical
- B. loc uses label-based indexing while iloc uses integer position-based indexing
- C. loc is faster than iloc always
- D. iloc uses label-based indexing

Answer: B

Q879. What is a decorator in Python?

- A. A way to add colors to output
- B. A function that modifies the behavior of another function without changing its source code
- C. A type of loop
- D. A data visualization tool

Answer: B

Q880. What does the pandas pivot_table() method do?

- A. Rotates a table physically
- B. Creates a spreadsheet-style pivot table for summarizing data by grouping and aggregating
- C. Deletes pivot columns
- D. Transposes the DataFrame

Answer: B

Q881. What is the difference between min-max scaling and z-score standardization?

- A. They produce identical results
- B. Min-max scales to a fixed range like 0-1 while z-score centers data to zero mean and unit variance
- C. Min-max is always better
- D. Z-score only works with integers

Answer: B

Q882. What is multivariate imputation and when is it preferred?

- A. Replacing missing values with zeros only
- B. Using relationships between multiple features to estimate missing values, preferred when features are correlated
- C. It only works for time series data
- D. It is never preferred over simple imputation

Answer: B

Q883. Why is stratified sampling important when splitting imbalanced datasets?

- A. It makes processing faster
- B. It ensures each split maintains the same class distribution as the original dataset
- C. It removes all minority class samples
- D. It is only used for text data

Answer: B

Q884. What is the purpose of a pipeline in scikit-learn for preprocessing?

- A. To create data visualizations
- B. To chain multiple preprocessing steps and the model into a single object ensuring consistent application
- C. To store data in databases
- D. To generate synthetic data

Answer: B

Q885. What is the effect of class imbalance on model training?

- A. It has no effect on model performance
- B. Models tend to be biased toward the majority class, performing poorly on minority class predictions
- C. It always improves accuracy
- D. It only affects unsupervised learning

Answer: B

Q886. What is feature binarization?

- A. Converting all features to text
- B. Converting numerical features to binary values using a threshold
- C. Deleting binary features
- D. Doubling all feature values

Answer: B

Q887. How does the Robust Scaler differ from Standard Scaler?

- A. They are identical
- B. Robust Scaler uses median and IQR instead of mean and std, making it resistant to outliers
- C. Robust Scaler is always slower
- D. Standard Scaler handles outliers better

Answer: B

Q888. What is the purpose of winsorization in data preprocessing?

- A. Deleting all outliers permanently
- B. Capping extreme values at a specified percentile to reduce the impact of outliers
- C. Converting data to Windows format
- D. Increasing the number of outliers

Answer: B

Q889. Why should you encode categorical variables before feeding data to most ML algorithms?

- A. Categorical data takes more storage
- B. Most ML algorithms perform mathematical operations and cannot process text categories directly
- C. Encoding is only needed for neural networks
- D. Categorical variables are always irrelevant

Answer: B

Q890. What is the difference between MCAR, MAR, and MNAR missing data?

- A. They are all the same type of missing data
- B. MCAR is completely random, MAR depends on observed data, and MNAR depends on the missing values themselves
- C. These are types of data encoding
- D. They describe data augmentation methods

Answer: B

Q891. What is the difference between a kernel density plot and a histogram?

- A. They are identical visualizations
- B. A KDE provides a smooth continuous estimate of the probability density while a histogram uses discrete bins
- C. KDE only works for categorical data
- D. Histograms are always more accurate

Answer: B

Q892. How does a parallel coordinates plot help with multivariate EDA?

- A. It only shows two variables at once
- B. It visualizes each observation as a line across parallel axes for each feature, revealing clusters and patterns in high-dimensional data
- C. It is a type of bar chart
- D. It can only show categorical data

Answer: B

Q893. What does the chi-squared test assess in EDA?

- A. The mean of a distribution
- B. Whether there is a statistically significant association between two categorical variables
- C. The slope of a regression line
- D. The normality of data

Answer: B

Q894. Why is it useful to create a missing value heatmap during EDA?

- A. To make the dataset look colorful
- B. To visually identify patterns in missing data across features and observations
- C. To remove all missing values automatically
- D. To encrypt sensitive columns

Answer: B

Q895. What does a jointplot in Seaborn display?

- A. Only a histogram
- B. A bivariate plot showing the relationship between two variables along with their marginal distributions
- C. A 3D surface plot
- D. A pie chart with labels

Answer: B

Q896. What is the significance of the interquartile range in identifying outliers?

- A. IQR identifies the mean value
- B. Points falling below $Q1 - 1.5 \times IQR$ or above $Q3 + 1.5 \times IQR$ are considered potential outliers
- C. IQR only applies to categorical data
- D. IQR measures correlation

Answer: B

Q897. What is the purpose of a lag plot in time series EDA?

- A. To create time delays in processing
- B. To check for autocorrelation by plotting each observation against a lagged version of itself
- C. To display GPS coordinates
- D. To compress time series data

Answer: B

Q898. How does the Shapiro-Wilk test complement visual normality assessment?

- A. It replaces all visualizations
- B. It provides a formal statistical test for normality to supplement visual methods like QQ plots and histograms
- C. It only tests for uniformity
- D. It is identical to the chi-squared test

Answer: B

Q899. What does a swarm plot show that a box plot might miss?

- A. The mean value
- B. Individual data points showing the actual distribution density and potential clusters within groups
- C. The standard deviation
- D. Only outliers

Answer: B

Q900. What is the purpose of profiling tools like pandas-profiling during EDA?

- A. To slow down analysis
- B. To automatically generate comprehensive data quality reports including statistics, correlations, and missing value analysis
- C. To convert data to PDF format
- D. To deploy ML models

Answer: B

Q901. What is elastic net regularization and when is it preferred?

- A. A type of neural network
- B. A combination of L1 and L2 regularization that balances feature selection and coefficient shrinkage
- C. A data preprocessing technique
- D. A visualization method

Answer: B

Q902. How does a decision tree handle continuous features for splitting?

- A. It ignores continuous features
- B. It evaluates all possible threshold values to find the split that maximizes information gain or minimizes impurity
- C. It converts them to binary first
- D. It only uses the mean value

Answer: B

Q903. What is the difference between batch gradient descent and stochastic gradient descent?

- A. They are identical algorithms
- B. Batch uses the entire dataset per update while SGD uses one sample, trading accuracy per step for faster iterations
- C. SGD uses the entire dataset
- D. Batch gradient descent is always faster

Answer: B

Q904. Why is polynomial regression considered a linear model despite fitting curves?

- A. It cannot fit curves
- B. It is linear in its parameters even though it fits nonlinear relationships by using polynomial features of the input
- C. It uses neural networks internally
- D. Polynomial regression is not a linear model

Answer: B

Q905. What is the difference between one-vs-rest and one-vs-one for multiclass classification?

- A. They produce identical results always
- B. One-vs-rest trains K binary classifiers while one-vs-one trains $K*(K-1)/2$ classifiers for K classes
- C. One-vs-rest only works for two classes
- D. One-vs-one is always less accurate

Answer: B

Q906. What is the purpose of cost-sensitive learning?

- A. To reduce the monetary cost of computing
- B. To assign different penalties for different types of misclassification errors based on their real-world impact
- C. To make models train faster
- D. To reduce the number of features

Answer: B

Q907. How does early stopping work as a regularization technique?

- A. It stops data collection early
- B. It monitors validation performance during training and stops when performance starts degrading, preventing overfitting
- C. It removes features early in the process
- D. It only works for linear models

Answer: B

Q908. What is the role of maximum margin in SVM classification?

- A. To minimize the margin between classes
- B. To find the hyperplane that maximizes the distance between itself and the nearest data points from each class
- C. To maximize training errors
- D. To reduce the number of features

Answer: B

Q909. What is the difference between parametric and non-parametric supervised learning methods?

- A. They are identical in approach
- B. Parametric methods assume a fixed functional form while non-parametric methods make fewer assumptions and grow in complexity with data
- C. Non-parametric methods always perform worse
- D. Parametric methods have no parameters

Answer: B

Q910. What is the purpose of grid search in hyperparameter tuning?

- A. To create data grids for visualization
- B. To exhaustively search through a specified subset of hyperparameter combinations to find the best model configuration
- C. To split data into grids
- D. To remove outliers from grid-shaped data

Answer: B

Q911. How does the subsample parameter in gradient boosting affect the model?

- A. It has no effect
- B. Using a fraction of training data per tree introduces randomness that reduces overfitting similar to bagging
- C. It increases training data size
- D. It controls the number of features per split

Answer: B

Q912. What is the difference between soft and hard voting in ensemble classification?

- A. They always produce identical results
- B. Hard voting uses majority class votes while soft voting averages predicted probabilities before making the decision
- C. Soft voting only works for regression
- D. Hard voting uses probabilities

Answer: B

Q913. How does feature importance work in Random Forest?

- A. It ranks features alphabetically
- B. It measures how much each feature contributes to reducing impurity across all trees in the forest
- C. It only considers the first tree
- D. It is based solely on feature correlations

Answer: B

Q914. What is the role of the max_depth parameter in tree-based ensembles?

- A. It controls the number of trees
- B. It limits how deep each individual tree can grow, trading expressiveness for regularization
- C. It sets the maximum number of features
- D. It determines the learning rate

Answer: B

Q915. How does LightGBM achieve faster training than XGBoost?

- A. It uses fewer trees
- B. It uses histogram-based splitting and leaf-wise tree growth instead of level-wise, reducing computation
- C. It skips the boosting step
- D. It uses a simpler loss function

Answer: B

Q916. What is the purpose of regularization parameters like lambda and alpha in XGBoost?

- A. To increase training speed only
- B. To penalize complex trees by adding L1 and L2 penalties on leaf weights, reducing overfitting
- C. To add more features
- D. To skip cross-validation

Answer: B

Q917. What is blending in ensemble learning?

- A. Mixing data from different datasets
- B. A simplified stacking approach where base model predictions on a holdout set are used to train a meta-learner
- C. Averaging all features together
- D. Removing outliers from predictions

Answer: B

Q918. Why does boosting typically have higher bias than bagging at the start but lower at the end?

- A. Boosting always has low bias
- B. Boosting starts with a weak learner (high bias) and sequentially reduces bias by correcting errors, while bagging combines full models from the start
- C. Bagging always has higher bias
- D. Bias is irrelevant in ensemble methods

Answer: B

Q919. What is the purpose of column subsampling in gradient boosting?

- A. To reduce the number of rows
- B. To randomly select a subset of features for each tree, increasing diversity and reducing overfitting
- C. To change the number of output classes
- D. To modify the learning rate

Answer: B

Q920. How do you determine the optimal number of boosting rounds?

- A. Always use exactly 100 rounds
- B. Use early stopping on a validation set, stopping when validation performance stops improving
- C. More rounds are always better
- D. Use exactly as many rounds as features

Answer: B

Q921. What is the difference between K-Means and K-Medoids clustering?

- A. They are identical algorithms
- B. K-Means uses mean centroids while K-Medoids uses actual data points as cluster centers, making it more robust to outliers
- C. K-Medoids is always faster
- D. K-Means uses actual data points as centers

Answer: B

Q922. How does the explained variance ratio help in choosing the number of PCA components?

- A. It is not useful for PCA
- B. It shows the proportion of total variance captured by each component, helping choose enough components to retain a desired percentage of information
- C. It measures clustering quality
- D. It indicates the number of outliers

Answer: B

Q923. What is the difference between DBSCAN's epsilon and minPoints parameters?

- A. They control the same thing
- B. Epsilon defines the neighborhood radius while minPoints sets the minimum neighbors needed to form a dense core point
- C. Epsilon counts points and minPoints measures distance
- D. They are both optional parameters

Answer: B

Q924. What is the Calinski-Harabasz index for clustering evaluation?

- A. A measure of classification accuracy
- B. The ratio of between-cluster dispersion to within-cluster dispersion, where higher values indicate better-defined clusters
- C. A feature selection metric
- D. A dimensionality reduction technique

Answer: B

Q925. How does Gaussian Mixture Model clustering assign soft cluster memberships?

- A. It uses hard assignments like K-Means
- B. Each data point receives a probability of belonging to each cluster based on the Gaussian component likelihoods
- C. It only assigns points to the nearest center
- D. It does not produce cluster assignments

Answer: B

Q926. What is the difference between complete linkage and single linkage in hierarchical clustering?

- A. They produce identical results
- B. Complete linkage uses maximum inter-cluster distance while single linkage uses minimum, leading to different cluster shapes
- C. Single linkage always produces better clusters
- D. Complete linkage is single linkage with extra steps

Answer: B

Q927. What is the reconstruction error in autoencoders and why is it important?

- A. It measures classification accuracy
- B. It measures how well the autoencoder's output matches its input, indicating the quality of the learned representation
- C. It counts the number of layers
- D. It measures training speed

Answer: B

Q928. What is the role of the Expectation-Maximization algorithm in GMM?

- A. It is a clustering evaluation metric
- B. EM iteratively estimates cluster parameters (E-step: compute responsibilities, M-step: update parameters) until convergence
- C. It only initializes clusters
- D. It is used for supervised learning only

Answer: B

Q929. How does t-SNE preserve local structure during dimensionality reduction?

- A. It preserves global structure instead
- B. It converts pairwise distances to conditional probabilities and minimizes KL divergence between high and low-dimensional distributions
- C. It uses linear transformations only
- D. It discards all distance information

Answer: B

Q930. What is the purpose of the perplexity parameter in t-SNE?

- A. It measures classification accuracy
- B. It controls the effective number of nearest neighbors considered, balancing attention between local and global aspects of the data
- C. It sets the output dimensions
- D. It determines the number of clusters

Answer: B

Q931. What is the precision-recall tradeoff and why does it exist?

- A. They always improve together
- B. Increasing the decision threshold increases precision but decreases recall because fewer positive predictions are made but they are more confident
- C. There is no tradeoff between them
- D. They are the same metric

Answer: B

Q932. What is the advantage of using mean absolute percentage error for regression evaluation?

- A. It is always the best metric
- B. MAPE expresses errors as percentages making it scale-independent and intuitive for stakeholders to understand
- C. It works well when actual values are near zero
- D. MAPE is identical to RMSE

Answer: B

Q933. How does leave-one-out cross-validation work?

- A. It removes one feature at a time
- B. Each data point is used as a single test set while all remaining points are used for training, repeated for every point
- C. It splits data into two halves
- D. It only uses the first data point for testing

Answer: B

Q934. What is the adjusted R-squared and why is it better than regular R-squared?

- A. They are identical metrics
- B. Adjusted R-squared penalizes for the number of features, preventing artificial inflation from adding irrelevant variables
- C. Adjusted R-squared is always lower
- D. Regular R-squared accounts for model complexity

Answer: B

Q935. What is a classification report in scikit-learn?

- A. A report about the dataset
- B. A summary table showing precision, recall, F1-score, and support for each class along with averages
- C. A list of all model parameters
- D. A data quality report

Answer: B

Q936. When is the F-beta score more appropriate than the F1 score?

- A. Never, F1 is always best
- B. When you want to weight precision and recall differently, with $\beta > 1$ favoring recall and $\beta < 1$ favoring precision
- C. When you have exactly two classes
- D. When datasets are perfectly balanced

Answer: B

Q937. What is the purpose of a cumulative gains chart in model evaluation?

- A. To show cumulative training loss
- B. To show how much of the positive class is captured by targeting the top-scored percentage of predictions
- C. To display feature importance
- D. To measure computational gains

Answer: B

Q938. What is the difference between macro and weighted averaging for multi-class metrics?

- A. They always produce the same result
- B. Macro averaging treats all classes equally regardless of size while weighted averaging accounts for class frequency
- C. Macro averaging is always preferred
- D. Weighted averaging ignores class sizes

Answer: B

Q939. What is the Huber loss and when is it preferred over MSE?

- A. They are identical losses
- B. Huber loss is quadratic for small errors and linear for large errors, making it robust to outliers while still being differentiable
- C. Huber loss is always worse than MSE
- D. It only works for classification

Answer: B

Q940. What is the concept of an evaluation metric being proper?

- A. It means the metric is correctly coded
- B. A proper scoring rule is maximized when the predicted probabilities match the true probabilities, encouraging honest probability estimates
- C. It means the metric is simple
- D. Proper metrics are only for regression

Answer: B

Q941. How does frequency encoding work for categorical variables?

- A. It converts categories to sound frequencies
- B. It replaces each category with its frequency of occurrence in the dataset, capturing popularity information
- C. It only works for time series
- D. It is identical to one-hot encoding

Answer: B

Q942. What is the purpose of creating ratio and proportion features?

- A. To normalize all features to 1
- B. To capture relative relationships between variables that raw values alone may not express
- C. To divide the dataset into portions
- D. To calculate model accuracy

Answer: B

Q943. How do sine and cosine transformations encode cyclical features?

- A. They convert cycles to straight lines
- B. They map cyclical values to a circle using sin and cos, preserving the fact that values like 23:00 and 01:00 are close
- C. They only work for audio data
- D. They remove cyclical patterns from data

Answer: B

Q944. What is the difference between backward elimination and forward selection for feature selection?

- A. They always select the same features
- B. Backward elimination starts with all features and removes the least important, while forward selection starts empty and adds the most important
- C. They are identical algorithms
- D. Forward selection removes features

Answer: B

Q945. What is weight of evidence encoding for categorical variables?

- A. It measures the physical weight of data
- B. WoE measures the predictive power of each category by computing the log ratio of the distribution of events to non-events within each category
- C. It only works for numerical features
- D. It assigns random weights to categories

Answer: B

Q946. How does the correlation-based filter method work for feature selection?

- A. It selects features randomly
- B. It selects features that have high correlation with the target variable but low correlation with each other, reducing redundancy
- C. It only removes constant features
- D. It requires model training

Answer: B

Q947. What is the purpose of creating window-based features for time series data?

- A. To resize data visualizations
- B. To capture temporal patterns by computing statistics like rolling mean, sum, or standard deviation over fixed time windows
- C. To remove time information
- D. To encrypt temporal data

Answer: B

Q948. What is the Recursive Feature Elimination method?

- A. A method that recursively adds features
- B. RFE trains a model, removes the least important feature, retrains, and repeats until the desired number of features remains
- C. It eliminates all features recursively
- D. It is a type of data augmentation

Answer: B

Q949. Why might you create statistical aggregate features from grouped data?

- A. To reduce the number of rows only
- B. Aggregates like group means, counts, medians, and standard deviations capture entity-level behavioral patterns from transactional data
- C. Aggregation always loses useful information
- D. Statistical aggregates are only for visualization

Answer: B

Q950. What is the difference between one-hot encoding and binary encoding for high cardinality features?

- A. They produce identical outputs
- B. One-hot creates one column per category while binary encoding uses $\log_2(n)$ columns with binary representation, greatly reducing dimensionality
- C. Binary encoding creates more columns
- D. One-hot always uses fewer columns

Answer: B

Q951. How does the Leaky ReLU activation function address the dying ReLU problem?

- A. It has the same issue as ReLU
- B. Instead of outputting zero for negative inputs, Leaky ReLU outputs a small negative slope, keeping neurons active and allowing gradient flow
- C. It only works for positive inputs
- D. It eliminates all negative values

Answer: B

Q952. What is the purpose of weight regularization in neural networks?

- A. To make weights larger
- B. To penalize large weight values in the loss function, constraining model complexity and reducing overfitting
- C. To initialize weights to zero
- D. To speed up inference

Answer: B

Q953. What is the difference between SGD with momentum and vanilla SGD?

- A. They are identical
- B. Momentum accumulates past gradients to smooth updates and accelerate convergence, especially in directions with consistent gradient sign
- C. Vanilla SGD is faster
- D. Momentum only works for small datasets

Answer: B

Q954. What is the Xavier/Glorot initialization strategy?

- A. Setting all weights to one
- B. Initializing weights from a distribution scaled by the number of input and output neurons to maintain signal variance across layers
- C. Using random integers as weights
- D. Copying weights from another model

Answer: B

Q955. How does data augmentation help in deep learning?

- A. It reduces the dataset size
- B. It artificially increases training data diversity by applying transformations, helping the model generalize and reducing overfitting
- C. It cleans the data
- D. It only works for text data

Answer: B

Q956. What is the difference between online learning and batch learning in neural networks?

- A. They are the same approach
- B. Online learning updates weights after each sample while batch learning processes the entire dataset before updating
- C. Online learning is always better
- D. Batch learning processes one sample at a time

Answer: B

Q957. What is the purpose of the He initialization for ReLU networks?

- A. It is identical to Xavier initialization
- B. He initialization scales weights by $\sqrt{2/\text{fan\_in}}$ to account for ReLU's zeroing of negative values, maintaining proper signal variance
- C. It initializes all weights to zero
- D. It only works for sigmoid networks

Answer: B

Q958. What is label smoothing and how does it help training?

- A. Making labels blurry in images
- B. Replacing hard 0/1 labels with soft values like 0.1/0.9, reducing model overconfidence and improving generalization
- C. It removes labels from the dataset
- D. It only works for regression

Answer: B

Q959. What is the warmup strategy in learning rate scheduling?

- A. Preheating the GPU hardware
- B. Starting with a very small learning rate and gradually increasing it to the target rate over initial training steps
- C. Using a constant high learning rate
- D. Warmup is only used during inference

Answer: B

Q960. What is the purpose of gradient accumulation in deep learning?

- A. To store gradients permanently
- B. To simulate larger batch sizes by accumulating gradients over multiple mini-batches before updating weights, useful when GPU memory is limited
- C. To remove gradients
- D. It slows down training intentionally

Answer: B

Q961. How does the forget gate in an LSTM cell work?

- A. It forgets the model parameters
- B. It decides what information to discard from the cell state using a sigmoid gate that outputs values between 0 and 1
- C. It removes training data
- D. It deletes gradient values

Answer: B

Q962. What is the discriminator's role in GAN training?

- A. It generates new data
- B. It classifies inputs as real or fake, providing training signal to the generator to improve its outputs
- C. It preprocesses data
- D. It sets the learning rate

Answer: B

Q963. What is batch renormalization and why was it introduced?

- A. It is identical to batch normalization
- B. Batch renormalization corrects batch normalization's issues with small or non-iid mini-batches by using running statistics with trainable correction parameters
- C. It removes normalization entirely
- D. It only works for very large batches

Answer: B

Q964. What is the attention mechanism's key-query-value framework?

- A. A database query system
- B. Queries determine what to attend to, keys determine relevance scores, and values carry the information to be aggregated based on attention weights
- C. Keys contain the input data only
- D. Queries and keys are always identical

Answer: B

Q965. What is the purpose of the bottleneck layer in a ResNet block?

- A. To slow down training
- B. To reduce computational cost by using 1x1 convolutions to decrease and then increase the channel dimensions around the expensive 3x3 convolution
- C. To create an autoencoder
- D. To remove skip connections

Answer: B

Q966. How does teacher forcing work in training sequence generation models?

- A. Using a teacher to label data
- B. During training, the model receives the actual ground truth output token as input for the next step rather than its own predicted token
- C. It only works during inference
- D. It replaces the decoder entirely

Answer: B

Q967. What is group normalization and when is it preferred over batch normalization?

- A. They are the same technique
- B. Group normalization normalizes over groups of channels within each sample, independent of batch size, preferred when batch sizes are too small for stable batch statistics
- C. Group norm requires large batches
- D. It only works for RNNs

Answer: B

Q968. What is the difference between transposed convolution and upsampling in CNNs?

- A. They are identical operations
- B. Transposed convolution learns upsampling parameters while standard upsampling uses fixed interpolation methods like bilinear or nearest neighbor
- C. Upsampling always produces better results
- D. Transposed convolution reduces dimensions

Answer: B

Q969. What is the concept of feature reuse in DenseNet architecture?

- A. Reusing training data
- B. Each layer receives feature maps from all preceding layers as input, enabling direct feature reuse, gradient flow improvement, and parameter efficiency
- C. Only the last layer reuses features
- D. Feature reuse causes overfitting

Answer: B

Q970. What is knowledge distillation's dark knowledge?

- A. Secret information hidden in models
- B. The soft probability distributions over non-target classes produced by the teacher model, containing inter-class similarity information
- C. Dark knowledge does not exist
- D. It refers to unlabeled data

Answer: B

Q971. How does the Skip-gram model in Word2Vec work?

- A. It skips words during processing
- B. It predicts surrounding context words given a center word, learning word embeddings that capture semantic relationships
- C. It classifies sentences into categories
- D. It only works with consecutive words

Answer: B

Q972. What is the difference between GloVe and Word2Vec embeddings?

- A. They produce identical embeddings
- B. Word2Vec uses local context windows with neural networks while GloVe uses global word co-occurrence statistics with matrix factorization
- C. GloVe is always better
- D. Word2Vec uses global statistics

Answer: B

Q973. What is the masked language modeling objective used in BERT?

- A. Removing all words from text
- B. Randomly masking some input tokens and training the model to predict the masked tokens from bidirectional context
- C. Translating masked text
- D. Only predicting the next word

Answer: B

Q974. What is the role of the encoder in a machine translation system?

- A. It translates the text directly
- B. It processes the input sentence into a contextual representation that captures its meaning for the decoder to use
- C. It only tokenizes the input
- D. It generates the output translation

Answer: B

Q975. What is the difference between autoregressive and autoencoding language models?

- A. They are identical approaches
- B. Autoregressive models predict tokens left-to-right (GPT-style) while autoencoding models use bidirectional context with masked tokens (BERT-style)
- C. Autoregressive models are always better
- D. Autoencoding models generate text one token at a time

Answer: B

Q976. What is named entity recognition used for in practical applications?

- A. Naming files on a computer
- B. Identifying and classifying entities like person names, organizations, locations, and dates in text for information extraction
- C. Renaming variables in code
- D. Creating new entity types

Answer: B

Q977. How does beam search differ from greedy decoding for text generation?

- A. They produce identical outputs
- B. Beam search maintains multiple candidate sequences at each step, exploring a broader search space than greedy decoding which only keeps the single best token
- C. Greedy decoding is always better
- D. Beam search uses random sampling

Answer: B

Q978. What is the purpose of the attention mask in Transformer models?

- A. To hide the model from users
- B. To prevent the model from attending to padding tokens or future positions, ensuring valid attention computation
- C. To mask training errors
- D. To speed up computation without any functional purpose

Answer: B

Q979. What is text embedding and how does it differ from word embedding?

- A. They are identical concepts
- B. Text embedding produces a single vector for an entire sentence or document while word embedding produces individual vectors for each word
- C. Text embedding only works for short texts
- D. Word embedding handles entire documents

Answer: B

Q980. What is the purpose of the temperature parameter in language model generation?

- A. It controls GPU temperature
- B. It scales the logits before softmax, with lower values making output more focused and deterministic and higher values increasing randomness and diversity
- C. It has no effect on output
- D. It controls the learning rate

Answer: B

Q981. How does the region proposal network work in Faster R-CNN?

- A. It manually selects regions
- B. RPN slides a small network over the feature map to predict object proposals and objectness scores simultaneously
- C. It uses random cropping for proposals
- D. RPN is a separate model from the detector

Answer: B

Q982. What is the difference between top-1 and top-5 accuracy in image classification?

- A. They measure the same thing
- B. Top-1 requires the correct class to be the single highest prediction while top-5 counts it as correct if the true class is among the five highest predictions
- C. Top-5 is always lower than top-1
- D. They are used for different types of images

Answer: B

Q983. What is mean Average Precision in object detection evaluation?

- A. The average image resolution
- B. mAP averages the precision across different recall levels and across all object classes, providing a single performance metric for detection
- C. It counts the number of detected objects
- D. It measures processing speed

Answer: B

Q984. How does the U-Net skip connections help with image segmentation?

- A. They skip the encoder entirely
- B. Skip connections concatenate encoder features with decoder features, providing high-resolution spatial information that helps precise boundary localization
- C. They remove low-level features
- D. Skip connections only connect the first and last layers

Answer: B

Q985. What is the purpose of image augmentation techniques like random erasing?

- A. To corrupt data permanently
- B. Random erasing masks random rectangular patches in training images, forcing the model to rely on diverse features rather than specific local patterns
- C. To reduce dataset size
- D. To remove objects from images permanently

Answer: B

Q986. What is the difference between single-shot and multi-scale object detection?

- A. They detect objects at the same scale
- B. Multi-scale detection processes images at multiple resolutions or uses feature pyramids to detect objects of various sizes, while single-scale may miss small or large objects
- C. Single-shot always detects more objects
- D. Multi-scale only works for large objects

Answer: B

Q987. What is semantic segmentation's pixel-wise classification?

- A. Classifying entire images into categories
- B. Assigning a class label to every individual pixel in the image, creating a dense prediction map
- C. Detecting objects with bounding boxes
- D. Counting pixels in each color

Answer: B

Q988. How does Mixup data augmentation work for training CV models?

- A. Mixing different datasets together
- B. Creating new training samples by linearly interpolating between pairs of images and their labels, encouraging smoother decision boundaries
- C. Mixing color channels randomly
- D. Combining two models into one

Answer: B

Q989. What is the role of backbone networks in object detection architectures?

- A. They provide structural support for servers
- B. Backbone networks extract hierarchical visual features from the input image that are shared by detection head and other task-specific modules
- C. They generate bounding boxes directly
- D. Backbones only process text data

Answer: B

Q990. What is the difference between instance segmentation and panoptic segmentation?

- A. They are identical tasks
- B. Instance segmentation only handles countable objects while panoptic segmentation unifies both instance segmentation for things and semantic segmentation for stuff regions
- C. Panoptic only detects backgrounds
- D. Instance segmentation covers everything in the image

Answer: B

Q991. How does Apache Spark's lazy evaluation improve performance?

- A. It makes Spark slower
- B. Spark builds an execution plan without computing results until an action is called, enabling query optimization and avoiding unnecessary computations
- C. It processes data immediately
- D. Lazy evaluation has no effect on performance

Answer: B

Q992. What is the difference between a data lake and a data lakehouse?

- A. They are identical concepts
- B. A data lakehouse combines the flexibility of data lakes with the management and performance features of data warehouses, supporting both analytics and ML workloads
- C. Data lakehouses only store structured data
- D. Data lakes are always better

Answer: B

Q993. What is the purpose of data serialization formats like Parquet and Avro?

- A. They are programming languages
- B. They efficiently encode structured data for storage and transmission, with Parquet optimized for columnar analytics and Avro for row-based serialization
- C. They only work with text data
- D. They replace databases entirely

Answer: B

Q994. How does Apache Kafka enable real-time data streaming?

- A. It stores data in batches only
- B. Kafka provides a distributed publish-subscribe messaging system where producers publish events to topics and consumers process them in near real-time
- C. It replaces all databases
- D. Kafka only works with text data

Answer: B

Q995. What is the role of a distributed file system in big data?

- A. It only stores small files
- B. It stores large datasets across multiple machines, providing fault tolerance through replication and enabling parallel access to data
- C. It replaces local file systems entirely
- D. It only works with structured data

Answer: B

Q996. What is the purpose of a message queue in big data architectures?

- A. To send emails between users
- B. To decouple data producers from consumers, buffering messages and enabling asynchronous processing at different rates
- C. To queue database queries
- D. To sort messages alphabetically

Answer: B

Q997. How does data partitioning improve query performance in big data systems?

- A. It always slows down queries
- B. Partitioning divides data into segments based on key columns, allowing queries to scan only relevant partitions instead of the entire dataset
- C. It creates duplicate data
- D. Partitioning only works for small datasets

Answer: B

Q998. What is the difference between structured, semi-structured, and unstructured data in big data?

- A. They are all the same format
- B. Structured has fixed schema (tables), semi-structured has flexible schema (JSON/XML), and unstructured has no schema (images/text)
- C. Only structured data is useful
- D. Unstructured data cannot be processed

Answer: B

Q999. What is the purpose of Apache Airflow in big data workflows?

- A. It provides air conditioning for data centers
- B. Airflow is a workflow orchestration platform that schedules, monitors, and manages complex data pipeline dependencies as directed acyclic graphs
- C. It processes data in real-time
- D. It replaces Apache Spark

Answer: B

Q1000. What is the concept of data locality in distributed computing?

- A. Storing all data in one location
- B. Moving computation to where the data resides rather than moving large datasets to the compute nodes, minimizing network transfer
- C. Data must always be moved to a central server
- D. Data locality only matters for small datasets

Answer: B

Q1001. What is the difference between concept drift and data drift?

- A. They are identical phenomena
- B. Data drift is a change in input feature distributions while concept drift is a change in the relationship between features and the target variable
- C. Concept drift only affects deep learning
- D. Data drift does not require monitoring

Answer: B

Q1002. How does the shadow deployment pattern work for ML models?

- A. Models run in the dark
- B. The new model receives production traffic and generates predictions alongside the existing model, but only the old model's predictions are served while the new model's performance is monitored
- C. It replaces the model immediately
- D. Shadow models never see real data

Answer: B

Q1003. What is the purpose of a model registry in MLOps?

- A. A government registration system
- B. A centralized repository that stores, versions, tracks, and manages ML model artifacts, metadata, and lifecycle stages
- C. A list of model architectures
- D. A training data storage system

Answer: B

Q1004. What is infrastructure as code and why is it important for MLOps?

- A. Writing code on physical infrastructure
- B. Defining and managing infrastructure through code files, enabling reproducible, version-controlled, and automated provisioning of ML environments
- C. It only applies to web development
- D. IaC replaces all manual processes

Answer: B

Q1005. How does model compression benefit edge deployment?

- A. It makes models larger
- B. Techniques like pruning, quantization, and distillation reduce model size and computation, enabling deployment on resource-constrained edge devices like mobile phones and IoT sensors
- C. Edge devices have unlimited resources
- D. Compression always reduces accuracy unacceptably

Answer: B

Q1006. What is the role of feature flags in ML model deployment?

- A. Flags used in feature engineering
- B. Feature flags enable gradually enabling new models for specific user segments, allowing controlled rollout and quick disabling if issues arise
- C. They only work for software features
- D. Feature flags are identical to A/B tests

Answer: B

Q1007. What is the difference between online and offline model evaluation?

- A. They produce identical results
- B. Offline evaluation uses held-out historical data while online evaluation measures performance on live production traffic with real user interactions
- C. Online evaluation is always more accurate
- D. Offline evaluation uses production data

Answer: B

Q1008. What is the purpose of model explainability tools in production?

- A. To make models more complex
- B. To provide human-understandable explanations for individual predictions, supporting debugging, regulatory compliance, and user trust
- C. Explainability is only for research
- D. All models are inherently explainable

Answer: B

Q1009. What is the concept of model staleness in production?

- A. Models that smell bad
- B. A model becoming less accurate over time as the real-world data distribution changes from the data it was trained on
- C. Models always improve with age
- D. Staleness only affects neural networks

Answer: B

Q1010. What is the concept of algorithmic recourse and why is it important?

- A. Recourse means repeating algorithms
- B. Algorithmic recourse provides individuals with actionable steps to change an unfavorable AI decision, ensuring people are not permanently harmed by automated systems
- C. It is a type of optimization algorithm
- D. Recourse is only relevant for recommendation systems

Answer: B

Q1011. How can feedback loops amplify bias in AI systems?

- A. Feedback loops always reduce bias
- B. Biased AI decisions influence future data collection which reinforces the original bias, creating a cycle where the system becomes increasingly biased over time
- C. Feedback loops do not exist in AI
- D. They only affect recommendation systems

Answer: B

Q1012. What is the difference between explainability and interpretability in AI?

- A. They are identical concepts
- B. Interpretability means a model is inherently understandable while explainability provides post-hoc explanations for complex models that are not inherently transparent
- C. Explainability is always preferred
- D. Interpretability only applies to neural networks

Answer: B

Q1013. What is the concept of privacy-preserving machine learning?

- A. Making ML models private property
- B. Techniques that enable training and inference on sensitive data while protecting individual privacy, including federated learning, differential privacy, and secure computation
- C. Privacy cannot be preserved in ML
- D. It only applies to healthcare data

Answer: B

Q1014. What are model cards and why are they important?

- A. Physical cards with model images
- B. Standardized documentation describing a model's intended use, performance metrics, limitations, and ethical considerations, promoting transparency and responsible deployment
- C. They are used for trading models
- D. Model cards replace all other documentation

Answer: B

Q1015. What is the problem of proxy discrimination in AI systems?

- A. Using proxy servers for AI
- B. When AI uses seemingly neutral features that are highly correlated with protected attributes like race or gender, resulting in discriminatory outcomes despite not explicitly using those attributes
- C. Proxy discrimination cannot occur in AI
- D. It only happens with simple models

Answer: B

Q1016. How does the concept of AI safety differ from AI security?

- A. They are identical concerns
- B. AI safety focuses on preventing unintended harmful behaviors from AI systems themselves, while AI security protects AI systems from external malicious attacks
- C. Safety is only about physical robots
- D. Security is not relevant to AI

Answer: B

Q1017. What is the right to erasure and how does it apply to AI systems?

- A. Erasing AI code permanently
- B. Under GDPR, individuals can request deletion of their personal data, which creates challenges for AI systems trained on that data as the model may retain learned patterns
- C. It does not apply to AI
- D. Only applies to social media

Answer: B

Q1018. What is the environmental impact of training large AI models?

- A. AI training has zero environmental impact
- B. Training large models consumes significant energy and produces carbon emissions, with some large model training runs emitting as much CO2 as multiple transatlantic flights
- C. Environmental impact is negligible
- D. Only GPU manufacturing has environmental impact

Answer: B

Q1019. What is the concept of AI value alignment?

- A. Aligning data values in a database
- B. Ensuring AI systems' goals, behaviors, and decisions are consistent with human values, intentions, and ethical principles
- C. Aligning model parameters to specific values
- D. Value alignment is not important for AI

Answer: B

Q1020. What is the purpose of a staging environment in ML deployment?

- A. A theater stage for AI presentations
- B. A pre-production environment that mirrors production for testing models with realistic data and infrastructure before live deployment
- C. A storage area for old models
- D. A training environment for data scientists

Answer: B

AI / Machine Learning & Data Analytics — Hard

510 questions

Q1021. The Chinese Room argument by John Searle challenges:

- A. Standard statistical data analytics methods
- B. Strong AI - that machines can truly understand
- C. Modern machine learning training algorithms
- D. Weak AI - that machines can mimic intelligence

Answer: B

Q1022. Which of the following problems is considered AI-complete?

- A. Sorting a list of numbers
- B. Computing matrix multiplication
- C. Performing a binary search
- D. Natural language understanding

Answer: D

Q1023. The frame problem in AI refers to:

- A. Challenges of reducing network latency across distributed systems
- B. Complications of managing memory allocation in modern computers
- C. Difficulty in determining what changes and what stays the same after an action
- D. Problems with optimizing database indexing for query performance

Answer: C

Q1024. Which approach to AI attempts to mimic biological neural structures?

- A. Symbolism
- B. Evolutionary computation
- C. Bayesian methods
- D. Connectionism

Answer: D

Q1025. In the context of AI, what is the combinatorial explosion?

- A. Rapid growth of possible solutions making brute force infeasible
- B. An advanced technique for compressing large data files
- C. A sudden failure in hardware caused by electrical overload
- D. A specialized type of deep neural network architecture

Answer: A

Q1026. What distinguishes Artificial General Intelligence (AGI) from Narrow AI?

- A. AGI consumes significantly less working memory
- B. AGI requires absolutely no input training data
- C. AGI can perform any intellectual task a human can
- D. AGI is faster at one specific computational task

Answer: C

Q1027. The symbol grounding problem in AI concerns:

- A. How to optimize the speed of sorting algorithms
- B. How to efficiently compress large data archives
- C. How to increase the clock speed of a processor
- D. How symbols in an AI system get their meaning

Answer: D

Q1028. Which of the following is a characteristic of a multi-agent system?

- A. Only one autonomous decision-maker
- B. Multiple interacting intelligent agents
- C. A single centralized processing unit
- D. No communication between components

Answer: B

Q1029. What is the knowledge representation bottleneck in AI?

- A. Slow data transfer speeds across network connections
- B. Difficulty in encoding real-world knowledge into a formal system
- C. Insufficient physical storage space on server hardware
- D. Limited pixel resolution on visual display monitors

Answer: B

Q1030. In the context of data analytics, what is the CRISP-DM model?

- A. A standard process model for data mining projects
- B. A multi-layer neural network architecture design
- C. A general-purpose interpreted programming language
- D. A scalable relational database management system

Answer: A

Q1031. The Hessian matrix contains:

- A. Eigenvalues of the matrix only
- B. The determinant values only
- C. Second-order partial derivatives
- D. First-order derivatives only

Answer: C

Q1032. The Kullback-Leibler divergence measures:

- A. The spread or variance of a single distribution
- B. The central tendency or mean of a distribution
- C. How one probability distribution differs from another
- D. The linear correlation between two variables

Answer: C

Q1033. A Jacobian matrix represents:

- A. First-order partial derivatives of a vector-valued function
- B. Only the output values of a single scalar function
- C. Only the second-order derivatives of a scalar function
- D. Only the eigenvalues of a square transformation matrix

Answer: A

Q1034. In the context of ML, why is the log-likelihood used instead of likelihood?

- A. It requires significantly less memory during training
- B. It converts products to sums, making computation easier
- C. It produces more statistically accurate final estimates
- D. It runs faster on modern parallel computing hardware

Answer: B

Q1035. The singular value decomposition (SVD) decomposes a matrix into:

- A. U, Sigma, and V-transpose matrices
- B. Only the eigenvector components
- C. Exactly two factor matrices
- D. Only the eigenvalue components

Answer: A

Q1036. A saddle point in optimization is where:

- A. The objective function reaches its overall global minimum
- B. The gradient of the function is completely undefined
- C. The objective function reaches its overall global maximum
- D. The gradient is zero but it is neither a minimum nor maximum

Answer: D

Q1037. The moment generating function uniquely determines:

- A. Only the median statistic
- B. Only the expected mean value
- C. The probability distribution
- D. Only the variance estimate

Answer: C

Q1038. In matrix calculus, the gradient of $x^T A x$ with respect to x is:

- A. $2x$
- B. Ax
- C. A^T
- D. $(A + A^T)x$

Answer: D

Q1039. The condition number of a matrix indicates:

- A. The trace or diagonal sum of the matrix
- B. Sensitivity of the solution to small changes in input
- C. The total number of columns in the matrix
- D. The total number of rows in the matrix

Answer: B

Q1040. Jensen's inequality states that for a convex function f :

- A. $f(E[X]) \leq E[f(X)]$
- B. $f(E[X]) \geq E[f(X)]$
- C. $f(E[X]) = 0$
- D. $f(E[X]) = E[f(X)]$

Answer: A

Q1041. What is the Global Interpreter Lock (GIL) in Python?

- A. A file system locking mechanism for preventing concurrent write access
- B. A garbage collection tool for automated memory resource management
- C. A cryptographic security feature for encrypting sensitive runtime data
- D. A mutex preventing multiple threads from executing Python bytecode simultaneously

Answer: D

Q1042. Which tool is best for parallel processing of large datasets in Python?

- A. Flask
- B. Django
- C. Tkinter
- D. Dask

Answer: D

Q1043. What is the difference between deepcopy and copy in Python?

- A. deepcopy creates copies of nested objects recursively, copy does not
- B. copy is faster and creates a more thorough deep duplication
- C. deepcopy only works on list objects and not dictionaries
- D. They are completely identical in behavior and performance

Answer: A

Q1044. In NumPy, what does np.einsum() do?

- A. Performs only element-wise operations on flat one-D arrays
- B. Performs Einstein summation for multi-dimensional array operations
- C. Creates identity matrices of a specified dimension size
- D. Calculates eigenvalues of a square matrix decomposition

Answer: B

Q1045. What is vectorization in the context of NumPy?

- A. Converting natural language text into numeric vectors
- B. Performing operations on entire arrays instead of loops
- C. Creating scalable vector graphics for visualization
- D. A lossless data compression encoding technique

Answer: B

Q1046. What does the __slots__ attribute do in Python classes?

- A. Defines abstract methods for interface contracts
- B. Enables multiple inheritance across class chains
- C. Restricts instance attributes and reduces memory usage
- D. Creates new class-level methods from descriptors

Answer: C

Q1047. Which library provides GPU-accelerated computing for Python ML?

- A. CuPy
- B. Pandas
- C. Matplotlib
- D. SciPy

Answer: A

Q1048. What is a context manager in Python and why is it useful in ML?

- A. It creates persistent database connections for data loading
- B. It manages resources using with statements ensuring proper cleanup
- C. It handles asynchronous network requests for API access
- D. It manages the training context of machine learning models

Answer: B

Q1049. What is the purpose of __call__ in a Python class?

- A. Copies the object into a new reference
- B. Initializes a new class from a template
- C. Destroys the instance and frees memory
- D. Makes an instance callable like a function

Answer: D

Q1050. How does memory mapping (np.memmap) help in handling large datasets?

- A. It maps files to memory allowing access without loading the entire file
- B. It encrypts data at rest to ensure privacy and compliance
- C. It compresses data into smaller archive files for disk savings
- D. It duplicates data across servers for redundancy and backups

Answer: A

Q1051. What is the SMOTE technique used for?

- A. Reducing the dimensionality of the feature space with PCA
- B. Oversampling the minority class by creating synthetic examples
- C. Undersampling the majority class by randomly removing records
- D. Selecting only the most informative features from the dataset

Answer: B

Q1052. When should you use target encoding instead of one-hot encoding?

- A. When the overall dataset is small
- B. When there are only two categories present
- C. When categorical variables have high cardinality
- D. When the data is purely numerical

Answer: B

Q1053. What is data leakage in preprocessing?

- A. When data columns are encrypted for secure storage
- B. When data records are accidentally duplicated twice
- C. When data is physically lost during the cleaning step
- D. When information from the test set influences training

Answer: D

Q1054. What is the purpose of Yeo-Johnson transformation?

- A. To detect and remove extreme outlier values from the numerical columns
- B. To encode high-cardinality categorical features into integer representations
- C. To make data more normally distributed, handling both positive and negative values
- D. To fill in missing values using the mean or median of each column

Answer: C

Q1055. In handling missing data, what is MCAR?

- A. Missing data that follows a clear and observable systematic pattern
- B. Missing Completely At Random - missingness is unrelated to any variable
- C. Missing data that occurs in only one specific column of data
- D. Missing data that was caused by systematic data entry errors

Answer: B

Q1056. What is the KNN imputation method?

- A. Replacing missing values with randomly generated numerical estimates
- B. Deleting every row that contains any missing values from the dataset
- C. Filling all missing entries with the single overall global mean value
- D. Using K nearest neighbors to estimate missing values based on similar records

Answer: D

Q1057. Why should standardization be fit only on training data?

- A. Because training data is inherently more important
- B. Because the computation is significantly faster
- C. To prevent data leakage from test set statistics
- D. Because the test data is a much smaller sample

Answer: C

Q1058. What is the Isolation Forest algorithm used for in preprocessing?

- A. Automated feature selection
- B. Anomaly and outlier detection
- C. Data range normalization
- D. Missing value imputation

Answer: B

Q1059. What is ordinal encoding and when is it preferred over one-hot encoding?

- A. It assigns ordered integers to categories with natural ordering
- B. It is exactly the same approach as basic label encoding
- C. It removes categorical variables from the feature set entirely
- D. It always creates separate binary columns for each category

Answer: A

Q1060. What is the effect of multicollinearity on preprocessing?

- A. It has absolutely no effect on preprocessing or model training
- B. Highly correlated features can cause instability in model coefficients
- C. It always improves the overall accuracy of the trained model
- D. It consistently reduces the total required model training time

Answer: B

Q1061. Simpson's paradox in EDA refers to:

- A. A trend that appears in groups but reverses when groups are combined
- B. A visualization error caused by incorrect axis scale calibration
- C. A specific type of missing data pattern observed in large datasets
- D. A random sampling method for selecting representative subsets

Answer: A

Q1062. What is the purpose of the Kolmogorov-Smirnov test?

- A. To calculate the arithmetic mean of a data sample
- B. To test if a sample comes from a specific distribution
- C. To encode categorical data into numerical integers
- D. To remove extreme outlier values from the dataset

Answer: B

Q1063. What is the curse of dimensionality in EDA?

- A. There are too few features for the model to learn
- B. There is simply too much data volume to process
- C. Data becomes increasingly sparse as dimensions increase
- D. The data is already too clean to analyze further

Answer: C

Q1064. Cramér's V statistic measures:

- A. The skewness of a single distribution
- B. Correlation between two numerical variables
- C. The arithmetic mean of a given dataset
- D. Association between two categorical variables

Answer: B

Q1065. What is the difference between correlation and causation in EDA?

- A. Correlation measures association; causation means one variable directly affects another
- B. Causation is a weaker relationship than correlation
- C. Correlation always directly implies a causal link
- D. They are completely identical concepts in statistics

Answer: B

Q1066. What is the Shapiro-Wilk test used for?

- A. Testing for the presence of outlier values
- B. Testing if a dataset is normally distributed
- C. Testing for the existence of duplicate rows
- D. Testing for the count of missing null values

Answer: B

Q1067. In EDA, what is a bimodal distribution?

- A. A completely uniform distribution
- B. A distribution with two distinct peaks
- C. A distribution with no peaks at all
- D. A distribution with one single peak

Answer: B

Q1068. What does the Durbin-Watson statistic test for?

- A. Normality of the data
- B. Homoscedasticity
- C. Multicollinearity issues
- D. Autocorrelation in residuals

Answer: B

Q1069. What is heteroscedasticity and why is it problematic?

- A. Non-constant variance of residuals, violating regression assumptions
- B. A specific type of variable correlation
- C. A pattern of missing data values
- D. Perfectly constant variance of all residuals

Answer: C

Q1070. What is the purpose of the Andrews curves visualization?

- A. To display proportional breakdowns in a circular pie format
- B. To visualize multivariate data as curves, each representing one observation
- C. To create standard grouped and stacked bar charts for categories
- D. To plot time series trend lines with seasonal decomposition

Answer: B

Q1071. What is the kernel trick in SVM?

- A. Mapping data to a higher-dimensional space without explicit computation
- B. A dimensionality reduction visualization projection technique
- C. A wrapper-based method for iterative feature selection
- D. A preprocessing data cleaning and normalization technique

Answer: A

Q1072. What is the VC dimension?

- A. The total count of input features in the dataset
- B. The step size or magnitude of the learning rate
- C. A measure of the capacity and complexity of a classification model
- D. The total number of training samples available

Answer: C

Q1073. In gradient boosting, what does each subsequent tree learn?

- A. The residuals (errors) of the previous ensemble
- B. Random patterns found within the noise
- C. The original target values from the training data
- D. Nothing new beyond the original input features

Answer: D

Q1074. What is the difference between hard and soft margin SVM?

- A. Hard margin and soft margin are completely identical approaches
- B. Hard margin is always the preferred choice over soft margin
- C. Soft margin SVM never works well on real-world datasets
- D. Hard margin allows no misclassification; soft margin allows some with a penalty

Answer: C

Q1075. What is the Representer Theorem?

- A. A foundational theorem about efficient compressed data representation and storage formats
- B. The optimal solution in kernel methods can be expressed as a linear combination of kernel evaluations at training points
- C. A graphical visualization principle for plotting high-dimensional feature space relationships
- D. A data warehousing method for efficiently storing columnar records in structured databases

Answer: B

Q1076. What is Platt scaling?

- A. A method to calibrate SVM outputs into probabilities using a sigmoid function
- B. A standardization feature scaling method using z-score transforms of values
- C. A model combination ensemble technique using weighted averaging of outputs
- D. A min-max data normalization technique for scaling feature ranges to a bound

Answer: A

Q1077. What is the effect of increasing the C parameter in SVM?

- A. The model becomes much simpler and heavily regularized overall
- B. The decision boundary margin becomes significantly wider
- C. The model becomes more sensitive to individual points, risking overfitting
- D. The amount of L2 regularization penalty increases significantly

Answer: C

Q1078. What is the difference between Gini impurity and entropy in decision trees?

- A. Gini impurity is always the better choice for all tree problems
- B. Both measure node impurity but Gini is computationally simpler; entropy uses logarithms
- C. Entropy is always the better choice for all tree problems
- D. They produce completely different tree structures every single time

Answer: B

Q1079. What is the Structural Risk Minimization principle?

- A. Always using the simplest available model regardless of performance
- B. Maximizing model complexity to fit all training data points exactly
- C. Balancing empirical risk and model complexity to minimize generalization error
- D. Minimizing only the training error and ignoring test performance

Answer: B

Q1080. In logistic regression, what does multicollinearity cause?

- A. More accurate and well-calibrated probability estimates
- B. Significantly faster convergence during the training process
- C. Unstable and unreliable coefficient estimates with large standard errors
- D. Consistently better and more accurate model predictions overall

Answer: C

Q1081. What is the bias-variance decomposition of ensemble methods?

- A. Bagging primarily reduces variance; boosting primarily reduces bias
- B. Neither technique affects the bias or variance components
- C. Both techniques only reduce the variance component of error
- D. Both techniques only reduce the bias component of error

Answer: A

Q1082. How does XGBoost handle regularization differently from traditional Gradient Boosting?

- A. XGBoost uses no regularization at all in its training objective
- B. Traditional Gradient Boosting has stronger regularization overall
- C. They handle regularization in the exact same identical manner
- D. XGBoost includes L1 and L2 regularization terms in its objective function

Answer: D

Q1083. What is the difference between XGBoost and LightGBM's tree growing strategy?

- A. Neither of them actually uses tree models
- B. XGBoost grows level-wise; LightGBM grows leaf-wise
- C. They grow trees in an identical manner always
- D. XGBoost uses leaf-wise; LightGBM uses level-wise

Answer: D

Q1084. In CatBoost, how are categorical features handled?

- A. They are silently ignored during the training and inference steps
- B. They are completely removed from the feature set before training
- C. They must be manually one-hot encoded before model training begins
- D. Using ordered target statistics with random permutations to avoid target leakage

Answer: D

Q1085. What is the effect of increasing the number of trees in a Random Forest?

- A. It always causes the model to underfit the training data
- B. Performance improves then plateaus; it generally does not overfit
- C. It always causes the model to overfit the training data
- D. Performance always decreases with each additional tree

Answer: B

Q1086. What is the role of the subsample parameter in Gradient Boosting?

- A. It sets the step size or learning rate of the optimization
- B. It selects which features are considered at each individual tree split
- C. It introduces stochastic gradient boosting by using a fraction of samples per tree
- D. It controls the maximum allowed depth of each individual tree

Answer: C

Q1087. How does the isolation mechanism work in Isolation Forest for ensemble anomaly detection?

- A. Anomalies require significantly more random splits to isolate
- B. The splits are entirely random and have no diagnostic meaning
- C. Anomalies are isolated in fewer splits because they are rare and different
- D. All data points require an exactly equal number of splits

Answer: C

Q1088. What is Bayesian Model Averaging?

- A. Random model selection from the available ensemble
- B. Simple majority voting across all base model predictions
- C. Weighting ensemble models by their posterior probabilities
- D. Using only the single highest-accuracy base model

Answer: C

Q1089. What is negative correlation learning in ensemble methods?

- A. Using the exact same training data for every individual model
- B. Removing highly correlated input features from the dataset
- C. Training all base models to produce completely identical outputs
- D. Encouraging base learners to make diverse errors through a penalty term

Answer: D

Q1090. How does DART (Dropouts meet Multiple Additive Regression Trees) improve boosting?

- A. By using significantly deeper trees for each individual boosting iteration
- B. By removing the least important features entirely from the training data
- C. By randomly dropping trees during boosting iterations to prevent over-specialization
- D. By adding many more trees to the overall boosted ensemble of the model

Answer: B

Q1091. What is the Gaussian Mixture Model (GMM)?

- A. A tree-based decision boundary model for supervised classification prediction
- B. A probabilistic model assuming data comes from a mixture of Gaussian distributions
- C. A linear regression method for predicting continuous numerical target values
- D. A filter-based feature selection technique using statistical hypothesis tests

Answer: B

Q1092. How does spectral clustering work?

- A. Uses deep neural networks to learn cluster assignment mappings
- B. Uses decision tree ensembles to group data into discrete clusters
- C. Uses eigenvalues of a similarity matrix to reduce dimensionality before clustering
- D. Applies K-Means clustering directly without any preprocessing transformation

Answer: C

Q1093. What is the UMAP algorithm?

- A. A dimensionality reduction technique based on manifold learning and topology
- B. A gradient-based numerical regression training technique
- C. A supervised multi-class classification prediction method
- D. An unsupervised density-based spatial clustering algorithm

Answer: A

Q1094. In DBSCAN, what are core points, border points, and noise points?

- A. Noise points are the ones that form the densest most cohesive clusters
- B. Core points have enough neighbors; border points are near core points; noise points are isolated
- C. Core points are the extreme outliers that are furthest from all clusters
- D. All three point types are treated exactly the same by the clustering algorithm

Answer: B

Q1095. What is the difference between hard and soft clustering?

- A. Hard assigns each point to one cluster; soft assigns probabilities of belonging to each cluster
- B. Soft clustering does not exist as a valid machine learning technique
- C. Hard clustering is always the strictly better approach for all problems
- D. They are completely identical approaches with no meaningful differences

Answer: A

Q1096. What is the Information Criterion (BIC/AIC) used for in clustering?

- A. Performing feature selection for supervised model training
- B. Measuring the internal purity of each individual data cluster
- C. Calculating the pairwise distances between all data points
- D. Selecting the optimal number of clusters by balancing fit and complexity

Answer: D

Q1097. What is Self-Organizing Map (SOM)?

- A. An unsupervised neural network that produces a low-dimensional representation of data
- B. A supervised classification model that predicts categorical labels
- C. A gradient boosting algorithm that builds sequential tree models
- D. A linear regression model that predicts continuous target values

Answer: A

Q1098. How does the OPTICS algorithm improve upon DBSCAN?

- A. It requires explicitly specifying the number K of clusters
- B. It only works with fully labeled and supervised training data
- C. It is always computationally faster than every other algorithm
- D. It handles clusters of varying density without requiring a fixed epsilon

Answer: D

Q1099. What is the manifold hypothesis in unsupervised learning?

- A. All real-world data is always uniformly distributed in space
- B. Data always naturally forms spherical well-separated clusters
- C. All feature dimensions are always statistically independent
- D. High-dimensional data often lies on a lower-dimensional manifold

Answer: D

Q1100. What is contrastive learning in the context of unsupervised representation learning?

- A. A linear regression method for predicting numerical outputs
- B. A purely supervised classification technique using labels
- C. A density-based spatial clustering approach for grouping data
- D. Learning representations by contrasting similar and dissimilar pairs

Answer: D

Q1101. What is the Matthews Correlation Coefficient (MCC)?

- A. The exact same metric as standard classification accuracy for balanced data
- B. A metric specifically designed for evaluating unsupervised clustering
- C. A metric that is only applicable to multi-class classification problems
- D. A balanced metric using all four confusion matrix values, ranging from -1 to 1

Answer: D

Q1102. What is the difference between Type I and Type II errors?

- A. The two types are completely identical errors
- B. Type I is a false positive; Type II is a false negative
- C. Type I is a false negative; Type II is a false positive
- D. Both are actually true positive outcomes

Answer: B

Q1103. What is nested cross-validation?

- A. An outer CV loop for evaluation with an inner CV loop for hyperparameter tuning
- B. A single random train-test split without any cross-validation folds
- C. Cross-validation performed entirely without any held-out validation data
- D. The same standard approach as regular single-loop K-fold cross-validation

Answer: A

Q1104. What is the Cohen's Kappa statistic?

- A. A metric that accounts for agreement occurring by chance between predicted and actual
- B. The exact same calculation as standard overall classification accuracy
- C. A regression-only metric for evaluating continuous predictions
- D. A feature importance measure for ranking input variables

Answer: A

Q1105. What is calibration in the context of model evaluation?

- A. Whether predicted probabilities reflect true likelihoods of outcomes
- B. The overall classification accuracy of the trained model
- C. A data preprocessing step for cleaning raw data
- D. The process of selecting the most relevant features

Answer: A

Q1106. What is the Brier score?

- A. A feature importance measure for trees
- B. The mean squared error of probabilistic predictions
- C. A ranking metric for ordering search results
- D. A clustering score for partition quality

Answer: B

Q1107. When should you use the PR-AUC instead of ROC-AUC?

- A. For evaluating unsupervised clustering partition quality
- B. When dealing with highly imbalanced datasets where positive class is rare
- C. When the class distribution is perfectly balanced and equal
- D. For evaluating regression models with continuous outputs

Answer: B

Q1108. What is the purpose of bootstrapping in model evaluation?

- A. Performing automated feature selection and dimensionality reduction
- B. Estimating confidence intervals for metrics by resampling with replacement
- C. Running hyperparameter tuning using grid or random search
- D. Increasing the total amount of available training data samples

Answer: B

Q1109. What is the difference between leave-one-out CV and K-fold CV?

- A. They are exactly identical approaches with no meaningful differences whatsoever
- B. LOOCV is always significantly faster computationally than K-fold approaches
- C. K-fold always produces strictly more accurate results than LOOCV methods
- D. LOOCV uses N-1 samples for training and 1 for testing each time; K-fold uses larger folds

Answer: D

Q1110. What is the expected calibration error (ECE)?

- A. A regression metric measuring the average absolute difference in predictions
- B. The exact same calculation as the standard log loss or cross-entropy loss metric
- C. The weighted average of difference between predicted confidence and actual accuracy across bins
- D. A clustering metric measuring the silhouette score across all partitions

Answer: C

Q1111. What is the Boruta algorithm for feature selection?

- A. A multi-layer feedforward deep neural network architecture for prediction
- B. A gradient-based linear regression method for continuous value estimation
- C. A wrapper method using shadow features and Random Forest to find relevant features
- D. A density-based unsupervised clustering algorithm for grouping similar data

Answer: C

Q1112. What is the difference between wrapper, filter, and embedded feature selection?

- A. Wrappers evaluate subsets with a model; filters use stats; embedded methods learn during training
- B. Filters use trained models to evaluate each candidate feature subset iteratively
- C. Wrappers are always strictly the best approach for every feature selection problem
- D. They are all identical approaches that produce the exact same feature subset selections

Answer: A

Q1113. What is the curse of dimensionality's impact on feature engineering?

- A. More features require exponentially more data to avoid sparsity
- B. The number of dimensions has no effect on model training
- C. Fewer features always cause the model to severely underfit
- D. More features always improve the model performance metrics

Answer: A

Q1114. What is mutual information in feature selection?

- A. A measure of the dependency between two variables based on information theory
- B. The linear correlation coefficient between two variables
- C. The overall variance of a single variable in a dataset
- D. The arithmetic mean of a single variable in a dataset

Answer: A

Q1115. What is feature crossing in deep learning?

- A. Combining two or more features to create a new feature capturing their interaction
- B. Normalizing features to have zero mean and unit variance
- C. Removing individual features from the dataset one at a time
- D. Visualizing features using scatter plots and histograms

Answer: A

Q1116. How does LASSO perform feature selection?

- A. By using only simple correlation analysis
- B. By removing features entirely at random
- C. By ranking all features only by variance
- D. By driving some feature coefficients exactly to zero through L1 regularization

Answer: C

Q1117. What is the difference between forward and backward feature selection?

- A. Forward starts empty and adds features; backward starts with all and removes features
- B. Forward selection actually removes features one at a time from model
- C. Backward selection actually adds features one at a time to the model
- D. Forward and backward selection are completely identical methods

Answer: D

Q1118. What is permutation importance?

- A. Simply ranking features by their alphabetical column order
- B. A method for sorting features by their variance values
- C. A data augmentation technique for expanding training data
- D. Measuring importance by shuffling each feature and observing the drop in performance

Answer: D

Q1119. What is the concept of information leakage in feature engineering?

- A. Features that are redundant copies of other existing features
- B. Features that have missing values in some of their data records
- C. Features containing target info that would not be available at prediction time
- D. Features that contain a large amount of measurement noise

Answer: C

Q1120. What is automated feature engineering (e.g., Featuretools)?

- A. Generating features completely at random without any data context
- B. Deleting features from the dataset to reduce dimensionality
- C. Relying exclusively on manual hand-crafted feature creation processes
- D. Using algorithms to auto-generate features from relational data via deep feature synthesis

Answer: D

Q1121. What is the dying ReLU problem?

- A. ReLU causes gradients to explode during backpropagation
- B. Neurons permanently output zero because they get stuck in the negative region
- C. ReLU increases peak memory usage beyond available capacity
- D. ReLU activation is computationally too slow for large networks

Answer: B

Q1122. What is the Lottery Ticket Hypothesis?

- A. All neural network architectures are equally effective regardless of size
- B. Sparse network architectures never work well for any real task
- C. Dense networks contain sparse subnetworks that can match full network performance
- D. Larger networks are always strictly better than smaller alternatives

Answer: C

Q1123. What is knowledge distillation?

- A. Removing irrelevant features from the input feature space
- B. Training a smaller student model to mimic a larger teacher model
- C. Transferring database records between different storage systems
- D. Augmenting the training data with synthetic generated samples

Answer: B

Q1124. What is the purpose of skip connections (residual connections)?

- A. Removing entire layers from the network to reduce complexity
- B. Skipping the data preprocessing step to speed up training
- C. Reducing the size of the training dataset to save storage
- D. Allowing gradients to flow directly by adding input to output of a block

Answer: D

Q1125. What is gradient clipping?

- A. Removing all gradients entirely from the backpropagation computation
- B. Setting all gradient values to exactly zero after each update step
- C. Increasing the learning rate to speed up convergence time
- D. Limiting gradient values to a maximum threshold to prevent exploding gradients

Answer: D

Q1126. What is the difference between SGD with momentum and Adam?

- A. SGD momentum uses a fixed learning rate with velocity; Adam adapts per parameter
- B. Adam optimizer never converges to a good solution on real data
- C. SGD with momentum is always faster than Adam for every problem
- D. They are completely identical optimization algorithms with no differences

Answer: A

Q1127. What is neural architecture search (NAS)?

- A. Automated methods for finding optimal neural network architectures
- B. Feature selection and dimensionality reduction algorithms
- C. Manual hand-designed network architecture engineering process
- D. Data preprocessing and cleaning pipeline automation tools

Answer: A

Q1128. What is the difference between pre-training and fine-tuning?

- A. They are completely identical stages in the same training process
- B. Fine-tuning always happens before the pre-training phase
- C. Pre-training is designed specifically for very small datasets
- D. Pre-training learns general representations; fine-tuning adapts to a specific task

Answer: D

Q1129. What is the effect of batch size on training?

- A. Smaller batch sizes are always strictly worse for model generalization
- B. Larger batch sizes are always strictly better for all training scenarios
- C. Larger batches give smoother gradients but may generalize worse; smaller batches add helpful noise
- D. Batch size has absolutely no measurable effect on training or generalization

Answer: C

Q1130. What is mixed-precision training?

- A. Using both 16-bit and 32-bit floating point to speed up training while maintaining accuracy
- B. Using only 8-bit integer arithmetic for all network computation steps
- C. Using only 64-bit double-precision floats for maximum numerical precision
- D. Training neural network models entirely without any GPU acceleration

Answer: A

Q1131. What is the difference between causal and bidirectional self-attention?

- A. Causal attention only looks at previous positions; bidirectional looks at all positions
- B. Bidirectional attention only looks backward at previous tokens in sequence
- C. Causal and bidirectional attention are completely identical mechanisms
- D. Causal attention actually looks at all positions in the input sequence

Answer: C

Q1132. What is the mode collapse problem in GANs?

- A. The generator produces limited variety instead of the full data distribution
- B. The model architecture has grown far too large for memory
- C. The discriminator fails completely and cannot distinguish anything
- D. The training process runs far too slowly to converge in time

Answer: A

Q1133. What is the Wasserstein GAN (WGAN) and how does it improve training?

- A. It uses only convolutional layers without any dense layers
- B. It uses the Wasserstein distance for more stable training gradients
- C. It completely removes the discriminator from the architecture
- D. It uses standard cross-entropy loss for the discriminator

Answer: B

Q1134. What is Neural ODE?

- A. Modeling continuous-depth neural networks using ordinary differential equations
- B. A generative adversarial network variant for image synthesis
- C. A standard discrete-layer feedforward neural network architecture
- D. An unsupervised density-based technique for data clustering

Answer: A

Q1135. What is the Flash Attention algorithm?

- A. An IO-aware exact attention algorithm reducing memory from quadratic to linear
- B. A data loading technique for prefetching training batches from disk
- C. An approximate attention method that trades accuracy for modest speed
- D. A new non-linear activation function for transformer hidden layers

Answer: A

Q1136. What is the difference between model parallelism and data parallelism?

- A. Data parallelism splits the model layers across devices for training
- B. Model parallelism splits the model across devices; data parallelism replicates model with split data
- C. Model parallelism splits the data while keeping the full model on one device
- D. They are completely identical distributed training strategies with no differences

Answer: B

Q1137. What is the concept of equivariance in CNNs?

- A. Output is always identical regardless of any transformation of input
- B. All layers in the network have exactly equal learned weight values
- C. Output transforms in the same way as the input (e.g., shift in input causes shift in output)
- D. The neural network architecture is perfectly symmetric across all layers

Answer: A

Q1138. What is a diffusion model?

- A. A recurrent neural network architecture for sequence modeling
- B. An unsupervised density-based clustering algorithm for data
- C. A generative model that learns to reverse a gradual noising process
- D. A generative adversarial network variant using two competing agents

Answer: C

Q1139. What is the Mixture of Experts (MoE) architecture?

- A. A standard model ensemble using simple majority voting
- B. A data preprocessing method for feature normalization
- C. A single monolithic large network without any routing
- D. A model using a gating network to route inputs to specialized sub-networks

Answer: D

Q1140. What is quantization in deep learning?

- A. Increasing the overall model size by adding more trainable parameters
- B. Applying data augmentation transforms to expand the training set
- C. Reducing weight and activation precision to lower bit representations for efficiency
- D. Adding more hidden layers to increase the depth of the network

Answer: C

Q1141. What is the difference between GPT and BERT architectures?

- A. Both use exactly the same attention mechanism and training objective
- B. GPT uses bidirectional attention; BERT uses causal left-to-right attention
- C. They are completely identical transformer architectures with no differences
- D. GPT uses causal attention for generation; BERT uses bidirectional attention for understanding

Answer: D

Q1142. What is byte-pair encoding (BPE) in tokenization?

- A. A tokenization approach that only works at the word level
- B. A tokenization strategy that works at sentence level
- C. A tokenization method operating at character level only
- D. A subword tokenization algorithm that iteratively merges the most frequent character pairs

Answer: B

Q1143. What is the perplexity metric in language models?

- A. The total elapsed time required for training the model
- B. The number of parameters or total size of the model
- C. A measure of how well a model predicts a sample; lower is better
- D. The total number of words in the vocabulary of the model

Answer: C

Q1144. What is retrieval-augmented generation (RAG)?

- A. Combining retrieval with generation to ground outputs in external knowledge
- B. An unsupervised clustering method for grouping similar documents
- C. A purely generative approach relying entirely on internal knowledge
- D. A purely retrieval approach returning documents without generation

Answer: A

Q1145. What is the problem of hallucination in large language models?

- A. Generating plausible-sounding but factually incorrect or fabricated information
- B. Using too much GPU memory during the inference computation
- C. Producing completely empty outputs with no generated tokens
- D. Generating text output at an excessively slow processing speed

Answer: A

Q1146. What is the concept of positional encoding in Transformers?

- A. Normalizing the positional coordinates of data in feature space
- B. Encoding the physical position of GPUs in a server rack cluster
- C. Adding position info to embeddings since Transformers lack inherent sequence order
- D. Sorting the input data samples by their index in the dataset

Answer: C

Q1147. What is cross-lingual transfer learning?

- A. Translating all text first then training on the translated version
- B. Ignoring language differences and treating all text the same
- C. Training on one language and applying knowledge to another language
- D. Training separate independent models for each individual language

Answer: C

Q1148. What is the difference between extractive and abstractive summarization?

- A. Extractive generates completely new text from the source material
- B. Abstractive only selects existing sentences from the original text
- C. Extractive and abstractive summarization are identical methods
- D. Extractive selects existing sentences; abstractive generates new sentences

Answer: C

Q1149. What is prompt engineering?

- A. Cleaning and preprocessing the raw input training data
- B. Modifying the internal neural network model architecture
- C. Training the language model from scratch on new domain data
- D. Designing effective input prompts to guide LLM behavior without fine-tuning

Answer: D

Q1150. What is the RLHF (Reinforcement Learning from Human Feedback) technique?

- A. Unsupervised pre-training using masked language modeling objectives
- B. Standard supervised fine-tuning using labeled input-output training pairs
- C. Data augmentation using paraphrasing and back-translation methods
- D. Fine-tuning language models using human preference judgments as reward signals

Answer: D

Q1151. What is the Feature Pyramid Network (FPN)?

- A. A single-scale object detector that operates at only one fixed resolution level
- B. A standard image classification network without multi-scale feature fusion
- C. A generative adversarial network for producing synthetic realistic images
- D. A multi-scale feature extractor combining low-res semantic and high-res spatial features

Answer: D

Q1152. What is the difference between one-stage and two-stage object detectors?

- A. One-stage (YOLO) detects directly; two-stage (R-CNN) proposes regions then classifies
- B. One-stage detectors are always significantly slower than two-stage methods
- C. They are completely identical detection approaches with no performance differences
- D. Two-stage detectors do not use region proposals at any processing stage

Answer: A

Q1153. What is panoptic segmentation?

- A. A task that performs only semantic segmentation without instances
- B. A task that performs only instance segmentation without semantics
- C. A task that is limited to standard object detection only
- D. A unified task combining semantic segmentation (stuff) and instance segmentation (things)

Answer: D

Q1154. What is the Vision Transformer (ViT)?

- A. A recurrent neural network architecture designed for image sequences
- B. A generative adversarial network for producing synthetic images
- C. A specialized convolutional neural network variant for image processing
- D. Applying the Transformer architecture directly to image patches for classification

Answer: D

Q1155. What is contrastive learning in computer vision (e.g., SimCLR)?

- A. A two-stage region-proposal based object detection algorithm pipeline
- B. Learning visual representations by contrasting augmented views of the same image against others
- C. A fully supervised classification method that requires complete labeled training data
- D. A generative adversarial network training method for synthesizing realistic images

Answer: B

Q1156. What is the concept of deformable convolutions?

- A. Standard fixed-grid convolutions with no adaptive sampling offsets
- B. Convolutions with learnable offsets that adapt the sampling grid to object shapes
- C. One-by-one pointwise convolutions for changing channel depth
- D. Dilated convolutions that increase the receptive field without offsets

Answer: B

Q1157. What is neural style transfer?

- A. Classifying images into predefined categorical labels with CNNs
- B. Applying the artistic style of one image to the content of another using CNNs
- C. Training a brand new neural network from scratch on random data
- D. Applying data augmentation transforms to expand the training set

Answer: B

Q1158. What is depth estimation in computer vision?

- A. Predicting the distance of each pixel from the camera
- B. Measuring the resolution of the image in pixels
- C. Classifying the entire image into a category
- D. Counting the total number of objects in a scene

Answer: A

Q1159. What is the CLIP model?

- A. A model learning visual concepts from language supervision, connecting images and text
- B. A single-modality object detector that only processes image pixel data
- C. A standard supervised image classifier trained only on labeled image categories
- D. A text-only language model without any visual understanding capabilities

Answer: A

Q1160. What is 3D point cloud processing?

- A. Processing natural language text data from document sources
- B. Processing unstructured 3D spatial data points from sensors like LiDAR
- C. Processing continuous audio waveform signals from microphones
- D. Processing standard two-dimensional image pixel data from cameras

Answer: B

Q1161. What is the Lambda architecture?

- A. A single-server architecture running everything on one machine
- B. An architecture supporting only offline batch processing workloads
- C. An architecture supporting only real-time stream processing
- D. A big data architecture combining batch and real-time stream processing

Answer: D

Q1162. What is Apache Flink?

- A. A standalone relational database for transactional query workloads
- B. A stream processing framework with event-time processing and exactly-once semantics
- C. A batch-only data processor without any stream processing capability
- D. An interactive data visualization and dashboard charting tool

Answer: B

Q1163. What is the difference between horizontal and vertical scaling?

- A. Vertical scaling adds additional machines to the cluster pool
- B. They are completely identical approaches to scaling infrastructure
- C. Horizontal scaling upgrades individual machine hardware resources
- D. Horizontal adds more machines; vertical adds more power to existing machines

Answer: D

Q1164. What is the concept of data lineage?

- A. The specific file format of the data such as CSV or JSON
- B. Tracking data from its origin through all transformations to its current state
- C. The chronological age of the data since it was created
- D. The total size of the data measured in bytes or rows

Answer: B

Q1165. What is eventual consistency in distributed systems?

- A. All replicas converge to the same value given enough time without new updates
- B. Consistency is fundamentally impossible in any distributed system
- C. All replicas are immediately and perfectly consistent at all times
- D. Data is never consistent across any of the distributed replicas

Answer: A

Q1166. What is Apache Arrow?

- A. A cross-language platform for in-memory columnar data with zero-copy reads
- B. A distributed event streaming platform for real-time pipelines
- C. A supervised machine learning library for model training
- D. A standalone relational database for transactional query workloads

Answer: A

Q1167. What is the Kappa architecture?

- A. A simplified Lambda alternative using only stream processing for real-time and batch
- B. An architecture designed only for small-scale single-machine data
- C. The exact same architecture as Lambda with no simplification
- D. An architecture supporting only offline batch processing workloads

Answer: A

Q1168. What is data skew in distributed processing?

- A. Perfectly even and balanced distribution of data across all nodes
- B. Uneven data distribution across partitions causing some nodes to be overloaded
- C. Data records that are missing or have null values throughout
- D. Data records that have been accidentally duplicated in storage

Answer: B

Q1169. What is the role of a distributed consensus algorithm like Raft or Paxos?

- A. Visualizing distributed system metrics on dashboards
- B. Sorting large distributed data records across nodes
- C. Training machine learning models on distributed nodes
- D. Ensuring all nodes agree on shared state despite failures

Answer: D

Q1170. What is columnar storage and why is it efficient for analytics?

- A. A type of secondary database index for accelerating query lookups
- B. Storing data by rows as in traditional relational database table layouts
- C. Storing data by columns not rows, enabling efficient compression and selective reads
- D. A data visualization technique for displaying column chart graphics

Answer: C

Q1171. What is the concept of shadow deployment?

- A. Running a new model in parallel with production without serving its predictions
- B. Deploying the model at night during off-peak hours only
- C. A/B testing between two model versions with live traffic
- D. Canary deployment with a small percentage of live users

Answer: A

Q1172. What is concept drift vs data drift?

- A. Data drift only affects the target output variable distribution
- B. Concept drift only affects the distribution of input features alone
- C. Concept drift changes input-target relationship; data drift changes input distribution
- D. They are completely identical phenomena with no meaningful differences

Answer: C

Q1173. What is model explainability in production?

- A. Storing more raw training data for future retraining sessions
- B. Providing interpretable explanations for why a model makes specific predictions
- C. Making the model inference significantly faster and more efficient
- D. Reducing the overall size and memory footprint of the model

Answer: B

Q1174. What is the purpose of experiment tracking tools like MLflow?

- A. Recording parameters metrics code and artifacts for each experiment
- B. Only visualizing final model results on a dashboard
- C. Only storing the raw training data on a file system
- D. Only deploying models to a production serving endpoint

Answer: A

Q1175. What is the blue-green deployment strategy?

- A. A data visualization technique using a blue-green color palette
- B. Running models on GPUs with blue and green LED indicator lights
- C. A model training strategy using two alternating learning rates
- D. Maintaining two identical production environments and switching traffic between them

Answer: D

Q1176. What is model compression for deployment?

- A. Increasing numerical precision of weights from FP16 to FP64
- B. Adding more hidden layers to increase the depth of network
- C. Reducing model size and complexity while maintaining acceptable performance
- D. Making models significantly larger by adding trainable parameters

Answer: C

Q1177. What is the role of infrastructure as code (IaC) in MLOps?

- A. Collecting and gathering raw data from external data sources
- B. Writing machine learning algorithm implementations and model code
- C. Defining and managing ML infrastructure through code for reproducibility
- D. Training machine learning models on labeled training datasets

Answer: C

Q1178. What is a serving graph in ML deployment?

- A. A computation graph used only during the model training process
- B. An interactive data visualization chart for exploring model outputs
- C. A diagram showing the internal layers and neurons of a network
- D. A DAG of preprocessing inference and postprocessing steps during prediction

Answer: D

Q1179. What is the challenge of training-serving skew?

- A. The training dataset being too small for adequate model learning overall
- B. The model training process converging far too slowly to be practical
- C. Models becoming too large to fit within the available GPU memory capacity
- D. Differences between training and serving environments causing inconsistent predictions

Answer: B

Q1180. What is GitOps for ML?

- A. Using Git as single source of truth for ML infrastructure configs and deployments
- B. Only storing the Python source code files in a Git repository
- C. A gradient-based training method for optimizing neural networks
- D. A type of version control system different from standard Git

Answer: A

Q1181. What is the alignment problem in AI?

- A. Ensuring advanced AI goals and behaviors align with human values and intentions
- B. Reducing the computational costs of training large-scale AI models
- C. Making AI systems process data at significantly faster inference speeds
- D. Training machine learning models to achieve the highest accuracy metrics

Answer: A

Q1182. What is membership inference attack?

- A. Deleting training data from the model's storage permanently
- B. Stealing the complete set of model weights from the server
- C. Determining whether a specific data point was used in training a model
- D. Changing the model's predictions by modifying its architecture

Answer: C

Q1183. What is the concept of Fairness through Awareness?

- A. Completely ignoring all protected attributes during model prediction
- B. Making random predictions without considering any input features
- C. Using the exact same model configuration for every single individual
- D. Treating similar individuals similarly using a task-specific similarity metric

Answer: D

Q1184. What is model inversion attack?

- A. Improving the model's overall prediction accuracy
- B. Reconstructing training data features from model outputs
- C. Making the model inference significantly faster
- D. Augmenting the training data with synthetic samples

Answer: B

Q1185. What is the difference between equality and equity in AI fairness?

- A. Equity ignores all differences between individuals and groups
- B. Equality is always strictly the better approach for fairness goals
- C. They are completely identical concepts with no meaningful differences
- D. Equality gives the same treatment; equity adjusts treatment for fair outcomes

Answer: D

Q1186. What is the EU AI Act?

- A. A supervised machine learning algorithm for classification tasks
- B. A structured data format for storing model configurations
- C. A risk-based regulatory framework for AI in the European Union
- D. A general-purpose compiled programming language specification

Answer: C

Q1187. What is algorithmic recourse?

- A. Providing individuals with actionable steps to change an unfavorable AI decision
- B. Completely removing the algorithm from production deployment
- C. Using a completely different dataset for model retraining
- D. Making the algorithm run faster through hardware optimization

Answer: A

Q1188. What is the difference between disparate treatment and disparate impact?

- A. Disparate treatment is the unintentional adverse effect on specific groups
- B. Disparate treatment uses protected attributes intentionally; disparate impact causes unequal effects
- C. Disparate impact is the intentional use of protected attributes in a decision model
- D. They are completely identical legal concepts with no meaningful differences

Answer: C

Q1189. What is homomorphic encryption and how does it relate to AI privacy?

- A. A compression algorithm for reducing data file sizes
- B. A process of permanently deleting data from storage
- C. Encryption allowing computation on encrypted data without decrypting it
- D. A standard symmetric encryption method for securing files

Answer: C

Q1190. What is the concept of AI safety?

- A. Making AI systems process data at significantly faster speeds for better user experience
- B. Ensuring AI systems behave as intended without causing unintended harm as capabilities grow
- C. Marketing and promoting AI products and services to potential commercial customers
- D. Reducing the overall financial costs of training and deploying large AI model systems

Answer: B

Q1191. A model achieves 99% training accuracy but only 55% test accuracy. Which strategy best addresses this?

- A. Increase model complexity by adding many more parameters and layers
- B. Remove all validation data to maximize available training data volume
- C. Increase the learning rate to help the model converge much faster
- D. Apply regularization techniques and collect more diverse training data

Answer: D

Q1192. When labeled data is scarce but unlabeled data is abundant, which learning paradigm is most suitable?

- A. Rule-based expert system with manually crafted knowledge base rules
- B. Pure unsupervised learning ignoring all available labeled data points
- C. Semi-supervised learning combining labeled and unlabeled data sources
- D. Fully supervised learning with extensive data augmentation pipelines

Answer: C

Q1193. Which challenge arises when deploying ML models trained on historical data that no longer reflects reality?

- A. Gradient vanishing causing training to stall at suboptimal solutions
- B. Feature explosion resulting from too many correlated input variables
- C. Memory overflow due to the increasing size of the stored model files
- D. Data drift causing degraded model performance over time in production

Answer: D

Q1194. A startup wants to predict rare diseases from patient records. What is the primary ML challenge?

- A. Class imbalance where positive cases are extremely underrepresented
- B. Feature extraction is impossible from electronic health record data
- C. The data will be too structured for machine learning algorithms used
- D. The model will require too many GPU hours for simple tabular data

Answer: A

Q1195. Why is the No Free Lunch theorem significant in ML algorithm selection?

- A. It states no single algorithm performs best across every possible task
- B. It proves deep learning always outperforms all traditional ML methods
- C. It shows unsupervised learning is superior to supervised approaches
- D. It guarantees ensemble methods will always improve baseline accuracy

Answer: A

Q1196. For autonomous vehicles, which combination of AI subfields is most critical?

- A. Recommendation systems combined with collaborative filtering engines
- B. Computer vision with reinforcement learning and sensor fusion systems
- C. Sentiment analysis combined with topic modeling for understanding
- D. Natural language processing combined with text summarization methods

Answer: B

Q1197. What is the key difference between model-based and instance-based learning?

- A. Model-based is always faster at inference while instance-based is always faster
- B. Model-based builds explicit parameter models while instance-based memorizes examples
- C. Model-based requires no training while instance-based needs extensive training time
- D. Model-based only works with images while instance-based only handles text data

Answer: B

Q1198. Adding more training data yields no accuracy improvement. What does this indicate about the model?

- A. The computing hardware has reached its maximum processing speed limits
- B. The model has reached its capacity and needs a more complex architecture
- C. The learning rate is set too high causing the optimizer to diverge rapidly
- D. The dataset contains no useful patterns for any learning algorithm to find

Answer: B

Q1199. In AI ethics, what does algorithmic accountability primarily require from organizations?

- A. Explaining and taking responsibility for AI-driven decisions outcomes
- B. Publishing all source code as open source for public use and changes
- C. Restricting AI development to only government-approved research labs
- D. Mandating that all AI models achieve above ninety-five percent rate

Answer: A

Q1200. Which approach best addresses catastrophic forgetting in continual learning systems?

- A. Removing all previous training data before introducing new examples
- B. Reducing the model size to prevent storing too much old information
- C. Using elastic weight consolidation to protect important parameters
- D. Retraining the entire model from scratch every time new data arrives

Answer: C

Q1201. Why is the Hessian matrix important in second-order optimization methods?

- A. It captures second-order derivative information to estimate curvature
- B. It stores the training data samples needed for batch processing
- C. It determines the initial random weight values for network layers
- D. It selects the appropriate activation function for each neuron

Answer: A

Q1202. When KL divergence between two distributions is zero, what does this indicate?

- A. One distribution has zero variance while the other has infinite range
- B. The two distributions have no overlapping support in their domains
- C. Both distributions are perfectly negatively correlated with each other
- D. The two probability distributions are completely identical everywhere

Answer: D

Q1203. Why can saddle points be problematic for optimization in high-dimensional spaces?

- A. Saddle points make it impossible to compute any derivative at that point
- B. Saddle points always cause the loss function value to increase unboundedly
- C. Gradients near saddle points approach zero causing very slow convergence
- D. Saddle points only occur in one-dimensional optimization never in higher

Answer: C

Q1204. What is the mathematical justification for using cross-entropy loss in classification?

- A. It guarantees convergence in exactly one epoch of training every time
- B. It derives from maximum likelihood estimation under a Bernoulli model
- C. It eliminates the need for any regularization in the model training
- D. It is computationally simpler than all other available loss functions used

Answer: B

Q1205. Why does the curse of dimensionality degrade distance-based algorithms?

- A. Higher dimensions always require more memory than any hardware provides
- B. Higher dimensions guarantee all data points will be perfectly separable
- C. In high dimensions the class count always exceeds the sample count total
- D. In high dimensions all pairwise distances converge making neighbors meaningless

Answer: D

Q1206. What role does the Jacobian matrix play in training multi-output neural networks?

- A. It contains all first-order partial derivatives of outputs versus inputs
- B. It determines the optimal batch size for stochastic gradient descent
- C. It stores bias terms for each layer of the neural network model used
- D. It specifies architecture including number of layers and their widths

Answer: A

Q1207. In Bayesian inference, how does the prior influence the posterior when data is very limited?

- A. The prior has minimal influence and the posterior matches the likelihood
- B. The prior is completely ignored by all Bayesian inference methods used
- C. The prior dominates the posterior since limited data provides weak signal
- D. The prior and posterior are always identical regardless of observed data

Answer: C

Q1208. What mathematical property makes softmax suitable for multi-class classification output?

- A. It compresses all inputs to a fixed range of negative one to one
- B. It outputs values that always sum to exactly one across all classes
- C. It always produces integer values representing discrete class indices
- D. It ensures every output is either exactly zero or exactly one always

Answer: B

Q1209. Why is the Fisher Information Matrix used in natural gradient descent?

- A. It captures statistical manifold curvature for more efficient update steps
- B. It eliminates the requirement for computing any first-order derivatives
- C. It replaces the need for any loss function during model training completely
- D. It guarantees global convergence regardless of the model architecture used

Answer: A

Q1210. What is the significance of positive semi-definiteness in covariance matrices?

- A. It restricts the matrix to having exactly two distinct eigenvalue values
- B. It ensures the matrix can only contain integer values in all its entries
- C. It means the matrix inverse always exists and is unique for every case
- D. It guarantees all eigenvalues are non-negative representing valid variances

Answer: D

Q1211. For a custom scikit-learn transformer, which methods must be implemented for pipeline compatibility?

- A. Only the predict method is required since transformers always make predictions
- B. The score and evaluate methods are the only ones required for all pipelines
- C. Only the transform method needs to be implemented for pipeline compatibility
- D. The fit and transform methods must both be implemented at minimum for use

Answer: D

Q1212. What is the advantage of multiprocessing over threading for CPU-bound ML tasks in Python?

- A. Multiprocessing creates separate processes bypassing GIL for true parallelism
- B. Threading bypasses the GIL while multiprocessing is limited by the GIL lock
- C. Threading uses less memory because it creates separate isolated memory spaces
- D. Multiprocessing is always slower but provides much better error handling now

Answer: A

Q1213. Why should you use np.allclose() instead of == when comparing floating-point arrays?

- A. The allclose function is significantly faster than equality operator for arrays
- B. The equality operator cannot be applied to any NumPy arrays at all ever
- C. Floating-point arithmetic introduces rounding errors making exact comparison fail
- D. The equality operator only works for integer arrays and raises errors on floats

Answer: C

Q1214. Why is it critical to apply fit() only on training data for preprocessing in production ML?

- A. Fitting on test data would make preprocessing steps run much more slowly
- B. Fitting on all data causes data leakage by incorporating test set statistics
- C. Fitting on training data alone ensures the model always achieves higher loss
- D. Fitting on test data would automatically delete the test set from memory

Answer: B

Q1215. What problem does functools.lru_cache solve in feature engineering pipelines?

- A. It logs all function calls to a database for auditing and tracking uses
- B. It converts all function outputs to lower precision to save system memory
- C. It automatically distributes computation across multiple GPU device units
- D. It caches expensive function results to avoid redundant recomputation work

Answer: D

Q1216. When handling very large datasets in pandas, what approach reduces memory most effectively?

- A. Specifying optimal dtypes and reading data in chunks with iteration
- B. Removing all column names to reduce the metadata overhead in RAM
- C. Sorting the DataFrame by index before performing any analysis steps
- D. Converting all columns to string type to ensure uniform representation

Answer: A

Q1217. What is the purpose of `__getitem__` and `__len__` in a PyTorch custom Dataset class?

- A. They define how to save and load model checkpoints to and from disk
- B. They specify loss function and optimizer used during backpropagation
- C. They enable indexed data access and size reporting for the DataLoader
- D. They control the learning rate schedule during model training loop runs

Answer: C

Q1218. Why is `np.einsum()` considered more flexible than standard NumPy operations for tensors?

- A. It runs exclusively on GPU hardware while standard operations use CPU only
- B. It expresses complex multi-dimensional operations in compact Einstein notation
- C. It automatically converts all inputs to higher precision floating point types
- D. It only works with two-dimensional arrays making the interface much simpler

Answer: B

Q1219. What design pattern does scikit-learn's Pipeline class implement and why is it beneficial?

- A. The observer pattern notifying all components when training data changes
- B. The composite pattern chaining steps to prevent data leakage in CV folds
- C. The singleton pattern ensuring only one model instance exists in memory
- D. The factory pattern creating new model instances based on input data type

Answer: B

Q1220. How does `contextlib.contextmanager` help manage resources in data processing?

- A. It provides automatic type checking for all function arguments runtime
- B. It creates permanent global variables accessible from any module at all
- C. It enables resource management using generator-based context managers
- D. It automatically converts synchronous code into asynchronous coroutines

Answer: C

Q1221. A dataset has 40% missing values in a critical feature. Which imputation strategy is most appropriate?

- A. Ignore the feature entirely and remove it from the training dataset now
- B. Simply delete all rows with missing values to ensure data quality overall
- C. Replace all missing values with zero since it is the simplest approach
- D. Use a predictive model like KNN or regression to impute the missing values

Answer: D

Q1222. Why can applying preprocessing transformations before splitting data cause data leakage?

- A. Preprocessing transformations always modify the target variable directly
- B. Statistics from test data influence the transformation applied to training data
- C. Transformations always remove the most important features from the dataset
- D. Preprocessing makes the model run slower during the inference stage overall

Answer: B

Q1223. When dealing with high-cardinality categorical features, why might target encoding outperform one-hot?

- A. One-hot encoding creates massive sparse matrices while target encoding is compact
- B. Target encoding always produces more accurate results regardless of the data
- C. Target encoding removes the need for any validation set during training time
- D. One-hot encoding automatically introduces data leakage into training process

Answer: A

Q1224. In time-series data, why must preprocessing respect temporal order during train-test splitting?

- A. Temporal order only matters for visualization and does not affect model results
- B. Time-series data must always be converted to images before model training steps
- C. Random splitting can leak future information into training causing unrealistic scores
- D. Time-series data always has fewer missing values than cross-sectional datasets

Answer: C

Q1225. A feature has extreme outliers that cannot be removed because they represent valid rare events. What approach is best?

- A. Use mean imputation to replace all outlier values with the column average
- B. Apply min-max scaling which will properly handle extreme outlier values well
- C. Apply robust scaling using median and IQR which is resistant to outlier values
- D. Delete the entire feature since it contains any outlier values in the data

Answer: C

Q1226. Why is the Yeo-Johnson transformation preferred over Box-Cox for some datasets?

- A. Yeo-Johnson is always faster computationally than Box-Cox transformation
- B. Yeo-Johnson only works with categorical features unlike Box-Cox method
- C. Yeo-Johnson can handle both positive and negative values unlike Box-Cox
- D. Yeo-Johnson produces exactly normal distributions while Box-Cox does not

Answer: C

Q1227. When preprocessing text data for NLP, why might subword tokenization outperform word-level tokenization?

- A. Subword tokenization removes the need for any stopword removal preprocessing
- B. It handles out-of-vocabulary words by breaking them into known subword units
- C. It converts all text into numerical features without any vocabulary mapping
- D. Subword tokenization always produces shorter sequences than word tokenization

Answer: B

Q1228. A dataset has features measured in different units with varying scales and distributions. Which preprocessing combination is most robust?

- A. Apply no preprocessing since modern algorithms handle raw data effectively
- B. Apply only min-max scaling to all features uniformly without further analysis
- C. Use power transformation followed by standardization for each feature column
- D. Use one-hot encoding on all features regardless of their data type values

Answer: C

Q1229. Why should you be cautious when using mean imputation for features with non-normal distributions?

- A. It artificially reduces variance and can distort the true distribution shape
- B. Mean imputation only works with categorical features not numerical ones
- C. Mean imputation always increases the standard deviation of the feature values
- D. It automatically removes all outliers before computing the replacement value

Answer: A

Q1230. In a pipeline processing streaming data, why is incremental preprocessing preferred over batch preprocessing?

- A. It automatically handles all missing values without any configuration needed
- B. It processes data point by point without needing the entire dataset in memory
- C. Incremental preprocessing eliminates the need for any feature engineering step
- D. Incremental preprocessing always produces more accurate transformations overall

Answer: B

Q1231. A dataset shows a Pearson correlation of 0.02 between two features, but the scatter plot reveals a clear U-shaped pattern. What explains this?

- A. The data has too many missing values to compute correlation correctly
- B. The scatter plot is incorrectly rendered due to a visualization error
- C. A correlation of 0.02 actually indicates a very strong relationship here
- D. Pearson only captures linear relationships and misses non-linear patterns

Answer: D

Q1232. When exploring a dataset with 500 features, which dimensionality reduction technique is most useful for initial EDA visualization?

- A. Removing all features except the first two columns from the original data
- B. Manually selecting 2 features based on column name alphabetical ordering
- C. Using t-SNE or UMAP to project high-dimensional data into 2D for plotting
- D. Creating 500 individual histograms and reviewing each one sequentially

Answer: C

Q1233. During EDA you discover that a feature has a bimodal distribution. What might this suggest about the underlying data?

- A. The data may contain two distinct subpopulations mixed into one feature
- B. Bimodal distributions always indicate that the feature is perfectly normal
- C. The feature should be removed because bimodal distributions are always errors
- D. The feature has too many outliers and needs to be replaced with its mean

Answer: A

Q1234. Why might the mean be a misleading measure of central tendency for income data?

- A. Income data always follows a perfectly normal distribution in all nations
- B. The mean cannot be computed for continuous variables like income amounts
- C. Income data is always categorical so the mean has no mathematical meaning
- D. Income data is typically right-skewed so the mean is pulled by high earners

Answer: D

Q1235. How does Simpson's Paradox affect conclusions drawn during exploratory data analysis?

- A. It only occurs in datasets with fewer than one hundred total observations
- B. A trend in subgroups can reverse when groups are combined into aggregate
- C. It guarantees that adding more features will always improve model accuracy
- D. It makes all statistical tests invalid regardless of sample size used here

Answer: B

Q1236. A feature shows near-zero variance in the training set. Why should this be investigated before modeling?

- A. They carry almost no discriminative information and may cause instability
- B. Near-zero variance features provide the strongest predictive signal always
- C. Near-zero variance means the feature is perfectly normally distributed
- D. They always indicate data collection errors that must be manually fixed

Answer: A

Q1237. You observe that two features have a Spearman correlation of 0.95. What preprocessing step might you consider?

- A. Multiply the two features together to create a more powerful interaction term
- B. Remove one of the redundant features or use PCA to reduce the collinearity
- C. Convert both features to categorical variables to eliminate the correlation
- D. Add both features to the model since high correlation always helps performance

Answer: B

Q1238. During EDA of a classification dataset, you notice heavy class overlap in feature space. What does this suggest?

- A. The classification task is inherently difficult and may need complex models
- B. The dataset is perfect for a simple linear classifier without any tuning
- C. The features should all be removed and replaced with randomly generated ones
- D. Class overlap always means the labels are incorrect and need relabeling

Answer: A

Q1239. Why is it important to analyze the relationship between features and the target variable separately for different subgroups?

- A. Analyzing subgroups always produces the same results as aggregate analysis does
- B. Different subgroups may exhibit different patterns that aggregate analysis hides
- C. Subgroup analysis is never useful and only wastes computational resources
- D. Subgroup analysis is only applicable to time-series data and no other types

Answer: B

Q1240. A dataset contains timestamps spanning five years. Which EDA technique best reveals seasonal patterns and trends?

- A. Creating a single histogram of all values regardless of their timestamps
- B. Sorting the data alphabetically by the timestamp column values only
- C. Computing a single mean value across all five years of data points
- D. Time-series decomposition into trend, seasonal, and residual components

Answer: D

Q1241. A linear SVM fails to classify a dataset with circular decision boundaries. Which approach best resolves this?

- A. Switching to an RBF kernel to capture the non-linear circular boundary
- B. Increasing the regularization parameter C to a very large positive value
- C. Reducing the training set size to remove noise from the boundary area
- D. Adding more linear features computed from the existing feature columns

Answer: A

Q1242. Why does Naive Bayes often perform surprisingly well despite its strong independence assumption?

- A. The independence assumption is actually true for nearly all real-world datasets
- B. Classification only needs correct ranking of class probabilities not exact values
- C. Naive Bayes secretly uses feature correlations even though it assumes independence
- D. The algorithm automatically corrects for violated assumptions during training

Answer: B

Q1243. In gradient boosting, how does each subsequent tree improve the overall model?

- A. Each tree duplicates the first tree but with different random weight values
- B. Each tree trains on entirely new data that was not used by any prior tree
- C. Each tree is trained on a random subset of features ignoring previous results
- D. Each tree fits the residual errors of the combined predictions of prior trees

Answer: D

Q1244. When should you prefer Ridge regression over Lasso regression for regularization?

- A. When you need exactly half the features to have zero coefficient values only
- B. When you want to perform automatic feature selection by zeroing coefficients
- C. When most features are relevant and you want to shrink all coefficients evenly
- D. When the dataset has categorical features that need one-hot encoding first

Answer: C

Q1245. A decision tree achieves perfect training accuracy but poor test accuracy. Which pruning strategy is most effective?

- A. Grow the tree to maximum depth then add more features to improve test scores
- B. Increase the minimum samples per leaf to the total training set size value
- C. Remove all leaf nodes and keep only the root node for maximum simplicity
- D. Apply cost-complexity pruning to find the subtree with best cross-validated score

Answer: D

Q1246. Why is the choice of distance metric critical for KNN performance on high-dimensional data?

- A. In high dimensions most distance metrics lose discriminative power between points
- B. High-dimensional data always has the same distances regardless of metric used
- C. KNN only works with Euclidean distance so the choice is never actually needed
- D. Distance metrics have no effect on KNN in any number of dimensions at all

Answer: A

Q1247. How does Platt scaling calibrate the output probabilities of an SVM classifier?

- A. It fits a logistic regression on the SVM decision values to produce probabilities
- B. It trains a separate neural network to convert SVM outputs into probabilities
- C. It replaces the SVM kernel with a probability density estimation function
- D. It applies min-max normalization directly to the raw SVM decision values

Answer: A

Q1248. In multi-class classification, what advantage does one-vs-rest have over one-vs-one strategy?

- A. Both strategies always produce identical results regardless of the dataset
- B. One-vs-rest trains fewer classifiers making it computationally more efficient
- C. One-vs-one trains fewer classifiers making it computationally more efficient
- D. One-vs-rest always achieves higher accuracy than one-vs-one on all datasets

Answer: B

Q1249. Why might a well-tuned logistic regression outperform a deep neural network for tabular data?

- A. Logistic regression always converges to the global optimum unlike neural networks
- B. Logistic regression can learn non-linear patterns better than neural networks
- C. Deep neural networks cannot process numerical features in tabular format data
- D. Deep networks need massive data and tabular datasets are often small with noise

Answer: D

Q1250. What is the effect of class imbalance on the decision boundary of a standard SVM?

- A. Class imbalance has no effect on SVM decision boundaries in any scenario ever
- B. The boundary shifts toward the minority class increasing its misclassification rate
- C. The boundary always shifts toward the majority class regardless of data layout
- D. SVM automatically handles class imbalance without any parameter adjustments

Answer: B

Q1251. In a gradient boosting ensemble, how does early stopping prevent overfitting?

- A. It reduces the learning rate to exactly zero after a fixed number of trees
- B. It removes the first few trees which are assumed to have the highest error
- C. It monitors validation loss and stops adding trees when performance degrades
- D. It limits the maximum number of features each tree can use at any split

Answer: C

Q1252. Why does XGBoost use regularization terms in its objective function unlike traditional GBDT?

- A. Regularization slows training to allow more careful optimization at each step
- B. It penalizes tree complexity reducing overfitting and improving generalization
- C. XGBoost regularization only affects the first tree and has no effect on others
- D. Regularization in XGBoost replaces the need for any learning rate parameter

Answer: B

Q1253. When would you prefer LightGBM's leaf-wise growth over XGBoost's level-wise growth?

- A. When all features are categorical and no numerical features exist in data
- B. When the dataset is very small and overfitting is a major concern for accuracy
- C. When you need the simplest possible model with minimal hyperparameters to set
- D. When training speed is critical and the dataset is large with many features

Answer: D

Q1254. How does the DART algorithm modify standard gradient boosting to reduce overfitting?

- A. It randomly drops previously built trees during each boosting iteration step
- B. It uses only the first and last trees and ignores all trees built in between
- C. It doubles the learning rate at each iteration to converge more quickly here
- D. It trains all trees simultaneously rather than sequentially to save total time

Answer: A

Q1255. In a production system, why might model ensembles be problematic despite higher accuracy?

- A. Ensembles are impossible to train on any modern GPU or cloud computing platform
- B. They increase inference latency, memory usage, and deployment complexity significantly
- C. Ensembles always produce less accurate predictions than single model systems
- D. They require manual human review for every single prediction made by the system

Answer: B

Q1256. What is the theoretical basis for why bagging reduces variance in predictions?

- A. The theoretical basis is unknown and bagging works only through empirical results
- B. Bagging increases variance because it uses more models than a single learner
- C. Bagging reduces bias not variance since it trains on different data subsets each
- D. Averaging independent estimates reduces variance by a factor of the ensemble size

Answer: D

Q1257. How does CatBoost handle categorical features differently from XGBoost and LightGBM?

- A. CatBoost requires all features to be one-hot encoded before training can begin
- B. CatBoost converts all categorical features into random numerical values first
- C. CatBoost uses ordered target statistics to encode categoricals avoiding leakage
- D. CatBoost cannot process any categorical features and only handles numerical ones

Answer: C

Q1258. In a stacking ensemble, why should base model predictions be generated using cross-validation?

- A. It prevents data leakage since base models should not predict on their training data
- B. It ensures that all base models have identical performance before stacking them
- C. Cross-validation makes base models train faster than using the full training set
- D. Cross-validation automatically selects the best base models for the final stack

Answer: A

Q1259. What is the relationship between ensemble size and the law of diminishing returns?

- A. Smaller ensembles always outperform larger ensembles due to reduced complexity
- B. Adding more models always linearly improves accuracy without any upper bound limit
- C. After a point additional models contribute marginal gains while increasing costs
- D. Ensemble size has no effect on performance and only affects training speed value

Answer: C

Q1260. Why is Bayesian optimization particularly effective for tuning ensemble hyperparameters?

- A. It only works with ensemble methods and cannot tune single model parameters
- B. It models the objective function to intelligently select promising configurations
- C. Bayesian optimization always finds the global optimum in exactly one iteration
- D. Bayesian optimization randomly samples hyperparameters like grid search does

Answer: B

Q1261. Why might K-Means converge to a suboptimal solution and how is this typically addressed?

- A. Suboptimal convergence only occurs when the dataset has fewer than ten samples
- B. K-Means always finds the globally optimal solution regardless of initialization
- C. It can converge to local optima so K-Means++ initialization is used for better starts
- D. K-Means is guaranteed to diverge without specialized GPU hardware for computation

Answer: C

Q1262. How does spectral clustering handle non-convex cluster shapes that K-Means cannot?

- A. It constructs a similarity graph and uses eigenvectors of its Laplacian for clustering
- B. It converts all non-convex clusters into convex ones before applying K-Means again
- C. It simply increases the number of clusters K until the shapes are captured correctly
- D. It uses the same distance metric as K-Means but with more iterations for accuracy

Answer: A

Q1263. What is the key advantage of UMAP over t-SNE for dimensionality reduction?

- A. UMAP is a linear method while t-SNE is non-linear which makes UMAP faster here
- B. UMAP requires labeled data while t-SNE works in a fully unsupervised manner only
- C. UMAP better preserves global structure and scales to much larger datasets efficiently
- D. UMAP always produces better visualizations than t-SNE on every possible dataset

Answer: C

Q1264. In topic modeling, how does Latent Dirichlet Allocation discover topics from documents?

- A. It models documents as mixtures of topics and topics as distributions over words
- B. It uses supervised labels to assign documents to predefined topic categories only
- C. It requires human experts to manually define all topics before running analysis
- D. It clusters documents using K-Means on word frequency vectors directly always

Answer: A

Q1265. Why is the choice of linkage criterion important in agglomerative hierarchical clustering?

- A. All linkage criteria produce identical dendrograms regardless of the input dataset
- B. Linkage criterion has no effect on the final clustering result in any case ever
- C. Linkage criterion only affects the visualization of dendrogram and not the clusters
- D. Different linkage criteria produce different cluster shapes and handle noise differently

Answer: D

Q1266. How does the Variational Autoencoder differ from a standard autoencoder for unsupervised learning?

- A. Both models are identical in architecture and only differ in their training data used
- B. VAE produces only deterministic encodings while standard autoencoders are probabilistic
- C. VAE learns a probabilistic latent space enabling meaningful data generation sampling
- D. Standard autoencoders can generate new data while VAEs can only compress existing data

Answer: C

Q1267. When evaluating clustering without ground truth labels, why is the Davies-Bouldin Index useful?

- A. It can only evaluate K-Means clustering and does not work with any other algorithms
- B. It always produces a score between zero and one like the accuracy metric in classification
- C. It measures the ratio of within-cluster to between-cluster distances with lower being better
- D. It requires ground truth labels to compute making it a supervised evaluation metric

Answer: C

Q1268. What is the fundamental limitation of using reconstruction error alone to evaluate autoencoders?

- A. Low reconstruction error may indicate memorization rather than useful representation learning
- B. Reconstruction error can only be computed for image data and not for tabular data
- C. Reconstruction error is too computationally expensive to compute on modern hardware
- D. Reconstruction error always perfectly reflects the quality of the learned latent space

Answer: A

Q1269. How does contrastive learning create useful representations without labels?

- A. It uses K-Means clustering as an intermediate step before training the final model
- B. It requires ground truth cluster assignments to define the contrastive loss function
- C. It trains models using manually annotated labels for every single data sample used
- D. It learns to pull augmented views of same samples together and push different apart

Answer: D

Q1270. Why is the Information Criterion approach preferred over the elbow method for determining optimal K?

- A. Information criteria require no data and determine K from theoretical analysis alone here
- B. The elbow method and information criteria always agree on the same optimal K value
- C. The elbow method is always more accurate than any information criterion approach used
- D. Information criteria like BIC provide a principled statistical framework for model selection

Answer: D

Q1271. In medical diagnosis, why is recall often prioritized over precision?

- A. Recall is always higher than precision so it is the easier metric to optimize for
- B. Missing a positive diagnosis is more dangerous than a false alarm in many cases
- C. Medical models always achieve perfect precision making recall the only variable metric
- D. Precision is only relevant for non-medical applications and cannot be used in health

Answer: B

Q1272. Why can nested cross-validation be necessary for unbiased model selection and evaluation?

- A. Nested cross-validation is only needed for datasets with fewer than fifty observations
- B. Hyperparameter tuning on the same CV folds used for evaluation causes optimistic bias
- C. Standard cross-validation already provides completely unbiased model selection results
- D. It is a deprecated technique that has been replaced by simple holdout validation now

Answer: B

Q1273. A model achieves 0.95 AUC but poor performance at the deployed threshold. What is the likely issue?

- A. The model was trained on too much data causing it to generalize too well overall
- B. The model is well-calibrated but the AUC metric was computed with an error here
- C. AUC summarizes all thresholds but the operational threshold may fall in a poor region
- D. An AUC of 0.95 guarantees excellent performance at every possible threshold value

Answer: C

Q1274. When comparing models, why is statistical significance testing important beyond comparing mean metrics?

- A. Statistical testing is only applicable to models trained on datasets exceeding millions
- B. Performance differences may be due to random variation rather than true model superiority
- C. Mean metrics always provide sufficient information to select the best model reliably
- D. It is never needed because cross-validation already accounts for all statistical variance

Answer: B

Q1275. What is the Matthews Correlation Coefficient and why is it preferred for imbalanced datasets?

- A. It is identical to accuracy and provides no additional information for imbalanced data
- B. It only considers true positives and ignores all other confusion matrix cell values
- C. It uses all confusion matrix values providing balanced evaluation even with skewed classes
- D. It requires balanced classes to compute and returns undefined for imbalanced datasets

Answer: C

Q1276. How does the precision-recall curve complement the ROC curve for rare event detection?

- A. Both curves always provide identical information regardless of the class balance ratio
- B. PR curves better expose model performance on the minority class that ROC may obscure
- C. ROC curves are always superior to PR curves in every evaluation scenario encountered
- D. PR curves can only be computed when classes are perfectly balanced in the dataset

Answer: B

Q1277. Why might a model perform well in cross-validation but poorly in real-world deployment?

- A. Distribution shift between training data and production data degrades model performance
- B. Cross-validation uses test data for training which inflates deployment expectations
- C. Models that perform well in CV are guaranteed to perform well in any deployment setup
- D. Cross-validation always provides perfectly accurate estimates of deployment performance

Answer: A

Q1278. What is the purpose of the DeLong test in comparing ROC curves of two models?

- A. It statistically tests whether two AUC values are significantly different from each other
- B. It measures the calibration quality of both models probability estimates simultaneously
- C. It determines whether one model trains faster than the other on the same dataset
- D. It automatically selects the optimal threshold for deploying both models in production

Answer: A

Q1279. In time-series model evaluation, why is standard K-fold cross-validation inappropriate?

- A. Standard K-fold is actually the recommended approach for all time-series evaluations
- B. Random fold assignment violates temporal ordering and leaks future data into training
- C. Time-series data always has too few samples for any cross-validation method to work
- D. K-fold cross-validation can only be applied to classification not regression problems

Answer: B

Q1280. How does Bayesian evaluation of classifiers improve upon frequentist hypothesis testing?

- A. It provides probability distributions over performance differences enabling richer analysis
- B. Bayesian evaluation only works with neural network classifiers and no other methods
- C. It eliminates the need for any test data by computing performance from prior alone
- D. Bayesian methods always agree with frequentist tests making them completely redundant

Answer: A

Q1281. Why can target encoding cause data leakage and how is it typically mitigated?

- A. It uses target values during encoding so leave-one-out or fold-based encoding prevents leak
- B. Target encoding never causes data leakage so no mitigation is ever required
- C. Data leakage only occurs with one-hot encoding and never with target encoding method
- D. Target encoding automatically prevents leakage through its internal smoothing mechanism

Answer: A

Q1282. When engineering features for a gradient boosted tree model, why is binning continuous features usually unnecessary?

- A. Tree-based models already find optimal split points so binning loses useful granularity
- B. Gradient boosted trees cannot process binned features and require raw continuous input
- C. Binning always improves gradient boosted tree performance without any exceptions
- D. Binning is only useful for neural networks and cannot be applied to any tree models

Answer: A

Q1283. How does autoML automate feature engineering and what are its limitations?

- A. AutoML perfectly replaces all manual feature engineering without any limitations ever
- B. AutoML only works with image data and cannot handle tabular or text feature engineering
- C. It explores transformations automatically but may miss domain-specific meaningful features
- D. It always produces fewer features than manual engineering making it strictly inferior

Answer: C

Q1284. Why might feature engineering differ between linear models and tree-based models?

- A. Tree-based models require normalized features while linear models handle raw values
- B. Both model types benefit from exactly identical feature engineering approaches always
- C. Linear models need non-linear transformations while trees handle non-linearity natively
- D. Feature engineering is only needed for tree-based models and never for linear models

Answer: C

Q1285. What is the risk of using highly engineered features that are specific to the training distribution?

- A. Engineered features are always more robust than raw features in all scenarios tested
- B. The risk is minimal because feature engineering always reduces overfitting in models
- C. They may not generalize to production data if the distribution shifts over time period
- D. Highly engineered features always generalize perfectly to any future data distribution

Answer: C

Q1286. How does mutual information differ from Pearson correlation for feature selection?

- A. Pearson captures non-linear relationships while mutual information is limited to linear
- B. Both methods measure identical relationships and always produce the same feature ranking
- C. Mutual information only works with binary features while Pearson works with all types
- D. Mutual information captures any dependency while Pearson only detects linear relationships

Answer: D

Q1287. In NLP, why might TF-IDF features outperform raw word count features for text classification?

- A. Raw word counts always outperform TF-IDF so this premise is incorrect in all cases
- B. TF-IDF downweights common words and upweights distinctive words improving discrimination
- C. TF-IDF converts words to their synonyms before counting improving vocabulary coverage
- D. TF-IDF always produces fewer features than raw word counts making models train faster

Answer: B

Q1288. What is the purpose of creating lag features in time-series feature engineering?

- A. They capture temporal dependencies by using past values as features for current predictions
- B. Lag features convert time-series data into image format for convolutional neural networks
- C. They eliminate seasonality from time-series data making it stationary for all models
- D. Lag features remove temporal dependencies to make data suitable for standard ML models

Answer: A

Q1289. How does the permutation importance method evaluate feature relevance after model training?

- A. It sorts features alphabetically and assigns importance based on their position order
- B. It shuffles each feature's values and measures how much model performance degrades
- C. It adds random noise to each feature and measures how much training accuracy improves
- D. It removes each feature entirely and retrains the model from scratch to compare results

Answer: B

Q1290. Why should you be cautious about using future information when engineering features for time-series models?

- A. Using future values creates temporal leakage leading to unrealistically optimistic evaluation
- B. Future information is always available at prediction time so there is no risk in using it
- C. Future information always improves time-series model accuracy without any negative effects
- D. Time-series models automatically detect and exclude future information during training

Answer: A

Q1291. Why do residual connections in ResNet help train very deep networks effectively?

- A. They allow gradients to flow directly through skip connections preventing vanishing
- B. Residual connections double the number of parameters in each layer of network
- C. Residual connections remove the need for any activation functions in the network
- D. They automatically reduce the learning rate as the network depth increases here

Answer: A

Q1292. What is the dying ReLU problem and how is Leaky ReLU a solution?

- A. Dying ReLU only affects the output layer while Leaky ReLU only affects hidden layers
- B. ReLU never has this problem and Leaky ReLU was created for a different purpose
- C. Dying ReLU means the function grows too large while Leaky ReLU caps the output
- D. Neurons with negative inputs permanently output zero and Leaky ReLU allows small negatives

Answer: D

Q1293. How does the attention mechanism in neural networks improve sequence modeling?

- A. It forces the model to process all elements equally regardless of their relevance
- B. It removes the need for any training data by using pre-computed attention weights
- C. It limits the model to processing only the first and last elements of sequences
- D. It allows the model to dynamically focus on relevant parts of the input sequence

Answer: D

Q1294. Why is the choice of weight initialization strategy critical for deep network training?

- A. Weight initialization has no effect on training since optimizers always find the same solution
- B. Weight initialization only matters for the first layer and has no effect on deeper layers
- C. Poor initialization can cause vanishing or exploding activations preventing effective learning
- D. All initialization strategies produce identical results after sufficient training epochs pass

Answer: C

Q1295. What is the lottery ticket hypothesis and its implications for neural network pruning?

- A. It suggests that random network architectures always outperform carefully designed ones
- B. It proves that larger networks always outperform smaller networks without any exceptions
- C. Dense networks contain sparse subnetworks that achieve comparable accuracy when trained alone
- D. It states that all neural network weights are equally important and none can be removed

Answer: C

Q1296. How does knowledge distillation compress a large model into a smaller one?

- A. It copies all weights directly from the large model into the smaller model architecture
- B. It trains the small model only on data that the large model classified incorrectly
- C. A smaller student model learns to mimic the soft output probabilities of a larger teacher
- D. It removes random layers from the large model until the desired size is reached

Answer: C

Q1297. Why do neural architecture search methods face a massive computational challenge?

- A. The challenge is purely theoretical and modern hardware makes NAS trivially inexpensive
- B. NAS only searches over learning rates not architectures so the space is very small
- C. The search space of possible architectures is exponentially large requiring many evaluations
- D. Neural architecture search always converges in a single iteration without much computation

Answer: C

Q1298. What role does the temperature parameter play in softmax for knowledge distillation?

- A. Temperature only affects training speed and has no effect on the output distribution
- B. Temperature is fixed at one and cannot be changed in any softmax implementation ever
- C. Lower temperature always produces better distillation results regardless of the task
- D. Higher temperature produces softer probabilities revealing more about learned similarities

Answer: D

Q1299. How does mixed precision training accelerate deep learning while maintaining accuracy?

- A. It halves the training data to reduce computation time at the cost of some accuracy
- B. It skips every other layer during forward pass to achieve faster computation speed
- C. It uses float16 for most operations and float32 for critical ones reducing memory and time
- D. It uses only 8-bit integers for all computations throughout the entire training process

Answer: C

Q1300. What is the neural tangent kernel framework and why is it theoretically important?

- A. It is a specific type of convolutional kernel used only for image recognition tasks
- B. It is a pruning technique for removing unnecessary connections from trained networks
- C. It is an optimizer that replaces gradient descent for all neural network training
- D. It shows infinite-width networks behave like kernel methods enabling theoretical analysis

Answer: D

Q1301. Why do Vision Transformers require large-scale pre-training to outperform CNNs?

- A. Vision Transformers have fewer parameters than CNNs and need more data to compensate
- B. CNNs always outperform Vision Transformers regardless of the training data scale used
- C. Vision Transformers can only process text data and need pre-training to handle images
- D. ViTs lack inductive biases like locality and translation equivariance that CNNs have

Answer: D

Q1302. How does the Wasserstein loss improve GAN training stability compared to the original formulation?

- A. It eliminates the need for a discriminator network in the adversarial training setup
- B. It provides smoother gradients based on earth mover distance even when distributions differ
- C. Wasserstein loss only works with image generation and not with other data modalities
- D. It uses the same loss as the original GAN but with a different optimizer algorithm

Answer: B

Q1303. What is the computational complexity of self-attention and how do efficient variants address it?

- A. Efficient variants make attention slower but produce more accurate attention weights
- B. Self-attention is $O(n)$ and efficient variants increase it to $O(n^2)$ for accuracy
- C. Self-attention is $O(n^2)$ and variants like Linformer use projections for $O(n)$
- D. Self-attention has constant complexity regardless of the sequence length provided

Answer: C

Q1304. How does the diffusion model generate high-quality images compared to GANs?

- A. They require significantly less training data than GANs to produce comparable results
- B. Diffusion models train adversarially like GANs but with more discriminator networks
- C. Diffusion models generate images in a single forward pass without any iterative steps
- D. They learn to reverse a gradual noising process producing diverse high-quality samples

Answer: D

Q1305. What is the significance of the universal approximation theorem for neural networks?

- A. It guarantees that deeper networks always outperform shallower networks on all tasks
- B. A sufficiently wide single-layer network can approximate any continuous function closely
- C. It states that neural networks can only approximate linear functions and nothing else
- D. It proves that neural networks always find the global optimum during training runs

Answer: B

Q1306. How does neural architecture search with weight sharing reduce computational cost?

- A. It trains each candidate architecture from scratch independently on separate hardware
- B. It searches only over learning rates not architectures making the space much smaller
- C. Multiple architectures share weights from a supernet avoiding full retraining each time
- D. Weight sharing eliminates the need for any gradient computation during architecture search

Answer: C

Q1307. Why is training stability a major challenge in GAN optimization?

- A. GAN training is always stable and converges to the optimal solution every single time
- B. The minimax game between generator and discriminator can oscillate without convergence
- C. The generator and discriminator always converge at the exact same rate making it easy
- D. Stability issues only occur with very small datasets of fewer than hundred total samples

Answer: B

Q1308. How does the mixture of experts architecture achieve computational efficiency in large models?

- A. It reduces model size by removing most parameters from each expert subnetwork
- B. It uses a single large expert for all inputs and ignores the routing mechanism
- C. It routes each input to only a subset of experts reducing computation per sample
- D. It trains all expert networks on every input sample to ensure comprehensive coverage

Answer: C

Q1309. What is the role of contrastive loss in self-supervised representation learning?

- A. It replaces all other loss functions and is the only one used in deep learning
- B. It only works with generative models and cannot be used with discriminative ones
- C. It pulls similar sample representations together and pushes dissimilar ones apart
- D. It requires labeled data pairs to compute the loss function during training phase

Answer: C

Q1310. How does the Flash Attention algorithm improve Transformer training efficiency?

- A. It uses tiling and recomputation to reduce memory IO making attention faster on GPU
- B. Flash Attention only works on CPU hardware and provides no benefit on GPU systems
- C. It reduces attention accuracy to save computation time during the training process
- D. It removes the attention mechanism entirely replacing it with simple averaging only

Answer: A

Q1311. Why do large language models sometimes generate factually incorrect but plausible-sounding text?

- A. LLMs verify all facts against a database before generating any output text content
- B. LLMs always generate perfectly accurate text since they are trained on factual data
- C. Factual errors only occur when the model has fewer than one million total parameters
- D. LLMs learn statistical patterns rather than factual knowledge causing hallucination errors

Answer: D

Q1312. How does the Transformer's multi-head attention provide an advantage over single-head attention?

- A. Multi-head attention is identical to single-head attention and provides no real advantage
- B. Multiple heads only work with image data and provide no benefit for text processing
- C. Multiple heads attend to different representation subspaces capturing diverse relationships
- D. Multi-head attention uses fewer parameters than single-head attention in all cases

Answer: C

Q1313. What is the fundamental challenge of evaluating open-ended text generation models?

- A. Open-ended generation models always produce identical outputs for the same input text
- B. Evaluation is trivial because BLEU score perfectly captures all aspects of text quality
- C. There is always exactly one correct output for any given text generation prompt used
- D. Multiple valid outputs exist making automatic metrics insufficient for quality assessment

Answer: D

Q1314. How does reinforcement learning from human feedback improve language model alignment?

- A. RLHF only affects the tokenizer and has no impact on the language model weights
- B. It fine-tunes the model using a reward signal trained on human preference judgments
- C. It replaces the Transformer architecture with a recurrent neural network approach
- D. RLHF removes all pre-training knowledge and trains the model entirely from scratch

Answer: B

Q1315. Why is the position of negation words critical for sentiment analysis accuracy?

- A. Negation words have no effect on sentiment and can be safely removed during preprocessing
- B. Negation reverses sentiment of subsequent words and mishandling it causes incorrect polarity
- C. Negation only appears in formal text and never occurs in informal social media content
- D. All negation words are stop words and are automatically removed by all NLP pipelines used

Answer: B

Q1316. What is the catastrophic forgetting problem when fine-tuning pre-trained language models?

- A. Catastrophic forgetting only occurs in computer vision models and never in NLP models
- B. The model loses general pre-trained knowledge when heavily adapted to a specific new task
- C. Fine-tuning always improves performance on all tasks simultaneously without any tradeoffs
- D. Fine-tuning adds new knowledge without affecting any previously learned representations

Answer: B

Q1317. How do retrieval-augmented generation models reduce hallucination in language models?

- A. They remove the generative component entirely and only return retrieved document text
- B. They retrieve relevant documents and condition generation on factual source material
- C. RAG models eliminate hallucination completely with a one hundred percent success rate
- D. They increase the model size to store more factual information in the network parameters

Answer: B

Q1318. Why is cross-lingual transfer learning effective for low-resource languages?

- A. Multilingual models learn shared representations that transfer knowledge between languages
- B. Cross-lingual transfer degrades performance on all languages including high-resource ones
- C. Each language requires a completely separate model with no knowledge sharing possible
- D. Cross-lingual transfer only works between languages that share the same script system

Answer: A

Q1319. What is the computational challenge of scaling attention to very long document contexts?

- A. Long documents always produce better results so there is no computational challenge here
- B. Long documents can be processed in constant time regardless of their total length overall
- C. Attention memory and compute scale quadratically with sequence length becoming prohibitive
- D. Attention complexity is independent of sequence length and depends only on model depth

Answer: C

Q1320. How does chain-of-thought prompting improve reasoning in large language models?

- A. It breaks complex problems into intermediate steps allowing systematic reasoning output
- B. It reduces the model's accuracy but makes the output more readable for human reviewers
- C. Chain-of-thought only works for arithmetic and cannot improve any other reasoning tasks
- D. It forces the model to generate the answer in a single token without any explanation

Answer: A

Q1321. Why do adversarial examples pose a serious threat to deployed computer vision systems?

- A. Adversarial examples only affect models during training and never at inference time
- B. All modern CNN architectures are completely immune to any adversarial perturbations
- C. Adversarial examples only exist in theory and cannot be generated for real images
- D. Imperceptible perturbations can cause confident misclassification in production models

Answer: D

Q1322. How does contrastive learning for visual representations reduce dependence on labeled data?

- A. It completely replaces supervised fine-tuning and achieves perfect accuracy on all tasks
- B. Contrastive learning only works with text data and cannot be applied to images ever
- C. It requires more labeled data than supervised learning to achieve comparable accuracy
- D. It learns representations by contrasting augmented views of images without any labels

Answer: D

Q1323. What is the domain adaptation challenge when deploying CV models across different environments?

- A. Distribution differences between training and deployment environments degrade performance
- B. Domain adaptation is only relevant for NLP tasks and does not apply to computer vision
- C. All visual environments produce identical image statistics so adaptation is unnecessary
- D. Models trained in one visual domain always generalize perfectly to all other domains

Answer: A

Q1324. How does the panoptic segmentation task unify semantic and instance segmentation?

- A. It assigns every pixel both a semantic class label and an instance identifier value
- B. It replaces both tasks with a simpler bounding box detection approach for efficiency
- C. Panoptic segmentation only works on outdoor scenes and cannot process indoor images
- D. It only performs semantic segmentation and completely ignores instance-level information

Answer: A

Q1325. Why is 3D object detection from point clouds fundamentally different from 2D image detection?

- A. Point clouds are identical to images and can be processed by standard 2D CNN methods
- B. 3D detection is always easier than 2D detection because more information is available
- C. Point clouds are sparse, unordered, and require specialized architectures like PointNet
- D. Point clouds can only represent indoor environments and not outdoor driving scenarios

Answer: C

Q1326. What is the role of the feature extractor backbone in modern object detection frameworks?

- A. It handles data augmentation and preprocessing before the actual detection begins
- B. It generates the final bounding box predictions and class labels for each object found
- C. The backbone is only used during training and is removed completely during inference
- D. It extracts hierarchical visual features that the detection head uses for predictions

Answer: D

Q1327. How does self-supervised pre-training with masked image modeling work for vision models?

- A. It only works with text-image pairs and cannot be applied to images alone at all
- B. It masks random image patches and trains the model to reconstruct the missing content
- C. It requires fully labeled segmentation maps for every image in the training dataset
- D. It trains models to classify images into predefined categories using labeled datasets

Answer: B

Q1328. Why is temporal consistency important in video object detection and how is it maintained?

- A. Temporal consistency is irrelevant because each video frame should be processed independently
- B. Video frames are always identical so temporal consistency is automatically guaranteed here
- C. Flickering predictions between frames indicate instability and tracking methods enforce consistency
- D. Temporal consistency only matters for video compression and has no effect on detection

Answer: C

Q1329. What is the advantage of vision-language models like CLIP for zero-shot image classification?

- A. They require separate fine-tuning for every possible class label before making predictions
- B. Vision-language models can only classify images into the exact categories seen during training
- C. They always perform worse than supervised models regardless of the number of training classes
- D. They match images to text descriptions enabling classification without task-specific training

Answer: D

Q1330. How does neural radiance field technology enable novel view synthesis from images?

- A. It requires thousands of input images from every possible angle of the target scene
- B. It simply stitches existing images together without any three-dimensional understanding
- C. It learns a volumetric scene representation mapping 3D coordinates to color and density
- D. NeRF only works with synthetic computer-generated scenes and not real-world photographs

Answer: C

Q1331. Why is exactly-once processing semantics challenging to achieve in distributed streaming systems?

- A. Network failures and node crashes can cause duplicates or losses requiring complex protocols
- B. Exactly-once processing is trivial and all modern streaming systems implement it easily
- C. Streaming systems never experience failures so exactly-once is guaranteed automatically
- D. Exactly-once only matters for batch processing and is irrelevant for streaming systems

Answer: A

Q1332. How does the Lambda architecture address the needs of both batch and real-time analytics?

- A. Lambda architecture only supports batch processing and has no real-time component
- B. It maintains separate batch and speed layers that serve a combined serving layer
- C. It uses only a single processing layer for both batch and real-time data analysis
- D. It replaces all batch processing with stream processing for unified data handling

Answer: B

Q1333. What is data skew and why does it degrade performance in distributed processing?

- A. Data skew only affects storage and has no impact on query processing performance
- B. Data skew always improves performance by concentrating work on the fastest machines
- C. All distributed systems automatically handle data skew without any intervention
- D. Uneven data distribution causes some nodes to be overloaded while others sit idle

Answer: D

Q1334. How does the Kappa architecture simplify the Lambda architecture?

- A. Kappa uses only a stream processing layer treating everything as streams eliminating batch
- B. Kappa removes the speed layer and relies solely on batch processing for all analytics
- C. Kappa adds a third processing layer on top of Lambda's existing batch and speed layers
- D. Kappa and Lambda architectures are identical and the terms are completely interchangeable

Answer: A

Q1335. Why is shuffle operation one of the most expensive operations in distributed data processing?

- A. Shuffle operations only move data within a single machine which is very fast operation
- B. Shuffles only occur in batch processing and never happen in stream processing pipelines
- C. Shuffles move data across the network between nodes causing significant IO and latency
- D. Shuffle operations are optimized by all frameworks and never cause performance issues

Answer: C

Q1336. How does delta lake improve upon traditional data lake architectures?

- A. It replaces the distributed file system with a single centralized database for storage
- B. Delta lake removes all structure and stores data as completely unformatted text files
- C. It adds ACID transactions and schema enforcement to data lake storage for reliability
- D. Delta lake only works with structured data and cannot store any unstructured data files

Answer: C

Q1337. What are the tradeoffs between using a wide table versus a normalized schema in big data?

- A. There are no tradeoffs as both approaches produce identical query performance results
- B. Wide tables are always superior to normalized schemas for every possible query pattern
- C. Wide tables reduce joins but increase redundancy while normalized schemas minimize redundancy
- D. Normalized schemas always perform better than wide tables in distributed query engines

Answer: C

Q1338. How does approximate query processing enable faster analytics on massive datasets?

- A. It only works for count queries and cannot approximate any other aggregation types
- B. It produces exact results faster by using more efficient algorithms on all the data present
- C. Approximate processing always produces completely wrong results with no useful insights
- D. It trades some accuracy for speed using sampling and sketches on subsets of the data

Answer: D

Q1339. Why is data lineage tracking important in complex big data pipelines?

- A. Data lineage is only useful for documentation and has no practical operational value
- B. It traces data transformations enabling debugging, compliance, and impact analysis
- C. Data lineage tracking always degrades pipeline performance by more than fifty percent
- D. It only applies to batch processing and cannot track streaming data transformations

Answer: B

Q1340. How does federated learning enable ML on distributed data without centralizing it?

- A. It only works with image data and cannot be applied to tabular or text data formats
- B. Models train locally on each node and only share model updates not raw data for privacy
- C. Federated learning always produces worse models than centralized training on all tasks
- D. It requires all data to be collected in a central location before any training can begin

Answer: B

Q1341. How does a feature store ensure consistency between training and serving in production ML?

- A. Feature stores only handle training features and have no role in serving predictions
- B. It provides a single source of truth for feature definitions and computation logic used
- C. Feature stores always cause training-serving skew due to different code paths in them
- D. It stores raw data only and requires separate feature computation for training and serving

Answer: B

Q1342. Why is reproducibility challenging in ML systems and how does MLOps address it?

- A. ML systems are perfectly reproducible by default and require no additional tooling at all
- B. MLOps makes all models deterministic by fixing random seeds and nothing else is needed
- C. Reproducibility is only important in academic research and irrelevant for production ML
- D. Non-determinism in training, data changes, and environment drift require systematic tracking

Answer: D

Q1343. What is the role of a model registry in enterprise MLOps workflows?

- A. Model registries are only useful for small teams and provide no value at enterprise scale
- B. It automatically trains new models without any human oversight or approval workflows
- C. It manages model lifecycle including versioning, staging, approval, and deployment tracking
- D. It only stores model code and has no capability to track model metadata or lineage

Answer: C

Q1344. How does data-centric AI differ from model-centric AI in improving ML system performance?

- A. Data-centric AI only applies to unstructured data and model-centric to structured data
- B. Data-centric and model-centric approaches are identical and interchangeable in all cases
- C. Data-centric focuses on improving data quality while model-centric focuses on architecture
- D. Model-centric AI never requires any training data and relies solely on model architecture

Answer: C

Q1345. What are the challenges of implementing real-time ML inference at scale?

- A. Real-time inference is trivial to implement and never poses any engineering challenges
- B. All models inherently provide sub-millisecond inference without any optimization needed
- C. Latency requirements, throughput scaling, and model optimization create significant complexity
- D. Real-time inference only works with batch predictions and cannot handle individual requests

Answer: C

Q1346. How does GitOps extend traditional DevOps practices for ML workflow management?

- A. It eliminates the need for any CI/CD pipelines by manually deploying all changes to prod
- B. It uses Git as the single source of truth for declarative infrastructure and ML pipeline config
- C. GitOps replaces Git with a custom version control system designed only for ML artifacts
- D. GitOps only works with data preprocessing and cannot manage model training or deployment

Answer: B

Q1347. Why is testing ML systems more complex than testing traditional software?

- A. Testing ML systems requires only standard unit tests identical to traditional software ones
- B. ML systems are simpler to test because they only require checking if the code compiles
- C. ML involves data dependencies, model behavior, and performance thresholds beyond unit tests
- D. ML systems never need testing because model accuracy guarantees correct system behavior

Answer: C

Q1348. What is the purpose of a model serving framework like TensorFlow Serving or Triton?

- A. They replace the need for any monitoring or logging of deployed model performance metrics
- B. They optimize and serve models efficiently handling batching, versioning, and concurrency
- C. They are only used for training models and have no capability for serving predictions
- D. Model serving frameworks only work with a single model and cannot manage multiple models

Answer: B

Q1349. How does ML governance address regulatory requirements for AI systems in production?

- A. Governance eliminates the need for any model monitoring after initial deployment is done
- B. It only applies to models making financial decisions and not to any other domain areas
- C. It provides audit trails, documentation, fairness monitoring, and compliance frameworks
- D. ML governance is only relevant for academic research and has no production implications

Answer: C

Q1350. What is the concept of ML technical debt and how does it accumulate in production systems?

- A. Technical debt only applies to traditional software and is irrelevant for ML systems always
- B. ML technical debt is automatically resolved by retraining the model on newer data only
- C. ML systems never accumulate technical debt because they are self-maintaining by design
- D. Data dependencies, pipeline complexity, and configuration debt compound over time in systems

Answer: D

Q1351. Why is it mathematically impossible to satisfy all fairness criteria simultaneously in most real-world scenarios?

- A. All fairness criteria can be satisfied simultaneously with enough training data available
- B. Different fairness metrics are fundamentally incompatible when base rates differ across groups
- C. Only linear models face this limitation while neural networks can satisfy all criteria easily
- D. Impossibility only applies to theoretical scenarios and never to practical AI applications

Answer: B

Q1352. How does federated learning attempt to address privacy concerns while enabling collaborative ML?

- A. It trains models locally sharing only model updates while keeping raw data decentralized
- B. It requires centralizing all data from all participants before any model training begins
- C. Federated learning provides no privacy benefits compared to centralized training approaches
- D. It encrypts all data using standard AES encryption and sends it to a central server only

Answer: A

Q1353. What is the value alignment problem in the context of advanced AI systems?

- A. Ensuring AI systems pursue goals consistent with complex and sometimes conflicting human values
- B. Value alignment is only relevant for recommendation systems and not for other AI applications
- C. It refers to aligning model weights with optimal values during the training optimization
- D. It guarantees AI systems will always act in humanity's best interest without any intervention

Answer: A

Q1354. How can model cards and datasheets improve responsible AI development practices?

- A. They replace the need for any testing or evaluation of AI models before deployment occurs
- B. Model cards are only useful for marketing purposes and provide no technical or ethical value
- C. They provide structured documentation about model capabilities, limitations, and intended use
- D. They automatically fix all bias issues in AI models without any human intervention needed

Answer: C

Q1355. What is the tension between model accuracy and fairness in high-stakes AI applications?

- A. Higher accuracy always guarantees better fairness outcomes for all groups simultaneously
- B. Optimizing for fairness constraints may reduce accuracy and vice versa requiring tradeoffs
- C. There is never any tension because accurate models are always fair to all groups by nature
- D. Fairness constraints always improve model accuracy making the tension nonexistent overall

Answer: B

Q1356. How do deepfakes pose unique challenges for AI ethics and society?

- A. They enable realistic fabrication of content undermining trust in media and enabling fraud
- B. Deepfakes are easily detectable by all humans and pose no significant societal challenges
- C. Deepfakes are only used for entertainment purposes and have no potential for misuse ever
- D. Deepfake technology can only produce low-quality content that no one would believe is real

Answer: A

Q1357. Why is the concept of meaningful human oversight important for autonomous AI systems?

- A. Meaningful oversight only applies to AI systems in military applications and no other fields
- B. Humans must retain ability to understand, intervene, and override AI decisions when needed
- C. Human oversight should be completely removed to maximize the efficiency of AI systems now
- D. Autonomous AI systems never make errors so human oversight is unnecessary and wasteful

Answer: B

Q1358. What are the environmental concerns associated with training large AI models?

- A. Training large AI models has no environmental impact and uses negligible energy resources
- B. Large model training consumes significant energy and computing resources increasing carbon footprint
- C. Environmental concerns only apply to models trained on renewable energy sources specifically
- D. Training small models produces more emissions than large models due to lower computational efficiency

Answer: B

Q1359. How does the EU AI Act categorize AI systems based on risk levels?

- A. The EU AI Act bans all AI systems regardless of their risk level or application domain
- B. The EU AI Act only applies to military AI systems and exempts all commercial applications
- C. It treats all AI systems identically without any risk-based categorization or differentiation
- D. It classifies systems into unacceptable, high, limited, and minimal risk with corresponding rules

Answer: D

Q1360. What is the challenge of ensuring AI accountability when AI systems make autonomous decisions?

- A. AI systems can be held legally accountable themselves without any human responsibility needed
- B. Accountability is only relevant when AI causes physical harm and not for any other type of impact
- C. AI accountability is straightforward since the developer is always clearly responsible for everything
- D. Complex AI systems make it difficult to attribute responsibility across developers, deployers, and users

Answer: D

Q1361. What is the Moravec paradox in AI research?

- A. Simple computational tasks are harder for AI than complex reasoning
- B. High-level reasoning requires less computation than sensorimotor skills
- C. AI systems excel at tasks humans find easy but struggle with tasks humans find hard
- D. Tasks easy for humans like perception and mobility are extremely hard for AI while abstract reasoning is comparatively easier

Answer: D

Q1362. What is the difference between deductive and inductive reasoning in AI systems?

- A. They are identical approaches
- B. Deductive reasoning goes from general rules to specific conclusions while inductive reasoning infers general rules from specific observations
- C. Deductive reasoning is always better than inductive
- D. Inductive reasoning does not use data

Answer: B

Q1363. What is the computational theory of mind and how does it relate to AI?

- A. Computers are conscious beings
- B. The mind operates like a computational system processing information, providing theoretical basis for AI
- C. All computations are intelligent
- D. Minds cannot be modeled computationally

Answer: B

Q1364. What is the Bitter Lesson identified by Rich Sutton in AI research?

- A. AI research is always unsuccessful
- B. General methods leveraging computation scale better than methods leveraging human domain knowledge
- C. Human knowledge is always superior to machine learning
- D. Smaller models always outperform larger ones

Answer: B

Q1365. What is the concept of emergence in complex AI systems?

- A. AI systems always behave predictably
- B. Complex behaviors and capabilities arising from simpler components that were not explicitly programmed
- C. All AI capabilities must be manually coded
- D. Emergence only occurs in biological systems

Answer: B

Q1366. How does the concept of bounded rationality apply to AI agent design?

- A. AI agents always have unlimited resources
- B. Agents must make satisficing decisions due to limited computational resources and information
- C. Bounded rationality means AI cannot learn
- D. It only applies to human decision-making

Answer: B

Q1367. What is the difference between symbolic AI and connectionist AI?

- A. They are the same approach
- B. Symbolic AI uses explicit rules and logic while connectionist AI uses neural networks to learn representations
- C. Symbolic AI is always superior
- D. Connectionist AI does not use mathematics

Answer: B

Q1368. What is the scaling hypothesis in modern AI research?

- A. Smaller models are always better
- B. Increasing model size, data, and compute will continue to yield improved capabilities and potentially lead to more general intelligence
- C. Scaling always leads to diminishing returns
- D. AI models cannot be scaled beyond a fixed size

Answer: B

Q1369. What is the concept of an AI winter and what historically caused them?

- A. A season when AI labs close for vacation
- B. Periods of reduced funding and interest in AI due to unmet expectations and hype cycles
- C. AI systems that only work in cold temperatures
- D. A type of cooling system for AI hardware

Answer: B

Q1370. What is multi-task learning and why can it improve generalization?

- A. Training separate models for each task independently
- B. Training a single model on multiple related tasks simultaneously so shared representations improve performance on each task
- C. It always reduces model accuracy
- D. Multi-task learning only works for image tasks

Answer: B

Q1371. Why is the softmax function a generalization of the sigmoid function for multiple classes?

- A. They are completely unrelated functions
- B. Softmax reduces to sigmoid for the two-class case and extends the logistic function to produce a probability distribution over K classes
- C. Sigmoid is more general than softmax
- D. Softmax only works with two classes

Answer: B

Q1372. What is the connection between maximum likelihood estimation and cross-entropy loss?

- A. They are unrelated concepts
- B. Minimizing cross-entropy loss is mathematically equivalent to maximizing the log-likelihood of the data under the model
- C. Cross-entropy always equals zero
- D. MLE does not apply to classification

Answer: B

Q1373. What is the significance of the spectral norm of a matrix in deep learning?

- A. It only applies to image processing
- B. The largest singular value that controls the Lipschitz constant and affects training stability in neural networks
- C. It is the sum of all matrix elements
- D. It measures matrix sparsity

Answer: B

Q1374. How does the reparameterization trick enable backpropagation through stochastic nodes?

- A. It removes all randomness from the model
- B. It separates the stochastic component from learnable parameters so gradients can flow through the deterministic path
- C. It doubles the learning rate
- D. It is only used in supervised learning

Answer: B

Q1375. What is the role of the Lagrangian in constrained optimization for ML?

- A. It is a type of neural network layer
- B. It converts constrained optimization into an unconstrained problem by incorporating constraints as penalty terms with multipliers
- C. It only applies to linear regression
- D. It eliminates the need for gradient descent

Answer: B

Q1376. Why is the positive semi-definiteness of a kernel matrix required in kernel methods?

- A. It makes computation faster
- B. It ensures the kernel implicitly computes inner products in a valid feature space per Mercer's theorem
- C. It is not actually required
- D. It guarantees the matrix is invertible

Answer: B

Q1377. What is the information-theoretic interpretation of entropy in machine learning?

- A. It measures dataset size
- B. It quantifies the expected amount of information or uncertainty in a random variable's outcomes
- C. It is the same as variance
- D. It only applies to text data

Answer: B

Q1378. How does the matrix rank relate to the information content of a dataset?

- A. Rank always equals the number of rows
- B. The rank indicates the number of linearly independent dimensions, revealing the true dimensionality and potential redundancy in the data
- C. Rank is always equal to one
- D. It measures the speed of matrix operations

Answer: B

Q1379. What is the relationship between the trace of a matrix and eigenvalues?

- A. They are unrelated
- B. The trace equals the sum of eigenvalues, connecting matrix operations to spectral properties
- C. The trace is always zero
- D. Eigenvalues cannot be summed

Answer: B

Q1380. Why does stochastic gradient descent converge despite using noisy gradient estimates?

- A. It does not actually converge
- B. Under conditions of decreasing learning rates and bounded variance, the noise averages out and SGD converges to a local minimum
- C. SGD always finds the global minimum
- D. Noise prevents any form of convergence

Answer: B

Q1381. How does Python's garbage collector handle circular references?

- A. It cannot handle them at all
- B. It uses a generational garbage collector that detects and collects reference cycles beyond simple reference counting
- C. Circular references never occur in Python
- D. It requires manual memory management

Answer: B

Q1382. What is the purpose of `__init__.py` in Python packages?

- A. It initializes variables to zero
- B. It marks a directory as a Python package, can run initialization code, and controls what is exported via `__all__`
- C. It is required for every Python file
- D. It only contains comments

Answer: B

Q1383. Why is joblib preferred over pickle for serializing scikit-learn models with large NumPy arrays?

- A. Joblib is newer and therefore better
- B. Joblib efficiently handles large NumPy arrays by using memory mapping and optimized serialization for numerical data
- C. Pickle cannot serialize any ML models
- D. Joblib produces smaller files for all data types

Answer: B

Q1384. What is the difference between asyncio and multiprocessing for concurrent ML workloads?

- A. They are identical approaches
- B. asyncio handles I/O-bound concurrency in a single thread while multiprocessing uses separate processes for CPU-bound parallelism
- C. asyncio is always faster
- D. multiprocessing cannot be used for ML

Answer: B

Q1385. How do Python descriptors work and where are they used in ML frameworks?

- A. They describe variable names
- B. Descriptors are objects defining `__get__`, `__set__`, or `__delete__` methods that control attribute access, used in frameworks for parameter validation and lazy loading
- C. They are only used for printing
- D. Descriptors are a type of loop

Answer: B

Q1386. What are metaclasses in Python and how do ML frameworks use them?

- A. They are classes that define how other classes are created, used in frameworks for automatic registration and validation of model components
- B. They are a type of data structure
- C. Metaclasses only exist in Java
- D. They are the same as abstract classes

Answer: A

Q1387. Why is using `numpy.random.Generator` preferred over the legacy `numpy.random` functions?

- A. It produces the same results
- B. Generator provides better statistical properties, reproducibility via explicit seed management, and thread safety compared to the global random state
- C. Legacy functions are faster
- D. There is no difference in practice

Answer: B

Q1388. How does Cython improve performance for computationally intensive ML code?

- A. It replaces Python entirely
- B. It compiles Python-like code to C, enabling static type declarations and direct C-level operations that bypass Python interpreter overhead
- C. Cython only works for web applications
- D. It automatically parallelizes all code

Answer: B

Q1389. What is the purpose of the `__repr__` and `__str__` methods in custom ML classes?

- A. They delete the object
- B. `__repr__` provides an unambiguous developer-facing representation while `__str__` provides a user-friendly readable string
- C. They are identical methods
- D. They are used for encryption

Answer: B

Q1390. What is the advantage of using Python's dataclasses for ML configuration management?

- A. They are faster than regular classes
- B. They auto-generate `__init__`, `__repr__`, `__eq__` and support type hints, reducing boilerplate for configuration objects while maintaining readability
- C. They cannot store numerical data
- D. They replace all other class types

Answer: B

Q1391. How does the iterative imputer (MICE) handle missing data differently from simple imputation?

- A. It deletes rows with missing values
- B. It models each feature with missing values as a function of other features, iterating until convergence
- C. It only replaces with the mean
- D. It requires complete data to begin

Answer: B

Q1392. Why can target encoding with naive implementation cause severe overfitting?

- A. It removes too many features
- B. Target information leaks into the encoded features, and rare categories get unreliable statistics that overfit to training noise
- C. It always underfits
- D. Target encoding is never problematic

Answer: B

Q1393. What is the impact of applying StandardScaler before train-test split versus after?

- A. There is no difference either way
- B. Applying before split causes data leakage because test set statistics influence the scaling parameters
- C. Applying after split is always wrong
- D. It only matters for deep learning

Answer: B

Q1394. How does ADASYN differ from SMOTE for handling class imbalance?

- A. They are identical algorithms
- B. ADASYN adaptively generates more synthetic samples for harder-to-learn minority instances near the decision boundary
- C. ADASYN only works for regression
- D. SMOTE generates more samples than ADASYN

Answer: B

Q1395. Why is preprocessing streaming data fundamentally different from batch preprocessing?

- A. Streaming data is always cleaner
- B. Streaming requires online or incremental algorithms that update statistics without access to the full dataset and must handle concept drift
- C. There is no practical difference
- D. Streaming data does not need preprocessing

Answer: B

Q1396. What is the optimal approach for preprocessing features with mixed distributions in a single dataset?

- A. Apply the same transformation to all features
- B. Use column transformers to apply different preprocessing pipelines to different feature subsets based on their characteristics
- C. Always use StandardScaler for everything
- D. Mixed distributions cannot be preprocessed

Answer: B

Q1397. How does quantile transformation make features follow a uniform or normal distribution?

- A. It multiplies all values by a constant
- B. It maps values to their cumulative distribution percentiles, then applies the inverse CDF of the target distribution
- C. It sorts values alphabetically
- D. It only works for binary features

Answer: B

Q1398. What challenges arise when preprocessing data with concept drift in production systems?

- A. No challenges arise since preprocessing is static
- B. Preprocessing statistics become stale as data distributions shift, requiring adaptive monitoring and periodic recalibration of transformers
- C. Concept drift only affects model weights
- D. Production systems never have concept drift

Answer: B

Q1399. Why is entity resolution important when integrating data from multiple sources?

- A. It improves data encryption
- B. It identifies and merges records referring to the same real-world entity despite different representations across sources
- C. It is only relevant for social media data
- D. Entity resolution deletes all duplicate data

Answer: B

Q1400. How does differential privacy noise injection during preprocessing protect sensitive data?

- A. It makes data completely useless
- B. It adds calibrated random noise that provides mathematical privacy guarantees while preserving aggregate statistical properties
- C. It encrypts individual records
- D. Noise injection always destroys data utility

Answer: B

Q1401. How can principal component analysis be used as an EDA tool for high-dimensional data?

- A. PCA is only for model training
- B. PCA reduces dimensions while preserving variance, enabling 2D/3D visualization that reveals clusters, outliers, and structure invisible in individual features
- C. PCA removes all data variation
- D. PCA only works for two features

Answer: B

Q1402. What is the Anscombe quartet and what lesson does it teach about EDA?

- A. It is a type of neural network
- B. Four datasets with identical summary statistics but drastically different distributions, demonstrating the necessity of visualization over summary statistics alone
- C. It is a data compression algorithm
- D. It is a type of hypothesis test

Answer: B

Q1403. How does mutual information provide a more general dependency measure than correlation in EDA?

- A. Mutual information is identical to correlation
- B. Mutual information captures any statistical dependency including nonlinear relationships, while correlation only measures linear association
- C. It only works for binary variables
- D. Mutual information is always zero

Answer: B

Q1404. Why might the Durbin-Watson statistic be crucial for EDA in regression analysis?

- A. It measures data size
- B. It detects autocorrelation in residuals, which violates regression assumptions and can lead to unreliable coefficient estimates and confidence intervals
- C. It only applies to classification
- D. It is a measure of accuracy

Answer: B

Q1405. What is the purpose of Cook's distance in regression EDA?

- A. To measure cooking time for algorithms
- B. To identify influential observations whose removal would substantially change the regression model's fitted values
- C. To measure the distance between clusters
- D. To compute feature importance

Answer: B

Q1406. How does the Kolmogorov-Smirnov test differ from the Anderson-Darling test for distribution testing?

- A. They are identical tests
- B. K-S measures the maximum difference between CDFs (sensitive to the center) while Anderson-Darling gives more weight to tails, better detecting tail deviations
- C. K-S is always more powerful
- D. Anderson-Darling cannot test normality

Answer: B

Q1407. What is the ecological fallacy and how can it mislead EDA conclusions?

- A. It is a type of environmental data
- B. Drawing conclusions about individuals based on aggregate group data, which can be misleading because group-level patterns may not hold for individuals
- C. It only occurs in biological data
- D. It is the same as Simpson's paradox

Answer: B

Q1408. How can SHAP summary plots enhance EDA by revealing feature-target relationships?

- A. SHAP only works after model deployment
- B. SHAP summary plots show each feature's impact on predictions across the dataset, revealing nonlinear relationships and interaction effects invisible in standard correlation analysis
- C. SHAP replaces all other EDA methods
- D. SHAP only works for linear models

Answer: B

Q1409. What is the Mahalanobis distance and why is it superior to Euclidean distance for multivariate outlier detection?

- A. It is the same as Euclidean distance
- B. It accounts for correlations and variances of features, correctly identifying outliers in correlated multivariate data where Euclidean distance fails
- C. It only works for two dimensions
- D. It ignores feature correlations

Answer: B

Q1410. How does the concept of data granularity affect EDA conclusions and subsequent modeling?

- A. Granularity has no effect on analysis
- B. The level of detail in data aggregation affects visible patterns, and analyzing at wrong granularity can hide important trends or create misleading artifacts
- C. Finer granularity is always better
- D. Granularity only matters for images

Answer: B

Q1411. What is the PAC learning framework and what does it guarantee?

- A. It is a data format standard
- B. It provides theoretical guarantees that a learning algorithm will probably approximately correctly learn a concept given sufficient data and computation
- C. It is a type of neural network
- D. PAC stands for Parallel Adaptive Computing

Answer: B

Q1412. How does Bayesian linear regression differ from ordinary least squares?

- A. They are mathematically identical
- B. Bayesian regression treats parameters as distributions rather than point estimates, incorporating prior beliefs and providing uncertainty quantification
- C. Bayesian regression cannot handle multiple features
- D. OLS always provides better predictions

Answer: B

Q1413. What is the dual formulation of SVM and why is it computationally advantageous?

- A. It doubles the training time
- B. The dual formulation expresses the problem in terms of inner products between data points, enabling the kernel trick and being more efficient when features outnumber samples
- C. It is only for linear problems
- D. The dual formulation always gives different results

Answer: B

Q1414. What is the relationship between logistic regression and maximum entropy models?

- A. They are completely unrelated
- B. Logistic regression is equivalent to a maximum entropy model with the same feature functions, both finding the least biased distribution consistent with observed data
- C. Maximum entropy is only for physics
- D. Logistic regression has higher entropy

Answer: B

Q1415. How does the Rademacher complexity bound relate to model generalization?

- A. It measures training speed
- B. It bounds the generalization gap by measuring how well the hypothesis class can fit random noise, with lower complexity indicating better generalization
- C. It is a type of activation function
- D. It only applies to unsupervised learning

Answer: B

Q1416. What is the difference between model stability and model accuracy in supervised learning?

- A. They always improve together
- B. Stability measures how much predictions change with small data perturbations while accuracy measures correctness, and there can be tradeoffs between them
- C. They are identical metrics
- D. Stability is irrelevant for good models

Answer: B

Q1417. Why can high-dimensional feature spaces make linear separability more likely?

- A. They always make classification harder
- B. Cover's theorem states that complex patterns are more likely to be linearly separable when projected into high-dimensional spaces
- C. High dimensions reduce data quality
- D. Linear separability is independent of dimensionality

Answer: B

Q1418. What is conformal prediction and how does it provide prediction guarantees?

- A. It is a type of data augmentation
- B. It produces prediction sets with a guaranteed coverage probability by using nonconformity scores from calibration data, requiring minimal distributional assumptions
- C. It only works for regression
- D. It is another name for Bayesian prediction

Answer: B

Q1419. How does quantile regression differ from ordinary least squares regression?

- A. They produce identical outputs
- B. Quantile regression estimates conditional quantiles rather than the conditional mean, providing a more complete picture of the response distribution
- C. Quantile regression is simpler than OLS
- D. OLS estimates all quantiles simultaneously

Answer: B

Q1420. What is the theory behind margin-based generalization bounds in classification?

- A. Margins are irrelevant to generalization
- B. Larger classification margins imply tighter generalization bounds because the model is more robust to perturbations, connecting SVM margins to PAC-Bayes theory
- C. Smaller margins always generalize better
- D. Margin theory only applies to linear models

Answer: B

Q1421. How does the second-order Taylor expansion in XGBoost's objective improve optimization?

- A. It makes training slower
- B. Using both first and second derivatives of the loss function provides curvature information for more accurate leaf value estimation and better splitting decisions
- C. It eliminates the need for a loss function
- D. Second-order expansion is identical to first-order

Answer: B

Q1422. What is the relationship between ensemble diversity and error reduction?

- A. Diversity is irrelevant to error
- B. The error of an ensemble is bounded by the average individual error minus a term proportional to diversity, so greater diversity leads to larger error reduction
- C. Maximum diversity always gives zero error
- D. Identical models give the best ensemble

Answer: B

Q1423. How does CatBoost's ordered boosting address target leakage in gradient boosting?

- A. It does not address target leakage
- B. It computes residuals using only previously seen observations in a random permutation, preventing the model from using future target information
- C. It removes all categorical features
- D. It uses the same ordering for all iterations

Answer: B

Q1424. What is the effect of correlation between base learners on ensemble variance reduction?

- A. Correlation has no effect
- B. Higher correlation between base learners reduces the variance reduction benefit, as the ensemble variance includes the average pairwise correlation term
- C. High correlation improves ensembles
- D. Correlation is impossible between ensemble members

Answer: B

Q1425. What is Shapley value-based feature importance and how does it improve upon impurity-based importance?

- A. They are identical measures
- B. Shapley values provide theoretically fair attribution by considering all possible feature coalitions, avoiding the bias toward high-cardinality features that affects impurity-based importance
- C. Shapley values are faster to compute
- D. Impurity-based importance is always more accurate

Answer: B

Q1426. Why can gradient boosting be interpreted as gradient descent in function space?

- A. It cannot be interpreted that way
- B. Each boosting iteration adds a function (tree) that approximates the negative gradient of the loss in function space, minimizing the loss by taking steps in the space of functions
- C. It only uses numerical gradients
- D. Function space interpretation is purely theoretical

Answer: B

Q1427. What is the computational complexity advantage of histogram-based gradient boosting?

- A. It has no advantage
- B. Binning continuous features into discrete histograms reduces split finding from $O(n \cdot \text{features})$ to $O(\text{bins} \cdot \text{features})$ per level, dramatically speeding up training on large datasets
- C. It increases memory usage
- D. It only works for categorical features

Answer: B

Q1428. How does the concept of complementarity differ from diversity in ensemble design?

- A. They are identical concepts
- B. Diversity means models make different errors, while complementarity means models' errors compensate each other in a way that benefits the combined prediction
- C. Complementarity is about feature selection
- D. Diversity is always sufficient for good ensembles

Answer: B

Q1429. What is the theoretical justification for why Random Forest's OOB error is a good estimate of generalization error?

- A. OOB error is not a good estimate
- B. Each sample is evaluated only by trees that did not include it in their bootstrap sample, making OOB predictions equivalent to cross-validation predictions
- C. OOB always overestimates error
- D. It is only valid for small datasets

Answer: B

Q1430. What is the multi-armed bandit approach to dynamic ensemble selection?

- A. It is a type of card game
- B. It treats each base model as an arm, dynamically selecting models for each prediction based on their recent performance using exploration-exploitation strategies
- C. It always selects all models
- D. It only works for binary classification

Answer: B

Q1431. What is the theoretical connection between K-Means and Gaussian Mixture Models?

- A. They are completely unrelated
- B. K-Means can be viewed as a special case of GMM where all covariances are equal isotropic matrices and cluster assignments become hard as variance approaches zero
- C. GMM is a simpler version of K-Means
- D. K-Means uses probabilistic assignments

Answer: B

Q1432. How does HDBSCAN improve upon DBSCAN for clusters of varying density?

- A. It uses the same algorithm as DBSCAN
- B. HDBSCAN builds a hierarchy of DBSCAN clusterings over all epsilon values and extracts the most stable clusters, automatically handling varying densities
- C. It requires the user to specify more parameters
- D. It only works for uniform density clusters

Answer: B

Q1433. Why does the curse of dimensionality particularly affect distance-based clustering algorithms?

- A. It has no effect on clustering
- B. In high dimensions, distances between points converge making clusters indistinguishable, and the volume of the space grows exponentially requiring exponentially more data
- C. High dimensions always improve clustering
- D. Distance-based algorithms are immune to dimensionality

Answer: B

Q1434. What is the information bottleneck method in unsupervised learning?

- A. A physical bottleneck in data pipelines
- B. A method that finds compressed representations that retain maximum mutual information with a relevant variable while discarding irrelevant information
- C. It only applies to autoencoders
- D. It is the same as PCA

Answer: B

Q1435. How does the Wasserstein distance provide a more meaningful comparison between distributions than KL divergence for clustering?

- A. They are mathematically equivalent
- B. Wasserstein distance accounts for the geometry of the space and is defined even when distributions have non-overlapping support, unlike KL divergence which becomes infinite
- C. KL divergence is always better
- D. Wasserstein distance cannot be computed

Answer: B

Q1436. What is the relationship between spectral clustering and graph partitioning?

- A. They are unrelated
- B. Spectral clustering constructs a similarity graph, then uses eigenvalues of the graph Laplacian to partition it, making clustering equivalent to the normalized graph cut problem
- C. Spectral clustering does not use graphs
- D. Graph partitioning is a supervised method

Answer: B

Q1437. Why is the Evidence Lower Bound (ELBO) used as the training objective in variational autoencoders?

- A. It is simpler than reconstruction error
- B. The true log-likelihood is intractable, so ELBO provides a tractable lower bound that combines reconstruction quality with regularization of the latent space
- C. ELBO is the same as MSE loss
- D. It is only used for classification

Answer: B

Q1438. What is the stability-based approach to determining the number of clusters?

- A. It always selects $K=2$
- B. It evaluates how consistently clustering solutions are reproduced under data perturbations, with the correct K yielding the most stable results
- C. It measures computational stability
- D. It only works for DBSCAN

Answer: B

Q1439. How does deep embedded clustering combine deep learning with clustering?

- A. It uses a single K-Means step
- B. It jointly optimizes a deep autoencoder's feature representation and cluster assignments, iteratively refining both the embedding and clusters
- C. It only uses linear transformations
- D. It is identical to standard K-Means

Answer: B

Q1440. What is the fundamental problem of identifiability in mixture models?

- A. Mixture models always produce unique solutions
- B. The likelihood function has multiple equivalent optima due to label switching and potential parameter degeneracies, making the solution non-unique
- C. Identifiability only matters for deep learning
- D. Mixture models have no parameters

Answer: B

Q1441. What is the relationship between the Brier score and model calibration?

- A. Brier score only measures discrimination
- B. The Brier score can be decomposed into calibration, refinement, and uncertainty components, making it sensitive to both calibration and discrimination
- C. Brier score ignores calibration
- D. It is only useful for multi-class problems

Answer: B

Q1442. Why might the McNemar test be more appropriate than paired t-test for comparing classifiers?

- A. They test the same thing
- B. McNemar's test compares classifiers based on their disagreement patterns on specific samples rather than aggregate metrics, providing more statistical power
- C. McNemar test requires more data
- D. Paired t-test is always more powerful

Answer: B

Q1443. What is the purpose of permutation testing for model evaluation?

- A. To permute the features
- B. To establish a null distribution by repeatedly shuffling labels and retraining, determining if the model's performance is significantly better than chance
- C. It always validates the model
- D. Permutation tests only work for linear models

Answer: B

Q1444. How does the concept of distribution shift affect model evaluation in production?

- A. Distribution shift never occurs in practice
- B. When production data differs from training/test data distribution, held-out test performance overestimates real-world performance, requiring ongoing monitoring
- C. Distribution shift only affects accuracy
- D. It can be completely prevented by larger test sets

Answer: B

Q1445. What is the purpose of isotonic regression in model calibration?

- A. It is a type of linear regression
- B. Isotonic regression fits a non-decreasing step function to map model scores to calibrated probabilities, more flexible than Platt scaling
- C. It always produces worse calibration
- D. It is only used for regression models

Answer: B

Q1446. What is the effective sample size problem in cross-validation and how does it affect reliability?

- A. Cross-validation always gives reliable estimates
- B. When data is limited, cross-validation folds share training data making fold estimates correlated, violating independence assumptions and causing underestimation of variance
- C. It only affects large datasets
- D. Effective sample size is always equal to dataset size

Answer: B

Q1447. Why is the area under the precision-recall curve more informative than ROC-AUC for highly imbalanced problems?

- A. ROC-AUC is always more informative
- B. PR-AUC is sensitive to the absolute number of false positives which dominates in imbalanced settings, while ROC-AUC can be misleadingly high due to the large number of true negatives
- C. PR-AUC and ROC-AUC always agree
- D. PR-AUC ignores the positive class

Answer: B

Q1448. What is the difference between prospective and retrospective evaluation of ML models?

- A. They are the same approach
- B. Prospective evaluation tests on future data collected after model training while retrospective uses historical held-out data, with prospective being more reliable for deployment
- C. Retrospective is always better
- D. Prospective evaluation uses training data

Answer: B

Q1449. How does the concept of metric elicitation help select the right evaluation metric?

- A. It always selects accuracy
- B. Metric elicitation formally derives the optimal evaluation metric from stakeholder preferences about the relative costs of different types of errors
- C. It selects metrics randomly
- D. It only applies to unsupervised learning

Answer: B

Q1450. What is the limitation of using a single train-test split for model evaluation and how does repeated stratified K-fold address it?

- A. Single splits are always sufficient
- B. A single split gives high variance estimates dependent on the specific random partition, while repeated stratified K-fold averages over multiple splits and preserves class ratios for more stable estimates
- C. Repeated K-fold is always worse
- D. Single splits are only bad for small datasets

Answer: B

Q1451. How does the Boruta algorithm determine feature relevance compared to regular feature importance?

- A. It uses the same approach as Random Forest importance
- B. Boruta creates shadow features by shuffling original features and compares each real feature's importance against the maximum shadow importance over multiple iterations
- C. It only removes constant features
- D. It is faster than simple importance ranking

Answer: B

Q1452. What is the concept of feature store consistency between training and serving?

- A. It means using the same programming language
- B. Feature store consistency ensures the same feature computation logic and transformations are applied during both model training and real-time inference, preventing training-serving skew
- C. It only matters for batch processing
- D. Consistency is guaranteed automatically

Answer: B

Q1453. Why might learned embeddings outperform manually engineered features for categorical variables?

- A. Manual features are always superior
- B. Embeddings learn dense representations that capture latent semantic relationships between categories in the context of the specific task, beyond what manual encoding schemes can express
- C. Embeddings only work for text
- D. Manual features capture more relationships

Answer: B

Q1454. How does automated feature engineering with deep feature synthesis work?

- A. It uses deep learning only
- B. DFS automatically generates features by stacking aggregation and transformation primitives across relational tables, systematically exploring the feature space
- C. It only creates simple averages
- D. It requires no data

Answer: B

Q1455. What is the theoretical basis for why polynomial feature expansion can lead to overfitting?

- A. Polynomials never cause overfitting
- B. The VC dimension grows rapidly with polynomial degree, increasing model capacity exponentially and requiring exponentially more data to avoid overfitting
- C. Polynomials always underfit
- D. Overfitting is unrelated to feature expansion

Answer: B

Q1456. How does entity embedding of categorical variables from neural networks transfer to tree-based models?

- A. It cannot be transferred
- B. Entity embeddings learned by neural networks can be extracted and used as numerical features in tree-based models, combining the representation learning of deep learning with the strengths of gradient boosting
- C. Tree models always outperform embeddings
- D. Neural embeddings are incompatible with trees

Answer: B

Q1457. What is the stability selection method and how does it improve feature selection reliability?

- A. It selects the most stable features across time
- B. Stability selection repeatedly subsamples data and applies feature selection, keeping features that are consistently selected across many subsamples, controlling false discovery rate
- C. It uses the same selection every time
- D. It only works for regression

Answer: B

Q1458. Why is the order of feature engineering steps important in a preprocessing pipeline?

- A. Order never matters
- B. Transformations are not commutative: scaling before encoding produces different results than encoding before scaling, and incorrect ordering can introduce data leakage or distort distributions
- C. All orderings produce identical results
- D. Only the last step matters

Answer: B

Q1459. How do feature interactions affect the performance gap between linear and nonlinear models?

- A. Interactions are irrelevant to model choice
- B. When important feature interactions exist, linear models require explicit interaction features while tree-based models discover them automatically, explaining their performance advantage
- C. Linear models automatically detect interactions
- D. Nonlinear models cannot use interactions

Answer: B

Q1460. What is the concept of leakage-free feature engineering in production ML systems?

- A. It is impossible to prevent leakage
- B. Ensuring all features are computed using only information available at prediction time and that no future or target information contaminates features during training or serving
- C. Leakage only occurs in training
- D. Production systems never have leakage

Answer: B

Q1461. What is the connection between information theory and deep learning through the Information Bottleneck principle?

- A. Information theory is irrelevant to deep learning
- B. Each layer progressively compresses input information while retaining information relevant to the output, balancing compression and prediction
- C. Information always increases through layers
- D. The Information Bottleneck only applies to autoencoders

Answer: B

Q1462. What is the double descent phenomenon in deep learning?

- A. Models always improve with more parameters
- B. Test error shows a classical U-shaped curve then decreases again in the over-parameterized regime, challenging classical bias-variance intuitions
- C. It only occurs with small datasets
- D. Double descent means training the model twice

Answer: B

Q1463. How do implicit biases of gradient descent favor certain solutions in over-parameterized networks?

- A. Gradient descent always finds the worst solution
- B. SGD implicitly regularizes toward flat minima with small norm weights, which tend to generalize better, even without explicit regularization
- C. Gradient descent has no bias
- D. Implicit bias only affects small networks

Answer: B

Q1464. What is the Sharpness-Aware Minimization technique and why does it improve generalization?

- A. It sharpens image inputs
- B. SAM seeks parameters in regions where the loss landscape is uniformly low rather than just at a single low point, finding flatter minima that generalize better
- C. It makes the loss function sharper
- D. SAM only works for classification

Answer: B

Q1465. What is the role of the Hessian spectrum in understanding neural network optimization?

- A. The Hessian is not relevant to optimization
- B. The eigenvalue distribution of the Hessian reveals the loss landscape geometry, with a few large eigenvalues and many near-zero values indicating low effective dimensionality
- C. The Hessian spectrum is always flat
- D. It only applies to linear models

Answer: B

Q1466. How does neural network pruning maintain accuracy while reducing model size?

- A. Pruning always degrades accuracy significantly
- B. Over-parameterized networks contain redundant connections, and structured or unstructured pruning can remove a large fraction of weights with minimal accuracy loss, especially with fine-tuning
- C. Pruning only removes input features
- D. It only works for convolutional networks

Answer: B

Q1467. What is the difference between post-training quantization and quantization-aware training?

- A. They are identical approaches
- B. Post-training quantization converts a trained model's weights to lower precision, while quantization-aware training simulates quantization during training for better accuracy retention
- C. Post-training is always better
- D. Quantization-aware training uses higher precision

Answer: B

Q1468. Why does batch normalization enable higher learning rates?

- A. It has no effect on learning rates
- B. By normalizing layer inputs, batch norm reduces internal covariate shift and smooths the loss landscape, allowing larger learning rate steps without divergence
- C. It only affects the first layer
- D. Batch norm always reduces learning rates

Answer: B

Q1469. What is the grokking phenomenon in deep learning?

- A. A standard training pattern
- B. A delayed generalization where a model memorizes training data first and only much later suddenly learns to generalize, well past the point of overfitting
- C. Grokking means fast convergence
- D. It only occurs in shallow networks

Answer: B

Q1470. How does the loss of plasticity problem affect continually trained neural networks?

- A. Plasticity always increases with training
- B. Networks gradually lose the ability to learn new tasks as training progresses, due to dead neurons, saturated weights, and reduced effective learning capacity
- C. Loss of plasticity only affects small models
- D. It is the same as catastrophic forgetting

Answer: B

Q1471. How does the Transformer's multi-head attention improve upon single-head attention?

- A. It uses more memory without benefit
- B. Multiple heads attend to different representation subspaces at different positions simultaneously, capturing diverse relational patterns that a single head cannot
- C. More heads always reduce performance
- D. Multi-head is computationally cheaper

Answer: B

Q1472. What is the theoretical basis behind why deeper networks can represent functions more efficiently than wider shallow ones?

- A. Depth has no theoretical advantage
- B. Depth enables compositional representation where complex functions are built hierarchically from simpler sub-functions, achieving exponential efficiency over shallow networks for certain function classes
- C. Wider networks are always more efficient
- D. Deep and shallow networks have equal capacity

Answer: B

Q1473. How does the score-based diffusion model formulation connect to stochastic differential equations?

- A. They are unrelated
- B. Diffusion models can be formulated as continuous-time SDEs where the forward process adds noise and the reverse process removes it, with the score function learned by the neural network guiding denoising
- C. SDEs are only for financial modeling
- D. Diffusion models use deterministic equations only

Answer: B

Q1474. What is the fundamental trade-off in designing efficient Transformer architectures?

- A. There is no trade-off
- B. Reducing the quadratic $O(n^2)$ attention complexity to linear or sub-quadratic while preserving the model's ability to capture long-range dependencies and global context
- C. Efficiency always improves accuracy
- D. Transformer efficiency only depends on model size

Answer: B

Q1475. How does LoRA enable efficient fine-tuning of large pre-trained models?

- A. It retrains all parameters
- B. LoRA freezes pre-trained weights and injects trainable low-rank decomposition matrices into attention layers, dramatically reducing trainable parameters while maintaining performance
- C. It deletes unused parameters
- D. LoRA only works for small models

Answer: B

Q1476. What is the role of the exponential moving average of model weights in improving generalization?

- A. It speeds up training only
- B. EMA maintains a smoothed version of weights that averages over the training trajectory, effectively ensembling models from different training stages and finding flatter minima
- C. EMA always reduces accuracy
- D. It is only used during data preprocessing

Answer: B

Q1477. Why do Vision Transformers partition images into patches rather than processing individual pixels?

- A. Patches are visually more appealing
- B. Processing individual pixels would make the self-attention sequence length equal to image resolution squared, making computation prohibitively expensive, while patches create manageable sequences
- C. Patches always produce better accuracy
- D. Pixel-level processing is computationally cheaper

Answer: B

Q1478. How does the Mixture of Experts architecture achieve conditional computation?

- A. All experts process every input
- B. A gating network routes each input to only a small subset of expert networks, so total computation scales sub-linearly with model size
- C. Experts are selected randomly without any gating
- D. MoE reduces model capacity

Answer: B

Q1479. What is the relationship between contrastive learning and the InfoNCE loss?

- A. They are unrelated
- B. InfoNCE is the standard loss function for contrastive learning that maximizes a lower bound on mutual information between positive pairs while treating other samples as negatives
- C. InfoNCE is only for supervised learning
- D. Contrastive learning does not use loss functions

Answer: B

Q1480. How does the concept of neural scaling laws inform model and dataset design decisions?

- A. Scaling laws are not useful for planning
- B. Empirical power-law relationships between model size, dataset size, compute budget, and loss enable predicting performance of larger models from smaller experiments, guiding resource allocation
- C. Performance scales linearly with compute
- D. Scaling laws only apply to language models

Answer: B

Q1481. What is the fundamental challenge of evaluating open-ended text generation with automatic metrics?

- A. Automatic metrics are always perfect
- B. There are many valid ways to express the same meaning, so reference-based metrics like BLEU penalize valid but differently-worded outputs, failing to capture semantic equivalence
- C. All generated text can be evaluated by word matching
- D. Open-ended generation does not need evaluation

Answer: B

Q1482. How does the rotary position embedding encode positional information in Transformers?

- A. It adds a fixed vector to all positions
- B. RoPE rotates the query and key vectors by position-dependent angles, encoding relative positions through the dot product's natural decay with distance
- C. It uses learned position embeddings
- D. RoPE removes all position information

Answer: B

Q1483. What is the constitutional AI approach to aligning language models?

- A. Writing an AI constitution document
- B. Training the model to critique and revise its own outputs according to a set of principles, reducing reliance on human feedback for each specific case
- C. It is a type of government regulation
- D. Constitutional AI replaces all human oversight

Answer: B

Q1484. What is the difference between sparse and dense retrieval in retrieval-augmented generation?

- A. They produce identical results
- B. Sparse retrieval uses term matching like BM25 while dense retrieval uses learned semantic embeddings, with dense capturing meaning beyond exact word overlap
- C. Sparse retrieval is always better
- D. Dense retrieval only matches exact words

Answer: B

Q1485. How does Direct Preference Optimization simplify the RLHF pipeline?

- A. It adds more complexity than RLHF
- B. DPO directly optimizes the language model policy using preference pairs without needing a separate reward model or reinforcement learning, simplifying the training pipeline
- C. DPO requires a separate reward model
- D. It is identical to standard RLHF

Answer: B

Q1486. What is the mixture of softmaxes approach and how does it address the softmax bottleneck?

- A. It mixes multiple models together
- B. It uses a mixture of multiple softmax distributions to increase the rank of the output distribution matrix, addressing the limitation that a single softmax cannot model complex distributions
- C. Single softmax has no limitations
- D. It reduces model capacity

Answer: B

Q1487. Why is tokenizer choice critically important for multilingual NLP models?

- A. Tokenizers are identical across languages
- B. The tokenizer determines how efficiently each language is represented: languages with poor tokenizer coverage get fragmented into more tokens, increasing compute cost and reducing effective context length
- C. Tokenizers only affect English text
- D. All languages require the same number of tokens

Answer: B

Q1488. What is the in-context learning phenomenon in large language models?

- A. Learning that occurs during pre-training
- B. LLMs can learn to perform new tasks from examples provided in the prompt without any parameter updates, implicitly implementing learning algorithms within their forward pass
- C. It requires fine-tuning the model
- D. In-context learning only works for classification

Answer: B

Q1489. How does the KV-cache optimization speed up autoregressive Transformer inference?

- A. It caches the entire model on disk
- B. It stores previously computed key and value tensors to avoid redundant recomputation at each generation step, reducing cumulative attention computation
- C. KV-cache only works during training
- D. It caches output probabilities

Answer: B

Q1490. What is the challenge of faithfulness in abstractive summarization systems?

- A. Faithfulness is not important for summaries
- B. Abstractive models can generate fluent but factually incorrect summaries that contradict or fabricate information not present in the source document
- C. Extractive summarization has worse faithfulness
- D. All neural summaries are perfectly faithful

Answer: B

Q1491. How do deformable convolutions improve upon standard convolutions for object detection?

- A. They use fixed rectangular receptive fields
- B. Deformable convolutions learn input-dependent offsets for sampling positions, enabling adaptive receptive fields that conform to object shapes
- C. They always produce worse results
- D. Deformable convolutions are faster than standard convolutions

Answer: B

Q1492. What is the concept of equivariance versus invariance in CNN design?

- A. They are the same property
- B. Equivariance means the output transforms predictably with input transformations while invariance means the output remains unchanged
- C. CNNs are always invariant to all transformations
- D. Equivariance prevents learning

Answer: B

Q1493. Why is the anchor-free approach gaining popularity over anchor-based methods in object detection?

- A. Anchors are always better
- B. Anchor-free methods directly predict object centers and sizes without predefined anchor boxes, reducing hyperparameters and simplifying the pipeline
- C. Anchor-free methods cannot detect objects
- D. All modern detectors use anchors

Answer: B

Q1494. What is the fundamental challenge of training object detection models with highly imbalanced foreground-background ratios?

- A. Imbalance does not affect detection
- B. The vast majority of anchor locations are background, which dominate the loss and overwhelm the gradient signal from sparse foreground objects
- C. All locations are equally important
- D. Background samples improve foreground detection

Answer: B

Q1495. How does the CLIP model enable zero-shot image classification?

- A. It memorizes all possible images
- B. CLIP learns a shared embedding space for images and text through contrastive pre-training, enabling classification by comparing image embeddings with text descriptions of classes
- C. Zero-shot classification is impossible
- D. CLIP only works for text

Answer: B

Q1496. What is the role of attention mechanisms in modern image segmentation architectures?

- A. Attention is not used in segmentation
- B. Attention modules capture long-range dependencies between distant pixels, enabling global context aggregation critical for understanding semantic relationships
- C. Attention only works for small images
- D. It replaces all convolutional layers

Answer: B

Q1497. Why is test-time augmentation effective for improving computer vision model predictions?

- A. It has no effect on predictions
- B. TTA applies multiple augmentations to the test image, runs inference on each, and aggregates predictions, effectively ensembling predictions from different perspectives
- C. It only works during training
- D. TTA always reduces accuracy

Answer: B

Q1498. How do neural radiance fields represent 3D scenes from 2D images?

- A. They stack 2D images together
- B. NeRF trains a neural network to map 3D coordinates and viewing direction to color and density, then uses volume rendering to synthesize novel views
- C. They require 3D scanners
- D. NeRF only works for simple objects

Answer: B

Q1499. What is the challenge of domain gap in transferring CV models across different visual domains?

- A. Domain gap does not exist
- B. Models trained on one visual domain perform poorly on another due to differences in appearance, lighting, style, and sensor characteristics, requiring domain adaptation techniques
- C. All visual domains look identical to CNNs
- D. Domain gap only affects text models

Answer: B

Q1500. What are the tradeoffs in the CAP theorem and how do modern distributed databases address them?

A. There are no tradeoffs in distributed systems
B. The CAP theorem states only two of consistency, availability, and partition tolerance can be fully guaranteed. Modern systems like CockroachDB and Spanner make nuanced tradeoffs using techniques like consensus protocols
C. All three guarantees are always achievable
D. CAP theorem is no longer relevant

Answer: B

Q1501. How does Apache Flink achieve exactly-once processing semantics in stream processing?

A. It simply processes each message once
B. Flink uses distributed snapshots (Chandy-Lamport algorithm) for consistent checkpointing combined with two-phase commit for external sinks to guarantee exactly-once end-to-end processing
C. Exactly-once is impossible in streaming
D. It buffers all data in memory

Answer: B

Q1502. What is the challenge of data skew in distributed joins and how can it be mitigated?

A. Data skew has no impact on joins
B. Skewed key distributions cause some partitions to receive disproportionately more data, creating bottleneck tasks. Mitigations include salted keys, broadcast joins for small tables, and adaptive query engines
C. All data is always evenly distributed
D. Skew only affects small datasets

Answer: B

Q1503. How does the Delta Lake transaction log provide ACID guarantees on top of object storage?

A. It uses a traditional relational database
B. Delta Lake maintains a transaction log of ordered JSON files recording every change, using optimistic concurrency control to provide atomicity, consistency, isolation, and durability on cloud object stores
C. ACID is impossible on object storage
D. It modifies the underlying storage system

Answer: B

Q1504. What is the theoretical basis for why bloom filters are space-efficient for approximate membership testing?

A. Bloom filters store exact data
B. Bloom filters use multiple hash functions mapping elements to a bit array, allowing false positives but no false negatives with space usage sub-linear in the number of elements
C. They always produce exact results
D. Bloom filters require more space than hash tables

Answer: B

Q1505. Why is backpressure management critical in streaming data systems?

A. Backpressure is not a concern in streaming
B. When downstream consumers cannot keep up with upstream producers, backpressure prevents system overload by propagating flow control signals to slow producers or buffer data appropriately
C. Streaming systems never have speed mismatches
D. Backpressure always causes data loss

Answer: B

Q1506. How does the concept of materialized views improve query performance in analytical databases?

- A. They have no performance benefit
- B. Materialized views pre-compute and store query results, trading storage space for query speed by avoiding re-computation of expensive aggregations and joins
- C. They only work for simple queries
- D. Materialized views always have stale data

Answer: B

Q1507. What is the log-structured merge tree and why is it used in write-heavy big data systems?

- A. It is a type of logging framework
- B. LSM trees buffer writes in memory, flush sorted segments to disk, and merge them periodically, optimizing write throughput at the cost of read amplification
- C. It only works for read-heavy workloads
- D. LSM trees are slower than B-trees for all operations

Answer: B

Q1508. How does federated query processing enable analytics across heterogeneous data sources?

- A. It requires all data to be in one database
- B. Federated query engines translate a single query into sub-queries for different data sources, execute them in parallel, and combine results, enabling analytics without data migration
- C. It only works with SQL databases
- D. Federated queries are always slower than centralized

Answer: B

Q1509. What is the challenge of maintaining data quality at scale in big data systems?

- A. Data quality is automatic at scale
- B. Scale amplifies data quality issues: schema drift across sources, late-arriving data, duplicate events, and silent failures require automated validation, schema registries, dead letter queues, and data observability platforms
- C. Big data is always high quality
- D. Data quality only matters for small datasets

Answer: B

Q1510. What is the training-serving skew problem and how does a feature store address it?

- A. There is no such problem
- B. Training-serving skew occurs when feature computation differs between training and serving, causing silent performance degradation. Feature stores provide a single source of truth for feature definitions used in both contexts
- C. Feature stores cause more skew
- D. Skew only affects small models

Answer: B

Q1511. How does continuous training differ from traditional periodic retraining in production ML?

- A. They are identical approaches
- B. Continuous training automatically triggers model retraining based on data changes, performance degradation, or schedules, with automated validation and deployment, creating a self-maintaining ML system
- C. Continuous training never stops training
- D. Traditional retraining is always better

Answer: B

Q1512. What are the unique challenges of testing ML systems compared to traditional software?

- A. ML systems are easier to test
- B. ML systems have non-deterministic outputs, depend on training data quality, require testing of data pipelines and model behavior, and lack clear oracles for correct outputs in many cases
- C. Testing is identical for ML and software
- D. ML systems do not need testing

Answer: B

Q1513. How does the concept of ML technical debt manifest in production systems?

- A. ML systems have no technical debt
- B. ML systems accumulate hidden debt through entangled features, undeclared data dependencies, feedback loops, configuration complexity, and the difficulty of monitoring and testing non-deterministic systems
- C. Technical debt is only a software concern
- D. ML debt is always visible

Answer: B

Q1514. What is the role of a serving graph in complex ML deployment architectures?

- A. A graph showing model accuracy
- B. A serving graph orchestrates multiple models and processing steps into a single prediction pipeline, handling feature transformation, model ensemble, post-processing, and fallback logic
- C. It only serves single models
- D. Serving graphs are only theoretical

Answer: B

Q1515. How does data-centric AI differ from the traditional model-centric approach to improving ML systems?

- A. They are the same approach
- B. Data-centric AI focuses on systematically improving the quality and quantity of training data rather than iterating on model architectures, recognizing data quality as the primary performance bottleneck
- C. Data-centric ignores data quality
- D. Model-centric is always superior

Answer: B

Q1516. What is the challenge of implementing real-time feature computation for online model serving?

- A. Real-time features are simple to implement
- B. Real-time features require low-latency computation from streaming data, consistent logic with training features, handling of late-arriving data, and maintaining state across events
- C. Real-time features are identical to batch features
- D. Latency does not matter for serving

Answer: B

Q1517. How does ML governance address compliance and regulatory requirements for AI systems?

- A. Governance is unnecessary for ML
- B. ML governance establishes policies, processes, and tools for model documentation, approval workflows, bias auditing, access control, and audit trails to meet regulatory requirements
- C. Governance only applies to financial models
- D. All ML models are automatically compliant

Answer: B

Q1518. What is the multi-armed bandit approach to model selection in production?

- A. A gambling strategy
- B. Multi-armed bandit algorithms dynamically allocate traffic between model variants based on their observed performance, balancing exploration and exploitation more efficiently than static A/B tests
- C. It always selects the same model
- D. It requires manual selection

Answer: B

Q1519. Why is observability more important than traditional monitoring for production ML systems?

- A. Observability and monitoring are identical
- B. Observability enables investigation of novel, unexpected failure modes using high-cardinality telemetry data, while monitoring only checks predefined metrics against thresholds and cannot diagnose unknown unknowns
- C. Monitoring covers all failure modes
- D. Observability is only for infrastructure

Answer: B

Q1520. Why is the impossibility theorem for fairness significant for AI system design?

- A. The theorem has been disproven
- B. The impossibility theorem shows that several intuitive fairness criteria cannot all be satisfied simultaneously, requiring explicit tradeoff decisions in AI system design
- C. All fairness criteria can be satisfied
- D. The theorem only applies to binary classification

Answer: B

Q1521. How does machine unlearning attempt to address the right to be forgotten in trained AI models?

- A. It deletes the model entirely
- B. Machine unlearning develops algorithms to efficiently remove the influence of specific training data points from a trained model without full retraining, satisfying data deletion requests
- C. Unlearning is impossible for neural networks
- D. Simply deleting data files is sufficient

Answer: B

Q1522. What is the concept of counterfactual fairness in AI decision-making?

- A. Making decisions based on fictional scenarios
- B. A decision is counterfactually fair if it would remain the same in a hypothetical world where the individual's protected attribute had been different, ensuring the attribute had no causal influence
- C. It means treating all groups identically
- D. Counterfactual fairness ignores protected attributes

Answer: B

Q1523. How does the concept of differential privacy provide mathematical guarantees for data protection?

- A. It encrypts all data permanently
- B. Differential privacy ensures that the output of an analysis is statistically indistinguishable whether or not any single individual's data is included, with the privacy budget epsilon quantifying the guarantee
- C. Differential privacy eliminates all utility
- D. It only works for numerical data

Answer: B

Q1524. What is the challenge of ensuring AI transparency across the full ML pipeline?

- A. Transparency is only needed for the model itself
- B. Full transparency requires documenting data collection and consent, preprocessing decisions, model selection rationale, training procedures, evaluation methodology, deployment context, and ongoing monitoring, which is complex and costly
- C. Transparency means making models open source
- D. Full transparency is easily achieved

Answer: B

Q1525. How do adversarial attacks on AI systems raise unique ethical concerns?

- A. Adversarial attacks have no ethical implications
- B. Adversarial vulnerabilities mean AI systems can be deliberately manipulated to make dangerous errors, raising concerns about safety-critical deployment, security, and the responsibility gap when AI is deceived
- C. Adversarial attacks only affect image models
- D. All AI systems are robust to adversarial attacks

Answer: B

Q1526. What is the tension between model performance optimization and fairness in high-stakes AI applications?

- A. There is no tension between performance and fairness
- B. Optimizing for overall accuracy may come at the cost of disparate performance across demographic groups, requiring explicit fairness constraints that may reduce overall accuracy but improve equity
- C. Fairness always improves accuracy
- D. Performance and fairness are identical objectives

Answer: B

Q1527. How does the EU AI Act's risk-based framework categorize AI systems?

- A. All AI systems are treated equally
- B. The Act categorizes AI into unacceptable risk (banned), high risk (strict requirements including conformity assessment), limited risk (transparency obligations), and minimal risk (no specific obligations)
- C. It only regulates social media AI
- D. The Act has no enforcement mechanism

Answer: B

Q1528. What is the concept of AI sovereignty and why is it geopolitically significant?

- A. AI that is self-aware
- B. National control over AI infrastructure, data, research capabilities, and regulatory frameworks, which has become a strategic priority affecting global power dynamics and technology independence
- C. It only matters for military AI
- D. AI sovereignty is not a real concept

Answer: B

Q1529. How does the concept of meaningful human control apply to autonomous AI systems?

- A. Humans must manually approve every AI decision
- B. Meaningful human control requires that humans can understand, intervene in, and override AI decisions at appropriate levels while maintaining effective oversight even as AI systems become more autonomous
- C. Human control is unnecessary for advanced AI
- D. It means AI should never make decisions

Answer: B

Q1530. How does the Segment Anything Model generalize to unseen segmentation tasks?

- A. It memorizes all possible object shapes
- B. SAM is trained on a massive diverse dataset with a promptable architecture that accepts points, boxes, or text to segment any object without task-specific fine-tuning
- C. It uses a fixed set of object categories
- D. It only works for previously seen objects

Answer: B

SUBJECT

Computer Networks & Cloud Computing

900 Multiple Choice Questions

Computer Networks & Cloud Computing — Easy

300 questions

Q1. What is the primary purpose of data communication?

- A. To exchange data between two devices
- B. To design hardware circuit boards
- C. To store data permanently on disks
- D. To compile programs into binaries

Answer: A

Q2. Which of the following is NOT a component of a data communication system?

- A. Compiler
- B. Receiver
- C. Sender
- D. Protocol

Answer: A

Q3. In simplex mode of data transmission, data flows in:

- A. One direction only
- B. Both directions at once
- C. Both ways but alternating
- D. Multiple directions

Answer: A

Q4. Which transmission mode allows data to flow in both directions simultaneously?

- A. Half-duplex
- B. Multiplex
- C. Simplex
- D. Full-duplex

Answer: D

Q5. What does bandwidth refer to in data communication?

- A. The count of devices on the network
- B. The physical width of the cable used
- C. The range of frequencies a channel passes
- D. The length of the transmission medium

Answer: C

Q6. Walkie-talkie is an example of which transmission mode?

- A. Full-duplex
- B. Half-duplex
- C. Simplex
- D. Automatic

Answer: B

Q7. Which of the following is a guided transmission medium?

- A. Infrared
- B. Microwaves
- C. Radio waves
- D. Twisted pair

Answer: D

Q8. What is the unit of data transmission speed?

- A. Amperes (A)
- B. Hertz (Hz)
- C. Watts (W)
- D. Bits per second (bps)

Answer: D

Q9. In data communication, what is a protocol?

- A. A hardware device on a NIC
- B. A software application suite
- C. A set of rules for data exchange
- D. A type of transmission cable

Answer: C

Q10. Which signal type has a continuous varying pattern?

- A. Analog signal
- B. Digital signal
- C. Binary signal
- D. Discrete signal

Answer: A

Q11. What type of network covers a small geographical area like a single building?

- A. LAN
- B. PAN
- C. MAN
- D. WAN

Answer: A

Q12. Which topology connects all devices to a single central cable?

- A. Star
- B. Ring
- C. Mesh
- D. Bus

Answer: D

Q13. How many layers does the OSI model have?

- A. 6
- B. 4
- C. 7
- D. 5

Answer: C

Q14. Which device operates at the physical layer to regenerate signals?

- A. Switch
- B. Repeater
- C. Gateway
- D. Router

Answer: B

Q15. Which network topology provides the highest redundancy?

- A. Full mesh topology
- B. Bus topology
- C. Star topology
- D. Ring topology

Answer: A

Q16. Which layer of the OSI model is responsible for routing?

- A. Data link layer
- B. Network layer
- C. Physical layer
- D. Transport layer

Answer: B

Q17. What does WAN stand for?

- A. Wide Access Node
- B. Wireless Area Network
- C. Web Access Network
- D. Wide Area Network

Answer: D

Q18. In which switching technique is a dedicated path established before data transfer?

- A. Circuit switching
- B. Cell switching
- C. Message switching
- D. Packet switching

Answer: A

Q19. Which networking device connects two different networks and operates at the network layer?

- A. Hub
- B. Router
- C. Repeater
- D. Switch

Answer: B

Q20. What is the TCP/IP model also known as?

- A. Internet model
- B. IEEE model
- C. OSI model
- D. ISO model

Answer: A

Q21. What is the main function of the data link layer?

- A. Node-to-node delivery of frames
- B. Routing packets between networks
- C. Physical signal encoding
- D. End-to-end message delivery

Answer: A

Q22. What is a MAC address?

- A. A port number for applications
- B. A physical address burned into a NIC
- C. An IP address used for routing
- D. A logical address assigned by software

Answer: B

Q23. How many bits are in a MAC address?

- A. 32 bits
- B. 48 bits
- C. 128 bits
- D. 64 bits

Answer: B

Q24. Which error detection method appends a calculated value at the end of the data?

- A. All of the above
- B. Parity check only
- C. Hamming code only
- D. CRC method only

Answer: A

Q25. What does CSMA/CD stand for?

- A. Carrier Sense Media Access with Collision Detection
- B. Central Station Multiple Access with Collision Detection
- C. Carrier Sense Multiple Access with Collision Detection
- D. Carrier Signal Multiple Access with Collision Division

Answer: C

Q26. Which sublayer of the data link layer controls access to the shared medium?

- A. Physical sublayer
- B. Network sublayer
- C. LLC sublayer
- D. MAC sublayer

Answer: D

Q27. What is framing in the data link layer?

- A. Assigning IP addresses to each host
- B. Dividing data into units called frames
- C. Converting digital signals to analog form
- D. Encrypting data for secure transfer

Answer: B

Q28. Which protocol is used to resolve an IP address to a MAC address?

- A. DNS
- B. RARP
- C. DHCP
- D. ARP

Answer: D

Q29. Simple parity check can detect which type of errors?

- A. Only even number of bit errors
- B. Only odd number of bit errors
- C. All types of errors in data
- D. Only burst errors in frames

Answer: B

Q30. In Ethernet, what happens when a collision is detected?

- A. Data is retransmitted right away immediately
- B. The entire network shuts down completely
- C. Devices wait a random time then retransmit
- D. The frame is discarded permanently by all

Answer: C

Q31. What is the size of an IPv4 address?

- A. 64 bits
- B. 128 bits
- C. 16 bits
- D. 32 bits

Answer: D

Q32. What is the main function of a router?

- A. Storing web pages on servers
- B. Forwarding packets between networks
- C. Providing wireless network access
- D. Connecting devices within a LAN

Answer: B

Q33. Which class of IPv4 addresses is used for multicasting?

- A. Class B
- B. Class D
- C. Class C
- D. Class A

Answer: B

Q34. What does the TTL field in an IP header stand for?

- A. Transfer Type Label
- B. Transmission Time Limit
- C. Total Transfer Length
- D. Time to Live

Answer: D

Q35. Which protocol is used to send error messages at the network layer?

- A. UDP
- B. TCP
- C. ARP
- D. ICMP

Answer: D

Q36. What is the default subnet mask for a Class C IPv4 address?

- A. 255.255.0.0
- B. 255.255.255.255
- C. 255.0.0.0
- D. 255.255.255.0

Answer: D

Q37. Which IP address range is reserved for loopback testing?

- A. 169.254.0.0/16
- B. 127.0.0.0/8
- C. 10.0.0.0/8
- D. 192.168.0.0/16

Answer: B

Q38. What tool uses ICMP echo requests to test connectivity?

- A. traceroute
- B. nslookup
- C. ping
- D. netstat

Answer: C

Q39. Which of the following is a private IPv4 address?

- A. 11.0.0.1
- B. 172.32.0.1
- C. 8.8.8.8
- D. 192.168.1.1

Answer: D

Q40. What is the purpose of NAT (Network Address Translation)?

- A. To translate private IPs to public IPs
- B. To compress packets for transfer
- C. To assign domain names to hosts
- D. To encrypt data during transit

Answer: A

Q41. Which two protocols operate at the transport layer?

- A. ARP and RARP
- B. IP and ICMP
- C. HTTP and FTP
- D. TCP and UDP

Answer: D

Q42. Which transport layer protocol provides reliable, connection-oriented service?

- A. IP
- B. ICMP
- C. UDP
- D. TCP

Answer: D

Q43. What is the range of port numbers?

- A. 0 to 49151
- B. 0 to 1023
- C. 0 to 65535
- D. 1 to 65535

Answer: C

Q44. Which well-known port is used by HTTP?

- A. 25
- B. 80
- C. 21
- D. 443

Answer: B

Q45. What type of service does UDP provide?

- A. Unreliable, connectionless
- B. Reliable, connectionless
- C. Reliable, connection-oriented
- D. Unreliable, connection-oriented

Answer: A

Q46. How many steps are in the TCP three-way handshake?

- A. 5
- B. 4
- C. 2
- D. 3

Answer: D

Q47. What is a socket in networking?

- A. A routing protocol name
- B. A type of cable connector
- C. A physical port on a device
- D. An IP address plus port number

Answer: D

Q48. Which application typically uses UDP?

- A. DNS queries
- B. Web browsing
- C. Email sending
- D. File transfer

Answer: A

Q49. What does the checksum field in the UDP header provide?

- A. Error detection
- B. Flow control
- C. Congestion control
- D. Packet sequencing

Answer: A

Q50. What is the purpose of the transport layer?

- A. Network-to-network routing
- B. Node-to-node frame delivery
- C. Signal encoding on media
- D. Process-to-process delivery

Answer: D

Q51. What does DNS stand for?

- A. Digital Network Standard
- B. Data Network Service
- C. Domain Name System
- D. Dynamic Name Server

Answer: C

Q52. Which protocol is used to send emails?

- A. FTP
- B. SMTP
- C. IMAP
- D. POP3

Answer: B

Q53. What port does FTP use for control connection?

- A. 23
- B. 21
- C. 22
- D. 20

Answer: B

Q54. What is HTTP?

- A. A routing protocol for networks
- B. An email delivery protocol
- C. A file transfer protocol only
- D. A protocol for transferring web pages

Answer: D

Q55. Which protocol is used to retrieve emails from a mail server while keeping them on the server?

- A. SMTP
- B. IMAP
- C. POP3
- D. FTP

Answer: B

Q56. Which port does SSH use?

- A. 25
- B. 21
- C. 22
- D. 23

Answer: C

Q57. What is Telnet used for?

- A. Remote login
- B. Email sending
- C. Web browsing
- D. File transfer

Answer: A

Q58. What does URL stand for?

- A. Universal Reference Locator
- B. Universal Resource Locator
- C. Uniform Resource Locator
- D. Unified Resource Link

Answer: C

Q59. Which protocol does a web browser use to access websites?

- A. FTP protocol
- B. SMTP protocol
- C. Telnet protocol
- D. HTTP/HTTPS

Answer: D

Q60. What is the role of a DNS resolver?

- A. Encrypting data for transfer
- B. Sending emails between servers
- C. Hosting websites on servers
- D. Translating domain names to IPs

Answer: D

Q61. What does Wi-Fi stand for?

- A. Wireless Fidelity standard
- B. Wide Field technology
- C. It is a brand name only
- D. Wired Fixture protocol

Answer: C

Q62. Which IEEE standard defines Wi-Fi?

- A. IEEE 802.16
- B. IEEE 802.11
- C. IEEE 802.15
- D. IEEE 802.3

Answer: B

Q63. What frequency band does Bluetooth primarily operate on?

- A. 900 MHz
- B. 60 GHz
- C. 5 GHz
- D. 2.4 GHz

Answer: D

Q64. What is an Access Point (AP) in a wireless network?

- A. A type of directional antenna used
- B. A wireless client device on the network
- C. A device bridging wireless to wired networks
- D. A wireless router with no other function

Answer: C

Q65. What is the typical range of Bluetooth?

- A. Up to 100 meters
- B. Up to 10 meters
- C. Up to 1 kilometer
- D. Up to 1 meter

Answer: B

Q66. What does SSID stand for in wireless networking?

- A. Secure Service Identification
- B. System Signal ID
- C. Service Set Identifier
- D. Standard Service ID

Answer: C

Q67. Which generation of cellular networks introduced mobile broadband data?

- A. 3G
- B. 1G
- C. 4G
- D. 2G

Answer: A

Q68. What is the hidden station problem in wireless networks?

- A. A station that is invisible on the network map
- B. A station with no assigned IP address
- C. A station using strong encryption protocol
- D. Two stations that cannot hear each other cause collisions

Answer: D

Q69. Which wireless technology is designed for very short-range communication used in contactless payments?

- A. WiMAX standard
- B. Wi-Fi standard
- C. Bluetooth Low Energy
- D. NFC technology

Answer: D

Q70. What type of network does ZigBee create?

- A. Satellite network for remote areas
- B. Wide Area Network for cities
- C. Cellular network for mobiles
- D. Low-power mesh network for IoT

Answer: D

Q71. What is cloud computing?

- A. A type of weather forecasting software tool
- B. On-demand delivery of resources via Internet
- C. Local server-based computing on premises
- D. Computing done using aerial drones

Answer: B

Q72. What does IaaS stand for?

- A. Infrastructure as a Service
- B. Information as a Service
- C. Integration as a Service
- D. Internet as a Service

Answer: A

Q73. Which of the following is an example of SaaS?

- A. Microsoft Azure VMs
- B. Google Gmail
- C. Docker containers
- D. Amazon EC2

Answer: B

Q74. What is a public cloud?

- A. A cloud hosted within company premises
- B. A cloud available to the general public
- C. A cloud with no security measures
- D. A cloud available to government only

Answer: B

Q75. What is the main benefit of cloud computing's pay-as-you-go model?

- A. Fixed monthly cost regardless of usage
- B. Paying only for resources you use
- C. No need for any internet access
- D. Unlimited free resources for everyone

Answer: B

Q76. What does PaaS provide?

- A. A platform for developing and deploying apps
- B. Network cables and hardware equipment
- C. Physical servers for data centers
- D. Pre-built software applications for users

Answer: A

Q77. What is a private cloud?

- A. Cloud infrastructure for a single organization
- B. The same thing as a public cloud
- C. A cloud with no internet connection
- D. A cloud with no active users at all

Answer: A

Q78. Which of the following is a major public cloud provider?

- A. Linux operating system
- B. Amazon Web Services (AWS)
- C. Cisco Routers hardware
- D. Microsoft Office suite

Answer: B

Q79. What is virtualization in cloud computing?

- A. Creating virtual versions of resources
- B. Creating virtual reality environments
- C. A type of encryption algorithm
- D. Making data invisible to users

Answer: A

Q80. What is scalability in cloud computing?

- A. The ability to adjust resources on demand
- B. The ability to weigh resources precisely
- C. The speed of the network connection
- D. The physical size of a data center

Answer: A

Q81. What is a firewall?

- A. A hardware component inside a router
- B. A type of computer virus or malware
- C. A device that monitors and controls traffic
- D. A wall constructed from fire materials

Answer: C

Q82. What does encryption do?

- A. Speeds up data transmission rate
- B. Deletes data from the storage
- C. Converts plaintext into ciphertext
- D. Compresses data to save space

Answer: C

Q83. What is a VPN?

- A. A virtual public network for browsing
- B. A very private network with no encryption
- C. A secure encrypted tunnel over public networks
- D. A virtual protocol network for routing

Answer: C

Q84. What is a DDoS attack?

- A. A type of computer virus infection
- B. A data decryption technique for ciphertext
- C. A routing protocol for network traffic
- D. Overwhelming a target with traffic from many sources

Answer: D

Q85. What is the purpose of an IDS (Intrusion Detection System)?

- A. To detect and alert on suspicious activity
- B. To assign IP addresses to devices
- C. To block all incoming network traffic
- D. To encrypt data during transmission

Answer: A

Q86. What is phishing?

- A. A social engineering attack to steal data
- B. A feature built into firewalls
- C. A network communication protocol
- D. A type of recreational fishing activity

Answer: A

Q87. What does SSL/TLS provide?

- A. Secure encrypted communication
- B. Faster network speeds overall
- C. IP address assignment to hosts
- D. File compression for storage

Answer: A

Q88. What is malware?

- A. A type of firewall software
- B. Malicious software designed to harm
- C. Defective hardware components
- D. A network topology design

Answer: B

Q89. What is the difference between symmetric and asymmetric encryption?

- A. Symmetric encryption is always much stronger
- B. They are the same encryption method
- C. Asymmetric uses a single shared key only
- D. Symmetric uses one key; asymmetric uses a key pair

Answer: D

Q90. What is a digital certificate?

- A. An electronic document binding key to identity
- B. A type of password for user accounts
- C. A printed diploma for graduates
- D. An IP address assigned to a server

Answer: A

Q91. What does IoT stand for?

- A. Internal Operating Terminal
- B. Integration of Technology
- C. Internet of Transactions
- D. Internet of Things

Answer: D

Q92. What is 5G?

- A. Fifth generation of mobile networks
- B. A type of Wi-Fi standard
- C. A network security protocol
- D. A cloud storage service

Answer: A

Q93. What is IPv6 primarily designed to address?

- A. Wireless communication needs
- B. The exhaustion of IPv4 addresses
- C. Better security features only
- D. Faster packet routing speeds

Answer: B

Q94. What is a smart city?

- A. A city with many computer stores
- B. A city with a very high population
- C. A virtual city in a video game
- D. A city using IoT to enhance services

Answer: D

Q95. What is the main advantage of fiber optic networks over copper networks?

- A. Better physical flexibility for bending
- B. Easier installation and maintenance work
- C. Much higher bandwidth and longer distance
- D. Lower cost of installation and materials

Answer: C

Q96. What does SDN stand for?

- A. Standard Digital Network
- B. System Data Node
- C. Secure Data Network
- D. Software-Defined Networking

Answer: D

Q97. What is a sensor network?

- A. A network of human sensor operators
- B. A type of local area network design
- C. Distributed sensor nodes monitoring conditions
- D. A social media network platform

Answer: C

Q98. What is Voice over IP (VoIP)?

- A. A routing protocol for packets
- B. Voice communications delivered over IP networks
- C. A type of network hardware device
- D. A video streaming service platform

Answer: B

Q99. What is network convergence?

- A. Networks colliding with each other
- B. The end of all networking technology
- C. Integrating voice, video, data on one network
- D. A type of router configuration mode

Answer: C

Q100. What is Li-Fi?

- A. A type of local area network
- B. A battery charging technology
- C. A fiber optic cable standard
- D. A technology using light for data transfer

Answer: D

Q101. What does the term 'throughput' measure in data communication?

- A. The maximum cable length allowed
- B. The voltage level of a channel
- C. The actual data transfer rate achieved
- D. The number of errors in a signal

Answer: C

Q102. Which type of cable uses light to transmit data signals?

- A. Coaxial cable
- B. Fiber optic
- C. Twisted pair
- D. Ethernet cable

Answer: B

Q103. What is the function of a modem in data communication?

- A. It compresses files before sending
- B. It connects two LANs wirelessly
- C. It modulates and demodulates signals
- D. It filters spam from email traffic

Answer: C

Q104. Which of the following is an unguided transmission medium?

- A. Twisted pair
- B. Fiber optic
- C. Radio waves
- D. Coaxial cable

Answer: C

Q105. What does 'latency' mean in the context of data communication?

- A. The speed of signal modulation
- B. The delay before data transfer begins
- C. The frequency range of a channel
- D. The size of the data payload sent

Answer: B

Q106. In data communication, what does 'noise' refer to?

- A. A type of data encryption method
- B. Unwanted signals that distort data
- C. The volume of audio transmissions
- D. The speed of packet forwarding

Answer: B

Q107. Which topology connects every device to a central hub?

- A. Ring topology
- B. Mesh topology
- C. Bus topology
- D. Star topology

Answer: D

Q108. What does 'attenuation' mean in signal transmission?

- A. Reflection of signal at endpoints
- B. Loss of signal strength over distance
- C. Increase in signal frequency
- D. Conversion of analog to digital

Answer: B

Q109. What is the role of a repeater in communication?

- A. It encrypts data for security
- B. It assigns IP addresses to hosts
- C. It routes packets between networks
- D. It amplifies and regenerates signals

Answer: D

Q110. Which encoding scheme represents data using two voltage levels?

- A. Unipolar encoding
- B. Analog encoding
- C. Multilevel encoding
- D. Bipolar encoding

Answer: A

Q111. What does LAN stand for in computer networking?

- A. Local Area Network
- B. Linear Array Network
- C. Linked Access Node
- D. Large Area Network

Answer: A

Q112. Which device connects multiple networks and routes packets?

- A. Router
- B. Repeater
- C. Bridge
- D. Hub

Answer: A

Q113. What is the primary function of a network switch?

- A. It forwards frames based on MAC address
- B. It assigns IP addresses to devices
- C. It provides wireless connectivity only
- D. It converts digital signals to analog

Answer: A

Q114. How many layers are in the OSI reference model?

- A. Six
- B. Four
- C. Seven
- D. Five

Answer: C

Q115. Which layer of the OSI model handles end-to-end delivery?

- A. Application layer
- B. Transport layer
- C. Network layer
- D. Session layer

Answer: B

Q116. What type of network covers a large geographic area like a country?

- A. WAN
- B. LAN
- C. PAN
- D. MAN

Answer: A

Q117. Which cable type is commonly used in Ethernet LANs?

- A. Coaxial cable only
- B. Satellite links
- C. Fiber optic only
- D. Twisted pair copper

Answer: D

Q118. What is a MAC address used for in networking?

- A. Identifying a device on the internet globally
- B. Encrypting data during wireless transmission
- C. Assigning a domain name to a web server
- D. Uniquely identifying a device on a local network

Answer: D

Q119. Which OSI layer converts data into a format suitable for transmission?

- A. Transport layer
- B. Application layer
- C. Session layer
- D. Presentation layer

Answer: D

Q120. What does a hub do when it receives a data frame?

- A. It broadcasts the frame to all connected ports
- B. It drops the frame if the destination is unknown
- C. It sends the frame only to the destination port
- D. It stores and forwards based on IP addresses

Answer: A

Q121. What is the primary function of the data link layer?

- A. End-to-end process communication
- B. Formatting data for display
- C. Routing packets across networks
- D. Reliable node-to-node data transfer

Answer: D

Q122. What is a frame in the context of the data link layer?

- A. A network routing table entry
- B. A data unit at the data link layer
- C. A type of physical cable connector
- D. A wireless signal modulation type

Answer: B

Q123. Which sublayer of the data link layer controls access to the shared medium?

- A. Media Access Control
- B. Physical Control
- C. Network Control
- D. Logical Link Control

Answer: A

Q124. What is the purpose of a parity bit in error detection?

- A. It compresses the data payload
- B. It encrypts the frame contents
- C. It determines the routing path used
- D. It detects single-bit transmission errors

Answer: D

Q125. What does CRC stand for in error detection?

- A. Central Routing Control
- B. Carrier Rate Conversion
- C. Cyclic Redundancy Check
- D. Circuit Relay Connection

Answer: C

Q126. Which framing method uses a special flag byte to mark frame boundaries?

- A. Clock encoding
- B. Bit stuffing
- C. Character count
- D. Byte stuffing

Answer: D

Q127. What does the LLC sublayer provide in the data link layer?

- A. Physical signal encoding methods
- B. Flow control and error management
- C. IP address assignment to devices
- D. Wireless frequency band selection

Answer: B

Q128. In Ethernet, what is the standard maximum frame size?

- A. 512 bytes
- B. 2048 bytes
- C. 4096 bytes
- D. 1518 bytes

Answer: D

Q129. What happens when a frame fails an error check at the receiver?

- A. The frame is stored indefinitely for later use
- B. The frame is forwarded to the next router
- C. The frame is typically discarded by receiver
- D. The frame is automatically corrected in place

Answer: C

Q130. Which protocol is a well-known data link layer protocol for point-to-point connections?

- A. FTP
- B. PPP
- C. DNS
- D. TCP

Answer: B

Q131. What is the main function of the network layer?

- A. Routing packets from source to destination
- B. Encrypting data for secure transfer
- C. Establishing physical connections
- D. Managing user application interfaces

Answer: A

Q132. Which protocol is primarily used for logical addressing?

- A. TCP
- B. IP
- C. ARP
- D. UDP

Answer: B

Q133. How many bits are in an IPv4 address?

- A. 48 bits
- B. 32 bits
- C. 16 bits
- D. 64 bits

Answer: B

Q134. What does a subnet mask define in IP networking?

- A. The maximum speed of data transfer
- B. The encryption key for data packets
- C. The network and host portions of an IP
- D. The physical address of a network card

Answer: C

Q135. What is the purpose of a default gateway?

- A. It blocks all unauthorized network traffic
- B. It stores all website data on the network
- C. It assigns IP addresses to local devices
- D. It forwards packets to networks outside the LAN

Answer: D

Q136. Which device operates primarily at the network layer?

- A. Router
- B. Hub
- C. Repeater
- D. Switch

Answer: A

Q137. What does ICMP stand for?

- A. Internet Connected Media Protocol
- B. Internet Control Message Protocol
- C. Internal Cache Management Protocol
- D. Integrated Circuit Module Process

Answer: B

Q138. What is the purpose of the TTL field in an IP packet?

- A. To limit the packet's lifetime in network
- B. To encrypt the packet data payload
- C. To identify the transport layer protocol
- D. To store the destination port number

Answer: A

Q139. What command is commonly used to test network connectivity?

- A. ping
- B. tracert
- C. netstat
- D. ipconfig

Answer: A

Q140. What is the loopback address in IPv4?

- A. 192.168.0.1
- B. 255.255.255.0
- C. 10.0.0.1
- D. 127.0.0.1

Answer: D

Q141. What is the main function of the transport layer?

- A. Routing across networks
- B. Physical signal transmission
- C. Data link error detection
- D. End-to-end communication

Answer: D

Q142. Which transport protocol provides reliable data delivery?

- A. UDP
- B. TCP
- C. ARP
- D. ICMP

Answer: B

Q143. What does UDP stand for in networking?

- A. Universal Direct Process
- B. Unverified Data Pathway
- C. Unified Data Protocol
- D. User Datagram Protocol

Answer: D

Q144. What is a port number used for in the transport layer?

- A. Specifying the data encoding format used
- B. Determining the routing path for packets
- C. Identifying a specific application or process
- D. Identifying the physical cable connection used

Answer: C

Q145. Which well-known port number is used by HTTP?

- A. Port 80
- B. Port 53
- C. Port 21
- D. Port 25

Answer: A

Q146. What is a socket in networking terminology?

- A. A physical cable connector on a device
- B. A combination of IP address and port number
- C. A type of wireless antenna for signals
- D. A protocol for error detection in frames

Answer: B

Q147. What type of service does UDP provide?

- A. Connectionless unreliable delivery
- B. Connection-oriented reliable delivery
- C. Connectionless reliable delivery
- D. Connection-oriented unreliable delivery

Answer: A

Q148. What is segmentation in the transport layer?

- A. Routing packets through different network paths
- B. Dividing data into smaller manageable units
- C. Encrypting data before network transmission
- D. Combining multiple packets into one large block

Answer: B

Q149. Which port number is used by HTTPS?

- A. Port 443
- B. Port 110
- C. Port 8080
- D. Port 143

Answer: A

Q150. Which protocol is preferred for real-time video streaming?

- A. TCP
- B. UDP
- C. FTP
- D. SMTP

Answer: B

Q151. What does DNS stand for in networking?

- A. Direct Network Signal
- B. Digital Node Switch
- C. Data Network Service
- D. Domain Name System

Answer: D

Q152. Which protocol is used to send email?

- A. DNS
- B. HTTP
- C. SMTP
- D. FTP

Answer: C

Q153. What is the primary function of FTP?

- A. Sending email messages
- B. Transferring files between hosts
- C. Browsing web pages online
- D. Resolving domain names

Answer: B

Q154. Which protocol is used to retrieve email from a server?

- A. POP3
- B. SNMP
- C. HTTP
- D. SMTP

Answer: A

Q155. What does HTTP stand for?

- A. HyperText Transfer Protocol
- B. Hyper Terminal Transfer Process
- C. High Throughput Test Platform
- D. Host Transfer Text Protocol

Answer: A

Q156. What is the purpose of the DHCP protocol?

- A. Resolving domain name queries
- B. Transferring files to a server
- C. Assigning IP addresses automatically
- D. Encrypting web page content

Answer: C

Q157. Which application layer protocol is used for remote login?

- A. Telnet
- B. DNS
- C. SMTP
- D. FTP

Answer: A

Q158. What is a URL in the context of the web?

- A. A protocol for securing email traffic
- B. A type of network cable connector
- C. The address used to locate web resources
- D. A device that manages web server load

Answer: C

Q159. What does SNMP stand for?

- A. Standard Network Module Platform
- B. Simple Network Management Protocol
- C. System Network Message Protocol
- D. Secure Node Monitoring Process

Answer: B

Q160. Which protocol provides secure web communication?

- A. HTTP
- B. SMTP
- C. HTTPS
- D. FTP

Answer: C

Q161. What does WiFi stand for?

- A. Wave Finder
- B. Wired Filter
- C. Wide Frequency
- D. Wireless Fidelity

Answer: D

Q162. Which IEEE standard defines wireless LAN technology?

- A. 802.16
- B. 802.11
- C. 802.3
- D. 802.15

Answer: B

Q163. What device provides wireless network access to clients?

- A. Modem
- B. Repeater
- C. Router
- D. Access Point

Answer: D

Q164. Which frequency band is commonly used by WiFi networks?

- A. 900 MHz
- B. 5 MHz
- C. 2.4 GHz
- D. 100 GHz

Answer: C

Q165. What is Bluetooth primarily used for?

- A. Short-range device communication
- B. Long-range internet connectivity
- C. Underwater data transmission
- D. Satellite television broadcast

Answer: A

Q166. What does SSID represent in a wireless network?

- A. The channel frequency used by the router
- B. The MAC address of the access point device
- C. The name that identifies a wireless network
- D. The encryption key for network access

Answer: C

Q167. Which generation of mobile networks introduced mobile broadband?

- A. 3G
- B. 4G
- C. 1G
- D. 2G

Answer: A

Q168. What is the main advantage of wireless networks over wired?

- A. Greater mobility for users
- B. Higher data transfer speeds
- C. Stronger signal over distances
- D. Lower electromagnetic interference

Answer: A

Q169. What type of wireless network has the shortest range?

- A. LAN
- B. WAN
- C. PAN
- D. MAN

Answer: C

Q170. What does NFC stand for in wireless technology?

- A. New Frequency Channel
- B. Network File Control
- C. Near Field Communication
- D. Node Forwarding Cache

Answer: C

Q171. What is cloud computing in simple terms?

- A. Connecting computers using only Bluetooth signals
- B. Building physical servers in an office building
- C. Delivering computing services over the internet
- D. Storing data on local hard drives only

Answer: C

Q172. What does IaaS stand for in cloud computing?

- A. Infrastructure as a Service
- B. Integration as a System
- C. Internet as a Service
- D. Information as a Standard

Answer: A

Q173. Which cloud service model provides ready-to-use software applications?

- A. DaaS
- B. SaaS
- C. PaaS
- D. IaaS

Answer: B

Q174. What is a public cloud?

- A. A cloud that uses only open source software tools
- B. A cloud available only to a single organization
- C. A cloud that stores only public government records
- D. A cloud accessible by any user over the internet

Answer: D

Q175. What is a private cloud?

- A. A social media platform with privacy settings
- B. A cloud that is not connected to any network
- C. A cloud dedicated to a single organization's use
- D. A personal computer connected to the internet

Answer: C

Q176. What is a virtual machine in cloud computing?

- A. A software emulation of a computer system
- B. A networking cable connecting two servers
- C. A type of database management software tool
- D. A physical server in a data center building

Answer: A

Q177. Which company provides the AWS cloud platform?

- A. Microsoft
- B. Amazon
- C. Apple
- D. Google

Answer: B

Q178. What is scalability in cloud computing?

- A. The ability to encrypt all stored data securely
- B. The ability to increase or decrease resources as needed
- C. The process of backing up data to external storage
- D. The speed at which data travels between cloud servers

Answer: B

Q179. What does PaaS provide to developers?

- A. Complete ready-to-use software for end users
- B. Network monitoring and security scanning tools
- C. A platform for building and deploying applications
- D. Only physical hardware servers and cables

Answer: C

Q180. What is a hybrid cloud deployment model?

- A. A cloud that stores data in multiple file formats
- B. A combination of public and private cloud services
- C. A cloud that only runs on mobile phone devices
- D. A cloud that uses only renewable energy sources

Answer: B

Q181. What is the primary purpose of a firewall?

- A. Filtering traffic between networks
- B. Assigning IP addresses to hosts
- C. Compressing data for faster transfer
- D. Increasing network bandwidth speed

Answer: A

Q182. What does encryption do to data?

- A. It increases data transfer speed on network
- B. It routes data through the fastest path
- C. It compresses data to save storage space
- D. It converts data into an unreadable format

Answer: D

Q183. What is a denial-of-service (DoS) attack?

- A. Stealing passwords from a database
- B. Modifying web pages without permission
- C. Flooding a system to make it unavailable
- D. Intercepting emails during transmission

Answer: C

Q184. What is the purpose of an antivirus program?

- A. It manages user login credentials securely
- B. It configures firewall rules automatically
- C. It detects and removes malicious software
- D. It speeds up network data transfers

Answer: C

Q185. What is phishing in cybersecurity?

- A. Installing updates on network equipment
- B. Scanning networks to find open ports
- C. Fraudulent attempts to steal sensitive info
- D. Monitoring bandwidth usage on a network

Answer: C

Q186. What does VPN stand for?

- A. Variable Protocol Number
- B. Visual Processing Node
- C. Virtual Private Network
- D. Verified Public Network

Answer: C

Q187. What is malware?

- A. A type of network cable connector
- B. A protocol for secure email transfer
- C. A tool for monitoring network traffic
- D. Software designed to cause system harm

Answer: D

Q188. What is two-factor authentication (2FA)?

- A. Using two different web browsers for access
- B. Requiring two forms of identity verification
- C. Creating two copies of encrypted file data
- D. Connecting through two separate network paths

Answer: B

Q189. What is the role of a security patch?

- A. It changes the user interface design layout
- B. It increases the software processing speed
- C. It adds new features to the software
- D. It fixes known security vulnerabilities

Answer: D

Q190. What does HTTPS protect against?

- A. Eavesdropping on web communication traffic
- B. Physical theft of computer hardware devices
- C. Power surges that damage server components
- D. Hard drive failures that cause data loss

Answer: A

Q191. What does IoT stand for in modern networking?

- A. Internet of Things
- B. Integrated Online Technology
- C. Internal Operating Terminal
- D. Internet of Transfers

Answer: A

Q192. What is 5G in terms of mobile networks?

- A. A satellite communication protocol for space
- B. The fifth version of WiFi technology
- C. A new type of fiber optic cable standard
- D. The fifth generation of mobile network technology

Answer: D

Q193. What is the purpose of smart home technology?

- A. To connect homes directly to satellite networks
- B. To replace all furniture with electronic versions
- C. To automate and remotely control home devices
- D. To eliminate the need for electricity in homes

Answer: C

Q194. What is a sensor network?

- A. A cable network connecting television channels
- B. A network exclusively for video surveillance only
- C. A network of high-speed gaming computers
- D. A group of sensors that collect and share data

Answer: D

Q195. What is artificial intelligence used for in networks?

- A. Designing the physical layout of data center rooms
- B. Automating network management and threat detection
- C. Manufacturing network hardware in smart factories
- D. Replacing all network cables with wireless signals

Answer: B

Q196. What is a smart city concept?

- A. A city that uses only renewable energy exclusively
- B. A city with no physical stores or shopping malls
- C. A city without any public transportation systems
- D. A city using technology and data to improve services

Answer: D

Q197. What does the term 'bandwidth on demand' mean?

- A. Restricting bandwidth during peak usage time periods
- B. Adjusting bandwidth allocation based on real-time needs
- C. Free unlimited internet for all users forever
- D. Permanently increasing bandwidth for all connections

Answer: B

Q198. What is the role of IPv6 in next-generation networks?

- A. It eliminates the need for routers in all networks
- B. It provides a vastly larger address space for devices
- C. It converts all networks to use satellite connections
- D. It replaces WiFi with a faster wireless technology

Answer: B

Q199. What is telemedicine in the context of networks?

- A. A type of network monitoring software for hospitals
- B. A network used exclusively by telephone companies
- C. Remote healthcare delivery using network technology
- D. A method of diagnosing network connection problems

Answer: C

Q200. What is a digital twin in next-generation technology?

- A. A backup copy of a website on a different server
- B. A virtual replica of a physical object or system
- C. A duplicate email account for security purposes
- D. A second network interface card on a computer

Answer: B

Q201. Which type of data transmission sends data in only one direction at a time?

- A. Multiplex transmission
- B. Half-duplex transmission
- C. Simplex transmission
- D. Full-duplex transmission

Answer: B

Q202. What is the smallest unit of data in digital communication?

- A. A single bit representing 0 or 1
- B. A word consisting of 16 bits
- C. A nibble consisting of 4 bits
- D. A byte consisting of 8 bits

Answer: A

Q203. Which device converts digital signals to analog signals for transmission over telephone lines?

- A. A repeater amplifying weak signals
- B. A router directing network traffic
- C. A modem performing signal conversion
- D. A network switch forwarding frames

Answer: C

Q204. What does the term 'baud rate' measure in data communication?

- A. The total bandwidth of a communication link
- B. The number of bytes transferred per minute
- C. The error rate during data transmission
- D. The number of signal changes per second

Answer: D

Q205. Which transmission medium offers the highest bandwidth capacity?

- A. Coaxial copper cable medium
- B. Twisted pair copper cable
- C. Fiber optic cable medium
- D. Unshielded telephone wire

Answer: C

Q206. What is the purpose of a communication protocol?

- A. To define rules governing data exchange
- B. To manufacture networking equipment
- C. To increase the voltage of signals
- D. To physically connect cables to devices

Answer: A

Q207. What is crosstalk in the context of data communication?

- A. Planned interference for signal testing
- B. A method of increasing data capacity
- C. The process of encoding digital data
- D. Unwanted signal coupling between wires

Answer: D

Q208. In serial data transmission, how are bits sent over the communication channel?

- A. Bits are split across multiple channels
- B. Bits are sent one after another sequentially
- C. Multiple bits are sent simultaneously
- D. Bits are grouped in fixed-size blocks

Answer: B

Q209. What does the term 'propagation delay' refer to in networking?

- A. Time to encrypt and decrypt data packets
- B. Time to convert data between formats
- C. Time to process packets inside a router
- D. Time for a signal to travel from source to destination

Answer: D

Q210. Which signal type uses discrete voltage levels to represent data?

- A. Acoustic signal through air medium
- B. Analog signal with continuous waves
- C. Digital signal with distinct levels
- D. Modulated carrier frequency signal

Answer: C

Q211. What is the primary function of a network interface card (NIC)?

- A. To connect a device to a computer network
- B. To store data temporarily during transfers
- C. To route packets between different networks
- D. To provide wireless power to portable devices

Answer: A

Q212. Which network topology arranges all devices in a circular chain?

- A. Mesh topology with full connections
- B. Bus topology with shared backbone
- C. Star topology with central device
- D. Ring topology with circular connection

Answer: D

Q213. What is a Metropolitan Area Network (MAN)?

- A. A network connecting countries across continents
- B. A network spanning a single room or building floor
- C. A personal network within a few meters range
- D. A network covering a city or large campus area

Answer: D

Q214. What does a gateway do in computer networking?

- A. It stores web pages for faster user access
- B. It connects networks using different protocols
- C. It monitors bandwidth usage on local links
- D. It amplifies signals on a single network

Answer: B

Q215. Which layer of the OSI model is responsible for data formatting and encryption?

- A. The session layer managing connections
- B. The transport layer handling segments
- C. The presentation layer handling format
- D. The application layer for user access

Answer: C

Q216. What is a peer-to-peer (P2P) network model?

- A. A model where each device can act as client and server
- B. A model requiring a central database for all data
- C. A model where one server manages all resources
- D. A model using only wireless communication links

Answer: A

Q217. What does bandwidth refer to in computer networking?

- A. The total storage available on a file server
- B. The maximum data transfer capacity of a link
- C. The number of devices connected to a network
- D. The physical length of a network cable

Answer: B

Q218. What is the client-server model in networking?

- A. A model where data is stored exclusively on client machines
- B. A model where devices share resources equally without hierarchy
- C. A model where clients request services from a dedicated server
- D. A model where only one device is connected at any given time

Answer: C

Q219. What does the physical layer of the OSI model deal with?

- A. Logical addressing and routing decisions
- B. Session establishment between applications
- C. Error detection within transmitted frames
- D. Raw bit transmission over physical media

Answer: D

Q220. What is a network protocol stack?

- A. A layered set of protocols working together
- B. A single protocol handling all network tasks
- C. A hardware component inside every router
- D. A physical rack holding network equipment

Answer: A

Q221. What is the purpose of flow control at the data link layer?

- A. To encrypt data before physical transmission
- B. To prevent the sender from overwhelming the receiver
- C. To route frames between different networks
- D. To assign IP addresses to connected devices

Answer: B

Q222. What is the stop-and-wait protocol in data link communication?

- A. The sender transmits all frames at once before waiting
- B. The receiver stops all incoming traffic when busy
- C. The sender waits for a timer before each transmission
- D. The sender sends one frame and waits for acknowledgment

Answer: D

Q223. What does ARQ stand for in data link layer protocols?

- A. Automatic Repeat reQuest for error recovery
- B. Asynchronous Relay Queue for data buffering
- C. Address Resolution Queue for frame delivery
- D. Adaptive Rate Quantization for bandwidth use

Answer: A

Q224. What is the broadcast MAC address used to reach all devices on a network?

- A. 00:00:00:00:00:00 representing zero address
- B. 01:00:00:00:00:00 representing multicast
- C. FF:FF:FF:FF:FF:FF representing all ones
- D. FE:FE:FE:FE:FE:FE representing link local

Answer: C

Q225. What type of error occurs when a single bit in a frame is changed during transmission?

- A. A burst error affecting multiple bits
- B. A framing error at the boundary mark
- C. A single-bit error in the data frame
- D. A sequence error in the frame order

Answer: C

Q226. What is the purpose of the destination address field in an Ethernet frame?

- A. To identify the intended recipient device
- B. To indicate the protocol type being used
- C. To contain error-checking information data
- D. To specify the sender's network location

Answer: A

Q227. What is the role of acknowledgment frames in reliable data delivery?

- A. They establish the initial connection setup
- B. They confirm successful receipt of data frames
- C. They carry user data from sender to receiver
- D. They request retransmission of all sent frames

Answer: B

Q228. What is a collision in the context of Ethernet networks?

- A. When a cable is physically disconnected from a port
- B. When a device sends data to an unknown MAC address
- C. When a frame exceeds the maximum allowed frame size
- D. When two devices transmit data simultaneously on shared media

Answer: D

Q229. What is the function of the type/length field in an Ethernet frame?

- A. It contains the frame check sequence value
- B. It indicates the protocol or payload length
- C. It stores the MAC address of the next hop
- D. It specifies the transmission speed to use

Answer: B

Q230. What does the term 'full-duplex Ethernet' mean?

- A. Data can only flow in one direction at a time
- B. Data is transmitted at double the normal speed
- C. Data can flow in both directions simultaneously
- D. Data is duplicated across two separate cables

Answer: C

Q231. What is the purpose of an IP address in networking?

- A. To specify the application protocol being used
- B. To logically identify a device on a network
- C. To determine the cable type connecting devices
- D. To identify the physical hardware of a device

Answer: B

Q232. What is the difference between a public and a private IP address?

- A. Public addresses are assigned by DHCP while private addresses are manually configured
- B. Private addresses use IPv6 while public addresses always use IPv4 format
- C. Private addresses are used within local networks while public addresses are on the internet
- D. Public addresses are used on local networks while private addresses are on the internet

Answer: C

Q233. What is the default subnet mask for a Class A IPv4 address?

- A. 255.255.255.0 with 24 network bits
- B. 255.255.255.128 with 25 network bits
- C. 255.0.0.0 with 8 network bits only
- D. 255.255.0.0 with 16 network bits

Answer: C

Q234. What is a routing table used for in a router?

- A. To determine the best path for forwarding packets
- B. To filter web content based on user preferences
- C. To encrypt all outgoing traffic at the gateway
- D. To store the physical locations of all devices

Answer: A

Q235. Which class of IPv4 addresses has a first octet range of 128 to 191?

- A. Class D addresses for multicast groups
- B. Class C addresses for small networks
- C. Class A addresses for large networks
- D. Class B addresses for medium networks

Answer: D

Q236. What is static routing in a network?

- A. Routes change dynamically based on current traffic load
- B. Routes are manually configured by a network administrator
- C. Routes are computed using the shortest path algorithm
- D. Routes are automatically learned from neighboring routers

Answer: B

Q237. What does the traceroute (tracert) command show?

- A. The MAC addresses of all devices on a local network
- B. The list of open ports on a destination host
- C. The bandwidth available on each network interface
- D. The path packets take through routers to a destination

Answer: D

Q238. What is an IPv4 header's minimum size in bytes?

- A. 20 bytes without any option fields
- B. 32 bytes without any option fields
- C. 10 bytes without any option fields
- D. 40 bytes without any option fields

Answer: A

Q239. What type of routing protocol learns routes automatically from other routers?

- A. Direct routing for locally connected subnets
- B. Default routing using a single gateway path
- C. Dynamic routing using protocol exchanges
- D. Static routing configured manually by admin

Answer: C

Q240. What is the purpose of the network layer's fragmentation mechanism?

- A. To combine small packets into larger ones for efficiency
- B. To split packets that exceed a link's maximum transfer unit
- C. To compress large packets for faster transmission speed
- D. To encrypt packet contents for secure delivery to hosts

Answer: B

Q241. What is the primary difference between TCP and UDP?

- A. TCP provides reliable delivery while UDP is connectionless
- B. TCP works only on wired networks while UDP works wirelessly
- C. TCP is faster while UDP provides guaranteed delivery
- D. UDP uses larger packets while TCP uses smaller packets

Answer: A

Q242. What is a well-known port number?

- A. A port used exclusively by operating system processes
- B. A dynamically assigned port used for temporary connections
- C. A port in the range 0-1023 reserved for standard services
- D. Any port above 49151 used by client applications

Answer: C

Q243. Which port number does DNS typically use?

- A. Port 23 for domain name queries
- B. Port 53 for domain name queries
- C. Port 67 for domain name queries
- D. Port 110 for domain name queries

Answer: B

Q244. What is multiplexing at the transport layer?

- A. Converting data formats between different application types
- B. Splitting a single application across multiple networks
- C. Encrypting traffic from a single application for security
- D. Combining data from multiple applications for transmission

Answer: D

Q245. What flag is used in the TCP handshake to initiate a connection?

- A. The ACK flag for acknowledgment setup
- B. The SYN flag for synchronization request
- C. The FIN flag for connection finalization
- D. The RST flag for connection reset action

Answer: B

Q246. What application layer service typically uses TCP port 25?

- A. Email sending using SMTP protocol
- B. Secure shell remote login to servers
- C. Web browsing using HTTP protocol
- D. File transfer using FTP data channel

Answer: A

Q247. What is the purpose of sequence numbers in TCP?

- A. To measure the round-trip time for each packet
- B. To encrypt the data payload of each segment
- C. To identify the source application on the host
- D. To track the order of transmitted data bytes

Answer: D

Q248. Why is UDP preferred for live video streaming applications?

- A. UDP guarantees all video frames arrive in order
- B. UDP provides better encryption for video content
- C. UDP has lower overhead and tolerates some data loss
- D. UDP supports larger maximum packet sizes than TCP

Answer: C

Q249. What is demultiplexing at the transport layer?

- A. Converting between different transport protocols dynamically
- B. Combining data from many applications into one stream
- C. Delivering received data to the correct application via port numbers
- D. Splitting data across multiple network paths for speed

Answer: C

Q250. What is an ephemeral port in networking?

- A. A port used exclusively for encrypted communication
- B. A permanently assigned port for a specific service
- C. A reserved port used only by system administrators
- D. A temporary port assigned to a client for a session

Answer: D

Q251. What is a web browser used for in networking?

- A. To monitor bandwidth usage across all links
- B. To access and display web pages from servers
- C. To manage database records on the network
- D. To configure router settings and interfaces

Answer: B

Q252. What port does POP3 use for email retrieval?

- A. Port 143 for email message retrieval
- B. Port 993 for email message retrieval
- C. Port 25 for email message retrieval
- D. Port 110 for email message retrieval

Answer: D

Q253. What is the purpose of TFTP (Trivial File Transfer Protocol)?

- A. To securely transfer files using encrypted communication channels
- B. To transfer large files with error correction and authentication
- C. To provide simple file transfers without authentication features
- D. To synchronize file versions across distributed storage systems

Answer: C

Q254. What does a DNS A record store?

- A. The IPv4 address mapped to a domain name
- B. The alias or canonical name for a domain
- C. The mail server address for the domain
- D. The authoritative nameserver for the domain

Answer: A

Q255. What is the role of an email client application?

- A. It routes email traffic between different mail servers
- B. It converts email protocols from SMTP to HTTP format
- C. It filters spam at the server before delivery to users
- D. It allows users to compose, send, and read email messages

Answer: D

Q256. What does the HTTP GET method request from a server?

- A. It requests to create a new resource on the server
- B. It requests to retrieve a resource from the server
- C. It requests to update an existing resource on server
- D. It requests to delete a resource from the server

Answer: B

Q257. What is IMAP used for in email communication?

- A. Accessing and managing email directly on the server
- B. Sending email messages between mail servers
- C. Filtering incoming email for spam and viruses
- D. Encrypting email content during transmission

Answer: A

Q258. What type of DNS record is used for email routing?

- A. A PTR record for reverse DNS mail lookups
- B. An A record pointing to the mail server IP
- C. A CNAME record aliasing the mail server name
- D. An MX record specifying the mail exchange server

Answer: D

Q259. What does NTP (Network Time Protocol) do?

- A. It transfers files between networked computers
- B. It translates network addresses between formats
- C. It synchronizes clocks across networked devices
- D. It monitors network traffic for security threats

Answer: C

Q260. What is the function of a proxy server?

- A. It assigns MAC addresses to new network devices
- B. It acts as an intermediary between clients and servers
- C. It generates encryption keys for secure connections
- D. It directly connects two LANs using physical cables

Answer: B

Q261. What is the purpose of a wireless router in a home network?

- A. To replace the ISP's connection to the internet
- B. To provide wireless and wired connectivity to the internet
- C. To boost cellular signal strength in buildings
- D. To connect only wired devices to the internet

Answer: B

Q262. What is the 5 GHz frequency band used for in WiFi?

- A. It provides higher data speeds with shorter range
- B. It is used only for outdoor wireless deployments
- C. It is reserved exclusively for Bluetooth devices
- D. It provides longer range but lower data speeds

Answer: A

Q263. What does WPA stand for in wireless security?

- A. Wide Protocol Authentication mechanism
- B. Wireless Protected Architecture standard
- C. Wireless Packet Authorization framework
- D. Wi-Fi Protected Access security protocol

Answer: D

Q264. What is a wireless hotspot?

- A. An area where wireless signal is intentionally blocked
- B. A tool for testing wireless network security
- C. A location providing public wireless internet access
- D. A device that measures wireless signal strength

Answer: C

Q265. What is the main purpose of WEP encryption in wireless networks?

- A. To assign IP addresses to wireless client devices
- B. To increase the speed of wireless data transfer
- C. To manage handoff between wireless access points
- D. To provide basic encryption for wireless communication

Answer: D

Q266. Which generation of mobile networks is primarily known for voice calls?

- A. 4G networks with LTE high-speed service
- B. 2G networks with digital voice capability
- C. 5G networks with ultra-low latency service
- D. 3G networks with mobile broadband data

Answer: B

Q267. What is a wireless repeater (range extender) used for?

- A. To extend the coverage area of an existing wireless network
- B. To secure the wireless network against unauthorized access
- C. To create a new wireless network with different settings
- D. To reduce interference between neighboring wireless networks

Answer: A

Q268. What does the term 'wireless channel' refer to in WiFi?

- A. The cable connecting an access point to a switch
- B. The physical antenna used to transmit signals
- C. A specific frequency range for wireless communication
- D. The security encryption method used by the router

Answer: C

Q269. What type of wireless network does IoT typically use for low-power devices?

- A. Standard WiFi 6 enterprise access points
- B. High-speed 5G millimeter wave connections
- C. Low-power wide-area networks like LoRaWAN
- D. Satellite-based global broadband connections

Answer: C

Q270. What is the role of an antenna in wireless communication?

- A. It encrypts the wireless signal for security
- B. It stores data while waiting for transmission slots
- C. It assigns channels to different wireless clients
- D. It converts electrical signals to radio waves and vice versa

Answer: D

Q271. What is a cloud data center?

- A. A personal computer storing data at home
- B. A facility housing cloud computing resources and servers
- C. A local hard drive connected to a network
- D. A mobile application for storing contacts

Answer: B

Q272. What is an example of Infrastructure as a Service (IaaS)?

- A. Amazon EC2 providing virtual server instances
- B. Google Docs for document editing online
- C. Salesforce for customer relationship management
- D. Microsoft Office 365 for productivity suite

Answer: A

Q273. What is cloud storage?

- A. Data backed up on a local external hard drive
- B. Data stored on remote servers accessed via the internet
- C. Data stored on physical USB drives in an office
- D. Data cached temporarily in a web browser's memory

Answer: B

Q274. What does the term 'on-demand' mean in cloud computing?

- A. Resources must be ordered weeks before they are needed
- B. Resources are shared equally among all users at all times
- C. Resources are available immediately when users need them
- D. Resources are allocated permanently to a single customer

Answer: C

Q275. What is Microsoft Azure?

- A. A cloud computing platform providing various cloud services
- B. A desktop operating system for personal computers
- C. A programming language for web application development
- D. A database management software for local installations

Answer: A

Q276. What is the main advantage of elasticity in cloud computing?

- A. It provides permanent storage that never changes size
- B. It eliminates the need for any internet connectivity
- C. It restricts user access to fixed resource allocations
- D. It automatically adjusts resources based on current demand

Answer: D

Q277. What is Google Cloud Platform (GCP)?

- A. A web browser developed by Google for internet access
- B. A cloud computing service suite offered by Google
- C. A mobile operating system developed by Google team
- D. A social media platform operated by Google company

Answer: B

Q278. What is multi-cloud computing?

- A. Using cloud services from two or more cloud providers
- B. Storing multiple copies of data in one cloud storage bucket
- C. Running multiple applications on one cloud virtual machine
- D. Using multiple data centers from a single cloud provider

Answer: A

Q279. What is a community cloud deployment model?

- A. A cloud shared by the general public without restrictions
- B. A cloud owned and operated by a single private company
- C. A cloud used exclusively by government defense agencies
- D. A cloud shared by organizations with common requirements

Answer: D

Q280. What is a cloud API?

- A. A monitoring tool for tracking cloud resource utilization
- B. A security certificate used to access cloud dashboards
- C. An interface allowing applications to interact with cloud services
- D. A physical connector between cloud data center servers

Answer: C

Q281. What is a strong password policy?

- A. Rules requiring complex, lengthy, and unique passwords
- B. Sharing passwords among trusted team members
- C. Using short passwords for easy memorization
- D. Changing passwords only when a breach is detected

Answer: A

Q282. What is social engineering in the context of cybersecurity?

- A. Building social media platforms for secure communication
- B. Manipulating people into revealing confidential information
- C. Designing network architectures for social media companies
- D. Programming chatbots for automated customer support

Answer: B

Q283. What is the purpose of a security audit?

- A. To install new software on all company computers
- B. To permanently block all external network connections
- C. To increase the bandwidth of the network infrastructure
- D. To evaluate and assess the security posture of a system

Answer: D

Q284. What does the term 'ransomware' refer to?

- A. A tool for managing network access control lists
- B. Software that speeds up your computer's performance
- C. Malware that encrypts data and demands payment for the key
- D. A backup solution that stores copies of important files

Answer: C

Q285. What is the function of an access control list (ACL) on a network device?

- A. It manages the allocation of IP addresses on the local network
- B. It lists all users who have physical access to the server room
- C. It records all login attempts to the network administration panel
- D. It defines rules to permit or deny network traffic on interfaces

Answer: D

Q286. What is a brute force attack?

- A. Systematically trying all possible passwords until finding the correct one
- B. Physically breaking into a data center facility
- C. Flooding a server with traffic to cause denial of service
- D. Intercepting network traffic between two communicating devices

Answer: A

Q287. What is the purpose of network monitoring in security?

- A. To replace firewalls with a more modern security solution
- B. To detect suspicious activities and potential security threats
- C. To increase the speed of all network connections
- D. To permanently store all data passing through the network

Answer: B

Q288. What is a security vulnerability?

- A. A planned feature in software for administrator access
- B. A strength in the system's defense against cyber threats
- C. A weakness that can be exploited to compromise security
- D. A configuration setting that improves network performance

Answer: C

Q289. What is the role of a certificate authority (CA)?

- A. To manage physical access to data center facilities
- B. To issue and verify digital certificates for entities
- C. To monitor network traffic for security threats
- D. To create firewall rules for network perimeter defense

Answer: B

Q290. What does the term 'authentication' mean in network security?

- A. The process of verifying the identity of a user or device
- B. The process of compressing data for faster transmission
- C. The process of routing packets through the fastest path
- D. The process of encrypting data before sending it

Answer: A

Q291. What is an autonomous vehicle in the context of next-generation networks?

- A. A server that operates independently without network connectivity
- B. A self-driving vehicle that relies on network communication for operation
- C. A drone used to deploy networking cables in remote locations
- D. A robotic system that manufactures network equipment automatically

Answer: B

Q292. What is augmented reality (AR) in the context of network applications?

- A. A technique that replaces the real world with a virtual environment
- B. A server architecture used for rendering cloud-based video games
- C. A network protocol designed for transferring 3D model data files
- D. A technology that overlays digital information onto the real world view

Answer: D

Q293. What is the concept of smart grid in next-generation networking?

- A. An intelligent electrical grid that uses network communication for management
- B. A high-performance computing grid for scientific research
- C. A display technology for showing network monitoring dashboards
- D. A network topology where all devices are arranged in a grid pattern

Answer: A

Q294. What is the Internet of Everything (IoE)?

- A. A faster version of the internet with unlimited bandwidth
- B. An extension of IoT connecting people, processes, data, and things
- C. A government initiative to provide internet access everywhere
- D. A protocol for connecting every device using IPv6 addresses

Answer: B

Q295. What is the purpose of wearable technology in next-generation networks?

- A. To replace desktop computers for all computing tasks
- B. To install network equipment without using any tools
- C. To protect network cables from environmental damage
- D. To provide personal health, fitness, and connectivity on the body

Answer: D

Q296. What is Industry 4.0 in the context of next-generation networks?

- A. The fourth major update to enterprise networking equipment
- B. The fourth version of the internet protocol standard
- C. The fourth industrial revolution driven by smart manufacturing and IoT
- D. The fourth generation of mobile wireless communication systems

Answer: C

Q297. What is a drone network in next-generation communication?

- A. A mesh network connecting satellites in geostationary orbit
- B. Unmanned aerial vehicles providing aerial communication coverage
- C. A network of underground cables for secure data transmission
- D. A cluster of servers processing drone surveillance video footage

Answer: B

Q298. What is the concept of connected healthcare?

- A. A social media platform for healthcare professionals to connect
- B. A VPN service designed specifically for medical record access
- C. Using networked devices and systems to improve healthcare delivery
- D. Connecting hospital buildings with high-speed fiber optic cables

Answer: C

Q299. What is a satellite internet constellation?

- A. A group of ground-based antennas pointed at a single satellite
- B. A star topology network named after celestial patterns
- C. A server cluster designed to process astronomical research data
- D. A large fleet of satellites providing global internet coverage

Answer: D

Q300. What is the role of 5G in enabling the Internet of Things?

- A. 5G provides high capacity, low latency, and massive device connectivity for IoT
- B. 5G eliminates the need for any IoT gateway or edge devices
- C. 5G is used only for smartphone communications not IoT devices
- D. 5G replaces WiFi entirely for all IoT device connections

Answer: A

Computer Networks & Cloud Computing — Medium

300 questions

Q301. According to the Nyquist theorem, the maximum data rate of a noiseless channel with bandwidth B and L signal levels is:

- A. $2B \log_2(L)$
- B. $2B / \log_2(L)$
- C. $B \log_2(L)$
- D. $B^2 \log_2(L)$

Answer: A

Q302. What is the Shannon capacity formula for a noisy channel?

- A. $C = B * \text{SNR}$
- B. $C = B \log_2(1 + \text{SNR})$
- C. $C = 2B \log_2(\text{SNR})$
- D. $C = B / \log_2(\text{SNR})$

Answer: B

Q303. Which multiplexing technique divides the bandwidth of a link into frequency bands?

- A. CDM
- B. FDM
- C. TDM
- D. WDM

Answer: B

Q304. In PCM (Pulse Code Modulation), what are the three steps in order?

- A. Encoding, Sampling, Quantization
- B. Quantization, Sampling, Encoding
- C. Sampling, Quantization, Encoding
- D. Sampling, Encoding, Quantization

Answer: C

Q305. What type of encoding uses the transition at the middle of a bit interval to represent data?

- A. Unipolar encoding
- B. Manchester encoding
- C. NRZ-I encoding
- D. NRZ-L encoding

Answer: B

Q306. If a signal-to-noise ratio (SNR) is 1000, what is the SNR in decibels?

- A. 20 dB
- B. 30 dB
- C. 10 dB
- D. 40 dB

Answer: B

Q307. Which type of transmission sends bits one at a time over a single channel?

- A. Serial transmission
- B. Parallel transmission
- C. Synchronous transmission
- D. Isochronous transmission

Answer: A

Q308. In asynchronous serial transmission, what is the purpose of start and stop bits?

- A. Compressing the data being sent
- B. Detecting transmission errors in data
- C. Encrypting the transmitted payload
- D. Synchronizing sender and receiver clocks

Answer: D

Q309. Wavelength Division Multiplexing (WDM) is conceptually similar to which multiplexing technique?

- A. TDM
- B. FDM
- C. CDM
- D. STDM

Answer: B

Q310. What is throughput in data communication?

- A. The delay in delivering packets
- B. Number of bits in each signal
- C. Maximum capacity of a channel
- D. Actual data rate through a point

Answer: D

Q311. In a full mesh topology with n devices, how many links are required?

- A. n
- B. n-1
- C. $n(n-1)/2$
- D. n^2

Answer: C

Q312. Which layer of the OSI model handles data encryption and compression?

- A. Presentation layer
- B. Application layer
- C. Session layer
- D. Transport layer

Answer: A

Q313. What is the main advantage of packet switching over circuit switching?

- A. It has simpler implementation
- B. It uses network resources efficiently
- C. It guarantees fixed bandwidth
- D. It provides much lower latency

Answer: B

Q314. Which TCP/IP layer corresponds to the OSI network layer?

- A. Network access layer
- B. Internet layer
- C. Application layer
- D. Transport layer

Answer: B

Q315. What type of switching does ATM (Asynchronous Transfer Mode) use?

- A. Message switching
- B. Cell switching
- C. Packet switching
- D. Circuit switching

Answer: B

Q316. Which organization is responsible for defining the Ethernet standard (IEEE 802.3)?

- A. W3C
- B. IETF
- C. IEEE
- D. ITU

Answer: C

Q317. What is the function of the session layer in the OSI model?

- A. Detecting errors in frames
- B. Encrypting transmitted data
- C. Managing dialog between systems
- D. Routing packets across networks

Answer: C

Q318. In packet switching, what is the difference between datagram and virtual circuit approaches?

- A. Datagrams always use fixed-size data packets
- B. Virtual circuits do not include packet headers
- C. Virtual circuits set up a path first; datagrams do not
- D. Datagrams offer lower latency than virtual circuits

Answer: C

Q319. A hub operates at which layer of the OSI model?

- A. Network layer
- B. Transport layer
- C. Data link layer
- D. Physical layer

Answer: D

Q320. What is the difference between a bridge and a switch?

- A. Bridges forward packets faster than switches do
- B. Bridges work at Layer 3; switches work at Layer 2
- C. There is no functional difference between them
- D. Switches handle multiple frames at once; bridges process one

Answer: D

Q321. What is the purpose of bit stuffing in HDLC?

- A. To prevent the flag pattern in data
- B. To compress the transmitted data
- C. To encrypt the frame contents
- D. To increase available bandwidth

Answer: A

Q322. In the Go-Back-N ARQ protocol, what happens when an error is detected in frame n?

- A. The entire connection is terminated
- B. Only frame n is retransmitted alone
- C. All frames from n onward are resent
- D. Frame n is skipped and ignored

Answer: C

Q323. What is the window size at the receiver in the Go-Back-N protocol?

- A. Same as sender window size
- B. Equal to N minus 1
- C. Always exactly 1 only
- D. Equal to $2^{(m-1)}$

Answer: C

Q324. In Selective Repeat ARQ, what is the maximum window size if the sequence number has m bits?

- A. $2^{(m-1)}$
- B. 2^m
- C. $2^m - 1$
- D. $2^m + 1$

Answer: A

Q325. What is the purpose of the LLC sublayer?

- A. Collision detection on the wire
- B. Signal encoding and modulation
- C. Physical addressing of devices
- D. Flow and error control for frames

Answer: D

Q326. What is the minimum frame size in standard Ethernet (IEEE 802.3)?

- A. 64 bytes
- B. 46 bytes
- C. 32 bytes
- D. 128 bytes

Answer: A

Q327. Which access method does IEEE 802.11 (Wi-Fi) use?

- A. CSMA/CD method
- B. Token passing
- C. CSMA/CA method
- D. FDMA technique

Answer: C

Q328. In the Hamming code, how many redundancy bits are needed for a 4-bit data word?

- A. 3
- B. 2
- C. 5
- D. 4

Answer: A

Q329. What is a VLAN (Virtual LAN)?

- A. A logical group of devices on a network
- B. A wireless LAN using access points
- C. A LAN without any switch devices
- D. A LAN that uses virtual machine hosts

Answer: A

Q330. What is the exponential backoff algorithm used for in Ethernet?

- A. Increasing the link bandwidth
- B. Performing error correction tasks
- C. Determining wait time after collision
- D. Assigning MAC addresses to NICs

Answer: C

Q331. In CIDR notation, what does /28 mean?

- A. 28 hosts are available on subnet
- B. 28 bits are for network addressing
- C. 28 bits are for host addressing
- D. 28 subnets exist in the network

Answer: B

Q332. How many usable host addresses are available in a /26 subnet?

- A. 64
- B. 30
- C. 62
- D. 126

Answer: C

Q333. Which routing protocol uses the Bellman-Ford algorithm?

- A. RIP
- B. OSPF
- C. BGP
- D. IS-IS

Answer: A

Q334. What is the maximum hop count in RIP?

- A. 255
- B. 16
- C. 15
- D. 8

Answer: C

Q335. OSPF is classified as which type of routing protocol?

- A. Path vector
- B. Link-state
- C. Distance vector
- D. Hybrid

Answer: B

Q336. What is the size of an IPv6 address?

- A. 64 bits
- B. 32 bits
- C. 128 bits
- D. 96 bits

Answer: C

Q337. What is the count-to-infinity problem associated with?

- A. Link-state protocols
- B. Distance vector protocols
- C. Static routing tables
- D. Path vector protocols

Answer: B

Q338. Which field in the IPv4 header is used for fragmentation reassembly?

- A. Header checksum field
- B. Identification field
- C. Protocol field
- D. TTL field

Answer: B

Q339. What does DHCP provide?

- A. Automatic IP address assignment
- B. Email delivery management
- C. Routing information exchange
- D. Domain name resolution services

Answer: A

Q340. Which protocol is used between autonomous systems on the Internet?

- A. RIP
- B. EIGRP
- C. BGP
- D. OSPF

Answer: C

Q341. In TCP, what is the purpose of the window size field?

- A. Controlling flow by advertising buffer space
- B. Specifying the maximum segment size used
- C. Detecting errors in transmitted segments
- D. Identifying the application layer protocol

Answer: A

Q342. What is the TCP mechanism for handling out-of-order segments?

- A. Buffering them indefinitely in memory
- B. Requesting retransmission of all data
- C. Discarding all out-of-order segments
- D. Using sequence numbers to reorder them

Answer: D

Q343. What is the purpose of the TCP FIN flag?

- A. To synchronize the sequence numbers
- B. To establish a new connection
- C. To reset an existing connection
- D. To gracefully terminate a connection

Answer: D

Q344. How many steps are involved in graceful TCP connection termination?

- A. 5
- B. 2
- C. 4
- D. 3

Answer: C

Q345. What is Nagle's algorithm in TCP?

- A. A routing algorithm for IP packets
- B. A congestion control mechanism for TCP
- C. An algorithm that buffers small segments
- D. An error correction algorithm for data

Answer: C

Q346. What is the difference between TCP's flow control and congestion control?

- A. Congestion control is faster than flow control always
- B. Flow control is used in UDP; congestion control is for TCP
- C. Flow control protects receiver; congestion control protects network
- D. They are the same mechanism in TCP

Answer: C

Q347. What port number does HTTPS use?

- A. 143
- B. 443
- C. 80
- D. 993

Answer: B

Q348. What is the maximum size of a TCP segment's data payload if the MSS is 1460 bytes?

- A. 65535 bytes
- B. 1500 bytes
- C. 536 bytes
- D. 1460 bytes

Answer: D

Q349. What is the size of the UDP header?

- A. 12 bytes
- B. 4 bytes
- C. 20 bytes
- D. 8 bytes

Answer: D

Q350. In TCP, what does a RST (Reset) flag indicate?

- A. Acknowledgment of data received
- B. Normal graceful termination
- C. An abrupt connection abort
- D. A request to synchronize

Answer: C

Q351. What is the difference between HTTP/1.1 persistent and non-persistent connections?

- A. Persistent connections use UDP instead of TCP
- B. Persistent keeps TCP open for multiple requests; non-persistent does not
- C. There is no difference between them at all
- D. Non-persistent connections are faster than persistent ones

Answer: B

Q352. What type of DNS record maps a domain name to an IPv4 address?

- A. AAAA record
- B. A record
- C. MX record
- D. CNAME record

Answer: B

Q353. What is the difference between FTP active and passive modes?

- A. Active mode uses TCP; passive mode uses UDP for transfer
- B. Active mode is encrypted; passive mode is not encrypted
- C. There is no functional difference between the two modes
- D. In active mode server initiates data; in passive mode client does

Answer: D

Q354. What HTTP status code indicates 'Not Found'?

- A. 403
- B. 200
- C. 301
- D. 404

Answer: D

Q355. What is the purpose of DNS caching?

- A. To create backup DNS server entries
- B. To block malicious domain name requests
- C. To encrypt DNS queries for privacy
- D. To store resolved names for faster lookups

Answer: D

Q356. Which protocol is used for secure file transfer?

- A. Telnet
- B. HTTP
- C. SFTP
- D. FTP

Answer: C

Q357. What is SNMP used for?

- A. Transferring files
- B. Browsing web pages
- C. Sending emails to users
- D. Managing network devices

Answer: D

Q358. In HTTP, what is the difference between GET and POST methods?

- A. GET is more secure than POST method
- B. GET retrieves data via URL; POST sends data in body
- C. POST is always faster than GET requests
- D. They are identical in every respect

Answer: B

Q359. What is a MIME type used for in email?

- A. Filtering out spam messages
- B. Routing emails between servers
- C. Defining the content type format
- D. Encrypting email messages

Answer: C

Q360. What port does SMTP use?

- A. 110
- B. 21
- C. 25
- D. 80

Answer: C

Q361. Why does Wi-Fi use CSMA/CA instead of CSMA/CD?

- A. Collision detection is impractical in wireless
- B. CSMA/CA uses significantly less power
- C. CSMA/CD is not defined for any wireless
- D. CSMA/CA provides faster throughput overall

Answer: A

Q362. What is the purpose of RTS/CTS mechanism in IEEE 802.11?

- A. To increase the available bandwidth
- B. To solve the hidden station problem
- C. To assign IP addresses to clients
- D. To encrypt the transmitted data frames

Answer: B

Q363. What frequency bands does IEEE 802.11n (Wi-Fi 4) support?

- A. 60 GHz band only
- B. Both 2.4 and 5 GHz
- C. 2.4 GHz band only
- D. 5 GHz band only

Answer: B

Q364. What technology does 4G LTE use for its air interface?

- A. FDMA
- B. OFDMA
- C. TDMA
- D. CDMA

Answer: B

Q365. What is MIMO in wireless networking?

- A. A type of signal modulation used
- B. Multiple antennas to boost throughput
- C. A wireless security protocol standard
- D. A specific radio frequency band

Answer: B

Q366. What is the difference between infrastructure mode and ad-hoc mode in Wi-Fi?

- A. They are the same wireless mode
- B. Ad-hoc mode requires an access point to function
- C. Infrastructure mode is slower than ad-hoc mode
- D. Infrastructure uses an AP; ad-hoc is direct device-to-device

Answer: D

Q367. What is handoff (handover) in cellular networks?

- A. Changing the phone number on a SIM
- B. Turning off the mobile phone device
- C. Transferring a call between cell towers
- D. Connecting a device to a Wi-Fi network

Answer: C

Q368. What is the maximum theoretical speed of IEEE 802.11ac (Wi-Fi 5)?

- A. 9.6 Gbps
- B. 1.3 Gbps
- C. 600 Mbps
- D. 6.9 Gbps

Answer: D

Q369. What does WPA3 improve over WPA2?

- A. Faster wireless data speeds overall
- B. Stronger encryption and resistance to dictionary attacks
- C. Greater wireless signal range coverage
- D. Improved battery life for all devices

Answer: B

Q370. What is frequency reuse in cellular networks?

- A. Assigning same frequencies to non-adjacent cells
- B. Changing frequencies every few seconds
- C. Using only one frequency for all traffic
- D. Using the same frequency in every cell

Answer: A

Q371. What is a hybrid cloud?

- A. A cloud running both Windows and Linux
- B. A mix of public and private clouds together
- C. A cloud without any virtualization layer
- D. A cloud powered by solar energy only

Answer: B

Q372. What is the difference between horizontal and vertical scaling?

- A. Vertical scaling is always the better choice
- B. They are the same scaling approach
- C. Horizontal adds machines; vertical adds power
- D. Horizontal scaling is slower than vertical

Answer: C

Q373. What is a hypervisor?

- A. A network communication protocol
- B. Software that creates and runs VMs
- C. A type of network firewall
- D. A cloud storage service platform

Answer: B

Q374. What is serverless computing?

- A. A model where providers manage servers for you
- B. A type of dedicated hardware platform
- C. Computing without any servers at all
- D. Computing without needing Internet access

Answer: A

Q375. What is the difference between a container and a virtual machine?

- A. Containers share the OS kernel; VMs include full OS
- B. Containers require a hypervisor to operate
- C. They are the same technology in practice
- D. VMs are lighter weight than containers are

Answer: A

Q376. What is multi-tenancy in cloud computing?

- A. Running multiple operating systems at once
- B. Using multiple different cloud providers
- C. Multiple customers sharing the same resources
- D. Having multiple data center locations

Answer: C

Q377. What is an SLA in cloud computing?

- A. A server location address identifier
- B. A software license agreement for vendors
- C. A system load analyzer monitoring tool
- D. A contract defining service quality guarantees

Answer: D

Q378. What is cloud migration?

- A. Moving workloads from on-premises to cloud
- B. Deleting cloud resources permanently
- C. Moving birds through cloud formations
- D. Changing between different cloud providers

Answer: A

Q379. What is object storage in cloud computing?

- A. Storing physical objects in warehouses
- B. A traditional relational database type
- C. Managing data as objects with metadata
- D. RAM-based temporary data storage

Answer: C

Q380. What is auto-scaling in cloud computing?

- A. Permanently reducing allocated resources
- B. Manual scaling done by administrators
- C. Automatically adjusting resources with demand
- D. Scaling only during business hours

Answer: C

Q381. What is the difference between IDS and IPS?

- A. IPS only detects without blocking
- B. IDS actively blocks all traffic
- C. They are identical in function
- D. IDS only alerts; IPS also blocks threats

Answer: D

Q382. What is a man-in-the-middle (MITM) attack?

- A. A brute force password cracking attack
- B. A type of network firewall configuration
- C. An attacker intercepting communication between parties
- D. A physical attack on network cables

Answer: C

Q383. What is ARP spoofing?

- A. Repairing corrupted ARP table entries
- B. A DNS poisoning attack on resolvers
- C. A routing protocol attack on BGP routers
- D. Sending fake ARPs to link attacker MAC to valid IP

Answer: D

Q384. What is the purpose of a DMZ (Demilitarized Zone) in network security?

- A. A restricted military zone on base
- B. A backup network for disaster recovery
- C. A type of encryption algorithm used
- D. A segment separating internal from external networks

Answer: D

Q385. What is port scanning?

- A. A type of data encryption technique
- B. A method to permanently close all ports
- C. Physically inspecting network port hardware
- D. Discovering open ports and services on a target

Answer: D

Q386. What is the purpose of IPSec?

- A. To speed up IP packet routing
- B. To replace TCP with a new protocol
- C. To assign IP addresses to devices
- D. To provide security services at IP layer

Answer: D

Q387. What is the difference between stateful and stateless firewalls?

- A. Stateless firewalls are more secure overall
- B. Stateful tracks connections; stateless filters packets individually
- C. They are the same type of firewall
- D. Stateful firewalls cannot track any connections

Answer: B

Q388. What is a honeypot in network security?

- A. A sweet treat left for hackers to find
- B. A type of firewall with extra logging
- C. An encryption algorithm for secure data
- D. A decoy system to attract and study attackers

Answer: D

Q389. What is the function of a WAF (Web Application Firewall)?

- A. Filtering email messages for spam
- B. Protecting web apps by filtering HTTP traffic
- C. Encrypting web pages for secure storage
- D. Blocking all web traffic on the network

Answer: B

Q390. What is two-factor authentication (2FA)?

- A. Logging into a system twice in succession
- B. Using two different usernames for access
- C. Using two different passwords to log in
- D. Requiring two identification factors to verify identity

Answer: D

Q391. What are the three main use cases of 5G defined by ITU?

- A. Voice, video, and data transfer
- B. Speed, security, and storage capacity
- C. eMBB, URLLC, and mMTC
- D. LAN, WAN, and MAN types

Answer: C

Q392. What is the role of MQTT protocol in IoT?

- A. A lightweight messaging protocol for IoT
- B. Transferring large files between devices
- C. Sending emails from IoT sensors
- D. Browsing websites on IoT devices

Answer: A

Q393. What is OpenFlow in the context of SDN?

- A. A distance vector routing protocol
- B. A type of network firewall
- C. A cloud computing service platform
- D. A protocol between SDN controller and switches

Answer: D

Q394. What is fog computing?

- A. Computing in foggy weather conditions
- B. Computing without any electricity source
- C. A type of cloud storage for backups
- D. Extending cloud computing to the network edge

Answer: D

Q395. What is the main purpose of LPWAN (Low-Power Wide-Area Network)?

- A. Replacing Wi-Fi in home networks
- B. Long-range low-power IoT communication
- C. Streaming high-definition video content
- D. High-speed online gaming connections

Answer: B

Q396. What is an IMS (IP Multimedia Subsystem)?

- A. An internet monitoring system tool
- B. A type of network router device
- C. A framework for multimedia over IP networks
- D. An instant messaging service for users

Answer: C

Q397. What is digital twin technology in the context of networks?

- A. Two identical physical networks side by side
- B. A virtual replica for simulation and monitoring
- C. A backup network for disaster recovery
- D. A VPN technology for secure tunnels

Answer: B

Q398. What is the concept of network automation?

- A. A type of network switch hardware
- B. Networks that never require any maintenance
- C. Using software to auto-configure network devices
- D. Manual network configuration by engineers

Answer: C

Q399. What is Content-Centric Networking (CCN) / Named Data Networking (NDN)?

- A. A paradigm focusing on content not host location
- B. A social networking platform for users
- C. A caching technology for web browsers only
- D. A type of domain name resolution system

Answer: A

Q400. What is Multi-access Edge Computing (MEC)?

- A. Cloud capabilities at the mobile network edge
- B. A type of cloud storage for backups
- C. A Wi-Fi standard for edge networks
- D. Computing on multiple user devices at once

Answer: A

Q401. In Manchester encoding, how is a binary 1 typically represented?

- A. A low-to-high voltage transition at mid-bit
- B. A constant high voltage for the full bit
- C. A high-to-low voltage transition at mid-bit
- D. A constant low voltage for the full bit

Answer: A

Q402. What is the primary advantage of differential Manchester encoding over standard Manchester?

- A. It uses less bandwidth overall
- B. It eliminates the need for any synchronization
- C. It offers better noise immunity via transitions
- D. It provides higher data transfer rate

Answer: C

Q403. Which multiplexing technique assigns unique codes to each channel?

- A. Code Division Multiplexing
- B. Time Division Multiplexing
- C. Wavelength Division Multiplexing
- D. Frequency Division Multiplexing

Answer: A

Q404. What is the main difference between synchronous and asynchronous transmission?

- A. Synchronous uses analog; asynchronous uses digital signals
- B. Synchronous is slower; asynchronous is always faster
- C. Synchronous uses wireless; asynchronous uses wired media
- D. Synchronous uses frames; asynchronous sends individual bytes

Answer: D

Q405. A channel has a bandwidth of 4 kHz and SNR of 31. What is the Shannon capacity?

- A. 24,000 bps
- B. 16,000 bps
- C. 32,000 bps
- D. 20,000 bps

Answer: D

Q406. What causes intersymbol interference (ISI) in digital communication?

- A. Excessive signal amplification at receiver end
- B. Too many repeaters placed along the channel
- C. Spreading of pulses that overlap adjacent symbols
- D. Use of fiber optic cables instead of copper

Answer: C

Q407. In TDM, what happens when a time slot's source has no data to send?

- A. The slot is transmitted empty as a placeholder
- B. The slot is given to another active source
- C. The slot is filled with error correction bits
- D. The entire frame transmission is paused

Answer: A

Q408. What is the purpose of a constellation diagram in digital modulation?

- A. It maps network topology connections visually
- B. It shows signal amplitude and phase combinations
- C. It illustrates the physical layout of cables
- D. It displays the frequency spectrum of a signal

Answer: B

Q409. What is the key advantage of statistical TDM over synchronous TDM?

- A. It dynamically allocates slots to active sources
- B. It provides lower latency for all sources
- C. It removes the need for framing information
- D. It uses wider bandwidth for faster transfers

Answer: A

Q410. What does QAM combine to create multiple signal variations?

- A. Compression and encryption simultaneously
- B. Digital and analog encoding simultaneously
- C. Amplitude and phase modulation together
- D. Frequency and wavelength modulation together

Answer: C

Q411. What is the key difference between a bridge and a switch?

- A. A bridge uses IP addresses; a switch uses MAC addresses
- B. A bridge is wireless; a switch requires wired connections
- C. A bridge works in software; a switch uses hardware ASICs
- D. A bridge operates at Layer 3; a switch at Layer 2 only

Answer: C

Q412. In the TCP/IP model, which layer corresponds to the OSI session and presentation layers?

- A. Network interface layer
- B. Transport layer
- C. Application layer
- D. Internet layer

Answer: C

Q413. What is the purpose of ARP in computer networking?

- A. It assigns domain names to IP addresses
- B. It resolves IP addresses to MAC addresses
- C. It encrypts data at the network layer
- D. It routes packets between different subnets

Answer: B

Q414. What is a collision domain in Ethernet networking?

- A. A network area where firewalls block traffic
- B. A group of devices sharing a broadcast address
- C. A subnet with identical IP address configurations
- D. A segment where simultaneous transmissions can collide

Answer: D

Q415. What is the primary advantage of packet switching over circuit switching?

- A. It offers more efficient use of network bandwidth
- B. It provides guaranteed constant bandwidth to users
- C. It ensures zero packet loss during transmission
- D. It eliminates the need for routing protocols entirely

Answer: A

Q416. What does CSMA/CD stand for and where is it used?

- A. Circuit Switched Multiple Access / Channel Division in MANs
- B. Coded Signal Modulation Access / Carrier Demodulation in PANs
- C. Central Station Multiple Access / Conflict Detection in WANs
- D. Carrier Sense Multiple Access / Collision Detection in LANs

Answer: D

Q417. What is the function of the network layer in the OSI model?

- A. It formats data for presentation to applications
- B. It handles end-to-end error control between processes
- C. It manages logical addressing and packet routing
- D. It establishes and maintains sessions between hosts

Answer: C

Q418. What is the purpose of subnetting in IP networking?

- A. To increase the total number of IP addresses
- B. To divide a network into smaller logical groups
- C. To encrypt data between network segments
- D. To connect wireless and wired networks together

Answer: B

Q419. How does a VLAN differ from a physical LAN?

- A. A VLAN requires separate cables for each group
- B. A VLAN only works with wireless network connections
- C. A VLAN uses IP routing; a LAN uses MAC switching
- D. A VLAN groups devices logically regardless of location

Answer: D

Q420. What is the difference between a broadcast domain and a collision domain?

- A. Collision domains are larger; broadcast domains are per port
- B. Both terms describe exactly the same network concept
- C. Broadcast domains are larger; collision domains are per port
- D. Broadcast domains exist only in wireless network setups

Answer: C

Q421. How does the Go-Back-N ARQ protocol handle frame errors?

- A. It retransmits the error frame and all subsequent frames
- B. It requests the receiver to correct the frame locally
- C. It retransmits only the specific erroneous frame alone
- D. It ignores the error and continues with new frame data

Answer: A

Q422. What is the advantage of Selective Repeat ARQ over Go-Back-N?

- A. It eliminates the need for acknowledgment frames
- B. It only retransmits the specific frames with errors
- C. It provides stronger encryption for transmitted frames
- D. It uses simpler receiver buffer management logic

Answer: B

Q423. What is the purpose of bit stuffing in HDLC framing?

- A. To increase the data transmission speed on the link
- B. To add error correction bits throughout the payload
- C. To prevent data patterns from mimicking frame delimiter
- D. To compress the data payload for efficient transfer

Answer: C

Q424. In CSMA/CA, what does the device do before transmitting?

- A. It requests a dedicated channel from central controller
- B. It sends data immediately without any delay checks
- C. It broadcasts a test packet to check for collisions
- D. It senses the channel and waits if it is already busy

Answer: D

Q425. What is the sliding window protocol's main benefit?

- A. It encrypts frames during transit across network
- B. It converts analog signals to digital frame format
- C. It allows multiple frames in transit simultaneously
- D. It eliminates the need for error detection codes

Answer: C

Q426. What is the binary exponential backoff algorithm used for?

- A. Calculating the optimal frame size for a network
- B. Encoding binary data into Ethernet frame formats
- C. Selecting the fastest route between two endpoints
- D. Determining retransmission wait time after collisions

Answer: D

Q427. How does a learning bridge build its forwarding table?

- A. By examining the source MAC address of incoming frames
- B. By querying a central DHCP server for address mappings
- C. By reading a pre-configured static file at startup
- D. By broadcasting requests to all devices on the network

Answer: A

Q428. What is the purpose of the preamble in an Ethernet frame?

- A. It synchronizes the receiver's clock with the sender
- B. It stores the VLAN tag for traffic prioritization
- C. It carries the destination MAC address information
- D. It contains error correction data for the payload

Answer: A

Q429. In token ring networks, how is channel access managed?

- A. A central controller assigns fixed time slots to nodes
- B. Devices transmit whenever the channel appears free
- C. A special token frame circulates granting send rights
- D. Devices use frequency division to avoid any collisions

Answer: C

Q430. What is the role of the FCS field in a data link frame?

- A. It stores the fragmentation offset for large payloads
- B. It specifies the priority level for quality of service
- C. It identifies the network layer protocol in the payload
- D. It contains the frame check sequence for error detection

Answer: D

Q431. What is the difference between classful and classless IP addressing?

- A. Classful uses fixed boundaries; classless uses variable masks
- B. Classful uses variable masks; classless uses fixed boundaries
- C. Classful supports IPv6; classless only supports IPv4 format
- D. Classful is used in WANs; classless is used in LANs only

Answer: A

Q432. What does CIDR notation /24 mean for an IP address?

- A. The subnet can hold exactly 24 host IP addresses
- B. The first 24 bits are the host portion of address
- C. The address has a total length of 24 bits only
- D. The first 24 bits are the network portion of address

Answer: D

Q433. How does NAT help conserve IPv4 addresses?

- A. It maps multiple private IPs to fewer public IP addresses
- B. It compresses IP headers to use fewer address bits
- C. It assigns temporary addresses that expire after one use
- D. It converts IPv4 addresses directly to IPv6 format

Answer: A

Q434. What is the key difference between distance-vector and link-state routing?

- A. Distance-vector shares routing tables; link-state shares LSA info
- B. Distance-vector shares full topology; link-state shares hop counts
- C. Distance-vector is faster to converge than link-state protocols
- D. Distance-vector uses flooding; link-state uses periodic updates

Answer: A

Q435. What routing protocol uses the Dijkstra algorithm for path computation?

- A. BGP
- B. OSPF
- C. EIGRP
- D. RIP

Answer: B

Q436. What is the purpose of IP fragmentation?

- A. To split large packets to fit the link's maximum unit
- B. To encrypt packets for secure transmission over links
- C. To compress packet headers for faster router processing
- D. To prioritize certain packets over others in the queue

Answer: A

Q437. What is the count-to-infinity problem in distance-vector routing?

- A. Routers keep incrementing hop counts for unreachable routes
- B. Routers count packets infinitely without forwarding any data
- C. Routers exceed their maximum memory for routing table size
- D. The metric value overflows the integer storage in routers

Answer: A

Q438. How does split horizon prevent routing loops?

- A. It divides the routing table into two separate equal halves
- B. It splits the network into isolated routing zones entirely
- C. It uses two different routing protocols simultaneously always
- D. It never advertises a route back to the interface it learned from

Answer: D

Q439. What is the main advantage of IPv6 over IPv4?

- A. IPv6 only works with wireless network connections
- B. IPv6 uses shorter 64-bit addresses for simplicity
- C. IPv6 eliminates the need for any routing protocols
- D. IPv6 provides a vastly larger 128-bit address space

Answer: D

Q440. What is the function of the DHCP protocol?

- A. It dynamically assigns IP addresses to network hosts
- B. It translates MAC addresses into IP address format
- C. It monitors network bandwidth usage across subnets
- D. It encrypts DNS queries for privacy and security

Answer: A

Q441. What is the TCP three-way handshake used for?

- A. To assign port numbers to communicating processes
- B. To encrypt data before transmission starts
- C. To fragment packets for network layer processing
- D. To establish a reliable connection between hosts

Answer: D

Q442. What does the TCP window size control?

- A. The encryption key length for secure connections
- B. The maximum number of TCP connections allowed
- C. The amount of data sent before acknowledgment needed
- D. The physical size of network interface buffers

Answer: C

Q443. How does TCP handle out-of-order segment delivery?

- A. It buffers segments and reorders using sequence numbers
- B. It discards all out-of-order segments immediately
- C. It forwards segments to the application without reordering
- D. It requests the sender to retransmit the entire data stream

Answer: A

Q444. What is the purpose of the TCP checksum field?

- A. It determines the optimal window size for the flow
- B. It identifies the priority level of the data segment
- C. It counts the total number of segments transmitted
- D. It detects errors in the TCP segment during transfer

Answer: D

Q445. What triggers TCP fast retransmit?

- A. Detection of a CRC error in the segment received
- B. A request from the application layer to resend data
- C. Expiration of the retransmission timeout timer
- D. Receipt of three duplicate acknowledgment messages

Answer: D

Q446. What is the difference between flow control and congestion control?

- A. Flow control prevents routing loops; congestion prevents collisions
- B. Flow control is for UDP only; congestion control is TCP only
- C. Flow control manages sender speed; congestion manages network load
- D. Flow control operates at Layer 3; congestion at Layer 4 only

Answer: C

Q447. What is Nagle's algorithm designed to address?

- A. Increasing the throughput for large file transfers
- B. Optimizing the routing of packets across subnets
- C. Preventing unauthorized access to network services
- D. Reducing the overhead from many small TCP segments

Answer: D

Q448. What does the URG flag indicate in a TCP segment?

- A. The receiver should increase its window size
- B. The segment is a retransmission of lost data
- C. The segment contains high-priority urgent data
- D. The connection is being reset by the sender

Answer: C

Q449. Why is UDP preferred over TCP for DNS queries?

- A. UDP provides more reliable delivery for DNS resolution
- B. DNS requires encryption that only UDP provides
- C. UDP's low overhead is ideal for small DNS query packets
- D. DNS queries require the connection setup that UDP offers

Answer: C

Q450. What is a TCP RST segment used for?

- A. To advertise a larger receive window to sender
- B. To initiate a new TCP connection with a server
- C. To abruptly terminate an existing TCP connection
- D. To request retransmission of lost data segments

Answer: C

Q451. What is the difference between POP3 and IMAP for email?

- A. POP3 downloads and deletes; IMAP keeps mail on the server
- B. POP3 uses encryption; IMAP sends messages in plain text
- C. POP3 works offline only; IMAP requires constant connection
- D. POP3 is for sending; IMAP is for receiving email messages

Answer: A

Q452. How does DNS resolution typically work in a recursive query?

- A. The DNS resolver handles the entire lookup on behalf of client
- B. The root server returns the final IP address immediately
- C. The client broadcasts a request to all DNS servers at once
- D. The client queries each DNS server in the hierarchy directly

Answer: A

Q453. What is the purpose of DNS caching?

- A. To speed up repeated lookups by storing recent resolutions
- B. To permanently store all DNS records on every client
- C. To balance the load across multiple DNS server instances
- D. To encrypt DNS queries to prevent eavesdropping attacks

Answer: A

Q454. What is the role of MIME in email communication?

- A. It encrypts the email body for confidential communication
- B. It compresses email attachments to reduce storage space used
- C. It extends email to support non-text attachments and formats
- D. It routes email messages between different mail servers

Answer: C

Q455. What HTTP method is used to submit form data to a server?

- A. HEAD
- B. DELETE
- C. POST
- D. GET

Answer: C

Q456. What is the difference between active and passive FTP modes?

- A. Active is faster; passive provides more reliable file transfer
- B. In active mode the server connects back; in passive the client connects
- C. Active encrypts data; passive transfers data in plain text
- D. Active uses one port; passive uses two ports for data

Answer: B

Q457. What does an HTTP status code 404 indicate?

- A. The client needs to authenticate before accessing resource
- B. The server encountered an internal processing error
- C. The client request was successfully processed by server
- D. The requested resource was not found on the server

Answer: D

Q458. What is the purpose of a reverse proxy server?

- A. It converts HTTP requests into FTP transfer commands
- B. It sits before servers to handle requests on their behalf
- C. It caches web pages for faster client-side browsing
- D. It translates domain names into IP addresses for clients

Answer: B

Q459. How does a CDN improve web content delivery?

- A. It encrypts web traffic to prevent data interception
- B. It compresses all web content to reduce file sizes
- C. It blocks malicious requests before they reach servers
- D. It distributes content to edge servers closer to users

Answer: D

Q460. What is the function of the SSH protocol?

- A. It transfers files using unencrypted connections only
- B. It sends email messages between different mail servers
- C. It provides secure encrypted remote access and commands
- D. It resolves domain names to their IP addresses securely

Answer: C

Q461. What is the key difference between WiFi 5 (802.11ac) and WiFi 6 (802.11ax)?

- A. WiFi 5 uses 2.4 GHz only; WiFi 6 uses 5 GHz band only
- B. WiFi 5 supports MU-MIMO; WiFi 6 does not support it
- C. WiFi 6 introduces OFDMA for better multi-device efficiency
- D. WiFi 6 has shorter range but much higher power consumption

Answer: C

Q462. What security protocol replaced WEP in wireless networks?

- A. SSL
- B. SSH
- C. WPA
- D. IPSec

Answer: C

Q463. What is the purpose of channel bonding in WiFi?

- A. It combines adjacent channels to increase bandwidth
- B. It encrypts data across multiple wireless channels
- C. It reduces interference by separating signal channels
- D. It connects multiple access points into a single unit

Answer: A

Q464. What is MU-MIMO and what problem does it solve?

- A. It modulates signals to reduce power consumption overall
- B. It allows simultaneous transmission to multiple devices
- C. It manages user authentication for wireless network access
- D. It monitors unauthorized intrusions on the wireless network

Answer: B

Q465. How does 5G differ from 4G in terms of architecture?

- A. 5G uses circuit switching; 4G uses packet switching
- B. 5G only works with stationary devices, not mobile ones
- C. 5G uses smaller cells and millimeter wave frequencies
- D. 5G eliminates base stations entirely for all connections

Answer: C

Q466. What is a wireless mesh network?

- A. A network where every device connects to a central hub
- B. A wired backbone connecting multiple wireless access points
- C. A network where nodes relay data for each other wirelessly
- D. A network using satellite links for all communication paths

Answer: C

Q467. What is the role of a wireless controller in enterprise networks?

- A. It encrypts all wired traffic before wireless transmission
- B. It replaces all access points with a single device
- C. It centrally manages and configures multiple access points
- D. It provides internet connectivity to the entire building

Answer: C

Q468. What is the purpose of beamforming in wireless communication?

- A. It focuses the wireless signal toward a specific device
- B. It converts analog signals into digital format wirelessly
- C. It compresses data packets for faster wireless transfer
- D. It spreads the signal equally in all directions around

Answer: A

Q469. What is a handoff (handover) in mobile wireless networks?

- A. The encryption key exchange between device and tower
- B. The initial registration of a device on a mobile network
- C. The process of powering off a mobile device gracefully
- D. The transfer of a connection from one cell to another

Answer: D

Q470. What is the ISM band and why is it significant for WiFi?

- A. A satellite communication band for international broadcasts
- B. An unlicensed band that WiFi and Bluetooth can use freely
- C. A licensed frequency band reserved for military usage
- D. A frequency band used exclusively for medical equipment

Answer: B

Q471. What is the difference between vertical and horizontal scaling?

- A. Vertical is for public cloud; horizontal is for private cloud
- B. Vertical adds more machines; horizontal upgrades existing machines
- C. Vertical upgrades one machine; horizontal adds more machines
- D. Vertical scales storage; horizontal scales computing power only

Answer: C

Q472. What is a container and how does it differ from a virtual machine?

- A. Containers include a full OS; VMs share the host OS kernel
- B. Containers are physical machines; VMs are software abstractions
- C. Containers share the host OS kernel; VMs include a full OS each
- D. Containers only run on private clouds; VMs run on public clouds

Answer: C

Q473. What is the purpose of a hypervisor in cloud computing?

- A. It manages network routing between cloud data centers
- B. It balances internet traffic across multiple web servers
- C. It creates and manages virtual machines on physical hosts
- D. It encrypts data stored in cloud storage services only

Answer: C

Q474. What does serverless computing mean?

- A. Applications run without any servers or infrastructure at all
- B. Applications run entirely on client devices with no backend
- C. The cloud provider manages servers; developers deploy code only
- D. Servers are physically removed from data center facilities

Answer: C

Q475. What is the role of a load balancer in cloud architecture?

- A. It distributes incoming traffic across multiple server instances
- B. It converts database queries into API calls for applications
- C. It monitors the temperature of physical servers in data centers
- D. It compresses data for faster storage on cloud disks

Answer: A

Q476. What is multi-tenancy in cloud computing?

- A. Multiple data centers hosting copies of the same application
- B. Multiple customers sharing the same physical infrastructure
- C. Multiple users accessing a cloud service through one account
- D. Multiple backups of data stored across different regions

Answer: B

Q477. What is the purpose of auto-scaling in cloud environments?

- A. It automatically encrypts data when storage is nearly full
- B. It automatically migrates data between different cloud providers
- C. It automatically adjusts resources based on current demand
- D. It automatically updates software to the latest version only

Answer: C

Q478. What is object storage and how does it differ from block storage?

- A. Object storage is faster; block storage provides better data durability
- B. Object storage is only for images; block storage is for all file types
- C. Object storage uses fixed blocks; block storage uses flexible objects
- D. Object storage stores data as objects with metadata; block uses raw blocks

Answer: D

Q479. What is a cloud region and availability zone?

- A. A region is a city; an availability zone is a building in it
- B. A region is a continent; an availability zone is a country within it
- C. A region is a geographic area; zones are isolated data centers within
- D. A region is a network; zones are different subnets within the network

Answer: C

Q480. What is the shared responsibility model in cloud security?

- A. Security duties are split between the provider and customer
- B. The customer handles all security without provider involvement
- C. A third-party security firm manages all cloud security tasks
- D. The cloud provider handles all security aspects completely

Answer: A

Q481. What is the difference between symmetric and asymmetric encryption?

- A. Symmetric uses one shared key; asymmetric uses a key pair
- B. Symmetric is slower; asymmetric is always faster in practice
- C. Symmetric uses two keys; asymmetric uses a single shared key
- D. Symmetric is for files; asymmetric is only for email messages

Answer: A

Q482. What is a man-in-the-middle (MITM) attack?

- A. An attacker intercepts communication between two parties secretly
- B. An attacker deletes data from the middle of a large database
- C. An attacker blocks only the middle portion of a data stream
- D. An attacker physically sits between two network servers

Answer: A

Q483. What is the purpose of an Intrusion Detection System (IDS)?

- A. It manages user passwords across the entire network
- B. It encrypts all data stored on network servers securely
- C. It monitors network traffic for suspicious activities
- D. It blocks all incoming network traffic automatically

Answer: C

Q484. How does a digital certificate work?

- A. It stores all user passwords in an encrypted database file
- B. It binds a public key to an entity verified by a trusted CA
- C. It routes encrypted traffic through the shortest network path
- D. It compresses encrypted data for faster transfer speeds

Answer: B

Q485. What is the purpose of network segmentation for security?

- A. To compress network traffic for more efficient routing
- B. To increase the overall network bandwidth capacity
- C. To merge multiple networks into one unified network
- D. To isolate network zones and limit breach impact spread

Answer: D

Q486. What is a DDoS attack and how does it differ from DoS?

- A. DDoS targets databases; DoS targets web servers exclusively
- B. DDoS originates from multiple sources; DoS from a single source
- C. DDoS is legal; DoS is the only illegal form of this attack
- D. DDoS uses encryption; DoS uses plain text for attacks

Answer: B

Q487. What is the principle of least privilege in security?

- A. Users should have only the minimum access rights they need
- B. Users should have all permissions to avoid workflow delays
- C. Users should share credentials to simplify access management
- D. Users should change permissions weekly for security rotation

Answer: A

Q488. What is the purpose of a DMZ in network architecture?

- A. It connects two private networks using encrypted tunnels
- B. It manages wireless access point configuration remotely
- C. It compresses all outgoing traffic to save internet bandwidth
- D. It hosts public-facing services isolated from the internal net

Answer: D

Q489. What is port scanning used for in network security?

- A. It assigns port numbers to newly installed server applications
- B. It discovers open ports and services on a target system
- C. It physically scans network cables for damage or breaks
- D. It increases the number of available network ports on switch

Answer: B

Q490. What is the role of TLS in network security?

- A. It manages domain name registration for web applications
- B. It monitors disk space usage on networked file servers
- C. It provides encryption for data in transit between endpoints
- D. It assigns IP addresses to devices on the local network

Answer: C

Q491. How does network automation improve operations?

- A. It eliminates all security vulnerabilities automatically
- B. It reduces manual tasks and human errors in configuration
- C. It replaces networking protocols with machine learning only
- D. It removes the need for any network hardware devices

Answer: B

Q492. What is the concept of intent-based networking?

- A. Networks that intentionally drop packets for load testing
- B. Networks that translate business intent into automated policies
- C. Networks that only connect devices with matching firmware
- D. Networks that administrators configure line by line manually

Answer: B

Q493. What is the role of blockchain in next-generation networks?

- A. It compresses network traffic to reduce bandwidth consumption
- B. It increases WiFi signal range through distributed antennas
- C. It replaces TCP/IP as the fundamental networking protocol
- D. It provides decentralized trust and secure transaction records

Answer: D

Q494. What is multi-access edge computing (MEC)?

- A. A technique for connecting multiple keyboard and mouse devices
- B. A method of storing data on multiple hard drives for backup
- C. Computing at the edge of the mobile network for low latency
- D. A protocol for accessing email from multiple client devices

Answer: C

Q495. How do digital twins benefit network management?

- A. They create physical copies of network equipment for backup
- B. They provide two-factor authentication for network access
- C. They double the network bandwidth by mirroring all traffic
- D. They simulate network behavior for testing without real impact

Answer: D

Q496. What is the significance of LPWAN for IoT deployments?

- A. It provides high-bandwidth connections for video streaming
- B. It replaces all existing WiFi standards with a new protocol
- C. It offers ultra-fast speeds for gaming and virtual reality
- D. It enables long-range, low-power connectivity for IoT sensors

Answer: D

Q497. What is the purpose of network telemetry?

- A. It collects real-time operational data from network devices
- B. It controls satellite communications for space networks
- C. It encrypts all management traffic on the network devices
- D. It provides telephone services over computer network lines

Answer: A

Q498. How does AIOps enhance network operations?

- A. It replaces all network devices with AI-powered hardware
- B. It uses AI and ML to automate and improve IT operations
- C. It generates artificial network traffic for testing purposes
- D. It provides artificial internet connections for offline work

Answer: B

Q499. What is the concept of network as a service (NaaS)?

- A. A free network service provided by government to all citizens
- B. Consuming networking capabilities as a cloud-delivered service
- C. A network that only provides services during business hours
- D. A physical network installed by the service provider on site

Answer: B

Q500. What is the role of quantum computing in future networks?

- A. It eliminates the need for any physical network connections
- B. It replaces all existing encryption methods with weaker ones
- C. It reduces the cost of network hardware to nearly zero price
- D. It promises faster processing and new cryptographic methods

Answer: D

Q501. What is the relationship between bit rate and baud rate in QPSK modulation?

- A. Bit rate is twice the baud rate value
- B. Bit rate equals the baud rate exactly
- C. Bit rate is four times the baud rate
- D. Bit rate is half the baud rate value

Answer: A

Q502. What is the primary purpose of line coding in digital communication?

- A. To multiplex several analog voice channels
- B. To convert digital data into digital signals
- C. To compress data before wireless transmission
- D. To encrypt data for secure communication

Answer: B

Q503. In Frequency Division Multiplexing, what prevents interference between channels?

- A. Time slots assigned to each channel
- B. Unique code sequences per channel
- C. Guard bands separating frequency ranges
- D. Priority levels for each data stream

Answer: C

Q504. What is the advantage of NRZ-I encoding over NRZ-L encoding?

- A. NRZ-I doubles the effective data rate
- B. NRZ-I uses less bandwidth per signal
- C. NRZ-I eliminates all baseline wander
- D. NRZ-I provides better clock synchronization

Answer: D

Q505. A channel has a bandwidth of 6 kHz. Using the Nyquist formula with 4 signal levels, what is the maximum data rate?

- A. 24 kbps with 4 levels encoding
- B. 48 kbps with 4 levels encoding
- C. 36 kbps with 4 levels encoding
- D. 12 kbps with 4 levels encoding

Answer: A

Q506. What is the primary difference between baseband and broadband transmission?

- A. Broadband uses digital signals on the entire bandwidth while baseband divides it
- B. Baseband uses digital signals on the entire bandwidth while broadband divides it
- C. Baseband supports higher data rates than broadband transmission systems
- D. Broadband can only carry a single channel at any given time

Answer: B

Q507. What problem does scrambling solve in data communication systems?

- A. It compresses data for faster throughput
- B. It increases signal power for long cables
- C. It reduces latency in fiber optic networks
- D. It avoids long sequences of constant bits

Answer: D

Q508. In Phase Shift Keying (PSK), what property of the carrier signal is modified?

- A. The phase of the carrier wave signal
- B. The frequency of the carrier wave
- C. The wavelength of the carrier wave
- D. The amplitude of the carrier wave

Answer: A

Q509. What is the role of an equalizer in a data communication receiver?

- A. To amplify signals for longer distances
- B. To compensate for signal distortion caused by the channel
- C. To encrypt incoming data for secure storage
- D. To convert analog signals into digital format

Answer: B

Q510. In Amplitude Shift Keying (ASK), how are binary values represented?

- A. By changing the frequency between two values
- B. By shifting the phase at each bit boundary
- C. By varying the amplitude of the carrier wave
- D. By combining frequency and phase variations

Answer: C

Q511. What is the primary difference between a Layer 2 switch and a Layer 3 switch?

- A. Layer 2 switches support wireless clients while Layer 3 cannot
- B. Layer 3 switches can perform routing based on IP addresses
- C. Layer 2 switches are faster but less reliable than Layer 3 switches
- D. Layer 3 switches only operate in star topology networks

Answer: B

Q512. What is the purpose of the encapsulation process in the OSI model?

- A. To remove headers as data moves down the layers
- B. To compress data at each layer for faster transmission
- C. To encrypt data at every layer for maximum security
- D. To add protocol information as data descends through layers

Answer: D

Q513. What is the function of the Address Resolution Protocol (ARP)?

- A. It assigns dynamic IP addresses to new network devices
- B. It resolves port numbers to specific running applications
- C. It maps IP addresses to their corresponding MAC addresses
- D. It maps domain names to their corresponding IP addresses

Answer: C

Q514. How does a switch learn which MAC addresses are on which ports?

- A. By examining the source MAC address of incoming frames
- B. By reading configuration files loaded at startup
- C. By querying a central MAC address database server
- D. By broadcasting ARP requests to all connected devices

Answer: A

Q515. What is the difference between unicast, multicast, and broadcast transmissions?

- A. Broadcast sends to one, unicast to a group, multicast to all
- B. Multicast sends to one, broadcast to a group, unicast to all
- C. Unicast sends to all, broadcast to a group, multicast to one
- D. Unicast sends to one, multicast to a group, broadcast to all

Answer: D

Q516. What does the data link layer PDU (Protocol Data Unit) consist of?

- A. Frames with MAC headers and trailer fields
- B. Packets with IP headers and payload data
- C. Bits transmitted as raw signals on the wire
- D. Segments with port numbers and sequence info

Answer: A

Q517. What is store-and-forward switching in a network switch?

- A. The switch only forwards broadcast frames to all ports
- B. The switch receives the entire frame before forwarding it
- C. The switch forwards frames before fully receiving them
- D. The switch stores frames indefinitely until requested

Answer: B

Q518. What is the purpose of RARP (Reverse Address Resolution Protocol)?

- A. It translates private IP addresses to public ones
- B. It resolves hostnames into IP address records
- C. It converts MAC addresses back to IP addresses
- D. It maps port numbers to application layer services

Answer: C

Q519. In a network with multiple paths, what advantage does load balancing provide?

- A. It assigns static IP addresses to all network devices
- B. It blocks redundant paths to simplify routing tables
- C. It distributes traffic across paths to optimize utilization
- D. It encrypts all traffic across different network paths

Answer: C

Q520. What is the role of the session layer in the OSI model?

- A. It converts data formats between different system types
- B. It handles physical transmission of bits across the medium
- C. It performs routing and logical addressing for packets
- D. It manages dialog control and synchronization between hosts

Answer: D

Q521. In the Go-Back-N protocol, what does the sender do when a timer expires for an unacknowledged frame?

- A. It waits for the receiver to send a negative acknowledgment
- B. It resends only the specific frame that timed out
- C. It closes the connection and initiates a new session
- D. It resends the timed-out frame and all subsequent sent frames

Answer: D

Q522. What is the difference between error detection and error correction?

- A. Detection finds errors and requests retransmission while correction fixes them directly
- B. Detection finds and fixes errors while correction only finds them
- C. Detection uses parity bits while correction uses checksum only
- D. Detection works only for burst errors while correction handles single-bit errors

Answer: A

Q523. What is the purpose of the interframe gap in Ethernet transmission?

- A. To synchronize clocks of all devices on the network
- B. To encrypt the gap between successive data frames
- C. To carry management data between consecutive frames
- D. To provide minimum idle time between frame transmissions

Answer: D

Q524. How does a two-dimensional parity check improve over simple parity?

- A. It only works with even numbers of data bytes in each block
- B. It can detect and correct single-bit errors in the data block
- C. It uses half the number of check bits compared to simple parity
- D. It eliminates the need for any retransmission of faulty frames

Answer: B

Q525. What is the piggybacking technique in data link layer protocols?

- A. Attaching acknowledgments to outgoing data frames to save bandwidth
- B. Compressing frame headers to reduce per-frame transmission overhead
- C. Duplicating frames across two links for redundancy and reliability
- D. Sending multiple data frames inside a single larger container frame

Answer: A

Q526. In CSMA/CD, what is the minimum frame size related to?

- A. The maximum number of devices on the network segment
- B. The total available bandwidth on the shared cable medium
- C. The round-trip propagation delay of the collision domain
- D. The processor speed of the transmitting network device

Answer: C

Q527. What is the spanning tree port state 'blocking' used for?

- A. The port is disabled and cannot receive any traffic
- B. The port is actively forwarding user data frames
- C. The port does not forward frames to prevent network loops
- D. The port is learning MAC addresses from incoming frames

Answer: C

Q528. What is the purpose of the jam signal in CSMA/CD?

- A. To request priority access to the shared transmission medium
- B. To notify all stations that a collision has been detected
- C. To test the cable for faults before data is transmitted
- D. To synchronize the clocks of all stations on the network

Answer: B

Q529. What is the role of the Logical Link Control (LLC) sublayer in frame handling?

- A. It provides an interface between the network layer and MAC sublayer
- B. It manages collision detection on shared Ethernet segments
- C. It handles physical signal encoding on the transmission medium
- D. It assigns physical addresses to each networked device

Answer: A

Q530. What is a transparent bridge and how does it operate?

- A. It requires manual configuration of all forwarding table entries
- B. It forwards frames based on IP addresses and routing tables
- C. It operates only between networks using different data link protocols
- D. It learns and forwards frames based on MAC addresses invisibly to hosts

Answer: D

Q531. What is the administrative distance used for in routing?

- A. It measures the physical distance between two routers in meters
- B. It ranks the trustworthiness of routing information sources
- C. It calculates the total bandwidth available on a route path
- D. It determines the maximum number of hops allowed on a route

Answer: B

Q532. In OSPF, what is a Link State Advertisement (LSA)?

- A. A message containing information about a router's links and their states
- B. A request sent to the designated router for database synchronization
- C. A packet used to discover neighboring OSPF routers on a link
- D. An acknowledgment confirming receipt of routing table updates

Answer: A

Q533. What is the purpose of the Don't Fragment (DF) flag in the IPv4 header?

- A. It marks the packet as the final fragment in a sequence
- B. It indicates the packet has already been fragmented once
- C. It instructs routers not to fragment the packet along the path
- D. It requests priority handling to avoid fragmentation delays

Answer: C

Q534. How does proxy ARP work in a network?

- A. A switch duplicates ARP requests and sends them to all VLANs
- B. A host caches ARP entries for all devices on the entire internet
- C. A firewall blocks ARP requests from unauthorized network segments
- D. A router answers ARP requests on behalf of hosts on another network

Answer: D

Q535. What is the difference between RIPv1 and RIPv2?

- A. RIPv1 supports VLSM and authentication while RIPv2 does not
- B. RIPv2 supports VLSM and multicast updates while RIPv1 does not
- C. RIPv2 has unlimited hop count while RIPv1 is limited to 15 hops
- D. RIPv1 uses link-state algorithm while RIPv2 uses distance-vector

Answer: B

Q536. What is the purpose of the OSPF hello protocol?

- A. To discover neighbors and maintain adjacency relationships
- B. To redistribute routes from other routing protocols into OSPF
- C. To calculate the shortest path using Dijkstra algorithm
- D. To exchange full routing tables between all OSPF routers

Answer: A

Q537. What is the purpose of the Identification field in the IPv4 header?

- A. It determines the priority level of the packet for QoS processing
- B. It specifies the version of the IP protocol being used
- C. It stores the checksum value for header integrity verification
- D. It uniquely identifies fragments belonging to the same original packet

Answer: D

Q538. What is the longest prefix match rule in IP routing?

- A. The route with the most hops to the destination is preferred
- B. The route learned from the oldest routing protocol is chosen
- C. The route with the most specific (longest) subnet mask is selected
- D. The route with the lowest administrative distance is preferred

Answer: C

Q539. What is the multicast address range in IPv4?

- A. 192.168.0.0 to 192.168.255.255 range
- B. 224.0.0.0 to 239.255.255.255 range
- C. 172.16.0.0 to 172.31.255.255 range
- D. 240.0.0.0 to 255.255.255.254 range

Answer: B

Q540. What is the purpose of ICMP redirect messages?

- A. To request a DNS resolver to redirect queries elsewhere
- B. To redirect all network traffic through a backup gateway
- C. To inform a host of a better route for a specific destination
- D. To notify the sender that a packet has been fragmented

Answer: C

Q541. How does TCP's sliding window mechanism improve throughput?

- A. It compresses data within each segment to reduce packet size
- B. It allows multiple segments to be sent before requiring acknowledgment
- C. It chooses the fastest network path for each individual segment
- D. It eliminates the need for sequence numbers in the TCP header

Answer: B

Q542. What is the purpose of the TCP Maximum Segment Size (MSS) option?

- A. It specifies the largest data payload a segment can carry
- B. It sets the timeout value for retransmission of segments
- C. It limits the total number of segments in a connection
- D. It determines the maximum window size for flow control

Answer: A

Q543. What happens during the TCP connection termination process?

- A. Both sides exchange FIN and ACK segments in a four-step process
- B. A single FIN segment from either side terminates the connection
- C. The server unilaterally closes the connection without client input
- D. One side sends a RST and the connection immediately closes

Answer: A

Q544. What is the TCP retransmission timeout (RTO) based on?

- A. The number of segments currently in the send buffer queue
- B. Estimated round-trip time and its variation for the connection
- C. A fixed interval of exactly 3 seconds for all connections
- D. The bandwidth of the network interface used for transmission

Answer: B

Q545. What is the difference between TCP's cumulative and selective acknowledgment?

- A. Cumulative ACKs work only with UDP while selective ACK works only with TCP
- B. Selective ACK confirms all data up to a point while cumulative identifies specific ranges
- C. Selective ACK requires more bandwidth but cumulative ACK causes more retransmissions
- D. Cumulative ACKs confirm all data up to a point while SACK identifies specific received ranges

Answer: D

Q546. What is the purpose of the TCP congestion window (cwnd)?

- A. It limits the total number of connections a server can accept
- B. It determines the priority of segments during network congestion
- C. It controls how much data the sender can transmit before receiving ACKs
- D. It specifies the maximum receive buffer size at the destination

Answer: C

Q547. What is delayed acknowledgment in TCP?

- A. The sender delays retransmission until multiple timeouts have occurred
- B. The sender delays sending data until it accumulates a full-size segment
- C. The receiver discards ACKs for duplicate segments to save bandwidth
- D. The receiver waits briefly before sending an ACK hoping to piggyback it with data

Answer: D

Q548. How does UDP handle data that arrives out of order?

- A. UDP buffers packets until all segments arrive then delivers them
- B. UDP discards out-of-order packets and requests retransmission
- C. UDP delivers data to the application in whatever order it arrives
- D. UDP reorders segments using sequence numbers before delivery

Answer: C

Q549. What does the TCP window scale option allow?

- A. It enables window sizes larger than the 16-bit field allows
- B. It dynamically adjusts the MSS during data transfer
- C. It reduces the header size for low-bandwidth connections
- D. It compresses window update notifications between peers

Answer: A

Q550. What is the purpose of the TCP keepalive mechanism?

- A. To periodically refresh the routing path for the TCP connection
- B. To detect if the other end of an idle connection is still reachable
- C. To prevent the congestion window from shrinking during idle time
- D. To maintain data throughput at a constant rate during transfers

Answer: B

Q551. What is the difference between iterative and recursive DNS queries?

- A. In iterative, the server resolves the query completely; in recursive, it returns a referral
- B. In recursive, the server resolves the query completely; in iterative, it returns a referral
- C. Recursive queries use TCP while iterative queries always use UDP protocol
- D. Iterative queries bypass caching while recursive queries always check cache first

Answer: B

Q552. What HTTP status code range indicates a client error?

- A. 300-399 redirection response code range
- B. 100-199 informational response codes
- C. 400-499 client error response code range
- D. 200-299 successful response code range

Answer: C

Q553. What is the purpose of HTTP cookies?

- A. To compress web page content for faster loading times
- B. To encrypt communication between browser and web server
- C. To validate the digital certificate of a web server
- D. To store state information for the stateless HTTP protocol

Answer: D

Q554. What is the DNS TTL (Time-to-Live) field used for?

- A. To specify how long a DNS record can be cached before refresh
- B. To set the maximum size of a DNS response message packet
- C. To limit the number of hops a DNS query can traverse
- D. To determine the priority of DNS servers for a domain

Answer: A

Q555. What is the purpose of the HTTP PUT method?

- A. To delete the resource located at the specified URI
- B. To retrieve a resource from the specified server URI
- C. To replace the entire resource at the specified URI
- D. To append data to an existing resource on the server

Answer: C

Q556. What is the CNAME record used for in DNS?

- A. To create an alias that points to another domain name
- B. To specify the text-based description of a DNS zone
- C. To map a domain name to an IPv6 address for hosts
- D. To define the service location for specific protocols

Answer: A

Q557. What is the difference between SFTP and FTPS?

- A. FTPS is faster than SFTP because it has less encryption overhead
- B. SFTP runs over SSH while FTPS adds TLS/SSL to the FTP protocol
- C. FTPS runs over SSH while SFTP adds TLS/SSL to the FTP protocol
- D. SFTP uses port 990 while FTPS uses port 22 for connections

Answer: B

Q558. What is the purpose of the HTTP Content-Type header?

- A. It defines the maximum size of the request or response payload
- B. It specifies the encoding used to compress the response body
- C. It authenticates the client making the HTTP request to the server
- D. It indicates the media type of the resource being sent or received

Answer: D

Q559. What is the role of a DNS root server in the name resolution hierarchy?

- A. It assigns new domain names to registrars for public sale
- B. It caches resolved DNS entries for all ISP customers worldwide
- C. It directs queries to the appropriate top-level domain servers
- D. It stores all DNS records for every domain on the internet

Answer: C

Q560. What is the HTTP 301 status code used to indicate?

- A. The requested resource was temporarily unavailable for maintenance
- B. The requested resource has been permanently moved to a new URL
- C. The server encountered an internal error processing the request
- D. The client must authenticate before accessing the resource

Answer: B

Q561. What is the primary benefit of WiFi 6E over WiFi 6?

- A. WiFi 6E removes backward compatibility to improve overall performance
- B. WiFi 6E adds the 6 GHz band providing more channels and less congestion
- C. WiFi 6E doubles the range of WiFi 6 using advanced antenna designs
- D. WiFi 6E uses a completely new modulation scheme for higher speeds

Answer: B

Q562. What is the purpose of the Distributed Coordination Function (DCF) in WiFi?

- A. It provides contention-based medium access using CSMA/CA for all stations
- B. It coordinates frequency hopping between channels to avoid interference
- C. It reserves dedicated time slots for each connected wireless device
- D. It centrally manages all wireless transmissions through the access point

Answer: A

Q563. What is roaming in enterprise wireless networks?

- A. The process of manually switching between different WiFi networks
- B. The technique of increasing transmission power for broader coverage
- C. The method of assigning static IP addresses to mobile wireless devices
- D. The automatic transition of a client between access points within a network

Answer: D

Q564. What is the difference between omnidirectional and directional antennas?

- A. Directional radiates in all horizontal directions while omnidirectional focuses signal in one
- B. Omnidirectional radiates in all horizontal directions while directional focuses signal in one
- C. Directional antennas have lower gain than omnidirectional antennas in all cases
- D. Omnidirectional works only indoors while directional is designed for outdoor use only

Answer: B

Q565. What does the term 'cell' refer to in cellular network architecture?

- A. A geographic area covered by a single base station
- B. A group of frequencies reserved for emergency calls
- C. The encryption module inside a cellular modem chip
- D. The battery unit that powers each mobile device

Answer: A

Q566. What is the purpose of the association process in WiFi?

- A. It assigns a fixed wireless channel to the connecting client device
- B. It discovers all available WiFi networks in the surrounding area
- C. It establishes a logical connection between a client and an access point
- D. It encrypts the data channel between client and access point

Answer: C

Q567. What is the dual-band capability in modern WiFi routers?

- A. The ability to connect to two internet service providers at the same time
- B. The ability to broadcast two separate SSIDs on the same frequency band
- C. The ability to operate on both 2.4 GHz and 5 GHz frequency bands simultaneously
- D. The ability to support both WPA2 and WPA3 security protocols concurrently

Answer: C

Q568. What is the function of the NAV (Network Allocation Vector) in WiFi?

- A. It acts as a virtual carrier sensing timer to reserve the channel
- B. It allocates IP addresses to wireless network participants
- C. It stores the routing table for wireless mesh networks
- D. It manages authentication keys for wireless client devices

Answer: A

Q569. What is the difference between BSS (Basic Service Set) and ESS (Extended Service Set)?

- A. ESS consists of one AP and its clients while BSS connects multiple ESSs together
- B. BSS consists of one AP and its clients while ESS connects multiple BSSs together
- C. ESS supports only wired connections while BSS supports only wireless connections
- D. BSS uses WPA3 encryption while ESS only supports the older WPA2 standard

Answer: B

Q570. What technology does 5G use to handle many connected IoT devices simultaneously?

- A. Frequency Division Multiple Access with guard bands
- B. Single-carrier modulation with higher power output
- C. Circuit switching with dedicated device channels
- D. Massive MIMO with hundreds of antenna elements

Answer: D

Q571. What is the difference between a Type 1 and Type 2 hypervisor?

- A. Type 1 runs directly on hardware while Type 2 runs on a host operating system
- B. Type 2 provides better performance than Type 1 in all cloud deployments
- C. Type 1 supports only Linux guests while Type 2 supports any guest operating system
- D. Type 2 runs directly on hardware while Type 1 runs on a host operating system

Answer: A

Q572. What is the purpose of a container orchestration platform?

- A. It compiles application source code into container images
- B. It converts virtual machines into lightweight container instances
- C. It provides a graphical interface for designing container architectures
- D. It automates deployment, scaling, and management of containerized applications

Answer: D

Q573. What is the concept of cloud-native microservices architecture?

- A. A single large database shared by all application components in the cloud
- B. A method of migrating legacy mainframe applications directly to cloud servers
- C. An approach where applications are built as small, independent, deployable services
- D. A monolithic application deployed entirely within a single cloud virtual machine

Answer: C

Q574. What is the purpose of a content delivery network (CDN) in cloud architecture?

- A. It manages database replication across multiple cloud data regions
- B. It caches and delivers content from edge locations closest to users
- C. It provides computing resources for running backend application logic
- D. It handles user authentication for cloud-hosted web applications

Answer: B

Q575. What is the difference between block storage and file storage in cloud?

- A. File storage manages raw storage volumes while block storage provides a file system hierarchy
- B. File storage offers higher performance than block storage in all scenarios
- C. Block storage manages raw storage volumes while file storage provides a file system hierarchy
- D. Block storage is only for databases while file storage is only for media content

Answer: C

Q576. What is a cloud function (Function as a Service)?

- A. A dedicated server leased monthly for running specific application workloads
- B. A small piece of code executed in response to events without managing servers
- C. A database query engine hosted in the cloud for analytical processing
- D. A virtual machine running continuously to handle all incoming requests

Answer: B

Q577. What is the purpose of cloud resource tagging?

- A. To label resources with metadata for organization, billing, and management
- B. To encrypt resources with unique security tokens for access control
- C. To assign priority levels to cloud resources during peak usage times
- D. To physically mark server hardware for identification in data centers

Answer: A

Q578. What is the concept of cloud data sovereignty?

- A. The ability of cloud users to access data from any global location
- B. The encryption standard used to protect data stored in cloud servers
- C. The cloud provider's guarantee of permanent data availability worldwide
- D. The legal requirement that data is subject to laws of the country where it resides

Answer: D

Q579. What is a VPC (Virtual Private Cloud)?

- A. An isolated virtual network within a public cloud for a customer's resources
- B. A VPN tunnel connecting an office to the internet through cloud proxy
- C. A physical data center dedicated exclusively to one customer
- D. A virtual machine with enhanced security features enabled by default

Answer: A

Q580. What is the difference between reserved and spot instances in cloud computing?

- A. Reserved instances are temporary while spot instances provide guaranteed availability
- B. Spot instances require long-term contracts while reserved instances are pay-per-use
- C. Spot instances are more expensive but offer better performance than reserved ones
- D. Reserved instances are cheaper with commitment while spot instances offer discounts on spare capacity

Answer: D

Q581. What is the difference between a vulnerability scan and a penetration test?

- A. A penetration test uses automated tools while a vulnerability scan requires manual testing
- B. A vulnerability scan actively exploits weaknesses while a penetration test only identifies them
- C. A vulnerability scan identifies weaknesses automatically while a penetration test actively exploits them
- D. Both vulnerability scans and penetration tests perform identical security assessment functions

Answer: C

Q582. What is the purpose of Multi-Factor Authentication (MFA)?

- A. To allow users to access systems with any single form of identification
- B. To distribute authentication requests across multiple authentication servers
- C. To encrypt user credentials using multiple encryption algorithms simultaneously
- D. To require multiple verification methods from different authentication categories

Answer: D

Q583. What is a SQL injection attack?

- A. An attack that intercepts SQL queries between application and database
- B. An attack that inserts malicious SQL code through application input fields
- C. An attack that floods a database server with excessive connection requests
- D. An attack that physically damages database storage hardware components

Answer: B

Q584. What is the purpose of network access control (NAC)?

- A. To accelerate network traffic through quality of service policies
- B. To manage the physical cabling infrastructure of the enterprise network
- C. To enforce security policies on devices before granting network access
- D. To compress network traffic headers for bandwidth conservation

Answer: C

Q585. What is a Cross-Site Scripting (XSS) attack?

- A. An attack that injects malicious scripts into web pages viewed by other users
- B. An attack that blocks access to a website through distributed denial requests
- C. An attack that redirects website visitors to a cloned phishing site
- D. An attack that exploits expired SSL certificates on insecure web servers

Answer: A

Q586. What is the purpose of RADIUS (Remote Authentication Dial-In User Service)?

- A. To encrypt all data transmitted between wireless clients and access points
- B. To manage DHCP address assignments for remote VPN client connections
- C. To detect and prevent unauthorized wireless access points on the network
- D. To provide centralized authentication, authorization, and accounting for network access

Answer: D

Q587. What is the concept of defense in depth in network security?

- A. Using the deepest encryption algorithm available for all data types
- B. Implementing multiple layers of security controls throughout a system
- C. Deploying security measures only at the network perimeter boundary
- D. Relying on a single strong firewall to protect the entire network

Answer: B

Q588. What is the purpose of a digital signature?

- A. To verify the sender's identity and ensure message integrity
- B. To route signed messages through prioritized network paths
- C. To encrypt the entire message content for confidentiality
- D. To compress messages for faster network transmission speed

Answer: A

Q589. What is a VLAN hopping attack?

- A. An attack that rapidly changes VLAN assignments to cause network instability
- B. An attack that disables VLAN trunking between switches to isolate network segments
- C. An attack where an unauthorized user gains access to a wireless VLAN
- D. An attack that allows an attacker to access traffic on other VLANs bypassing segmentation

Answer: D

Q590. What is the role of hashing in password storage?

- A. It encrypts passwords so they can be decrypted and verified during login
- B. It duplicates passwords across multiple servers for redundancy and availability
- C. It converts passwords into fixed-length values that cannot be reversed to reveal the original
- D. It compresses passwords to reduce the storage space needed in databases

Answer: C

Q591. What is the purpose of a digital twin in network operations?

- A. To duplicate network traffic for load balancing across twin paths
- B. To pair every physical device with an identical standby device
- C. To build a virtual replica of a network for simulation and planning
- D. To create an identical backup of all network hardware equipment

Answer: C

Q592. What is the concept of network function chaining in NFV?

- A. Linking network monitoring tools to create a unified dashboard view
- B. Physically connecting network appliances in a serial chain with cables
- C. Chaining multiple physical firewalls together for redundant protection
- D. Directing traffic through an ordered sequence of virtual network functions

Answer: D

Q593. What is the role of YANG data modeling language in network automation?

- A. It generates graphical network topology diagrams automatically
- B. It models the structure of network device configuration and state data
- C. It defines the programming logic for automated network scripts
- D. It encrypts network automation commands for secure transmission

Answer: B

Q594. What is the concept of network slicing in 5G architecture?

- A. Creating multiple virtual networks on shared physical infrastructure for different needs
- B. Slicing large data packets into smaller fragments for transmission
- C. Dividing the radio spectrum into equal frequency slices for all users
- D. Physically dividing network cables into thinner sections for more connections

Answer: A

Q595. What is the NETCONF protocol used for in network management?

- A. It provides a mechanism to configure and manage network devices programmatically
- B. It encrypts network traffic between data center and branch offices
- C. It monitors network performance through passive packet capture
- D. It distributes network routing updates between autonomous systems

Answer: A

Q596. What is the concept of Vehicle-to-Everything (V2X) communication?

- A. A system for transmitting vehicle diagnostic data to repair shops
- B. A cellular network dedicated to providing entertainment in vehicles
- C. Communication between vehicles and infrastructure, pedestrians, and other vehicles
- D. A satellite navigation system designed exclusively for commercial vehicles

Answer: C

Q597. What is the purpose of an IoT gateway device?

- A. It generates power for battery-free IoT sensor devices
- B. It provides cloud computing resources directly to IoT sensors
- C. It physically protects IoT devices from environmental damage
- D. It bridges communication between IoT devices and cloud or enterprise networks

Answer: D

Q598. What is the concept of haptic communication in next-generation networks?

- A. Communication limited to text-based messaging protocols only
- B. Communication that transmits touch and force feedback over a network
- C. Communication using visible light instead of radio frequencies
- D. Communication between devices using acoustic sound wave signals

Answer: B

Q599. What is the significance of Open RAN (O-RAN) for mobile network operators?

- A. It requires operators to use a single vendor for all radio access equipment
- B. It enables interoperable multi-vendor radio access network components
- C. It eliminates the need for physical cell towers in mobile network design
- D. It restricts RAN deployment to only open-source software implementations

Answer: B

Q600. What is the purpose of a Software-Defined WAN (SD-WAN)?

- A. To eliminate the need for WAN connectivity between branch offices
- B. To replace all WAN links with a single high-speed fiber connection
- C. To physically define WAN boundaries using software-generated maps
- D. To intelligently manage WAN connections using software-based controls

Answer: D

Computer Networks & Cloud Computing — Hard

300 questions

Q601. A channel has a bandwidth of 4 KHz and SNR of 63. What is the maximum achievable data rate according to Shannon's theorem?

- A. 24 Kbps
- B. 12 Kbps
- C. 48 Kbps
- D. 36 Kbps

Answer: A

Q602. In CDMA (Code Division Multiple Access), if a station's chip sequence is $(-1, -1, -1, +1, +1, -1, +1, +1)$ and the received data is $(-1, -1, -3, +1, -1, -3, +1, +1)$, what is the station's data bit?

- A. Indeterminate
- B. Bit is -1
- C. Bit is +1
- D. Bit is 0

Answer: C

Q603. What is the main disadvantage of Differential Manchester encoding compared to standard Manchester encoding?

- A. It is more complex to implement
- B. It requires more bandwidth
- C. It lacks self-clocking ability
- D. It has higher error rates

Answer: A

Q604. In a QAM-16 constellation diagram, how many bits does each signal element represent?

- A. 2 bits
- B. 3 bits
- C. 8 bits
- D. 4 bits

Answer: D

Q605. A signal has passed through 3 cascaded amplifiers, each with a gain of 10 dB. If the original signal power is 5 mW, what is the output power?

- A. 5000 mW
- B. 50000 mW
- C. 500 mW
- D. 50 mW

Answer: A

Q606. In Statistical Time Division Multiplexing (STDM), what is the key advantage over synchronous TDM?

- A. It allocates time slots based on demand
- B. It guarantees lower latency always
- C. It offers simpler implementation
- D. It provides higher total bandwidth

Answer: A

Q607. A digitized voice channel is made by sampling at 8000 samples/sec with 8 bits per sample. What is the required data rate?

- A. 32 Kbps
- B. 128 Kbps
- C. 64 Kbps
- D. 48 Kbps

Answer: C

Q608. Which scrambling technique replaces 8 consecutive zeros with a specific violation pattern to maintain synchronization?

- A. AMI
- B. MLT-3
- C. B8ZS
- D. HDB3

Answer: C

Q609. What is the relationship between bit rate and baud rate when using 8-PSK modulation?

- A. Bit rate = 8 * baud rate
- B. Bit rate = 3 * baud rate
- C. Bit rate = 2 * baud rate
- D. Bit rate = baud rate

Answer: B

Q610. In spread spectrum communication, what happens to the signal bandwidth compared to the original data bandwidth?

- A. It is halved exactly
- B. It decreases significantly
- C. It remains the same
- D. It increases significantly

Answer: D

Q611. In the OSI model, at which layer does the PDU (Protocol Data Unit) change from 'segment' to 'packet'?

- A. From Session to Transport layer
- B. From Transport to Network layer
- C. From Data Link to Physical layer
- D. From Network to Data Link layer

Answer: B

Q612. Which RFC defines the Internet Protocol version 4 (IPv4)?

- A. RFC 793
- B. RFC 791
- C. RFC 2460
- D. RFC 768

Answer: B

Q613. What problem does the Spanning Tree Protocol (STP) solve in switched networks?

- A. Domain name resolution failures
- B. Broadcast storms from switching loops
- C. Automatic IP address assignment
- D. Bandwidth allocation conflicts

Answer: B

Q614. In a hierarchical network design, what is the role of the distribution layer?

- A. Policy-based routing between access and core
- B. High-speed backbone packet forwarding
- C. Connecting end-user devices directly
- D. Providing wireless access to clients

Answer: A

Q615. What is the key concept behind Software-Defined Networking (SDN)?

- A. Hosting all networking functions in the cloud
- B. Eliminating all physical network device hardware
- C. Using only software-based routers for all traffic
- D. Separating the control plane from the data plane

Answer: D

Q616. What is the purpose of MPLS (Multi-Protocol Label Switching) in networking?

- A. To encrypt all network traffic end-to-end
- B. To provide wireless connectivity to devices
- C. To completely replace IP addressing schemes
- D. To speed up forwarding using labels not IPs

Answer: D

Q617. In network performance, what is jitter?

- A. Maximum throughput of a link
- B. Total time to deliver a message
- C. Loss of packets during transit
- D. Variation in packet arrival delay

Answer: D

Q618. What distinguishes a Layer 3 switch from a traditional router?

- A. It performs routing in hardware via ASICs
- B. It operates at a much higher OSI layer
- C. It cannot route between different VLANs
- D. It only works with wireless networks

Answer: A

Q619. In the context of Quality of Service (QoS), what does DiffServ provide?

- A. Guaranteed zero latency for all flows
- B. Per-flow resource reservation for traffic
- C. Automatic bandwidth doubling on demand
- D. Traffic classification using DSCP values

Answer: D

Q620. What is the main purpose of Network Function Virtualization (NFV)?

- A. To create virtual LAN segments on switches
- B. To create backup networks for failover
- C. To virtualize and manage IP address pools
- D. To replace hardware appliances with software

Answer: D

Q621. If the generator polynomial for CRC is $x^3 + 1$, what is the binary divisor?

- A. 1001
- B. 1101
- C. 1111
- D. 1011

Answer: A

Q622. In the HDLC protocol, what type of frame is used for flow and error control without carrying any data?

- A. U-frame
- B. P-frame
- C. I-frame
- D. S-frame

Answer: D

Q623. In a sliding window protocol with a window size of 7 and sequence numbers 0-7, what is the maximum sender window size in Go-Back-N?

- A. 7
- B. 8
- C. 3
- D. 4

Answer: A

Q624. What is the purpose of the IEEE 802.1Q tag in Ethernet frames?

- A. Quality of Service marking
- B. VLAN identification tagging
- C. Frame payload encryption
- D. Error correction coding

Answer: B

Q625. What is the maximum number of VLANs supported by IEEE 802.1Q?

- A. 65535
- B. 1024
- C. 4094
- D. 256

Answer: C

Q626. What is the Hamming distance needed to correct t errors?

- A. $2t$
- B. $t + 1$
- C. $2t + 1$
- D. t

Answer: C

Q627. In Ethernet, why is there a minimum frame size requirement of 64 bytes?

- A. To reduce processing overhead on devices
- B. To support VLAN tagging in the header
- C. To maintain backward compatibility with hubs
- D. To ensure collision detection within the network

Answer: D

Q628. What is the difference between persistent and non-persistent CSMA?

- A. There is no functional difference between the two modes
- B. Non-persistent is significantly faster than persistent always
- C. Persistent transmits when idle; non-persistent waits randomly before sensing
- D. Persistent CSMA relies on a token passing mechanism

Answer: C

Q629. In the PPP (Point-to-Point Protocol) frame, what is the role of the LCP (Link Control Protocol)?

- A. Establishing and maintaining the link
- B. Resolving domain names for hosts
- C. Assigning IP addresses to endpoints
- D. Routing packets across the network

Answer: A

Q630. CRC-32 used in Ethernet can detect all burst errors of length up to how many bits?

- A. 32
- B. 64
- C. 24
- D. 16

Answer: A

Q631. Given the IP address 172.16.45.14/21, what is the network address?

- A. 172.16.32.0
- B. 172.16.40.0
- C. 172.16.45.0
- D. 172.16.44.0

Answer: B

Q632. In OSPF, what is an Area Border Router (ABR)?

- A. A router that runs the BGP protocol
- B. A router operating within a single OSPF area
- C. A router connecting two or more OSPF areas
- D. A router connecting to external networks only

Answer: C

Q633. What technique does split horizon use to solve the count-to-infinity problem?

- A. Not advertising routes back through learned interfaces
- B. Using TTL values to limit the route propagation
- C. Sending updates to directly connected routers only
- D. Encrypting all routing update messages sent

Answer: A

Q634. In IPv6, what replaces broadcast?

- A. No replacement exists
- B. Multicast and anycast
- C. Unicast addressing
- D. Simplex mode

Answer: B

Q635. What is the purpose of the OSPF Designated Router (DR)?

- A. To connect to external autonomous systems
- B. To serve as the default gateway for hosts
- C. To handle DHCP requests from all clients
- D. To reduce adjacencies on multi-access networks

Answer: D

Q636. A company needs to create 6 subnets from a /24 network. What is the most efficient subnet mask to use?

- A. /29
- B. /26
- C. /28
- D. /27

Answer: D

Q637. What is the function of the Protocol field in the IPv4 header?

- A. To indicate the total length of the packet
- B. To identify the upper-layer protocol used
- C. To store the header checksum for errors
- D. To specify the version of IP being used

Answer: B

Q638. In BGP, what is the AS_PATH attribute used for?

- A. Listing traversed ASes to prevent loops
- B. Measuring the link bandwidth capacity
- C. Encrypting routing updates over links
- D. Assigning IP addresses to BGP peers

Answer: A

Q639. What is the main advantage of VLSM (Variable Length Subnet Masking)?

- A. It enables faster packet routing overall
- B. It simplifies network configuration greatly
- C. It provides better security for subnets
- D. It allows subnets of different sizes for efficiency

Answer: D

Q640. What is route aggregation (supernetting) and why is it important?

- A. Combining network prefixes to reduce routing tables
- B. Assigning multiple IP addresses to a single host
- C. Creating backup routes for network redundancy
- D. Splitting a network into smaller subnets for isolation

Answer: A

Q641. In TCP congestion control, what triggers the slow start algorithm to switch to congestion avoidance?

- A. When all sent data has been acknowledged
- B. When the receiver window fills up completely
- C. After a retransmission timeout event occurs
- D. When congestion window reaches the ssthresh

Answer: D

Q642. What happens in TCP fast retransmit?

- A. The sender waits for a timeout before resending
- B. All unacknowledged segments are retransmitted
- C. The receiver requests immediate retransmission
- D. The sender resends after three duplicate ACKs

Answer: D

Q643. In the TCP state diagram, what state does a client enter after sending a SYN?

- A. SYN_RECEIVED
- B. ESTABLISHED
- C. SYN_SENT
- D. LISTEN

Answer: C

Q644. What is the TIME_WAIT state in TCP used for?

- A. Waiting for lost data to be retransmitted
- B. Waiting for the server to respond to requests
- C. Performing the initial connection setup phase
- D. Ensuring old duplicate segments expire first

Answer: D

Q645. What is TCP SACK (Selective Acknowledgment)?

- A. A compression method for TCP segments
- B. An extension to report non-contiguous data blocks
- C. A method to acknowledge every single byte received
- D. A security feature for TCP authentication

Answer: B

Q646. What is the Silly Window Syndrome in TCP?

- A. A routing loop caused by TCP misconfiguration
- B. A security vulnerability in older TCP stacks
- C. A DNS resolution error affecting TCP connections
- D. Inefficient exchange of tiny segments due to small windows

Answer: D

Q647. In TCP Reno, what happens when three duplicate ACKs are received?

- A. The cwnd is reset to 1 MSS and slow start begins
- B. The TCP connection is terminated by the sender
- C. The cwnd is doubled and transmission continues
- D. The ssthresh is halved and fast recovery is entered

Answer: D

Q648. What is the purpose of the TCP PSH (Push) flag?

- A. To indicate urgent data in the stream
- B. To establish a new TCP connection
- C. To deliver buffered data to the app now
- D. To reset the existing TCP connection

Answer: C

Q649. What is a SYN flood attack?

- A. Sending many SYNs without completing handshakes
- B. Flooding the network with excessive UDP packets
- C. Sending too much data at once to overflow buffers
- D. Sending many malformed DNS query messages

Answer: A

Q650. What distinguishes QUIC from TCP?

- A. QUIC is only used for email protocols
- B. QUIC does not support stream multiplexing
- C. QUIC is slower but more reliable than TCP
- D. QUIC runs over UDP with built-in encryption

Answer: D

Q651. In DNS, what is a recursive query?

- A. A query where the server fully resolves the name
- B. A query that only checks local cache entries
- C. A query that returns only partial results
- D. A query that bypasses all DNS caches

Answer: A

Q652. What is the key improvement in HTTP/2 over HTTP/1.1?

- A. It uses UDP instead of TCP for speed
- B. It removes all encryption and TLS support
- C. It uses a completely different port number
- D. It multiplexes requests over a single connection

Answer: D

Q653. What is DNS amplification attack?

- A. Modifying DNS responses to redirect users
- B. Using open resolvers to flood a target with traffic
- C. Blocking all DNS queries on the network
- D. Stealing DNS records from name servers

Answer: B

Q654. What is the purpose of DNSSEC?

- A. To speed up DNS query resolution time
- B. To authenticate and verify DNS responses
- C. To encrypt DNS queries for user privacy
- D. To replace DNS with a new modern protocol

Answer: B

Q655. What is a RESTful API?

- A. An API that only supports GET requests
- B. An API using HTTP methods for stateless access
- C. An API that only works during off-peak hours
- D. An API built on SOAP protocol framework

Answer: B

Q656. What is DNS-over-HTTPS (DoH)?

- A. A new DNS record type for websites
- B. A faster version of DNS using caching
- C. A protocol encapsulating DNS within HTTPS
- D. A way to host DNS on web servers only

Answer: C

Q657. In HTTP, what is the purpose of the ETag header?

- A. Session management cookies
- B. Resource versioning for caching
- C. User authentication tokens
- D. Content encoding indicators

Answer: B

Q658. What is the function of a reverse proxy?

- A. To block all incoming network traffic
- B. To hide the client identity from servers
- C. To forward requests to backend servers
- D. To replace DNS resolution entirely

Answer: C

Q659. What is the purpose of a CDN (Content Delivery Network)?

- A. To encrypt emails during transit
- B. To replace web servers entirely
- C. To provide DNS resolution services
- D. To distribute content globally for speed

Answer: D

Q660. What is WebSocket and how does it differ from HTTP?

- A. WebSocket is only designed for file transfers
- B. WebSocket provides full-duplex persistent communication
- C. WebSocket uses UDP instead of TCP for transport
- D. WebSocket is a faster version of the HTTP protocol

Answer: B

Q661. What is beamforming in 5G and Wi-Fi 6?

- A. Using a single omnidirectional antenna only
- B. Focusing signal energy toward specific devices
- C. Broadcasting signals in all directions equally
- D. Reducing signal power to save energy

Answer: B

Q662. What is the key technology difference between 5G mmWave and sub-6 GHz 5G?

- A. Sub-6 GHz provides faster speeds than mmWave
- B. They are identical in performance and range
- C. mmWave offers extreme speed but limited range; sub-6 gives wider coverage
- D. mmWave has better penetration through buildings

Answer: C

Q663. What is MU-MIMO and how does it differ from SU-MIMO?

- A. They are the same MIMO technology in practice
- B. MU-MIMO uses fewer antennas than SU-MIMO does
- C. SU-MIMO is newer and more advanced than MU-MIMO
- D. MU-MIMO serves multiple users at once; SU-MIMO serves one

Answer: D

Q664. What is OFDMA and how does it improve Wi-Fi 6?

- A. A wireless security protocol for encryption
- B. A technique dividing channels into sub-channels for users
- C. A type of data encryption for Wi-Fi
- D. A new dedicated radio frequency band

Answer: B

Q665. What is network slicing in 5G?

- A. Creating virtual networks on shared infrastructure
- B. Reducing overall network speed for stability
- C. Dividing frequency bands into smaller chunks
- D. Physically cutting and splicing network cables

Answer: A

Q666. What is the exposed station problem in wireless networks?

- A. A station without any encryption configured on it
- B. A security vulnerability allowing eavesdropping attacks
- C. A station that unnecessarily defers its own transmission
- D. A station that is visible to all users on the network

Answer: C

Q667. In Wi-Fi 6 (802.11ax), what is BSS Coloring?

- A. Marking frames to differentiate overlapping BSSs
- B. Changing the LED color on the router hardware
- C. A security feature for frame encryption
- D. A QoS mechanism for traffic prioritization

Answer: A

Q668. What is the role of the Mobility Management Entity (MME) in LTE architecture?

- A. Radio signal transmission to devices
- B. Control-plane functions like auth and handover
- C. Forwarding user data between nodes
- D. Content delivery to mobile users

Answer: B

Q669. What is the KRACK (Key Reinstallation Attack) vulnerability?

- A. A DNS spoofing attack on wireless networks
- B. An attack exploiting the WPA2 four-way handshake
- C. A brute force password cracking technique
- D. A physical attack on router hardware devices

Answer: B

Q670. What is the purpose of Target Wake Time (TWT) in Wi-Fi 6?

- A. To increase the transmit power of antennas
- B. To keep all devices active and always on
- C. To change wireless channels automatically
- D. To schedule wake times to save device power

Answer: D

Q671. What is the CAP theorem in distributed cloud systems?

- A. A theorem about total network capacity limits
- B. A theorem about reducing cloud service costs
- C. A theorem about choosing two of three guarantees
- D. A theorem about CPU performance scaling

Answer: C

Q672. What is cloud-native architecture?

- A. Cloud storage solutions without compute services
- B. Applications designed for on-premises servers only
- C. Native mobile apps that run on phones only
- D. Apps built with microservices, containers, and CI/CD

Answer: D

Q673. What is the shared responsibility model in cloud security?

- A. Provider secures infrastructure; customer secures data
- B. The cloud provider handles all security alone
- C. No one is responsible for cloud security
- D. The customer handles all security responsibilities

Answer: A

Q674. What is Kubernetes?

- A. A container orchestration platform
- B. A programming language for cloud
- C. A cloud provider platform service
- D. A type of virtual machine image

Answer: A

Q675. What is edge computing and how does it relate to cloud computing?

- A. A complete replacement for cloud computing
- B. Processing data near the source to cut latency
- C. Computing at the edge of a physical desk
- D. Computing only on mobile phone devices

Answer: B

Q676. What is Infrastructure as Code (IaC)?

- A. Managing infrastructure via configuration files
- B. Coding without using a computer at all
- C. A type of cloud storage service
- D. Writing code directly on physical servers

Answer: A

Q677. What is vendor lock-in in cloud computing and how can it be mitigated?

- A. A security feature that protects cloud accounts
- B. Being locked out of a vendor's office building
- C. Dependency on one provider, mitigated by open standards
- D. A pricing model for reserved cloud instances

Answer: C

Q678. What is a cloud service mesh?

- A. A type of cloud object storage bucket
- B. An infrastructure layer for service communication
- C. Physical network cables in a cloud data center
- D. A wireless network within cloud data centers

Answer: B

Q679. What is the difference between disaster recovery (DR) and high availability (HA) in cloud?

- A. HA prevents downtime; DR recovers from disasters
- B. DR is always faster than HA to implement
- C. HA is only applicable to database services
- D. They are the same concept with different names

Answer: A

Q680. What is FinOps in the context of cloud computing?

- A. A cloud provider offering compute services
- B. A practice for managing cloud spending effectively
- C. Financial operations for stock market trading
- D. A type of encryption for financial data

Answer: B

Q681. What is the difference between IPSec tunnel mode and transport mode?

- A. Tunnel encrypts entire packet; transport encrypts payload only
- B. Transport mode encrypts the entire IP packet
- C. They are identical in operation and security
- D. Tunnel mode provides less security than transport

Answer: A

Q682. What is a zero-day vulnerability?

- A. A vulnerability that takes zero days to fix
- B. A vulnerability with zero security impact
- C. An unknown flaw exploited before a patch exists
- D. A vulnerability found on the software release day

Answer: C

Q683. What is the TLS 1.3 handshake improvement over TLS 1.2?

- A. It reduces handshake to 1-RTT with 0-RTT option
- B. It uses more round trips for security
- C. It removes all encryption for faster speed
- D. It uses significantly longer encryption keys

Answer: A

Q684. What is DNS cache poisoning?

- A. Physically destroying DNS server hardware
- B. Clearing the DNS cache on all resolvers
- C. A DNS backup and recovery method
- D. Injecting false DNS entries to redirect users

Answer: D

Q685. What is network segmentation and why is it important for security?

- A. Creating one large flat network for simplicity
- B. Dividing networks into segments to limit attacks
- C. A type of data encryption for networks
- D. Disconnecting all network cables physically

Answer: B

Q686. What is the principle of zero trust security?

- A. Having zero security measures on the network
- B. Trusting only traffic from external sources
- C. Trusting all internal network traffic by default
- D. Never trust, always verify every access request

Answer: D

Q687. What is the BGP hijacking attack?

- A. A DNS spoofing attack on name servers
- B. A wireless deauthentication attack
- C. Stealing physical router hardware devices
- D. Announcing unauthorized IP prefixes via BGP

Answer: D

Q688. What is the purpose of SIEM (Security Information and Event Management)?

- A. Optimizing network speed and performance
- B. Managing email systems for organizations
- C. Securing file transfers between servers
- D. Collecting and analyzing security events for threats

Answer: D

Q689. What is perfect forward secrecy (PFS) in cryptographic protocols?

- A. A type of network firewall technology
- B. Ensuring past sessions stay safe if keys leak
- C. Using the same encryption key forever
- D. A backup encryption method for storage

Answer: B

Q690. What is the difference between signature-based and anomaly-based intrusion detection?

- A. They are the same detection method
- B. Signature-based can detect brand new attacks
- C. Anomaly-based detection is less effective overall
- D. Signature matches known patterns; anomaly detects deviations

Answer: D

Q691. What is the concept of intent-based networking (IBN)?

- A. A fully manual network configuration approach
- B. Admins define outcomes and the system auto-configures
- C. Networking based only on user browsing intentions
- D. A type of routing protocol for WANs

Answer: B

Q692. What is Segment Routing (SR) and why is it important for next-gen networks?

- A. DNS-based routing for domain resolution
- B. A type of firewall filtering technique
- C. Routing through physical cable segments only
- D. Source routing using segment lists to simplify forwarding

Answer: D

Q693. What is the role of AI/ML in next-generation network management?

- A. Only powering customer service chatbot systems
- B. Creating virtual network topologies from scratch
- C. Replacing all network hardware with software
- D. Enabling predictive analytics and self-healing networks

Answer: D

Q694. What is the concept of network disaggregation?

- A. Breaking network cables into smaller pieces
- B. Separating network hardware from software layers
- C. A type of encryption for network traffic
- D. Combining all network functions into one box

Answer: B

Q695. What is the P4 programming language used for in networking?

- A. Web development and frontend design
- B. Database management and SQL queries
- C. Cloud computing resource provisioning
- D. Programming how devices process packets

Answer: D

Q696. What is Quantum Key Distribution (QKD) in the context of next-gen network security?

- A. Distributing physical keys by courier
- B. A cloud service for key management
- C. A type of VPN tunnel technology
- D. Using quantum mechanics for provably secure keys

Answer: D

Q697. What is Time-Sensitive Networking (TSN) and which industries benefit from it?

- A. A wireless protocol for mobile devices only
- B. IEEE standards for deterministic Ethernet communication
- C. A faster version of standard Ethernet protocol
- D. A cloud service for time synchronization

Answer: B

Q698. What is the concept of network as a service (NaaS)?

- A. Free networking for all users
- B. Networking infrastructure provided on-demand as a service
- C. A programming language for networks
- D. A type of physical network router

Answer: B

Q699. What is the significance of Open RAN (O-RAN) in 5G networks?

- A. Disaggregating RAN with open interfaces for interop
- B. A security protocol for radio access
- C. A new radio frequency band for 5G
- D. A type of antenna for signal boosting

Answer: A

Q700. What is the concept of self-organizing networks (SON) in mobile communications?

- A. A manual configuration tool for base stations
- B. A type of routing protocol for mobile data
- C. Networks that physically rearrange themselves
- D. Networks that auto-configure, optimize, and self-heal

Answer: D

Q701. A noiseless channel has 5 kHz bandwidth and uses 16 signal levels. What is the maximum data rate per Nyquist?

- A. 80,000 bps
- B. 40,000 bps
- C. 20,000 bps
- D. 60,000 bps

Answer: B

Q702. In 64-QAM, how many bits are represented by each signal element?

- A. 6 bits per element
- B. 8 bits per element
- C. 4 bits per element
- D. 5 bits per element

Answer: A

Q703. What is the primary limitation of increasing signal levels to boost data rate?

- A. It increases the physical size of transmitters
- B. It makes the receiver more susceptible to noise
- C. It reduces the frequency of carrier signals
- D. It requires longer transmission cables overall

Answer: B

Q704. A signal has a power of 50 mW and noise power of 5 uW. What is the SNR in decibels?

- A. 30 dB
- B. 20 dB
- C. 40 dB
- D. 50 dB

Answer: C

Q705. In spread spectrum communication, what is the purpose of the chipping code?

- A. It compresses data to reduce bandwidth usage
- B. It encrypts data using symmetric key algorithms
- C. It corrects errors in received data automatically
- D. It spreads the signal across a wider frequency band

Answer: D

Q706. Why does frequency hopping spread spectrum (FHSS) change frequencies during transmission?

- A. To increase the overall data throughput rate
- B. To reduce power consumption at the transmitter
- C. To synchronize timing between sender and receiver
- D. To avoid prolonged interference on any one band

Answer: D

Q707. What is the impact of jitter on real-time data communication applications?

- A. It causes variation in packet arrival times
- B. It reduces the overall power consumption
- C. It increases the bandwidth of the channel
- D. It permanently corrupts all transmitted data

Answer: A

Q708. In PCM, what determines the number of quantization levels?

- A. The carrier frequency of the channel used
- B. The sampling rate of the analog signal
- C. The number of bits per sample allocated
- D. The bandwidth of the transmission medium

Answer: C

Q709. What is quantization noise and when does it become significant?

- A. Distortion from using excessively long fiber optic cables
- B. Interference caused by adjacent frequency band signals
- C. Noise from power supply fluctuations in the transmitter
- D. Error introduced by rounding analog values to discrete levels

Answer: D

Q710. How does OFDM improve data transmission in broadband systems?

- A. By amplifying signal power at regular interval points
- B. By splitting data across many orthogonal subcarriers
- C. By compressing data before modulation on the channel
- D. By using a single high-frequency carrier for all data

Answer: B

Q711. In a hierarchical network design, what is the function of the distribution layer?

- A. It enforces policies, filtering, and inter-VLAN routing
- B. It provides high-speed backbone connectivity between sites
- C. It manages wireless access points and mobile devices
- D. It connects end-user devices to the network directly

Answer: A

Q712. What problem does the Spanning Tree Protocol (STP) solve?

- A. It prevents IP address conflicts on the network
- B. It encrypts data flowing between network switches
- C. It eliminates broadcast storms from Layer 2 loops
- D. It balances traffic load across multiple gateways

Answer: C

Q713. How does software-defined networking (SDN) differ from traditional networking?

- A. SDN eliminates the need for any network protocols
- B. SDN separates the control plane from the data plane
- C. SDN replaces switches with direct cable connections
- D. SDN uses only wireless media for all communication

Answer: B

Q714. What is the purpose of MPLS in modern networks?

- A. To assign MAC addresses to network interfaces dynamically
- B. To encrypt all traffic between two endpoint routers
- C. To translate domain names into corresponding IP addresses
- D. To label packets for fast forwarding along predefined paths

Answer: D

Q715. In the context of QoS, what is traffic shaping?

- A. Controlling the rate of outgoing traffic for compliance
- B. Compressing packets to reduce overall bandwidth usage
- C. Physically rerouting cables for optimal signal paths
- D. Encrypting traffic to prevent unauthorized access

Answer: A

Q716. What is the role of an autonomous system (AS) in internet routing?

- A. A device that converts between IPv4 and IPv6 addresses
- B. A protocol for encrypting data across network boundaries
- C. A collection of routers under a single administrative policy
- D. A single router that manages all global internet traffic

Answer: C

Q717. How does network function virtualization (NFV) reduce costs?

- A. By removing the need for IP addressing in modern networks
- B. By replacing dedicated hardware with software on commodity servers
- C. By eliminating all network cables and using wireless only
- D. By using a single protocol for all communication types

Answer: B

Q718. What is the convergence time of a routing protocol?

- A. The interval between consecutive routing table backups
- B. The time taken to encrypt all routing table entries
- C. The delay between sending and receiving a single packet
- D. The time for all routers to agree on the network topology

Answer: D

Q719. What is the primary advantage of intent-based networking (IBN)?

- A. It allows network configuration through business intent policies
- B. It eliminates security threats through hardware isolation
- C. It provides unlimited bandwidth to all connected devices
- D. It removes the need for switches and routers entirely

Answer: A

Q720. How does segment routing simplify traffic engineering in networks?

- A. By physically segmenting the network into isolated zones
- B. By compressing routing tables to reduce memory usage
- C. By encrypting each packet segment individually for security
- D. By encoding the forwarding path in the packet header itself

Answer: D

Q721. In Go-Back-N with a window size of 7, what is the minimum number of sequence number bits needed?

- A. 3 bits
- B. 5 bits
- C. 4 bits
- D. 2 bits

Answer: A

Q722. Why can't the window size in Go-Back-N equal the sequence number space?

- A. The sender buffer would overflow causing system failures
- B. The receiver could confuse new frames with retransmissions
- C. It would exceed the maximum transmission unit size limit
- D. It would require more bandwidth than the link can handle

Answer: B

Q723. What is the maximum efficiency of pure ALOHA protocol?

- A. 12.5 percent
- B. 36.8 percent
- C. 18.4 percent
- D. 50.0 percent

Answer: C

Q724. How does slotted ALOHA improve over pure ALOHA?

- A. It doubles throughput by restricting starts to time slots
- B. It uses frequency division to separate all transmissions
- C. It eliminates collisions entirely through token passing
- D. It compresses frames to reduce the chance of overlap

Answer: A

Q725. In Selective Repeat, what is the maximum window size for n-bit sequence numbers?

- A. $2^{(n+1)}$
- B. $2^{(n-1)}$
- C. 2^n minus one
- D. 2^n

Answer: B

Q726. What problem does the hidden terminal issue cause in wireless LANs?

- A. The access point fails to detect any transmitted frames
- B. All devices on the network lose their IP configurations
- C. Encrypted frames are decrypted by unauthorized receivers
- D. Two stations that cannot hear each other collide at the AP

Answer: D

Q727. How does the RTS/CTS mechanism address the hidden terminal problem?

- A. By reserving the channel before data frame transmission
- B. By increasing transmission power to reach all stations
- C. By encrypting frames to prevent unauthorized decoding
- D. By assigning fixed frequencies to each wireless device

Answer: A

Q728. What is the minimum frame size requirement in standard Ethernet and why?

- A. 256 bytes, to guarantee sufficient error correction data space
- B. 64 bytes, to ensure collision detection before transmission ends
- C. 32 bytes, to maintain compatibility with token ring networks
- D. 128 bytes, to provide enough space for header and payload

Answer: B

Q729. What is the difference between persistent and non-persistent CSMA?

- A. Persistent CSMA continuously monitors; non-persistent waits randomly
- B. Persistent CSMA encrypts data; non-persistent sends it plainly
- C. Persistent CSMA uses tokens; non-persistent uses frequency slots
- D. Persistent CSMA is wireless only; non-persistent is wired only

Answer: A

Q730. How does 802.1Q VLAN tagging modify an Ethernet frame?

- A. It appends VLAN information after the frame check sequence
- B. It changes the preamble to include VLAN routing information
- C. It replaces the destination MAC address with a VLAN identifier
- D. It inserts a 4-byte tag between source MAC and type field

Answer: D

Q731. Given the IP address 172.16.45.0/26, how many usable host addresses are available?

- A. 64 hosts
- B. 126 hosts
- C. 62 hosts
- D. 30 hosts

Answer: C

Q732. What is the purpose of route summarization (supernetting)?

- A. It assigns additional IP addresses to overloaded subnets
- B. It combines multiple smaller routes into a single entry
- C. It splits a large route into more specific smaller routes
- D. It encrypts routing updates between adjacent routers

Answer: B

Q733. How does BGP differ from OSPF in terms of routing scope?

- A. BGP and OSPF both operate only within a single AS domain
- B. BGP handles inter-AS routing; OSPF is for intra-AS routing
- C. BGP is for LANs only; OSPF is for WANs exclusively used
- D. BGP is for intra-AS routing; OSPF handles inter-AS routing

Answer: B

Q734. What is the role of the Protocol field in the IPv4 header?

- A. It identifies which transport layer protocol is encapsulated
- B. It contains the checksum for the IP header verification
- C. It indicates the total number of fragments for this packet
- D. It specifies the version of IP being used for routing

Answer: A

Q735. What mechanism does OSPF use to handle large networks efficiently?

- A. It uses only static routes for all network destinations
- B. It limits the number of routers to 50 per network
- C. It compresses all LSAs into a single combined broadcast
- D. It divides the network into areas with Area 0 backbone

Answer: D

Q736. In IPv6, what is the purpose of the flow label field?

- A. It identifies packets belonging to the same traffic flow
- B. It stores the source and destination MAC addresses
- C. It contains the fragment offset for reassembly process
- D. It specifies the maximum hop limit for the IP packet

Answer: A

Q737. How does Anycast addressing work in IPv6?

- A. It delivers packets to the nearest device in a group
- B. It assigns unique addresses to every network interface
- C. It sends packets to all devices in the network at once
- D. It translates IPv4 addresses to IPv6 format directly

Answer: A

Q738. What is the tunneling technique used for IPv6 transition?

- A. It encapsulates IPv6 packets inside IPv4 packets for transit
- B. It drops IPv6 packets when they reach an IPv4 only network
- C. It converts IPv6 addresses into compatible IPv4 addresses
- D. It replaces all IPv4 routers with IPv6 routers instantly

Answer: A

Q739. What is the purpose of ECMP (Equal-Cost Multi-Path) routing?

- A. It assigns different costs to each available network path
- B. It encrypts traffic flowing across multiple network paths
- C. It selects the single lowest cost path for all packets
- D. It distributes traffic across multiple equal-cost routes

Answer: D

Q740. How does Path MTU Discovery work in IP networking?

- A. It finds the smallest MTU along the path to avoid fragmentation
- B. It measures the total bandwidth available on the route
- C. It identifies all routers along the path using ICMP requests
- D. It discovers the fastest path between source and receiver

Answer: A

Q741. How does TCP Reno handle packet loss detection through triple duplicate ACKs?

- A. It halves the congestion window and enters fast recovery phase
- B. It resets the congestion window to one segment immediately
- C. It doubles the congestion window to recover lost bandwidth
- D. It closes the connection and re-establishes a new session

Answer: A

Q742. What is the silly window syndrome in TCP?

- A. When tiny amounts of data are exchanged very inefficiently
- B. When large segments are sent through low bandwidth links
- C. When DNS resolution takes excessively long to complete
- D. When the routing table contains incorrect gateway entries

Answer: A

Q743. What is the purpose of TCP SACK (Selective Acknowledgment)?

- A. It encrypts acknowledgments to prevent spoofing attacks
- B. It selects which port number to use for the connection
- C. It allows the receiver to report non-contiguous blocks received
- D. It aggregates multiple acknowledgments into a single message

Answer: C

Q744. How does TCP handle the TIME_WAIT state after connection close?

- A. It sends additional data segments to flush the pipeline
- B. It immediately releases all resources for the connection
- C. It waits for 2x MSL to ensure all packets are delivered
- D. It resets the sequence numbers for the next connection

Answer: C

Q745. What is the TCP slow start threshold (ssthresh) used for?

- A. It sets the minimum segment size for transmission allowed
- B. It defines the timeout period for retransmission of lost segments
- C. It determines when to switch from slow start to congestion avoidance
- D. It limits the maximum number of simultaneous TCP connections

Answer: C

Q746. What problem does TCP head-of-line blocking cause?

- A. It prevents new connections from being established on server
- B. A lost segment delays delivery of all subsequent segments
- C. It blocks DNS resolution until the TCP connection times out
- D. It causes the routing table to become incorrectly populated

Answer: B

Q747. How does QUIC (used in HTTP/3) improve over TCP+TLS?

- A. It replaces IP addressing with a new addressing scheme used
- B. It uses larger packet sizes for higher throughput overall
- C. It combines transport and encryption in fewer round trips
- D. It eliminates the need for any congestion control mechanism

Answer: C

Q748. What is the purpose of ECN (Explicit Congestion Notification)?

- A. To notify applications when their port number is in use
- B. To signal congestion without dropping packets at the router
- C. To extend the congestion window beyond its normal limits
- D. To encrypt traffic flowing through congested network links

Answer: B

Q749. What is the difference between TCP Tahoe and TCP Reno on timeout?

- A. Tahoe uses fast recovery; Reno resets cwnd to one segment
- B. Both reset cwnd to one on timeout, Reno adds fast recovery for dup ACKs
- C. Reno uses slow start only; Tahoe uses congestion avoidance only
- D. Tahoe closes the connection; Reno continues transmitting data

Answer: B

Q750. What is Multipath TCP (MPTCP) designed to achieve?

- A. To reduce the MTU size for faster processing by routers
- B. To encrypt multiple TCP streams using a single shared key
- C. To use multiple network paths for a single TCP connection
- D. To create multiple connections using a single source port

Answer: C

Q751. What is DNS amplification attack and how does it work?

- A. Attacker spoofs the victim's IP and sends small queries to get large replies
- B. Attacker overwhelms DNS servers by sending millions of registration requests
- C. Attacker intercepts DNS responses and replaces them with false information
- D. Attacker modifies DNS cache entries to redirect users to malicious websites

Answer: A

Q752. What is the purpose of DNSSEC (DNS Security Extensions)?

- A. It filters malicious domain names from DNS resolution
- B. It replaces DNS with a more secure naming system entirely
- C. It encrypts all DNS query and response traffic end-to-end
- D. It authenticates DNS responses using digital signatures

Answer: D

Q753. How does HTTP/2 improve performance over HTTP/1.1?

- A. It multiplexes multiple requests over a single connection
- B. It uses a text-based protocol for easier debugging
- C. It increases the maximum URL length for complex queries
- D. It eliminates the need for TLS encryption on all connections

Answer: A

Q754. What is the CAP theorem in distributed application systems?

- A. A system must choose between Caching, Addressing, and Protocol compatibility
- B. A system can have Compression, Authentication, and Performance simultaneously
- C. A system balances Concurrency, Atomicity, and Persistence for transactions
- D. A system can guarantee only two of Consistency, Availability, and Partition tolerance

Answer: D

Q755. What is the purpose of WebSocket protocol?

- A. It provides a new addressing scheme for web-based resources
- B. It enables full-duplex communication over a single TCP connection
- C. It replaces HTTP entirely for all web communications now
- D. It compresses static web content for faster initial page loads

Answer: B

Q756. What is the difference between gRPC and REST APIs?

- A. gRPC works without any network; REST requires internet connectivity
- B. gRPC uses Protocol Buffers and HTTP/2; REST uses JSON and HTTP/1.1 typically
- C. gRPC is only for web browsers; REST is for all client applications
- D. gRPC uses XML encoding; REST uses binary serialization for data

Answer: B

Q757. How does DNS over HTTPS (DoH) improve privacy?

- A. It stores DNS records locally to avoid network queries
- B. It blocks all tracking cookies from websites visited
- C. It encrypts DNS queries within HTTPS to prevent snooping
- D. It anonymizes the user's IP address from DNS servers

Answer: C

Q758. What is the purpose of HSTS (HTTP Strict Transport Security)?

- A. It blocks HTTP traffic from reaching the web server entirely
- B. It compresses HTTPS traffic for faster encrypted page loads
- C. It generates SSL certificates automatically for all domains
- D. It forces browsers to always use HTTPS for a specific domain

Answer: D

Q759. What is GraphQL's main advantage over traditional REST APIs?

- A. It eliminates the need for a database on the server backend
- B. It automatically encrypts all data exchanged between nodes
- C. It provides built-in authentication for all API endpoints
- D. It allows clients to request exactly the data fields they need

Answer: D

Q760. What is the role of service mesh in microservices architecture?

- A. It manages inter-service communication, observability, and security
- B. It provides a physical network topology for container hosting
- C. It stores persistent data shared across all microservice nodes
- D. It replaces all application code with auto-generated services

Answer: A

Q761. What is the KRACK attack on WPA2 wireless networks?

- A. It exploits the four-way handshake to reinstall encryption keys
- B. It jams the wireless frequency to deny service to all users
- C. It brute-forces the WiFi password using parallel computing
- D. It clones the access point to create a fake network nearby

Answer: A

Q762. How does Massive MIMO differ from conventional MIMO systems?

- A. It uses a single antenna instead of multiple antenna arrays
- B. It employs hundreds of antennas at the base station for capacity
- C. It eliminates the need for any digital signal processing steps
- D. It operates exclusively in the sub-1 GHz frequency band range

Answer: B

Q763. What is the purpose of network slicing in 5G networks?

- A. It splits the frequency spectrum into equal fixed portions
- B. It creates virtual networks tailored to specific use cases
- C. It physically divides the antenna into separate segments
- D. It reduces the cell tower height for urban deployments

Answer: B

Q764. What is the near-far problem in wireless CDMA systems?

- A. A strong nearby signal overwhelms weaker signals from far users
- B. Near users experience more interference than far away users
- C. Distant users are unable to connect to any base station
- D. The antenna cannot distinguish between near and far frequencies

Answer: A

Q765. What is the role of the EPC (Evolved Packet Core) in LTE?

- A. It provides power supply management for all base stations
- B. It manages the physical radio transmission between towers
- C. It controls the display settings on mobile user devices
- D. It handles core network functions like authentication and routing

Answer: D

Q766. How does carrier aggregation improve LTE-Advanced performance?

- A. It compresses data before transmission to save bandwidth space
- B. It reduces the number of connected devices to improve speed
- C. It combines multiple frequency bands for greater total bandwidth
- D. It increases the transmission power of the base station antenna

Answer: C

Q767. What is the purpose of the BSS color field in WiFi 6?

- A. It identifies the color scheme for network management GUIs
- B. It determines the physical location of each connected device
- C. It assigns priority levels based on the device manufacturer
- D. It distinguishes overlapping BSSs to reduce co-channel interference

Answer: D

Q768. What is the main challenge of millimeter wave (mmWave) in 5G?

- A. It provides extremely low data rates unsuitable for broadband
- B. It has very limited range and is easily blocked by obstacles
- C. It only works in underwater communication environments now
- D. It requires excessively large antennas that are impractical

Answer: B

Q769. What is Device-to-Device (D2D) communication in LTE/5G?

- A. Communication between two base stations without user devices
- B. Transfer of device configuration settings during factory reset process
- C. Communication between a device and its cloud backup storage server
- D. Direct communication between nearby devices without base station relay

Answer: D

Q770. How does full-duplex wireless communication differ from current systems?

- A. It uses two separate antennas for upload and download traffic
- B. It doubles the frequency band allocation for each user device
- C. It transmits and receives on the same frequency simultaneously
- D. It alternates between transmission and reception at high speed

Answer: C

Q771. What is the purpose of Kubernetes in cloud-native architectures?

- A. It orchestrates deployment, scaling, and management of containers
- B. It provides virtual machine hypervisor management for data centers
- C. It encrypts all network traffic between microservices automatically
- D. It replaces traditional databases with distributed file storage

Answer: A

Q772. What is the concept of immutable infrastructure in cloud?

- A. Infrastructure that is immune to all security vulnerabilities
- B. Hardware that never needs physical maintenance or replacement
- C. Infrastructure that cannot be modified after initial deployment
- D. Servers that automatically update their own operating systems

Answer: C

Q773. What is a service level agreement (SLA) in cloud computing?

- A. A software license for cloud application source code access
- B. A network protocol for secure cloud data transfer operations
- C. A contract defining guaranteed performance and uptime metrics
- D. A hardware specification for physical cloud server components

Answer: C

Q774. How does a cloud-native application differ from a traditional application?

- A. It requires manual scaling and dedicated hardware for deployment
- B. It uses monolithic architecture deployed on single physical servers
- C. It runs only on desktop computers without internet access
- D. It is designed for cloud environments using microservices and containers

Answer: D

Q775. What is the purpose of Infrastructure as Code (IaC)?

- A. Managing and provisioning infrastructure through code and templates
- B. Writing application code that runs on cloud infrastructure
- C. Converting physical servers into virtual machines automatically
- D. Encoding network traffic for secure cloud communication links

Answer: A

Q776. What is cloud bursting and when is it used?

- A. When data is deleted from cloud storage due to inactivity timeout
- B. When multiple cloud providers merge their resources into one pool
- C. When a cloud server physically overheats and shuts itself down
- D. When private cloud overflows workloads to public cloud during peaks

Answer: D

Q777. What is the purpose of a chaos engineering approach in cloud?

- A. To overload systems deliberately to find performance limits
- B. To randomly generate test data for application benchmarking
- C. To create confusing network topologies that test admin skills
- D. To intentionally introduce failures and test system resilience

Answer: D

Q778. What is the difference between cloud-native and cloud-enabled applications?

- A. Cloud-native is less scalable; cloud-enabled offers better performance
- B. Cloud-native is built for cloud; cloud-enabled is migrated legacy apps
- C. Cloud-native uses containers; cloud-enabled uses only virtual machines
- D. Cloud-native requires bare metal; cloud-enabled works on any platform

Answer: B

Q779. What is edge computing and how does it relate to cloud?

- A. It replaces cloud computing entirely with local device processing
- B. It stores all data at the center of the cloud data center only
- C. It processes data at the network edge, reducing latency to cloud
- D. It encrypts data at the boundary of the corporate network only

Answer: C

Q780. What is the FinOps framework in cloud computing?

- A. A financial auditing tool for cloud provider tax compliance
- B. A protocol for encrypting financial transactions in the cloud
- C. A cloud-based accounting software for small business finance
- D. A practice for managing cloud costs through collaboration and data

Answer: D

Q781. What is a zero-day vulnerability?

- A. A security issue that affects zero users in the network
- B. A bug that was fixed exactly zero days after discovery
- C. A vulnerability that only exists for zero days before expiring
- D. A flaw exploited before the vendor has released any patch

Answer: D

Q782. How does IPSec provide security at the network layer?

- A. It replaces IP addresses with encrypted identifiers in headers
- B. It filters packets based on source and destination IP only
- C. It blocks all ICMP traffic to prevent network reconnaissance
- D. It encrypts and authenticates IP packets using AH and ESP

Answer: D

Q783. What is the purpose of a honeypot in network security?

- A. It provides backup power to critical network infrastructure
- B. It distributes network traffic across multiple security zones
- C. It encrypts sensitive data stored on production file servers
- D. It acts as a decoy system to attract and study attackers

Answer: D

Q784. What is the Diffie-Hellman key exchange used for?

- A. It securely establishes a shared secret over an insecure channel
- B. It authenticates users using their biometric data remotely
- C. It compresses public keys for efficient network transmission
- D. It encrypts stored files on shared network drives securely

Answer: A

Q785. What is ARP spoofing and what can it enable?

- A. It intercepts DHCP requests to assign wrong IP addresses
- B. It floods the network with fake ARP requests for DoS attacks
- C. It modifies DNS records to redirect traffic to malicious sites
- D. It sends fake ARP replies to link attacker's MAC to victim's IP

Answer: D

Q786. What is the purpose of certificate pinning in mobile apps?

- A. It creates a backup copy of the server certificate on device
- B. It pins certificate files to email attachments for verification
- C. It stores certificates locally to work offline without network
- D. It restricts which certificates are trusted for a specific domain

Answer: D

Q787. What is the concept of zero trust security architecture?

- A. It never trusts and always verifies every access request made
- B. It trusts all internal network traffic without verification
- C. It grants permanent access after initial identity verification
- D. It removes all firewalls to simplify the network architecture

Answer: A

Q788. How does a SYN flood attack exploit the TCP handshake?

- A. It sends many SYN requests without completing the handshake
- B. It completes thousands of handshakes to exhaust server memory
- C. It modifies the SYN packet to inject malicious code payloads
- D. It intercepts SYN-ACK packets to steal session credentials

Answer: A

Q789. What is the role of SIEM in enterprise security?

- A. It provides physical access control for server room facilities
- B. It encrypts all stored data across the enterprise network
- C. It replaces firewalls with software-defined security boundaries
- D. It aggregates and analyzes security events from multiple sources

Answer: D

Q790. What is perfect forward secrecy (PFS) in TLS?

- A. It ensures past sessions cannot be decrypted if long-term key leaks
- B. It guarantees that no data will ever be lost in transit
- C. It provides unlimited bandwidth for encrypted network connections
- D. It permanently stores encryption keys for future session recovery

Answer: A

Q791. What is the concept of network disaggregation?

- A. Separating network hardware from software for vendor flexibility
- B. Dividing the network into smaller broadcast domains only
- C. Removing all redundant paths from the network topology
- D. Combining all network functions into a single proprietary box

Answer: A

Q792. How does quantum key distribution (QKD) enhance security?

- A. It replaces all digital certificates with quantum identifiers
- B. It generates longer passwords using quantum random number math
- C. It encrypts data using the physical properties of fiber optics
- D. It uses quantum mechanics to create unbreakable encryption keys

Answer: D

Q793. What is deterministic networking and why is it important?

- A. Networks that randomly route traffic for load balancing
- B. Networks that only operate during predetermined time windows
- C. Networks that determine user identity before allowing access
- D. Networks guaranteeing bounded latency and zero packet loss

Answer: D

Q794. What is the purpose of a digital twin network (DTN)?

- A. A second physical network installed for disaster recovery
- B. A virtual model of a network for simulation and optimization
- C. A backup network that activates when the primary fails
- D. A network that only carries duplicated data for redundancy

Answer: B

Q795. What challenges does post-quantum cryptography aim to address?

- A. The high cost of managing digital certificates across networks
- B. The latency introduced by current encryption and decryption steps
- C. The threat of quantum computers breaking current encryption methods
- D. The difficulty of implementing encryption on IoT sensor devices

Answer: C

Q796. What is the concept of programmable data planes in next-gen networks?

- A. Data planes that can be programmed by end users directly
- B. Network connections that adjust their physical medium dynamically
- C. Data storage planes that automatically organize stored data files
- D. Network hardware whose packet processing logic can be defined in code

Answer: D

Q797. How does federated learning benefit network intelligence?

- A. It centralizes all data in one location for faster processing
- B. It federates multiple networks into one large unified network
- C. It trains AI models across distributed nodes without sharing raw data
- D. It distributes stored data evenly across all network node devices

Answer: C

Q798. What is the role of SASE in next-generation enterprise networking?

- A. It provides physical security for enterprise server room access
- B. It replaces all enterprise applications with cloud alternatives
- C. It separates network management from security administration
- D. It converges networking and security into a unified cloud service

Answer: D

Q799. What is the concept of computing continuum from cloud to edge?

- A. A method of continuously compressing data as it crosses network
- B. A single massive computer that handles all processing tasks
- C. A seamless spectrum of computing resources from cloud to device
- D. A continuous network connection that never drops under any load

Answer: C

Q800. How does 6G envision advancing beyond 5G capabilities?

- A. By eliminating all wireless communication in favor of wired only
- B. By reducing network speeds to improve reliability and coverage
- C. By providing terahertz frequencies, AI integration, and sensing abilities
- D. By using only ground-based infrastructure without any satellites

Answer: C

Q801. In a 256-QAM modulation scheme, how many bits does each symbol carry?

- A. 10 bits per symbol in the constellation
- B. 8 bits per symbol in the constellation
- C. 12 bits per symbol in the constellation
- D. 6 bits per symbol in the constellation

Answer: B

Q802. A noisy channel has a bandwidth of 3 kHz and SNR of 127. What is the Shannon capacity?

- A. 35 kbps maximum capacity
- B. 28 kbps maximum capacity
- C. 14 kbps maximum capacity
- D. 21 kbps maximum capacity

Answer: D

Q803. What is the fundamental problem with unipolar NRZ encoding for long data streams?

- A. It consumes excessive bandwidth per symbol
- B. It cannot operate above 1 Mbps data rates
- C. It introduces a DC component causing baseline wander
- D. It requires complex decoding circuitry at receivers

Answer: C

Q804. In Direct Sequence Spread Spectrum (DSSS), what determines the spreading factor?

- A. The ratio of chip rate to data bit rate in the system
- B. The number of time slots available in each frame period
- C. The amplitude variation range of the modulated signal
- D. The number of frequency hops per second in the pattern

Answer: A

Q805. Why is the Shannon limit considered a theoretical upper bound for channel capacity?

- A. It assumes error-free coding with infinite complexity at the encoder
- B. It assumes zero latency in all signal processing hardware stages
- C. It assumes synchronous clocking across all connected network nodes
- D. It assumes ideal filtering with zero guard bands between channels

Answer: A

Q806. What distinguishes Differential Phase Shift Keying (DPSK) from conventional PSK?

- A. DPSK requires a coherent carrier reference at the receiver
- B. DPSK uses amplitude changes instead of phase changes
- C. DPSK operates at double the frequency of conventional PSK
- D. DPSK encodes data as changes between consecutive phase values

Answer: D

Q807. What is the Nyquist bandwidth for a channel carrying a signal with a baud rate of 10,000 symbols/s?

- A. 10 kHz minimum channel bandwidth
- B. 5 kHz minimum channel bandwidth
- C. 20 kHz minimum channel bandwidth
- D. 15 kHz minimum channel bandwidth

Answer: B

Q808. In CDMA, what happens when a receiver multiplies a received composite signal by a station's chip sequence?

- A. It amplifies signals from all stations equally for decoding
- B. It compresses the composite signal to reduce overall bandwidth
- C. It filters out the target station's data by orthogonal separation
- D. It encrypts the signal with the station's unique security key

Answer: C

Q809. What is the main advantage of OFDM over single-carrier modulation in wideband channels?

- A. OFDM eliminates the need for error correction coding entirely
- B. OFDM is resilient to multipath fading by using parallel subcarriers
- C. OFDM doubles the available spectrum through signal compression
- D. OFDM reduces transmitter power consumption significantly

Answer: B

Q810. A PCM system samples a signal at 16,000 samples/s using 12-bit quantization. What is the resulting data rate?

- A. 128 kbps output data stream
- B. 224 kbps output data stream
- C. 192 kbps output data stream
- D. 160 kbps output data stream

Answer: C

Q811. What is the primary purpose of the Rapid Spanning Tree Protocol (RSTP) over STP?

- A. RSTP enables routing capabilities within Layer 2 switch devices
- B. RSTP provides significantly faster convergence after topology changes
- C. RSTP supports more VLANs per switch than standard STP protocol
- D. RSTP eliminates the need for root bridge election in networks

Answer: B

Q812. In the context of SDN, what is the function of the southbound API?

- A. It enables communication between the controller and network devices
- B. It provides network analytics to management applications
- C. It connects external applications to the SDN controller layer
- D. It manages user authentication for the SDN control plane

Answer: A

Q813. What is the purpose of ECMP (Equal-Cost Multi-Path) in network design?

- A. To encrypt multiple paths for secure data delivery
- B. To create backup paths that activate only during failure
- C. To distribute traffic across multiple equal-cost routes
- D. To select the single lowest-cost path and block others

Answer: C

Q814. What is a fabric network architecture in data center design?

- A. A legacy three-tier design using core, distribution, and access layers
- B. A bus topology where all servers share a single backbone cable
- C. A ring-based topology connecting servers in a circular pattern
- D. A flat, scalable topology using spine-and-leaf switch arrangement

Answer: D

Q815. What is control plane policing (CoPP) used for in network infrastructure?

- A. To protect the router's control plane from excessive traffic
- B. To prioritize user data traffic over management traffic
- C. To balance routing protocol traffic across multiple interfaces
- D. To encrypt all control plane communications between routers

Answer: A

Q816. What is the difference between in-band and out-of-band network management?

- A. In-band management works only for wired networks and out-of-band only for wireless
- B. In-band uses production network paths while out-of-band uses dedicated management channels
- C. Out-of-band uses production network paths while in-band uses dedicated management channels
- D. Out-of-band management requires specialized hardware while in-band uses standard NICs

Answer: B

Q817. What is the purpose of BFD (Bidirectional Forwarding Detection) in networks?

- A. To authenticate routing protocol messages between peer routers
- B. To encrypt bidirectional traffic between two network devices
- C. To balance network traffic bidirectionally across redundant paths
- D. To provide rapid failure detection between adjacent forwarding engines

Answer: D

Q818. In MPLS, what is the purpose of the label distribution protocol (LDP)?

- A. It converts IP headers into MPLS labels at network edges
- B. It establishes label-switched paths by distributing label bindings
- C. It encrypts MPLS labels to prevent label spoofing attacks
- D. It monitors label utilization and optimizes path selection

Answer: B

Q819. What is the concept of network telemetry and how does it differ from SNMP polling?

- A. Telemetry pushes data in real-time while SNMP uses periodic polling
- B. Telemetry is limited to local networks while SNMP works globally
- C. Telemetry requires manual data collection while SNMP is automated
- D. Telemetry only monitors hardware while SNMP monitors software too

Answer: A

Q820. What is the role of a route reflector in large-scale BGP deployments?

- A. It converts eBGP routes into OSPF routes for internal distribution
- B. It encrypts BGP update messages between internal BGP speakers
- C. It reduces the need for full mesh iBGP peering by reflecting routes
- D. It filters malicious BGP routes from external autonomous systems

Answer: C

Q821. What is the throughput efficiency of the pure ALOHA protocol expressed as a fraction?

- A. Approximately 18.4% maximum channel utilization
- B. Approximately 36.8% maximum channel utilization
- C. Approximately 50.0% maximum channel utilization
- D. Approximately 25.0% maximum channel utilization

Answer: A

Q822. In the CRC error detection scheme, if the generator polynomial is $x^4 + x + 1$, how many check bits are appended?

- A. 5 check bits are appended to the data
- B. 3 check bits are appended to the data
- C. 6 check bits are appended to the data
- D. 4 check bits are appended to the data

Answer: D

Q823. What is the maximum throughput efficiency of slotted ALOHA compared to pure ALOHA?

- A. Slotted ALOHA triples throughput to about 55.2% by using time slots
- B. Slotted ALOHA quadruples throughput to about 73.6% by time slots
- C. Slotted ALOHA doubles throughput to about 36.8% by using time slots
- D. Slotted ALOHA achieves the same throughput as pure ALOHA protocol

Answer: C

Q824. In a Hamming code with 11-bit data words, how many redundancy bits are required?

- A. 3 redundancy bits for 11 data bits
- B. 4 redundancy bits for 11 data bits
- C. 5 redundancy bits for 11 data bits
- D. 6 redundancy bits for 11 data bits

Answer: B

Q825. What is the difference between 1-persistent and p-persistent CSMA?

- A. p-persistent transmits immediately when idle while 1-persistent transmits with probability p
- B. p-persistent is used only in wireless networks while 1-persistent is for wired only
- C. 1-persistent waits a random time while p-persistent waits a fixed time period
- D. 1-persistent transmits immediately when idle while p-persistent transmits with probability p

Answer: D

Q826. What is the purpose of the BPDU (Bridge Protocol Data Unit) in spanning tree operation?

- A. It exchanges topology information between bridges for loop prevention
- B. It carries user data frames between bridges in the network
- C. It encrypts forwarding table entries for secure bridge operation
- D. It assigns IP addresses to bridge ports during initialization

Answer: A

Q827. In Link Aggregation (IEEE 802.3ad), what is the primary benefit of combining multiple physical links?

- A. It enables different speed links to operate at the same data rate
- B. It increases bandwidth and provides link redundancy as one logical link
- C. It eliminates the need for spanning tree on aggregated link ports
- D. It reduces the MAC address table size on connected switches

Answer: B

Q828. What is the channel capture effect in CSMA/CD networks?

- A. When the broadcast domain captures all unicast frames on the segment
- B. When a switch port captures and mirrors all traffic for monitoring
- C. When one station dominates the channel because its backoff counter resets to zero after success
- D. When a collision causes all stations to simultaneously attempt retransmission

Answer: C

Q829. What is the purpose of the 802.1Q native VLAN concept?

- A. It handles untagged frames on a trunk link by assigning them to a default VLAN
- B. It reserves bandwidth for management traffic between switches
- C. It encrypts inter-VLAN routing traffic on Layer 3 switches
- D. It assigns all unknown unicast traffic to a quarantine VLAN

Answer: A

Q830. How does the token bucket algorithm differ from the leaky bucket algorithm for traffic shaping?

- A. Token bucket discards excess tokens while leaky bucket stores them indefinitely
- B. Leaky bucket allows bursts up to a limit while token bucket enforces a constant rate
- C. Leaky bucket uses tokens for rate control while token bucket uses timers only
- D. Token bucket allows bursts up to a limit while leaky bucket enforces a constant rate

Answer: D

Q831. Given the address 10.45.128.0/17, how many host addresses are available in this subnet?

- A. 32,766 usable host addresses available
- B. 131,070 usable host addresses available
- C. 65,534 usable host addresses available
- D. 16,382 usable host addresses available

Answer: A

Q832. In OSPF, what is the purpose of stub areas?

- A. They serve as the backbone area connecting all other OSPF areas
- B. They handle inter-area routing between non-backbone OSPF areas
- C. They contain all external routes and redistribute them to other areas
- D. They block external route advertisements to reduce routing table size

Answer: D

Q833. What is the purpose of the BGP LOCAL_PREF attribute?

- A. It tracks the sequence of autonomous systems a route has traversed
- B. It specifies the physical distance to the destination network prefix
- C. It indicates the preference for exit paths within an autonomous system
- D. It assigns a community tag for route filtering between providers

Answer: C

Q834. What is the difference between NAT and PAT (Port Address Translation)?

- A. PAT maps each private IP to a unique public IP while NAT uses port-based multiplexing
- B. PAT supports only TCP traffic while NAT supports both TCP and UDP protocols
- C. NAT operates at the data link layer while PAT operates at the network layer only
- D. NAT maps each private IP to a unique public IP while PAT maps many to one using ports

Answer: D

Q835. What is the poison reverse technique in distance-vector routing?

- A. Setting the metric to infinity for routes learned from a neighbor back to that neighbor
- B. Sending routing updates with encrypted metrics to prevent tampering by attackers
- C. Removing failed routes immediately from the routing table without waiting for timers
- D. Blocking all routing updates from a specific neighbor for a fixed timeout period

Answer: A

Q836. In IPv6, what is a link-local address and what prefix does it use?

- A. A multicast group address using the ff00::/8 address prefix
- B. An address valid only on a single link using the fe80::/10 prefix
- C. A loopback address using the ::1/128 single host address
- D. A globally routable address using the 2001::/16 address prefix

Answer: B

Q837. What is the purpose of the OSPF virtual link?

- A. To connect non-backbone areas that are not physically adjacent to Area 0
- B. To redistribute external routes from BGP into the OSPF routing domain
- C. To load balance traffic between two equal-cost paths in the backbone
- D. To provide encrypted tunnels between OSPF routers across the internet

Answer: A

Q838. What is Gratuitous ARP and what is its primary use case?

- A. An ARP message that assigns new IP addresses to devices joining a network
- B. An ARP reply sent in response to a multicast discovery query from a router
- C. An ARP request where the sender asks for its own IP to detect address conflicts
- D. An ARP update used to flush old MAC entries from neighboring device tables

Answer: C

Q839. In BGP route selection, what is the MED (Multi-Exit Discriminator) attribute used for?

- A. To indicate the maximum number of paths available for equal-cost load balancing
- B. To determine the originating router's preference for internal path selection
- C. To specify the exit point for traffic leaving the local autonomous system
- D. To suggest preferred entry points into an AS to neighboring autonomous systems

Answer: D

Q840. What is the purpose of the Router Solicitation and Router Advertisement messages in IPv6?

- A. They establish IPsec security associations between IPv6 endpoints
- B. They enable hosts to discover routers and obtain network configuration
- C. They provide DNS resolution services for IPv6 host name lookups
- D. They are used for multicast group membership management on a link

Answer: B

Q841. In TCP congestion control, what is the additive increase multiplicative decrease (AIMD) principle?

- A. Window stays constant during data transfer and doubles when congestion is cleared
- B. Window increases exponentially during slow start and resets to one on any timeout
- C. Window doubles on each ACK and halves on congestion detection for rapid adaptation
- D. Window increases by one MSS per RTT and halves on congestion for stable convergence

Answer: D

Q842. What is the TCP CUBIC algorithm and when is it commonly used?

- A. A retransmission algorithm that groups lost segments into cubic-sized recovery blocks
- B. A congestion control algorithm using a cubic function for window growth in high-BDP networks
- C. A scheduling algorithm that assigns cubic priority levels to competing TCP flows
- D. A flow control algorithm that triples the window size after each successful round trip

Answer: B

Q843. What is the TCP fast open (TFO) mechanism designed to reduce?

- A. The CPU cost of computing TCP checksums on high-throughput connections
- B. The overhead of maintaining idle TCP connection state on servers
- C. The latency of TCP connection establishment by sending data in the SYN
- D. The bandwidth consumed by TCP keepalive probes on long-lived connections

Answer: C

Q844. What is the fundamental problem that QUIC's connection migration solves?

- A. The inability to maintain a session when a client's IP address changes
- B. The difficulty of encrypting UDP traffic across multiple network paths
- C. The complexity of implementing flow control over unreliable datagram service
- D. The overhead of establishing separate TLS and TCP handshake sequences

Answer: A

Q845. In TCP, what is the purpose of the Karn's algorithm?

- A. It prevents RTT estimation from using retransmitted segments' measurements
- B. It selects the best MSS value based on the path MTU discovery results
- C. It calculates optimal initial window size based on network bandwidth estimates
- D. It determines when to switch from slow start to congestion avoidance phase

Answer: A

Q846. What is the BBR (Bottleneck Bandwidth and Round-trip) congestion control approach?

- A. A delay-based algorithm that reduces rate only when latency exceeds a threshold
- B. A model-based algorithm that estimates bottleneck bandwidth and minimum RTT
- C. A loss-based algorithm that halves the window on any detected packet loss
- D. A hybrid algorithm combining slow start with multiplicative decrease on timeout

Answer: B

Q847. What problem does TCP's Nagle algorithm interaction with delayed ACK cause?

- A. It causes excessive retransmissions due to premature timeouts on the sender
- B. It causes connection resets when both algorithms activate simultaneously
- C. It leads to buffer overflow on the receiver due to rapid small packet arrival
- D. It creates a latency problem where small writes are delayed up to 500ms

Answer: D

Q848. What is the purpose of the SCTP (Stream Control Transmission Protocol)?

- A. To reduce TCP header size for low-bandwidth satellite communication links
- B. To encrypt all transport layer communications without needing TLS overhead
- C. To provide multi-homing and multi-streaming over a single transport association
- D. To replace UDP entirely for all real-time multimedia streaming applications

Answer: C

Q849. How does Explicit Congestion Notification (ECN) reduce packet loss?

- A. It allows routers to signal congestion by marking packets rather than dropping them
- B. It encrypts congestion signals to prevent third parties from dropping packets
- C. It reserves bandwidth for critical flows to prevent congestion from occurring
- D. It duplicates packets across alternate paths to bypass congested network links

Answer: A

Q850. What is the difference between TCP Tahoe and TCP NewReno in handling multiple losses?

- A. NewReno doubles the ssthresh on loss while Tahoe halves it before entering slow start
- B. Tahoe enters fast recovery for each loss while NewReno resets to slow start on every loss
- C. NewReno can handle multiple losses in one window without exiting fast recovery while Tahoe cannot
- D. Tahoe uses selective acknowledgments while NewReno relies only on cumulative acknowledgments

Answer: C

Q851. What is HTTP/3's primary underlying transport protocol and why was it chosen?

- A. QUIC was chosen because it eliminates head-of-line blocking at the transport layer
- B. TCP was chosen because it provides built-in reliable ordered delivery
- C. DCCP was chosen because it provides congestion control without reliability overhead
- D. SCTP was chosen because it supports multi-homing natively across interfaces

Answer: A

Q852. What is the purpose of the DNS SRV record?

- A. It maps domain names to IPv4 addresses for web server access
- B. It creates an alias pointing one domain name to another domain
- C. It stores arbitrary text data associated with a DNS domain name
- D. It specifies the host and port for a specific service within a domain

Answer: D

Q853. What is the key difference between HTTP/2 server push and WebSocket communication?

- A. WebSocket allows the server to proactively send resources while server push provides full-duplex channels
- B. WebSocket requires HTTP/2 as a transport while server push works independently of version
- C. Server push allows the server to proactively send resources while WebSocket provides full-duplex communication
- D. Server push works only with GET requests while WebSocket works with all HTTP methods

Answer: C

Q854. What is the OCSP (Online Certificate Status Protocol) used for in HTTPS?

- A. To negotiate the cipher suite for TLS encrypted connections
- B. To check the revocation status of a digital certificate in real time
- C. To generate and distribute new SSL certificates to web servers
- D. To compress certificate chains for faster TLS handshake completion

Answer: B

Q855. What is the concept of HTTP content negotiation?

- A. The mechanism where client and server agree on the best representation of a resource
- B. The process of establishing a TCP connection before sending HTTP requests
- C. The method of splitting large HTTP responses into smaller chunked transfers
- D. The technique of compressing HTTP headers to reduce request overhead

Answer: A

Q856. What is DNS zone transfer and which record type initiates it?

- A. The encryption of DNS query data using DNSKEY records for secure transfer
- B. The migration of domain registration between different DNS registrars
- C. The process of delegating a subdomain to a different nameserver using NS records
- D. The replication of DNS data between servers initiated by the SOA record

Answer: D

Q857. What is the purpose of HPACK header compression in HTTP/2?

- A. It combines multiple HTTP requests into a single TCP segment for efficiency
- B. It encrypts HTTP headers to prevent man-in-the-middle header inspection
- C. It reduces header overhead by encoding headers using static and dynamic tables
- D. It compresses the HTTP response body for faster content delivery

Answer: C

Q858. What is the purpose of the DANE (DNS-based Authentication of Named Entities) protocol?

- A. To encrypt all DNS queries between recursive resolvers and stub resolvers
- B. To authenticate DNS client requests using challenge-response mechanisms
- C. To provide automatic DNS failover when primary nameservers become unavailable
- D. To bind TLS certificates to domain names using TLSA DNS records

Answer: D

Q859. What is the difference between HTTP caching with ETag and Last-Modified headers?

- A. ETag uses a content hash for validation while Last-Modified uses a timestamp
- B. ETag works only with static content while Last-Modified handles dynamic content
- C. Last-Modified uses a content hash while ETag relies on file size comparisons
- D. Last-Modified is more precise than ETag for detecting content modifications

Answer: A

Q860. What is the Server-Sent Events (SSE) mechanism and how does it compare to WebSocket?

- A. SSE requires a dedicated transport protocol while WebSocket uses standard HTTP
- B. SSE provides unidirectional server-to-client streaming over HTTP while WebSocket is bidirectional
- C. SSE provides bidirectional communication while WebSocket is server-to-client only
- D. SSE supports binary data frames while WebSocket is limited to text-only messages

Answer: B

Q861. What is the purpose of the 802.11r (Fast BSS Transition) standard?

- A. It increases wireless data throughput by doubling channel bandwidth
- B. It reduces roaming latency by pre-authenticating with target access points
- C. It adds support for the 6 GHz frequency band in enterprise deployments
- D. It provides backward compatibility with legacy 802.11b/g wireless clients

Answer: B

Q862. What is the SAE (Simultaneous Authentication of Equals) protocol in WPA3?

- A. A multi-factor authentication system requiring biometric verification for WiFi access
- B. A certificate-based authentication protocol replacing pre-shared keys entirely
- C. A key exchange protocol replacing the WPA2 four-way handshake with stronger security
- D. A centralized authentication protocol that requires a RADIUS server for all clients

Answer: C

Q863. What is the concept of small cells in 5G network densification?

- A. Deploying low-power base stations covering small areas to increase capacity
- B. Compressing cell tower signals into smaller packets for faster processing
- C. Reducing the physical size of 5G base station equipment for portability
- D. Using smaller frequency bands to achieve higher penetration through walls

Answer: A

Q864. What is the purpose of the FILS (Fast Initial Link Setup) protocol in WiFi?

- A. It extends the range of WiFi signals using advanced beamforming techniques
- B. It provides redundant link connectivity between access points and switches
- C. It enables file sharing between WiFi clients without requiring an access point
- D. It accelerates initial WiFi connection setup for IoT and mobile devices

Answer: D

Q865. What is Non-Orthogonal Multiple Access (NOMA) being considered for in future wireless systems?

- A. Eliminating the need for base stations by enabling pure device-to-device networks
- B. Reducing antenna count requirements by using single-element directional antennas
- C. Allowing multiple users to share the same frequency and time resources via power levels
- D. Providing stronger encryption for wireless data transmission security

Answer: C

Q866. What is the purpose of the Opportunistic Wireless Encryption (OWE) in WiFi?

- A. It opportunistically increases bandwidth by combining adjacent channels
- B. It encrypts wireless management frames to prevent deauthentication attacks
- C. It provides authenticated encryption on password-protected WiFi networks
- D. It encrypts open WiFi network traffic without requiring a shared password

Answer: D

Q867. What is the concept of coordinated multi-point (CoMP) in LTE-Advanced?

- A. Multiple base stations jointly processing signals to reduce interference at cell edges
- B. A single base station dynamically adjusting its coverage area based on demand
- C. Coordinating spectrum allocation between licensed and unlicensed frequency bands
- D. Coordinating multiple mobile devices to form a mesh network

Answer: A

Q868. What is the Multi-Link Operation (MLO) feature in WiFi 7 (802.11be)?

- A. It enables a device to connect to multiple SSIDs at the same time
- B. It allows a single device to simultaneously use multiple frequency bands and channels
- C. It provides link-level encryption across multiple concurrent sessions
- D. It connects multiple access points using wireless backhaul links

Answer: B

Q869. What is the Reconfigurable Intelligent Surface (RIS) technology being explored for 6G?

- A. A reconfigurable processor that adapts its architecture for different protocols
- B. A software-defined antenna that changes its frequency band dynamically
- C. A self-healing network fabric that repairs physical cable breaks automatically
- D. A surface with controllable elements that can reflect and shape wireless signals

Answer: D

Q870. What is the Private 5G network concept and what advantage does it offer enterprises?

- A. A consumer 5G plan with guaranteed bandwidth for home users
- B. A virtual private network tunnel running exclusively over public 5G infrastructure
- C. A dedicated 5G network operated by an enterprise for its own use with controlled QoS
- D. A 5G network that operates only in airplane mode for in-flight connectivity

Answer: C

Q871. What is the concept of a service mesh in cloud-native architecture?

- A. A physical network connecting cloud data centers across regions using fiber links
- B. A mesh of virtual machines providing redundant compute capacity for applications
- C. A dedicated infrastructure layer handling service-to-service communication in microservices
- D. A security framework that meshes multiple firewall rules into a single policy

Answer: C

Q872. What is the purpose of a cloud-native GitOps approach?

- A. It converts Git commit messages into automated cloud billing invoices
- B. It uses Git repositories as the single source of truth for declarative infrastructure and deployments
- C. It provides a Git-based code editor hosted in the cloud for collaborative programming
- D. It synchronizes Git repositories across multiple cloud providers for code redundancy

Answer: B

Q873. What is the twelve-factor app methodology in cloud application design?

- A. A pricing model with twelve tiers of service for different cloud workload sizes
- B. A methodology with twelve principles for building scalable, maintainable cloud-native apps
- C. A security framework defining twelve encryption standards for cloud applications
- D. A testing framework requiring twelve automated test suites before cloud deployment

Answer: B

Q874. What is the purpose of a cloud access security broker (CASB)?

- A. It provides visibility, compliance, and threat protection for cloud service usage
- B. It negotiates pricing between cloud customers and cloud service providers
- C. It brokers compute resources between different cloud provider regions
- D. It distributes network traffic across multiple cloud availability zones

Answer: A

Q875. What is the concept of cloud-native observability and its three pillars?

- A. Compute, storage, and networking resources monitored for utilization
- B. Encryption, authentication, and authorization for securing cloud services
- C. Availability, durability, and scalability measured across cloud deployments
- D. Metrics, logs, and distributed traces for understanding system behavior

Answer: D

Q876. What is the purpose of a cloud landing zone?

- A. A disaster recovery site that activates when the primary cloud region fails
- B. A physical location where cloud data center construction begins
- C. A pre-configured, secure, multi-account cloud environment following best practices
- D. A staging environment where applications are tested before going to production

Answer: C

Q877. What is the blast radius concept in cloud architecture?

- A. The coverage area of a cloud provider's content delivery network edges
- B. The processing speed of a distributed cloud computing cluster under load
- C. The scope of impact when a failure or security incident occurs in the system
- D. The maximum geographic distance a cloud data center can serve effectively

Answer: C

Q878. What is the strangler fig pattern in cloud migration?

- A. A pattern that monitors cloud costs and automatically shuts down idle resources
- B. A pattern of incrementally replacing legacy components with new cloud services over time
- C. A pattern where legacy systems are immediately replaced by cloud-native versions
- D. A pattern for distributing database queries across multiple cloud-hosted replicas

Answer: B

Q879. What is the concept of data gravity in cloud computing?

- A. The gravitational pull affecting satellite-based cloud network connections
- B. The force required to transfer large datasets between different clouds
- C. The physical weight of storage hardware in cloud data center facilities
- D. The tendency of data to attract applications and services to its location

Answer: D

Q880. What is the difference between cloud repatriation and cloud migration?

- A. Migration moves workloads to the cloud while repatriation moves them back on-premises
- B. Migration is automated while repatriation requires manual intervention for every workload
- C. Repatriation moves workloads from on-premises to cloud while migration moves within clouds
- D. Repatriation upgrades cloud services while migration downgrades them for cost savings

Answer: A

Q881. What is the difference between IKEv1 and IKEv2 in IPsec VPN establishment?

- A. IKEv2 uses fewer message exchanges and supports MOBIKE for seamless mobility
- B. IKEv2 only supports pre-shared keys while IKEv1 supports certificate authentication
- C. IKEv1 is more efficient with fewer exchanges while IKEv2 requires more overhead
- D. IKEv1 natively supports NAT traversal while IKEv2 requires additional configuration

Answer: A

Q882. What is the purpose of certificate transparency (CT) logs?

- A. To manage the lifecycle of internal certificates within an organization
- B. To store private keys securely for all issued digital certificates
- C. To encrypt certificate revocation lists before distributing them to clients
- D. To provide a public, verifiable record of all issued TLS certificates for a domain

Answer: D

Q883. What is a side-channel attack in cryptographic systems?

- A. An attack that intercepts encrypted data during transmission through network side channels
- B. An attack that exploits physical implementation details like timing, power, or electromagnetic emissions
- C. An attack that uses social engineering to obtain encryption keys from system administrators
- D. An attack that directly breaks the mathematical foundation of an encryption algorithm

Answer: B

Q884. What is the MITRE ATT&CK framework used for in cybersecurity?

- A. It defines compliance requirements for financial services security standards
- B. It offers automated penetration testing tools for discovering network vulnerabilities
- C. It catalogs adversary tactics, techniques, and procedures based on real-world observations
- D. It provides a standardized encryption algorithm for securing network protocols

Answer: C

Q885. What is the purpose of HPKP (HTTP Public Key Pinning) and why was it deprecated?

- A. It pinned port numbers to services but was deprecated due to conflicts with NAT devices
- B. It pinned public keys to prevent MitM attacks but risked permanent site lockout on misconfiguration
- C. It pinned DNS records to prevent cache poisoning but was deprecated due to complexity
- D. It pinned session cookies to prevent hijacking but was deprecated due to privacy concerns

Answer: B

Q886. What is the difference between SOAR and SIEM in security operations?

- A. SIEM replaces human analysts entirely while SOAR assists them with data visualization
- B. SOAR collects and analyzes security data while SIEM automates response and orchestration workflows
- C. SOAR is used only in cloud environments while SIEM works exclusively in on-premises setups
- D. SIEM collects and analyzes security data while SOAR automates response and orchestration workflows

Answer: D

Q887. What is the concept of a supply chain attack in cybersecurity?

- A. An attack that compromises software or hardware through a trusted third-party vendor
- B. An attack targeting the physical delivery of hardware networking equipment
- C. An attack on the logistics systems used for shipping cloud data center components
- D. An attack that disrupts the supply of electricity to critical infrastructure systems

Answer: A

Q888. What is the purpose of RPKI (Resource Public Key Infrastructure) for BGP security?

- A. It provides authentication for BGP peer sessions using digital certificates
- B. It monitors BGP routing tables for anomalies and generates security alerts
- C. It validates the authorization of ASes to originate specific IP prefixes
- D. It encrypts all BGP route advertisements between autonomous systems

Answer: C

Q889. What is the concept of microsegmentation in zero trust network security?

- A. Breaking large security policies into micro-policies for faster processing
- B. Segmenting encryption keys into smaller fragments for distributed storage
- C. Creating fine-grained security zones around individual workloads or applications
- D. Dividing network traffic into microsecond time slots for precise scheduling

Answer: C

Q890. What is the TLS 1.3 0-RTT resumption feature and what security risk does it introduce?

- A. It allows data transfer without any handshake but introduces vulnerability to replay attacks
- B. It pre-negotiates cipher suites but increases susceptibility to downgrade attacks
- C. It caches session keys permanently but makes them vulnerable to key extraction
- D. It eliminates encryption overhead entirely but allows passive eavesdropping on initial data

Answer: A

Q891. What is the concept of Terahertz (THz) communication being explored for 6G?

- A. A technique for compressing data to one-terabyte packets for faster delivery
- B. A method of using terraforming technology to improve signal propagation distance
- C. Communication using frequencies between 0.1 and 10 THz for extremely high data rates
- D. Communication using thermal radiation from electronic components for data encoding

Answer: C

Q892. What is the concept of Ambient IoT in next-generation networks?

- A. Battery-free IoT devices that harvest energy from ambient sources like RF signals
- B. IoT devices that only function in controlled indoor environments
- C. Background IoT processes running on cloud servers during low-demand periods
- D. IoT sensors designed specifically for monitoring air quality and pollution

Answer: A

Q893. What is the purpose of Integrated Sensing and Communication (ISAC) in 6G?

- A. Integrating multiple ISP connections into a single logical communication pipe
- B. Using communication signals simultaneously for both data transmission and radar sensing
- C. Integrating wired and wireless sensors into a single network management platform
- D. Combining sensory input devices like cameras and microphones for video conferencing

Answer: B

Q894. What is the role of the ORAN Alliance's RIC (RAN Intelligent Controller)?

- A. It manages billing and subscription information for mobile network users
- B. It controls the physical orientation of radio antennas at cell sites
- C. It provides intelligent, programmable control and optimization of RAN functions
- D. It encrypts all radio access network traffic using quantum-resistant algorithms

Answer: C

Q895. What is the concept of semantic communication in future networks?

- A. Communication that focuses on transmitting the meaning rather than exact bit sequences
- B. Communication that uses natural language processing to translate between languages
- C. A standardized naming convention for network protocols and services
- D. A technique for embedding metadata into network packet headers

Answer: A

Q896. What is the purpose of Non-Terrestrial Networks (NTN) in 3GPP standards?

- A. Providing networking services exclusively for underground data centers
- B. Creating isolated networks that operate without any connection to the internet
- C. Deploying submarine cables for transoceanic high-capacity data transmission
- D. Integrating satellite and aerial platforms into the cellular network ecosystem

Answer: D

Q897. What is the concept of AI-native networking in 6G vision?

- A. Training AI models exclusively on network traffic data from previous 5G deployments
- B. Using AI only for post-deployment network troubleshooting and incident reports
- C. Replacing all network protocols with AI-generated custom protocols for each connection
- D. Designing networks where AI is a fundamental architectural component from the ground up

Answer: D

Q898. What is the concept of digital twin network (DTN) in next-generation network management?

- A. Connecting two data centers using twin fiber optic cables for maximum bandwidth
- B. Creating a real-time virtual model of the network for prediction, optimization, and verification
- C. Mirroring all network traffic to a second network for security analysis
- D. Deploying two identical physical networks for redundancy and failover purposes

Answer: B

Q899. What is the purpose of the ETSI Multi-access Edge Computing (MEC) standard?

- A. It manages authentication of edge devices connecting to core networks
- B. It standardizes the encryption protocols used at network edge devices
- C. It defines a framework for running applications at the network edge with low latency
- D. It specifies hardware requirements for edge computing server equipment

Answer: C

Q900. What is the concept of zero-touch network and service management (ZSM)?

- A. Fully automated end-to-end network management without human intervention
- B. Networks that operate without any software updates or maintenance
- C. Networks requiring no physical cables or hardware for operation
- D. Touch-free interfaces for configuring network devices using gestures

Answer: A

SUBJECT

Cyber Security

1,440 Multiple Choice Questions

Cyber Security — Easy

480 questions

Q1. What is cyber security?

- A. Assembling and configuring enterprise hardware components
- B. Developing and deploying scalable application software
- C. Architecting and building responsive web applications
- D. Protecting computer systems, networks, and data from digital attacks

Answer: D

Q2. Which of the following is a goal of cyber security?

- A. Improving user interface design
- B. Increasing internet speed
- C. Reducing hardware costs
- D. Protecting confidentiality of data

Answer: D

Q3. What does the CIA triad stand for in cyber security?

- A. Computer, Internet, Application
- B. Confidentiality, Integrity, Availability
- C. Central Intelligence Agency
- D. Code, Integration, Authentication

Answer: B

Q4. Which of the following is an example of a cyber threat?

- A. Phishing email
- B. Power outage
- C. Software update
- D. Hardware upgrade

Answer: A

Q5. What is the primary purpose of a firewall?

- A. Reduce file sizes through compression algorithms
- B. Filter incoming and outgoing network traffic
- C. Maintain redundant copies of critical data
- D. Optimize internet speed and network throughput

Answer: B

Q6. Which of the following is considered personal identifiable information (PII)?

- A. Public news article
- B. National ID card number
- C. Weather forecast
- D. Open-source code

Answer: B

Q7. What is a vulnerability in the context of cyber security?

- A. A security tool for scanning and detecting vulnerabilities
- B. A category of self-replicating malicious software
- C. A standard network communication protocol for data transfer
- D. A weakness in a system that can be exploited

Answer: D

Q8. What is the role of antivirus software?

- A. Detect and remove malicious software
- B. Expand available system memory resources
- C. Organize and catalog system file structures
- D. Schedule and generate automated data backups

Answer: A

Q9. Which organization is responsible for cyber security standards globally?

- A. ISO (International Organization for Standardization)
- B. UNICEF within enterprise security environments
- C. WHO within enterprise security environments
- D. FIFA within enterprise security environments

Answer: A

Q10. What does the term 'threat' mean in cyber security?

- A. A potential cause of an unwanted incident that may harm a system
- B. A routine patch applied to update system software
- C. A high-level language used for development
- D. A hardware component inside wireless networking routers

Answer: A

Q11. What does confidentiality mean in information security?

- A. Data is regularly backed up to remote locations
- B. Data is continuously available to all authorized users
- C. Data is only accessible to authorized individuals
- D. Data remains unmodified and accurately preserved

Answer: C

Q12. What does integrity mean in information security?

- A. Data remains accurate and unaltered during storage and transmission
- B. Data is available 24/7 within enterprise security environments
- C. Data is deleted after use within enterprise security environments
- D. Data is always encrypted regardless of the specific situation or context

Answer: A

Q13. What does availability mean in the CIA triad?

- A. Data can be accessed by anyone in security contexts
- B. Data is encrypted within enterprise security environments
- C. Data is stored in the cloud within enterprise security environments
- D. Authorized users can access data and resources when needed

Answer: D

Q14. Which of the following is a strong password practice?

- A. Using password123 within enterprise security environments
- B. Using your name as password within enterprise security environments
- C. Using a mix of uppercase, lowercase, numbers, and special characters
- D. Using the same password for all accounts

Answer: C

Q15. What is encryption?

- A. Deleting files permanently within enterprise security environments
- B. Converting data into a coded format to prevent unauthorized access
- C. Compressing files to save space within enterprise security environments
- D. Backing up data to cloud within enterprise security environments

Answer: B

Q16. What is the purpose of a backup?

- A. To encrypt files using established cryptographic standards
- B. To speed up computer processing performance speed
- C. To delete unnecessary files within the data management framework
- D. To create a copy of data for recovery in case of data loss

Answer: D

Q17. Which of the following is a type of security control?

- A. Gaming control
- B. Preventive control
- C. Marketing control
- D. Advertising control

Answer: B

Q18. What is authentication?

- A. Verifying the identity of a user or system
- B. Applying cryptographic ciphers to protect data
- C. Compressing files to reduce disk storage consumption
- D. Architecting and building responsive web applications

Answer: A

Q19. What does a password manager do?

- A. Attempts to crack and compromise stored passwords
- B. Broadcasts and shares passwords on public platforms
- C. Permanently removes and erases stored passwords
- D. Securely stores and manages passwords for various accounts

Answer: D

Q20. Which is an example of 'something you know' in authentication?

- A. Smart card
- B. Retina scan
- C. Password
- D. Fingerprint

Answer: C

Q21. What is cryptography?

- A. Study of databases within enterprise security environments
- B. Study of networks within enterprise security environments
- C. Study of computers within enterprise security environments
- D. The practice of securing communication through encoding messages

Answer: D

Q22. What is plaintext in cryptography?

- A. The original readable message before encryption
- B. A cryptographic key applied to data protection workflows
- C. A type of cipher applied to data protection workflows
- D. Encrypted data within enterprise security environments

Answer: A

Q23. What is ciphertext?

- A. A hash function within modern computing environments
- B. A type of key within modern computing environments
- C. A readable message within modern computing environments
- D. The encrypted, unreadable form of a message

Answer: D

Q24. What is a cryptographic key?

- A. A physical metal key for a locked server room
- B. A piece of information used to encrypt and decrypt data
- C. A strain of self-replicating malicious software programs
- D. A physical cable used for network connections

Answer: B

Q25. Which of the following is a symmetric encryption algorithm?

- A. RSA
- B. ECC
- C. Diffie-Hellman
- D. AES

Answer: D

Q26. What is decryption?

- A. Converting plaintext to ciphertext
- B. Converting ciphertext back to plaintext
- C. Compressing data files for reduced storage space consumption
- D. Deleting encrypted data in security contexts

Answer: B

Q27. What is the Caesar cipher?

- A. An asymmetric algorithm within modern computing environments
- B. A hash function within modern computing environments
- C. A modern encryption standard applied to data protection workflows
- D. A simple substitution cipher that shifts letters by a fixed number

Answer: D

Q28. What is the purpose of a digital signature?

- A. To compress files for reducing disk storage consumption
- B. To sign documents physically within enterprise computing infrastructure
- C. To verify the authenticity and integrity of a digital message
- D. To encrypt all data using established cryptographic standards

Answer: C

Q29. Which of the following is an asymmetric encryption algorithm?

- A. Blowfish
- B. DES
- C. RSA
- D. AES

Answer: C

Q30. What is a public key in asymmetric cryptography?

- A. A key that is freely shared and used for encrypting messages
- B. A key that must be kept secret used in enterprise computing environments
- C. A password within the identity management system
- D. A physical key within modern computing environments

Answer: A

Q31. What is a firewall?

- A. A physical fireproof barrier within a building structure
- B. A category of self-replicating malicious software
- C. A high-level language used for development used in enterprise computing environments
- D. A network security device that monitors and filters network traffic

Answer: D

Q32. What does VPN stand for?

- A. Very Personal Network
- B. Verified Public Network
- C. Virtual Private Network
- D. Visual Processing Node

Answer: C

Q33. What is the purpose of a VPN?

- A. To reduce data sizes through compression methods
- B. To increase internet speed for improved operational efficiency
- C. To block all websites within enterprise computing infrastructure
- D. To create a secure, encrypted connection over a public network

Answer: D

Q34. What protocol is used for secure web browsing?

- A. FTP
- B. HTTPS
- C. Telnet
- D. HTTP

Answer: B

Q35. What is a network intrusion?

- A. Adding new devices to a network
- B. Upgrading network hardware
- C. Unauthorized access to a computer network
- D. Installing network software

Answer: C

Q36. Which port number is commonly used for HTTPS?

- A. 21
- B. 80
- C. 25
- D. 443

Answer: D

Q37. What is a DMZ in networking?

- A. A network segment between internal and external networks to host public-facing services
- B. A military zone within enterprise computing environments
- C. A wireless network used in enterprise network infrastructure
- D. A network routing device for managing enterprise traffic flows

Answer: A

Q38. What does IDS stand for in network security?

- A. Integrated Development System
- B. Internal Data Storage
- C. Internet Download Service
- D. Intrusion Detection System

Answer: D

Q39. What is packet filtering?

- A. Encrypting all packets regardless of the specific situation or context
- B. Deleting all packets regardless of the specific situation or context
- C. Compressing network packets within enterprise security environments
- D. Examining packets and allowing or blocking them based on defined rules

Answer: D

Q40. What is the function of a proxy server in security?

- A. To act as an intermediary between users and the internet, providing anonymity and filtering
- B. To directly connect to the internet within enterprise computing infrastructure
- C. To create viruses for enterprise computing environments and management
- D. To store passwords within enterprise computing infrastructure and management

Answer: A

Q41. What is OS hardening?

- A. Making the OS run faster within enterprise security environments
- B. Increasing storage capacity within enterprise security environments
- C. Installing new applications within enterprise security environments
- D. The process of securing an operating system by reducing its attack surface

Answer: D

Q42. Why is it important to keep operating systems updated?

- A. To fix security vulnerabilities and improve system stability
- B. To make the computer slower within enterprise computing infrastructure
- C. To increase file storage within the data management framework
- D. To change the wallpaper within enterprise computing infrastructure

Answer: A

Q43. What is a user account in operating system security?

- A. A software application used for enterprise computing operations
- B. A network connection used in enterprise network infrastructure
- C. An identity used to access and interact with the OS with specific permissions
- D. A social media profile within modern computing environments

Answer: C

Q44. What is the purpose of file permissions in an OS?

- A. To compress files for reducing disk storage consumption
- B. To encrypt all files automatically
- C. To make files larger within the data management framework
- D. To control who can read, write, or execute files

Answer: D

Q45. What is a system log?

- A. A file that records events, errors, and activities within the operating system
- B. A strain of self-replicating malicious software programs
- C. A physical network cable used for connecting infrastructure devices
- D. A physical security measure for protecting building infrastructure

Answer: A

Q46. What is the purpose of disabling unnecessary services on an OS?

- A. To free up disk space only within enterprise computing infrastructure
- B. To reduce the attack surface by eliminating potential entry points
- C. To make the OS look cleaner within enterprise computing infrastructure
- D. To speed up boot time only for improved operational efficiency

Answer: B

Q47. What is a security patch?

- A. A software update that fixes a specific security vulnerability
- B. A decorative element within modern computing environments
- C. A physical patch on hardware installed within computing infrastructure
- D. A category of self-replicating malicious software

Answer: A

Q48. Which is a basic OS security practice?

- A. Disabling the firewall within enterprise security environments
- B. Running all programs as administrator
- C. Using strong passwords and enabling automatic updates
- D. Sharing admin passwords within enterprise security environments

Answer: C

Q49. What is Windows Defender?

- A. A built-in antimalware component of Windows operating system
- B. A file manager for organizing system directories
- C. A standard web browser for accessing internet sites
- D. A first-person video game for entertainment

Answer: A

Q50. What is the root account in Linux?

- A. The superuser account with unrestricted access to all commands and files
- B. A regular user account within the identity management system
- C. A temporary account within the identity management system
- D. A guest account within the identity management system

Answer: A

Q51. What does HTTPS indicate in a website URL?

- A. The website is an older legacy version of the platform
- B. The website loads with higher overall speed performance
- C. The website is free to access without any subscription
- D. The website uses encrypted communication via SSL/TLS

Answer: D

Q52. What is a phishing website?

- A. A government website providing official public services
- B. A secure website verified by a certificate authority
- C. A website about recreational fishing techniques and tips
- D. A fake website designed to trick users into revealing personal information

Answer: D

Q53. What is a web application firewall (WAF)?

- A. A standard web browser used for accessing internet-hosted content
- B. An online platform used for creating and hosting web content
- C. A physical barrier installed to protect building infrastructure
- D. A security solution that filters and monitors HTTP traffic between a web app and the internet

Answer: D

Q54. What is the purpose of CAPTCHA on websites?

- A. To deliberately slow down website page loading speed
- B. To distinguish between human users and automated bots
- C. To compress and optimize images for web page loading
- D. To encrypt data using symmetric cipher algorithms

Answer: B

Q55. What is a cookie in web security?

- A. A category of self-replicating malicious software
- B. A small piece of data stored by a web browser for session management
- C. A baked food snack or treat served at parties
- D. A security tool for scanning and detecting vulnerabilities

Answer: B

Q56. Why check for a padlock icon in the browser address bar?

- A. It shows the site operates without any advertisements
- B. It means the site loads with high-performance speed
- C. It means the site is popular and heavily visited
- D. It indicates the connection is encrypted with SSL/TLS

Answer: D

Q57. What is a secure password practice for web accounts?

- A. Using the same password everywhere
- B. Using single-character passwords
- C. Writing passwords on sticky notes
- D. Using unique, strong passwords for each website

Answer: D

Q58. What is the purpose of two-factor authentication on websites?

- A. To deliberately make the login process much slower
- B. To completely block all users from accessing the site
- C. To add an extra layer of security beyond just a password
- D. To encrypt the entire website using a secret algorithm

Answer: C

Q59. What does 'session' mean in web security?

- A. A formal class held at a school or university within modern computing environments
- B. A software application used for enterprise computing operations
- C. A period of interaction between a user and a web application, tracked by a session identifier
- D. A physical cable used for network connections used in enterprise network infrastructure

Answer: C

Q60. What is input validation in web security?

- A. Checking keyboard hardware functionality and connectivity
- B. Verifying that user-submitted data meets expected criteria before processing
- C. Formatting and styling text content on a web page
- D. Compressing and reducing the size of input data

Answer: B

Q61. What is malware?

- A. A physical hardware component inside computer systems
- B. Software intentionally designed to cause damage to a computer, server, or network
- C. Legitimate helpful software designed for user productivity
- D. An operating system for managing system resources used in enterprise computing environments

Answer: B

Q62. What is a computer virus?

- A. A written record or logbook for tracking daily operational activities
- B. Malicious code that attaches to programs and replicates when the host program runs
- C. A routine system update for improving stability used in enterprise computing environments
- D. A self-replicating strain of malicious software targeting systems

Answer: B

Q63. What is a computer worm?

- A. A physical hardware component used in computing infrastructure
- B. Self-replicating malware that spreads across networks without needing a host program
- C. A software application used for enterprise computing operations
- D. A hardware component inside wireless networking routers

Answer: B

Q64. What is a Trojan horse in computing?

- A. A physical hardware component used in computing infrastructure
- B. Malware disguised as legitimate software to trick users into installing it
- C. An antivirus program designed to detect known threats
- D. A wooden horse artifact from ancient Greek history

Answer: B

Q65. What is ransomware?

- A. Malware that encrypts files and demands payment for the decryption key
- B. Free and open-source software available for download
- C. A backup tool for creating copies of important data
- D. An antivirus update that patches known vulnerabilities

Answer: A

Q66. What is spyware?

- A. Software that secretly monitors and collects user information without consent
- B. A security tool for scanning and detecting vulnerabilities
- C. A telescope used for astronomical observation used in enterprise computing environments
- D. A standard web browser for accessing internet sites

Answer: A

Q67. What is adware?

- A. A security program designed to protect against malware
- B. An advertising company that creates marketing campaigns
- C. Software that automatically displays or downloads unwanted advertisements
- D. A helpful tool for managing and organizing digital files

Answer: C

Q68. What is a phishing attack?

- A. A routine security scan assessing system vulnerabilities used in enterprise computing environments
- B. A standard network communication protocol for data transmission
- C. A recreational fishing technique using specialized gear used in enterprise computing environments
- D. A social engineering attack using deceptive messages to trick victims into revealing sensitive information

Answer: D

Q69. What is a Denial of Service (DoS) attack?

- A. A network upgrade that improves bandwidth and throughput used in enterprise computing environments
- B. Refusing customer service in a retail environment across computing environments
- C. A software application used for enterprise computing operations
- D. An attack that overwhelms a system with traffic to make it unavailable to legitimate users

Answer: D

Q70. What is the best defense against malware?

- A. Completely avoiding and never using a computer at all
- B. Only using free open-source software for all tasks
- C. Permanently disconnecting the system from internet access
- D. Using updated antivirus software and practicing safe computing habits

Answer: D

Q71. What is multi-factor authentication (MFA)?

- A. Using multiple different passwords for one account
- B. Using two or more different verification methods to confirm identity
- C. Displaying multiple login screens for a single service
- D. Using multiple different usernames for one account

Answer: B

Q72. What are the three main factors of authentication?

- A. Name, address, phone within enterprise security environments
- B. Hardware, software, firmware within enterprise security environments
- C. Username, password, email within enterprise security environments
- D. Something you know, something you have, something you are

Answer: D

Q73. What is a biometric authentication method?

- A. Authenticating identity using a traditional password or passphrase
- B. Using physical characteristics like fingerprints or facial recognition to verify identity
- C. Using a smart card hardware token for two-factor authentication
- D. Using a numeric PIN code for verifying user identity at login

Answer: B

Q74. What is role-based access control (RBAC)?

- A. Access permissions assigned based on a user's role within the organization
- B. No formal access control mechanism exists in the system
- C. Everyone has the same unrestricted access to resources
- D. Access is assigned randomly without specific criteria

Answer: A

Q75. What is a PIN (Personal Identification Number)?

- A. A numeric password used to authenticate a user's identity
- B. A symmetric key data encryption algorithm
- C. A network identifier assigned to connected devices
- D. A physical metal pin used for hardware components

Answer: A

Q76. What is single sign-on (SSO)?

- A. An authentication scheme allowing a user to log in once and access multiple systems
- B. A next-generation firewall for filtering network traffic flows
- C. Creating a single user account for system administration
- D. Using one password for everything without variation

Answer: A

Q77. What is the purpose of a username?

- A. To speed up computer processing performance speed
- B. To identify a specific user account in a system
- C. To create automated backup copies of user data
- D. To encrypt data using symmetric cipher algorithms

Answer: B

Q78. What is account lockout?

- A. Normally logging out of an active and authenticated user session
- B. A security mechanism that locks an account after too many failed login attempts
- C. Permanently deleting and removing a user account from the system
- D. Changing a user account password for improved security posture

Answer: B

Q79. What is a one-time password (OTP)?

- A. A shared password used by multiple user accounts
- B. A permanent password that never expires or changes
- C. A password valid for only one login session or transaction
- D. A master password that unlocks all system accounts

Answer: C

Q80. What is authorization?

- A. Permanently deleting files and data from the system storage drives
- B. Determining what resources and actions an authenticated user is allowed to access
- C. Creating and provisioning a new user account entry in the directory
- D. Verifying and confirming who you are as a user during the login process

Answer: B

Q81. What is secure software development?

- A. Writing detailed technical documentation for all application code modules
- B. Only testing for bugs and defects at the very end of the development cycle
- C. Writing application code quickly without any formal quality review process
- D. Integrating security measures throughout the entire software development lifecycle

Answer: D

Q82. What is the SDLC?

- A. A high-level language used for development used in enterprise computing environments
- B. A database management system for storing data records
- C. A security tool for scanning and detecting vulnerabilities
- D. A structured process for planning, creating, testing, and deploying software

Answer: D

Q83. Why is input validation important in secure coding?

- A. To ensure user input is safe and prevent malicious data from being processed
- B. To make the user interface look visually appealing
- C. To speed up the application processing and response time
- D. To reduce the overall file size of application resources

Answer: A

Q84. What is a software vulnerability?

- A. A routine patch applied to update and improve existing system software
- B. A category of self-replicating malicious software designed for harm
- C. A weakness or flaw in software that can be exploited to compromise security
- D. A planned and well-documented software feature built for end users

Answer: C

Q85. What is code review in secure development?

- A. Copying code from the internet without attribution or proper licensing
- B. Examining source code to identify security flaws, bugs, and code quality issues
- C. Permanently deleting old obsolete source code from repository branches
- D. Writing code faster without any verification of quality or correctness

Answer: B

Q86. What does 'security by design' mean?

- A. Adding security measures only after production deployment
- B. Building security into software from the earliest stages of development
- C. Installing antivirus software on the development machine
- D. Using only encryption as the single security measure

Answer: B

Q87. What is the purpose of error handling in secure coding?

- A. To deliberately cause the application to crash on errors
- B. To log all error details publicly for transparency
- C. To ignore all errors and continue processing without alerts
- D. To gracefully manage errors without exposing sensitive information

Answer: D

Q88. What is a security bug?

- A. A physical hardware failure requiring component replacement
- B. A network connectivity issue affecting system availability
- C. A software defect that could be exploited to compromise system security
- D. A planned feature request from the product stakeholders

Answer: C

Q89. What is the purpose of using HTTPS in web applications?

- A. To block unwanted advertisements from displaying
- B. To encrypt data transmitted between client and server
- C. To compress web pages for reduced bandwidth usage
- D. To optimize the website for faster loading performance

Answer: B

Q90. Why should default passwords be changed?

- A. To comply with organizational branding requirements
- B. To improve overall system performance and speed
- C. To make the login process more difficult for users
- D. Because default passwords are publicly known and easily exploited

Answer: D

Q91. What does Wi-Fi stand for?

- A. Wide Firewall
- B. Wired Finder
- C. Wireless Fidelity
- D. Wireless Firewall

Answer: C

Q92. What is the purpose of a Wi-Fi password?

- A. To slow down the connection within enterprise computing infrastructure
- B. To restrict network access to authorized users and encrypt wireless traffic
- C. To identify the network name across the enterprise network infrastructure
- D. To increase internet speed for improved operational efficiency

Answer: B

Q93. What is Bluetooth?

- A. A short-range wireless technology for exchanging data between devices
- B. A dental condition affecting tooth enamel coloring
- C. A wired connection using physical Ethernet cables
- D. A strain of self-replicating malicious software programs

Answer: A

Q94. Why should you avoid unknown public Wi-Fi networks?

- A. They are always blocked by network providers
- B. They always have slow data transfer speeds
- C. They consume too much device battery power
- D. They may be set up by attackers to intercept your data

Answer: D

Q95. What is the purpose of screen lock on a mobile device?

- A. To speed up device processing and app performance
- B. To conserve and extend device battery life span
- C. To prevent unauthorized physical access to the device and its data
- D. To improve the display quality and screen resolution

Answer: C

Q96. What is mobile device encryption?

- A. Converting all data on the device into an unreadable format requiring authentication
- B. Making the phone processor run faster and smoother
- C. A screen saver that activates after inactivity timeout used in enterprise computing environments
- D. Compressing files to reduce disk storage consumption

Answer: A

Q97. What should you do if your mobile device is lost or stolen?

- A. Do nothing at all and wait patiently for the situation to resolve itself
- B. Buy a new replacement device immediately without taking any other action
- C. Use remote wipe and tracking features, change passwords, and report to authorities
- D. Wait patiently for the lost or stolen device to be returned by someone

Answer: C

Q98. What is the risk of outdated mobile operating systems?

- A. Known security vulnerabilities remain unpatched and exploitable
- B. Newer wallpapers and themes are not available to install
- C. Applications appear different with slightly changed layouts
- D. The phone appears visually old and aesthetically outdated

Answer: A

Q99. What is an SSID in wireless networking?

- A. A hardware component inside wireless networking routers
- B. A symmetric key data encryption algorithm
- C. A wireless security protocol for data encryption
- D. The name that identifies a specific wireless network

Answer: D

Q100. Why should you keep Bluetooth off when not in use?

- A. To reduce the attack surface and prevent unauthorized connections
- B. To make phone calls connect and complete faster overall
- C. To customize and change the phone color theme appearance
- D. To improve camera quality and photo capture resolution

Answer: A

Q101. What is cloud computing?

- A. A weather forecasting system using satellite data analysis
- B. Storing files exclusively on your local desktop hard drive
- C. Delivering computing services like servers, storage, and software over the internet
- D. A type of external hard drive for portable data storage

Answer: C

Q102. What are the three main cloud service models?

- A. Small, Medium, Large
- B. RAM, CPU, GPU
- C. IaaS, PaaS, SaaS
- D. HTTP, FTP, SMTP

Answer: C

Q103. What is the shared responsibility model in cloud security?

- A. Both the provider and customer share responsibility for different aspects of security
- B. Only the customer is responsible for all security measures including infrastructure
- C. The cloud provider is solely responsible for everything including customer data
- D. No one is responsible for implementing security controls in cloud environments

Answer: A

Q104. What is a public cloud?

- A. Cloud infrastructure shared among multiple organizations over the internet
- B. A government-operated cloud for public sector agencies
- C. A cloud deployment visible to everyone on the internet
- D. A private physical server in an on-premises data center

Answer: A

Q105. What is a private cloud?

- A. A secret cloud that nobody uses or accesses at all
- B. Cloud infrastructure exclusively used by a single organization
- C. A specific type of weather and atmospheric phenomena
- D. A personal desktop computer used for individual tasks

Answer: B

Q106. Why is data encryption important in cloud computing?

- A. To protect data confidentiality on shared infrastructure and during transmission
- B. To organize files better with structured directory layouts
- C. To make data load faster with improved performance speed
- D. To reduce storage costs through efficient data management

Answer: A

Q107. What is multi-tenancy in cloud computing?

- A. Multiple users connected to one physical computer terminal for shared access
- B. Having multiple user accounts on different cloud services for various purposes
- C. A cloud computing platform designed for hosting distributed enterprise workloads
- D. Multiple customers sharing physical infrastructure while data remains logically isolated

Answer: D

Q108. What is a cloud access security broker (CASB)?

- A. A next-generation firewall for filtering network traffic flows
- B. A cloud provider offering infrastructure as a service
- C. A security tool between users and cloud services to enforce security policies
- D. An automated backup solution for enterprise data recovery needs

Answer: C

Q109. What is the risk of misconfigured cloud storage?

- A. Faster data access speeds and improved system performance
- B. Accidental public exposure of sensitive data due to incorrect access permissions
- C. Better performance throughput for cloud-hosted applications
- D. Lower costs for cloud infrastructure resource consumption

Answer: B

Q110. What is IAM in cloud security?

- A. A framework for managing digital identities and controlling user access to cloud resources
- B. A social media feature for managing online profile settings
- C. A file management system for organizing stored documents used in enterprise computing environments
- D. An email service for sending and receiving electronic messages

Answer: A

Q111. What is digital forensics?

- A. Repairing damaged computers and replacing failed hardware components in infrastructure
- B. A standard software application used for routine enterprise computing operations
- C. Installing and configuring software applications on production computing systems
- D. Collecting, analyzing, and preserving digital evidence from electronic devices for investigation

Answer: D

Q112. What is digital evidence?

- A. A physical security measure for protecting building infrastructure
- B. Physical fingerprints collected at a crime scene within enterprise security environments
- C. A software application used for enterprise computing operations
- D. Any data stored or transmitted using a computer that supports or refutes a theory in a legal case

Answer: D

Q113. Why is chain of custody important in digital forensics?

- A. It reduces storage space required for evidence preservation
- B. It makes the forensic investigation process faster
- C. It ensures evidence integrity and admissibility by documenting who handled it and how
- D. Continuous monitoring is not important for security for modern enterprise security environments

Answer: C

Q114. What is a forensic image?

- A. A digital photograph taken with a camera for documentation
- B. A bit-by-bit exact copy of a storage device for forensic examination
- C. A screenshot captured from a computer display for reference
- D. A photograph of a physical crime scene by investigators

Answer: B

Q115. What types of devices can contain digital evidence?

- A. Only USB drives can contain relevant digital evidence for forensic investigation
- B. Only desktop computers can contain relevant digital evidence for investigation
- C. Only smartphones can contain relevant digital evidence for forensic investigation
- D. Computers, smartphones, tablets, servers, IoT devices, USB drives, and any digital storage media

Answer: D

Q116. What is the first step in a digital forensics investigation?

- A. Deleting suspicious files from the compromised system
- B. Restarting the computer to clear temporary memory contents
- C. Installing antivirus software on the compromised system
- D. Identifying and securing the scene to prevent evidence tampering

Answer: D

Q117. What is file recovery in digital forensics?

- A. Creating new files on the forensic examination workstation
- B. Encrypting files within enterprise security environments
- C. Retrieving deleted, damaged, or lost files from storage media
- D. Compressing files to reduce disk storage consumption

Answer: C

Q118. What is metadata in digital forensics?

- A. A high-level language used for development used in enterprise computing environments
- B. A strain of self-replicating malicious software programs
- C. Data about data, such as file creation date, author, and modification history
- D. A standard network communication protocol for data transfer

Answer: C

Q119. What is a write blocker used for in forensics?

- A. To block network traffic across the enterprise network infrastructure
- B. To block websites within enterprise computing infrastructure
- C. To prevent any write operations to the evidence drive during examination
- D. To block writing on paper within enterprise computing infrastructure

Answer: C

Q120. What is the purpose of hashing in digital forensics?

- A. To create a unique digital fingerprint of evidence to verify its integrity
- B. To reduce data sizes through compression methods and management
- C. To speed up computers for improved operational efficiency
- D. To encrypt files using established cryptographic standards

Answer: A

Q121. What is an incident in cyber security?

- A. A routine patch applied to update system software used in enterprise computing environments
- B. An event that threatens the security, confidentiality, integrity, or availability of information assets
- C. A physical hardware component used in computing infrastructure
- D. A scheduled maintenance within enterprise computing environments

Answer: B

Q122. What is incident response?

- A. An organized approach to addressing and managing a security breach to limit damage
- B. Generating redundant backup copies of system data for disaster recovery
- C. Installing routine software updates on regularly scheduled maintenance days
- D. Ignoring security events and hoping they resolve on their own naturally

Answer: A

Q123. Why is having an incident response plan important?

- A. It ensures quick, organized, and effective response to security incidents
- B. Continuous monitoring is not important for security
- C. It eliminates all threats regardless of the specific situation or context
- D. It replaces security tools within enterprise security environments

Answer: A

Q124. What is the first phase of incident response?

- A. Recovery
- B. Containment
- C. Preparation
- D. Eradication

Answer: C

Q125. What is an incident response team?

- A. A marketing team managing brand awareness campaigns used in enterprise computing environments
- B. Trained personnel responsible for detecting, analyzing, and responding to security incidents
- C. A software application used for enterprise computing operations
- D. A group of malicious hackers targeting an organization used in enterprise computing environments

Answer: B

Q126. What should you do if you suspect a security incident?

- A. Report it immediately to the appropriate security team
- B. Try to fix it yourself without informing anyone
- C. Delete all files to eliminate any potential evidence
- D. Ignore it and continue with normal operations as usual

Answer: A

Q127. What is the purpose of incident documentation?

- A. To blame someone specific for causing the incident
- B. To delete evidence of the incident from all records
- C. To create unnecessary bureaucratic paperwork and overhead
- D. To maintain a detailed record of the incident, actions taken, and findings

Answer: D

Q128. What is the difference between an event and an incident?

- A. Events are worse than incidents in terms of damage across computing environments
- B. They are fundamentally identical concepts with no meaningful differences
- C. Incidents are planned events scheduled by the security team
- D. An event is any observable occurrence; an incident negatively impacts security or violates policy

Answer: D

Q129. What is the purpose of the containment phase?

- A. To ignore the incident and let it resolve on its own
- B. To limit the scope and damage by isolating affected systems
- C. To start a new project unrelated to the current incident
- D. To spread and propagate the incident to other systems

Answer: B

Q130. What is a security alert?

- A. A fire alarm system installed in a physical building
- B. A notification indicating a potential security event requiring investigation
- C. A performance warning about high system resource usage
- D. A software update notification from the operating system

Answer: B

Q131. What is security monitoring?

- A. Monitoring attendance records for employee time tracking
- B. Watching security guards on physical surveillance cameras
- C. Continuous observation and analysis of systems and networks for security threats
- D. A video surveillance system for monitoring building access

Answer: C

Q132. What is a security log?

- A. A record of security-relevant events and activities within a system or network
- B. A wooden log used for building physical fire structures
- C. A login page for entering user authentication credentials
- D. A security guard's written diary of daily activity notes

Answer: A

Q133. What is an alert in security monitoring?

- A. A routine system update for improving stability used in enterprise computing environments
- B. A user account type with specifically assigned access permissions
- C. A notification when a security tool detects suspicious or potentially malicious activity
- D. An alarm clock that wakes people up at a set time used in enterprise computing environments

Answer: C

Q134. What is the purpose of monitoring network traffic?

- A. To count the total number of packets transmitted on network
- B. To slow down overall network performance and throughput
- C. To increase available bandwidth for improved download speeds
- D. To detect unusual patterns, unauthorized access, and potential security threats

Answer: D

Q135. What is a dashboard in security monitoring?

- A. A file manager for organizing system directories used in enterprise computing environments
- B. A visual interface displaying real-time security metrics, alerts, and status information
- C. A web browser application for accessing internet-hosted content
- D. A car dashboard displaying vehicle speed and fuel information

Answer: B

Q136. Why is continuous monitoring important?

- A. Continuous monitoring exists solely to use more electricity
- B. Continuous monitoring is not important for security for modern enterprise security environments
- C. Threats can occur at any time and continuous monitoring ensures quick detection
- D. Continuous monitoring exists only to generate more data

Answer: C

Q137. What is log management?

- A. Collecting, storing, analyzing, and retaining log data from various systems
- B. Managing a personal blog for publishing online content
- C. Managing a lumber yard for processing wood materials
- D. A task management tool for organizing project work items

Answer: A

Q138. What type of events should be logged for security?

- A. Login attempts, access to sensitive data, system changes, and privilege escalations
- B. Only successful events should be logged for monitoring and compliance reporting
- C. Only errors and crashes should be logged for security analysis and remediation
- D. Only network events should be logged for analysis and security monitoring

Answer: A

Q139. What is a false positive in security monitoring?

- A. A true security threat confirmed by analysis investigation
- B. A false identity used for unauthorized system access
- C. A system error causing application crashes or instability
- D. An alert that incorrectly identifies normal activity as a security threat

Answer: D

Q140. What is the purpose of antivirus monitoring?

- A. To continuously watch for and detect malware infections in real-time
- B. To delete all files from the system storage permanently
- C. To sell software licenses for antivirus subscriptions
- D. To slow down the computer for detailed system analysis

Answer: A

Q141. What is cybercrime?

- A. Playing computer games for recreational entertainment and leisure purposes
- B. Criminal activity involving computers, networks, or digital devices as tools or targets
- C. Using computers for normal everyday work productivity and communications
- D. Building websites for establishing personal or commercial online presence

Answer: B

Q142. What is PECA 2016 in Pakistan?

- A. An education policy for governing school curriculum standards
- B. Pakistan's primary legislation addressing cybercrimes, data protection, and electronic fraud
- C. A health regulation for managing public medical facilities used in enterprise computing environments
- D. A traffic law regulating vehicle movement on roads used in enterprise computing environments

Answer: B

Q143. What is intellectual property in the digital context?

- A. A physical hardware component used in computing infrastructure
- B. Creative works, inventions, designs, and software protected by law from unauthorized use
- C. Internet speed and bandwidth available for data transfers
- D. Physical property like land and buildings owned by individuals

Answer: B

Q144. What is data privacy?

- A. Making data public and freely accessible for anyone across computing environments
- B. The right of individuals to control how their personal information is collected, used, and shared
- C. Hiding your computer from others by placing it out of sight
- D. Deleting all data from storage devices permanently across computing environments

Answer: B

Q145. What is unauthorized access in cyber law?

- A. Logging into your own user account with correct credentials
- B. Downloading free software from authorized official sources
- C. Using public Wi-Fi for browsing the internet content
- D. Accessing a computer system or network without permission

Answer: D

Q146. What is online harassment?

- A. Using digital communication to threaten, intimidate, or harm another person
- B. Social media marketing campaigns for brand awareness
- C. Sending friendly emails to colleagues for collaboration
- D. Online gaming with other players for entertainment purposes

Answer: A

Q147. What is software piracy?

- A. Software testing for validating application feature quality
- B. The unauthorized copying, distribution, or use of copyrighted software
- C. Open-source development contributing code to public projects
- D. Sailing ships equipped with computer navigation technology

Answer: B

Q148. What is digital consent?

- A. A symmetric key data encryption algorithm applied to data protection workflows
- B. A computer command executed from the terminal or console used in enterprise computing environments
- C. A digital signature used for verifying message authenticity used in enterprise computing environments
- D. Permission given by an individual for their personal data to be collected, processed, or shared

Answer: D

Q149. What is identity theft in the digital context?

- A. Creating a new email account for personal communication
- B. Changing your username on a social media platform account
- C. Forgetting your password and requesting an account reset
- D. Stealing personal information to impersonate someone for fraud or other crimes

Answer: D

Q150. What is the purpose of acceptable use policies (AUP)?

- A. To deploy and install application software and management
- B. To restrict all computer use for security purposes and management
- C. To increase internet speed for improved operational efficiency
- D. To define rules and guidelines for responsible and secure use of IT resources

Answer: D

Q151. What is AI in cyber security?

- A. A next-generation firewall security appliance deployed across enterprise environments
- B. The use of machine learning and intelligent algorithms to detect, prevent, and respond to threats
- C. A physical security measure for protecting building infrastructure
- D. A software application used for enterprise computing operations

Answer: B

Q152. What is the Internet of Things (IoT)?

- A. A network of physical devices connected to the internet that collect and exchange data
- B. A web browser application for accessing internet-hosted content
- C. A social media platform for sharing posts and updates used in enterprise computing environments
- D. A new internet service provider offering broadband access

Answer: A

Q153. Why are IoT devices a security concern?

- A. They process data too fast for security tools to monitor
- B. They consume too much electricity for normal household budgets
- C. They are too expensive for consumers to purchase and use
- D. Many have weak security, default passwords, and limited update capabilities

Answer: D

Q154. What is blockchain technology?

- A. A next-generation firewall for filtering network traffic flows
- B. A cryptographic algorithm used for protecting sensitive data
- C. A distributed, immutable ledger that records transactions across many computers
- D. A database backup system for creating redundant data copies

Answer: C

Q155. What is ransomware-as-a-service (RaaS)?

- A. A backup service for managing enterprise data resources
- B. A legitimate cloud service for hosting web applications
- C. A data recovery service for restoring encrypted file backups
- D. A criminal model where ransomware developers lease tools to other criminals

Answer: D

Q156. What is biometric authentication technology?

- A. A standard network communication protocol for data transfer
- B. A cryptographic algorithm used for protecting sensitive data
- C. Using unique physical or behavioral characteristics for identity verification
- D. Using only passwords for user identity verification login

Answer: C

Q157. What is cloud-native security?

- A. A physical security measure specifically designed for protecting building infrastructure
- B. Weather-based security monitoring using atmospheric sensors and satellite imaging data
- C. Security approaches designed specifically for cloud environments including containers and serverless
- D. A self-replicating strain of malicious software designed for targeting computing systems

Answer: C

Q158. What is a deepfake?

- A. AI-generated synthetic media realistically depicting people saying or doing things they never did
- B. A software application used for enterprise computing operations
- C. A deep sea photograph taken underwater for marine research used in enterprise computing environments
- D. A symmetric key data encryption algorithm applied to data protection workflows

Answer: A

Q159. What is 5G and why does it matter for security?

- A. A strain of self-replicating malicious software programs
- B. The fifth generation of personal computer hardware architecture
- C. The fifth generation of mobile network technology bringing new security challenges
- D. A security certification for mobile network professionals

Answer: C

Q160. What is cyber resilience?

- A. A next-generation firewall for filtering network traffic flows
- B. Never experiencing any cyber attacks or security incidents
- C. An automated backup solution for enterprise data recovery needs
- D. An organization's ability to continuously deliver outcomes despite adverse cyber events

Answer: D

Q161. What does the term 'attack surface' refer to in cyber security?

- A. The graphical interface of a security application
- B. The total number of employees in an organization
- C. The set of points where an attacker can try to enter
- D. The physical area covered by a wireless network

Answer: C

Q162. Which term describes an individual who attempts to gain unauthorized access to systems?

- A. Developer
- B. Hacker
- C. Analyst
- D. Administrator

Answer: B

Q163. What is the main purpose of security awareness training?

- A. Training staff to configure enterprise-level firewalls
- B. Teaching employees to write secure code for applications
- C. Educating users to recognize and avoid security threats
- D. Certifying professionals for network administration roles

Answer: C

Q164. Which of the following best describes a 'white hat' hacker?

- A. A hacker who creates malware to disrupt critical services
- B. An ethical hacker who tests systems with proper authorization
- C. A malicious hacker who exploits systems for personal gain
- D. A hacker who sells stolen data on underground marketplaces

Answer: B

Q165. What does 'data breach' mean in cyber security?

- A. Authorized sharing of data between partner organizations
- B. Unauthorized access and disclosure of sensitive information
- C. Scheduled backup of organizational data to offsite storage
- D. Routine migration of data between different server systems

Answer: B

Q166. What is the function of encryption in cyber security?

- A. Deleting outdated files from the system permanently
- B. Compressing files to reduce overall storage capacity
- C. Converting data into unreadable format for protection
- D. Scanning networks to detect unauthorized intrusions

Answer: C

Q167. Which type of cyber attack tricks users into revealing sensitive information via fake emails?

- A. Sniffing
- B. Phishing
- C. Brute force
- D. Keylogging

Answer: B

Q168. What is the purpose of a security policy in an organization?

- A. Defining rules and procedures for protecting information assets
- B. Listing hardware specifications for all organizational devices
- C. Documenting employee performance reviews and evaluations
- D. Recording financial transactions and quarterly budget reports

Answer: A

Q169. Which of the following is NOT a pillar of the CIA triad?

- A. Confidentiality
- B. Integrity
- C. Availability
- D. Scalability

Answer: D

Q170. What does the term 'insider threat' refer to?

- A. A natural disaster affecting the data center infrastructure
- B. A hardware malfunction causing temporary system downtime
- C. A security threat originating from within the organization
- D. An external attacker probing the network from the internet

Answer: C

Q171. What is the purpose of access control in information security?

- A. Monitoring hardware temperature for system stability
- B. Compressing files to save disk storage space usage
- C. Restricting who can view or use resources in a system
- D. Speeding up data transfer across network connections

Answer: C

Q172. Which type of security control is a locked door to a server room?

- A. Logical
- B. Technical
- C. Administrative
- D. Physical

Answer: D

Q173. What does 'integrity' mean in the context of information security?

- A. Keeping sensitive information hidden from unauthorized people
- B. Providing fast network speeds for data transfer and access
- C. Making sure systems are always available to authorized users
- D. Ensuring data is accurate and has not been tampered with

Answer: D

Q174. What is a security baseline?

- A. A software tool for scanning networks against vulnerabilities
- B. A type of firewall used at the network perimeter gateway
- C. A minimum set of security standards for systems to meet
- D. The highest possible security level an organization uses

Answer: C

Q175. Which of the following is an example of a detective security control?

- A. Audit log
- B. Encryption
- C. Backup
- D. Firewall

Answer: A

Q176. What is the purpose of a password policy?

- A. Documenting disaster recovery procedures for data centers
- B. Defining rules for creating and managing strong passwords
- C. Specifying network bandwidth allocation per each department
- D. Listing all approved software applications for installation

Answer: B

Q177. What does 'availability' ensure in the CIA triad?

- A. Data is hidden from all external network users at all times
- B. Data cannot be modified by any internal user of the system
- C. Systems and data are accessible when needed by authorized users
- D. All network traffic is encrypted between source and destination

Answer: C

Q178. Which term describes the process of verifying a user's claimed identity?

- A. Encryption
- B. Accounting
- C. Authorization
- D. Authentication

Answer: D

Q179. What is social engineering in the context of security?

- A. Building secure social media platforms for enterprise users
- B. Creating automated social network bots for data collection
- C. Manipulating people into revealing confidential information
- D. Designing user-friendly interfaces for security applications

Answer: C

Q180. What is the primary function of a security patch?

- A. Upgrading hardware components for better system performance
- B. Adding new features and capabilities to existing software
- C. Fixing known security vulnerabilities in software or systems
- D. Migrating data from legacy storage to modern cloud services

Answer: C

Q181. What is plaintext in cryptography?

- A. A hash value generated from a digital signature
- B. Data that has been encrypted using a cipher algorithm
- C. A secret key used for decrypting encoded messages
- D. Original readable data before encryption is applied

Answer: D

Q182. Which type of cryptography uses the same key for encryption and decryption?

- A. Steganography
- B. Asymmetric
- C. Symmetric
- D. Hashing

Answer: C

Q183. What is the output of a hash function called?

- A. Digest
- B. Plaintext
- C. Token
- D. Ciphertext

Answer: A

Q184. Which algorithm is a widely used symmetric encryption standard?

- A. AES
- B. RSA
- C. ECC
- D. DSA

Answer: A

Q185. What is the primary purpose of a digital signature?

- A. Verifying the authenticity and integrity of a message
- B. Generating random encryption keys for secure sessions
- C. Compressing data to reduce network bandwidth consumption
- D. Encrypting the entire message content for confidentiality

Answer: A

Q186. What does RSA stand for in cryptography?

- A. Rivest-Shamir-Adleman
- B. Recursive Signing Architecture
- C. Random Security Algorithm
- D. Rapid Symmetric Authentication

Answer: A

Q187. What is a certificate authority (CA) responsible for?

- A. Monitoring network traffic for suspicious activity and intrusions
- B. Manufacturing hardware security modules for data center operations
- C. Issuing and managing digital certificates for secure communications
- D. Developing encryption algorithms for government security agencies

Answer: C

Q188. Which of the following is an asymmetric encryption algorithm?

- A. DES
- B. RSA
- C. RC4
- D. AES

Answer: B

Q189. What is the purpose of a cryptographic key?

- A. A software license required to install encryption applications
- B. A physical device used to unlock encrypted hardware storage units
- C. A parameter that determines the output of a cryptographic algorithm
- D. A network address assigned to encrypted communication channels

Answer: C

Q190. What property of hash functions means the output cannot be reversed to find the input?

- A. Key derivation
- B. Collision resistance
- C. One-way property
- D. Block chaining

Answer: C

Q191. What is the primary function of a network firewall?

- A. Managing user accounts across the enterprise network
- B. Storing backup copies of important network data files
- C. Increasing the overall speed of network connections
- D. Filtering traffic based on predefined security rules

Answer: D

Q192. What does a VPN provide for network communications?

- A. Load balancing across multiple server instances
- B. Faster download speeds for large file transfers
- C. Encrypted tunnel for secure data transmission
- D. Automatic virus scanning of all network traffic

Answer: C

Q193. What is a DMZ in network security?

- A. A protocol for encrypting database connections between application server nodes
- B. A tool for monitoring bandwidth usage across all organizational network links
- C. A network segment that separates internal networks from untrusted external networks
- D. A type of malware that spreads automatically across connected wireless networks

Answer: C

Q194. What does IDS stand for in network security?

- A. Intrusion Detection System
- B. Integrated Display Server
- C. Internet Data Service
- D. Internal Defense System

Answer: A

Q195. What is the purpose of network segmentation?

- A. Dividing a network into smaller segments to improve security and performance
- B. Removing all firewalls to simplify the overall network architecture
- C. Increasing the physical cable length between network connected devices
- D. Combining multiple small networks into one large unified network system

Answer: A

Q196. Which protocol provides secure web browsing by encrypting HTTP traffic?

- A. HTTPS
- B. SNMP
- C. FTP
- D. SMTP

Answer: A

Q197. What is a proxy server used for in network security?

- A. Acting as an intermediary between users and the internet for security
- B. Directly connecting users to the internet without any filtering
- C. Replacing the router as the main network traffic forwarding device
- D. Generating encryption keys for all network-connected user devices

Answer: A

Q198. What type of attack floods a server with traffic to make it unavailable?

- A. DoS attack
- B. SQL injection
- C. Spoofing
- D. Phishing

Answer: A

Q199. What does NAT stand for in networking?

- A. Network Address Translation
- B. Network Audit Technique
- C. Network Access Terminal
- D. Node Authentication Token

Answer: A

Q200. What is the purpose of an access control list (ACL) on a network device?

- A. Recording the browsing history of all network users for auditing
- B. Listing all devices currently connected to the network for inventory
- C. Managing software licenses for applications installed on the server
- D. Defining rules that permit or deny traffic based on specified criteria

Answer: D

Q201. What is the primary role of user account management in OS security?

- A. Managing the color scheme and desktop wallpaper preferences
- B. Controlling who can access the system and their permission levels
- C. Increasing the processing speed of all running applications
- D. Improving the graphical user interface design for better usability

Answer: B

Q202. What is the purpose of file permissions in an operating system?

- A. Organizing files alphabetically in directory listings
- B. Setting the default font size for text documents
- C. Controlling who can read, write, or execute a file
- D. Determining how fast files can be read from disk

Answer: C

Q203. What does the 'root' account represent in Linux operating systems?

- A. A standard user account for regular daily computing tasks
- B. A disabled account used only for emergency system recovery
- C. The superuser account with full administrative privileges
- D. A guest account with limited temporary access to the system

Answer: C

Q204. What is the purpose of operating system patching?

- A. Adding new entertainment features to the operating system
- B. Upgrading the hardware drivers for better graphics performance
- C. Changing the default language settings of the operating system
- D. Fixing security vulnerabilities and bugs in the OS software

Answer: D

Q205. What is a host-based firewall?

- A. A centralized network device protecting the entire corporate network
- B. A hardware appliance installed at the internet service provider
- C. A firewall installed on individual computers to control their traffic
- D. A cloud service that scans emails for malicious file attachments

Answer: C

Q206. What is the function of an OS audit log?

- A. Compressing old files to free up available disk storage space
- B. Speeding up the boot process by caching startup configurations
- C. Recording system events and user activities for security review
- D. Displaying real-time CPU usage statistics on the desktop screen

Answer: C

Q207. What is the purpose of disabling unnecessary services on a server?

- A. Improving the visual appearance of the server management console
- B. Increasing the amount of available RAM for user applications
- C. Reducing the attack surface by eliminating potential entry points
- D. Enabling faster network communication between all server nodes

Answer: C

Q208. What does UAC stand for in Windows security?

- A. Unified Audit Console
- B. Update Administration Center
- C. User Account Control
- D. Universal Access Code

Answer: C

Q209. What is the purpose of disk encryption on a laptop?

- A. Protecting data if the laptop is lost or stolen by making it unreadable
- B. Increasing the read and write speed of the hard drive significantly
- C. Preventing the laptop from connecting to unsecured wireless networks
- D. Reducing the storage capacity needed for files on the encrypted disk

Answer: A

Q210. What is a security hardening guide for an operating system?

- A. A document providing steps to secure an OS by reducing vulnerabilities
- B. A manual for repairing physical damage to computer hardware components
- C. A guide for increasing internet connection speeds through OS tweaks
- D. A tutorial for installing entertainment software on the operating system

Answer: A

Q211. What is cross-site scripting (XSS)?

- A. A protocol for sharing authentication tokens between different websites
- B. An attack that injects malicious scripts into web pages viewed by users
- C. A method for optimizing website loading speed across browsers
- D. A technique for cross-browser testing of web application functionality

Answer: B

Q212. What is SQL injection?

- A. A method of creating structured database tables and indexes
- B. An attack that inserts malicious SQL code into application queries
- C. A tool for migrating data between different database platforms
- D. A database optimization technique for faster query results

Answer: B

Q213. What does HTTPS provide that HTTP does not?

- A. Faster page loading speeds for all website resources
- B. Larger file upload limits for web form submissions
- C. Encrypted communication between browser and server
- D. Better search engine rankings for website content

Answer: C

Q214. What is a web application firewall (WAF)?

- A. A security tool that filters and monitors HTTP traffic to web applications
- B. A network switch that connects multiple web servers in a data center
- C. A device that increases the bandwidth available to web server connections
- D. A software program that designs web page layouts and visual templates

Answer: A

Q215. What is the purpose of input validation in web applications?

- A. Converting user input into different languages automatically
- B. Improving the visual appearance of input fields on web forms
- C. Ensuring user input meets expected formats before processing it
- D. Speeding up form submission by compressing input data first

Answer: C

Q216. What does CSRF stand for in web security?

- A. Cached Session Recovery Feature
- B. Cross-Site Request Forgery
- C. Central Server Response Filter
- D. Client-Side Resource Failure

Answer: B

Q217. What is the purpose of the same-origin policy in web browsers?

- A. Preventing web pages from making requests to different domains than their origin
- B. Ensuring all web pages load at the same speed regardless of server location
- C. Requiring all websites to use identical CSS stylesheets for consistent design
- D. Blocking users from opening multiple browser tabs at the same time period

Answer: A

Q218. What is a session token used for in web applications?

- A. Measuring the loading time of web pages for performance optimization
- B. Encrypting all data stored in the web application's backend database
- C. Generating random numbers for CAPTCHA verification on login forms
- D. Identifying and maintaining a user's authenticated session with the server

Answer: D

Q219. What is clickjacking?

- A. Tricking users into clicking hidden elements overlaid on legitimate web pages
- B. A technique for optimizing click-through rates on web advertisements
- C. Stealing user passwords by recording their keyboard strokes while typing
- D. A method of bypassing CAPTCHA challenges using automated mouse clicks

Answer: A

Q220. What is the OWASP Top 10?

- A. A ranking of the top ten fastest web servers available for commercial purchase
- B. A list of the ten most critical web application security risks updated regularly
- C. A collection of ten programming languages recommended for web development
- D. A standard defining ten required features for modern web browser software

Answer: B

Q221. What is a computer virus?

- A. A software tool used for optimizing computer system performance
- B. A program that replicates by attaching itself to other programs or files
- C. A hardware component that protects computers from power surges
- D. A network protocol designed for secure file transfer operations

Answer: B

Q222. What is ransomware?

- A. Malware that encrypts files and demands payment for decryption
- B. A tool that helps organize files into categorized folder systems
- C. A program that provides free access to premium software licenses
- D. Software that speeds up internet browsing on older computers

Answer: A

Q223. How does a worm differ from a virus?

- A. A worm only affects hardware while a virus only affects software
- B. A worm requires user interaction while a virus spreads automatically
- C. A worm spreads independently without needing to attach to host files
- D. A worm is harmless while a virus always causes system destruction

Answer: C

Q224. What is a Trojan horse in cyber security?

- A. A security tool that automatically detects and removes all known viruses
- B. Malware disguised as legitimate software to trick users into installing it
- C. An encryption method used to protect files during network transmission
- D. A firewall configuration that blocks all incoming network traffic completely

Answer: B

Q225. What is spyware designed to do?

- A. Improve computer performance by monitoring resource usage patterns
- B. Protect sensitive files by creating encrypted backup copies of data
- C. Secretly collect information about a user's activities without consent
- D. Block malicious websites from loading in the user's web browser

Answer: C

Q226. What is a botnet?

- A. A secure private network used by government agencies for communications
- B. A legitimate network of robots used in manufacturing and automation
- C. A network of compromised computers controlled remotely by an attacker
- D. A high-speed connection linking multiple data centers across regions

Answer: C

Q227. What is a keylogger?

- A. A device that locks the keyboard to prevent unauthorized system access
- B. A feature that creates keyboard shortcuts for frequently used programs
- C. A program that records every keystroke made by the user on a computer
- D. A tool that tests keyboard hardware for mechanical defects and issues

Answer: C

Q228. What is adware?

- A. A service that manages advertising campaigns across multiple platforms
- B. Software that displays unwanted advertisements on the user's device
- C. A program that blocks all advertisements while browsing the internet
- D. A tool used by marketers to create professional advertisement designs

Answer: B

Q229. What is a brute force attack?

- A. Exploiting software bugs to gain unauthorized access to a database
- B. Physically damaging computer hardware to disrupt system operations
- C. Trying every possible combination to guess a password or encryption key
- D. Flooding a network with traffic to deny service to legitimate users

Answer: C

Q230. What is a man-in-the-middle attack?

- A. A strategy for overwhelming servers with simultaneous connection requests
- B. A technique for bypassing firewalls by tunneling through allowed ports
- C. A method of hiding malware inside legitimate software update packages
- D. An attack where the attacker intercepts communication between two parties

Answer: D

Q231. What is multi-factor authentication (MFA)?

- A. Logging into multiple applications with a single set of credentials
- B. Creating multiple user accounts for the same person in a system
- C. Using two or more verification methods to confirm a user's identity
- D. Setting up multiple passwords for a single user account for safety

Answer: C

Q232. What is single sign-on (SSO)?

- A. A technique for creating unique passwords for every individual application
- B. A security measure requiring users to sign in separately to each application
- C. A method of encrypting passwords before storing them in the user database
- D. A system allowing users to access multiple applications with one login credential

Answer: D

Q233. What is a biometric authentication method?

- A. Creating long and complex passwords that are difficult for attackers to guess
- B. Using a physical security token device to generate one-time access codes
- C. Using physical characteristics like fingerprints or facial features to verify identity
- D. Sending a verification code to a registered phone number for confirmation

Answer: C

Q234. What is the purpose of account lockout policies?

- A. Preventing users from accessing their accounts outside of regular business hours
- B. Forcing users to change their passwords after every single successful login event
- C. Temporarily disabling accounts after multiple failed login attempts to stop attacks
- D. Permanently deleting user accounts that have been inactive for over twelve months

Answer: C

Q235. What are the three factors of authentication?

- A. First name, last name, and date of birth for verification
- B. Something you know, something you have, and something you are
- C. Email address, phone number, and physical mailing address
- D. Username, password, and security question answer combination

Answer: B

Q236. What is role-based access control (RBAC)?

- A. Giving every user in the organization identical access rights to all resources
- B. Restricting access based on the time of day the user attempts to log in
- C. Assigning permissions to users based on their organizational role or job function
- D. Allowing users to choose which resources they want to access independently

Answer: C

Q237. What is a one-time password (OTP)?

- A. A password that can be used unlimited times until the user changes it
- B. A default system password assigned to all new employee user accounts
- C. A permanent password set during initial account creation for the user
- D. A password that is valid for only one login session or transaction

Answer: D

Q238. What is the principle of least privilege in access control?

- A. Restricting access to systems only during designated working hours daily
- B. Requiring users to request permission for every individual file they access
- C. Granting users only the minimum access needed for their specific job duties
- D. Providing all users with administrator-level access for operational convenience

Answer: C

Q239. What is a CAPTCHA used for?

- A. Tracking user browsing behavior across different websites for analytics
- B. Measuring the loading speed of web pages for performance optimization
- C. Encrypting user passwords before storing them in the application database
- D. Distinguishing human users from automated bots during online interactions

Answer: D

Q240. What is an access control list (ACL)?

- A. A list defining which users or groups have permission to access specific resources
- B. A catalog of all software applications installed on the organizational network
- C. A record of all users who have ever logged into the system since installation
- D. A directory listing all hardware devices connected to the computer network

Answer: A

Q241. What is secure software development?

- A. Writing code that prioritizes speed over all other quality attributes
- B. Creating software that focuses exclusively on user interface design
- C. Building software with security integrated throughout the development lifecycle
- D. Developing software as quickly as possible without any testing phases

Answer: C

Q242. What is the purpose of code review in secure development?

- A. Measuring the execution speed of individual functions in code
- B. Formatting code to follow consistent visual styling conventions
- C. Translating code from one programming language to another one
- D. Examining code to find security flaws and bugs before deployment

Answer: D

Q243. What does SDLC stand for in software development?

- A. System Data Logging Control
- B. Software Development Life Cycle
- C. Secure Database Login Credentials
- D. Standard Digital Library Catalog

Answer: B

Q244. What is input sanitization in secure coding?

- A. Formatting input data to display it in a more readable user interface
- B. Cleaning user input to remove or escape potentially harmful characters
- C. Converting all input text to uppercase for consistent data storage
- D. Compressing input data to reduce the database storage requirements

Answer: B

Q245. What is the principle of 'secure by default' in software design?

- A. Software should allow all features by default for maximum user flexibility
- B. Software should disable all functionality until security is configured
- C. Software should require users to manually enable all security features
- D. Software should be configured with the most secure settings out of the box

Answer: D

Q246. What is a buffer overflow vulnerability?

- A. When a hard drive runs out of storage space preventing new files from being saved
- B. When a network connection transfers more data than the bandwidth can accommodate
- C. When a database table exceeds its maximum number of allowed records or entries
- D. When a program writes more data to a buffer than it can hold causing memory corruption

Answer: D

Q247. What is static application security testing (SAST)?

- A. Testing a running application by sending malicious requests to endpoints
- B. Monitoring application behavior in production for suspicious activity
- C. Analyzing source code without executing it to find security vulnerabilities
- D. Scanning network traffic for signs of application-level security attacks

Answer: C

Q248. Why should sensitive data like passwords never be stored in plain text?

- A. Because plain text passwords can be read directly if the database is compromised
- B. Because plain text passwords cannot be validated during the login process flow
- C. Because plain text takes up more storage space than encrypted text in databases
- D. Because plain text is incompatible with modern database management systems today

Answer: A

Q249. What is the purpose of error handling in secure coding?

- A. Displaying all error details to help users troubleshoot their problems
- B. Managing errors gracefully without revealing sensitive system information
- C. Ignoring errors so the application continues running without interruption
- D. Logging errors only to the browser console for developer convenience

Answer: B

Q250. What is the purpose of using version control in secure development?

- A. Compiling code into executable format for production server deployment
- B. Tracking code changes enabling rollback and audit trail of modifications
- C. Encrypting all source code files to prevent unauthorized code access
- D. Automatically fixing security vulnerabilities found in application code

Answer: B

Q251. What is the most secure wireless encryption protocol currently available?

- A. WPA
- B. WEP
- C. WPS
- D. WPA3

Answer: D

Q252. What is a rogue access point?

- A. A legitimate access point that has been configured with a strong password
- B. A backup access point that activates when the primary one stops working
- C. A guest network access point provided for visitors in a corporate office
- D. An unauthorized wireless access point connected to a network without approval

Answer: D

Q253. What is the purpose of a mobile device management (MDM) solution?

- A. Providing free mobile applications to all employees for personal usage
- B. Upgrading the hardware components inside company-issued mobile phones
- C. Increasing the battery life of mobile devices through power optimization
- D. Centrally managing and securing mobile devices used within an organization

Answer: D

Q254. What is Bluetooth security's main concern?

- A. Excessive battery drain caused by Bluetooth hardware power consumption
- B. Slow data transfer speeds compared to modern WiFi network connections
- C. Unauthorized pairing and data interception over short-range connections
- D. Incompatibility between different Bluetooth device manufacturers products

Answer: C

Q255. What is the risk of connecting to public WiFi networks?

- A. Attackers can intercept unencrypted data transmitted over the shared network
- B. Public WiFi networks require stronger passwords than private home networks
- C. Public WiFi networks always provide faster speeds than private connections
- D. Public WiFi automatically installs security software on connected devices

Answer: A

Q256. What does BYOD stand for in mobile security?

- A. Backup Your Online Data
- B. Build Your Own Database
- C. Bring Your Own Device
- D. Browse Your Own Domain

Answer: C

Q257. What is the purpose of remote wipe capability on mobile devices?

- A. Cleaning the device screen remotely using an automated cleaning mechanism
- B. Deleting old text messages to free up storage space on the mobile device
- C. Removing unused applications to improve the mobile device's performance
- D. Erasing all data on a lost or stolen device to prevent unauthorized access

Answer: D

Q258. What is an evil twin attack in wireless security?

- A. Connecting two identical routers to the same network causing IP address conflicts
- B. Creating a fake WiFi access point that mimics a legitimate one to steal data
- C. Sending duplicate data packets across a wireless network to cause congestion
- D. Installing two antivirus programs that conflict with each other on a device

Answer: B

Q259. What is the security risk of jailbreaking or rooting a mobile device?

- A. It enables the device to connect to more WiFi networks simultaneously
- B. It removes built-in security controls making the device vulnerable to malware
- C. It increases the device's processing speed by unlocking hidden CPU features
- D. It improves battery life by disabling unnecessary background system processes

Answer: B

Q260. What is the purpose of a VPN on a mobile device?

- A. Increasing mobile data speed by compressing all network traffic packets
- B. Encrypting network traffic to protect data when using untrusted networks
- C. Extending the WiFi range of the device to connect to distant networks
- D. Blocking all incoming phone calls from unknown or unregistered numbers

Answer: B

Q261. What is the shared responsibility model in cloud security?

- A. A model where the cloud provider handles all security with no customer involvement
- B. A model where the customer handles all security without any provider assistance
- C. A model where security responsibilities are split between the cloud provider and customer
- D. A model where third-party vendors manage all security for both provider and customer

Answer: C

Q262. What are the three main cloud service models?

- A. LAN, WAN, and MAN
- B. CPU, RAM, and SSD
- C. IaaS, PaaS, and SaaS
- D. HTTP, FTP, and SMTP

Answer: C

Q263. What is a cloud access security broker (CASB)?

- A. A person who negotiates cloud service contracts on behalf of organizations
- B. A network device that routes traffic between different cloud provider data centers
- C. A certification program for cloud security professionals in the IT industry
- D. A security tool that sits between users and cloud services to enforce policies

Answer: D

Q264. What is the risk of misconfigured cloud storage buckets?

- A. Data transfer speeds decrease significantly making applications unusable
- B. Sensitive data may be exposed publicly if access controls are not properly set
- C. Cloud storage costs increase dramatically due to inefficient configuration
- D. The cloud provider revokes the organization's account for policy violations

Answer: B

Q265. What is multi-tenancy in cloud computing?

- A. A customer maintaining separate accounts for each department within an organization
- B. Multiple customers sharing the same physical infrastructure in a cloud environment
- C. A single customer using multiple cloud providers simultaneously for redundancy
- D. Multiple data centers connected together to form one large computing cluster

Answer: B

Q266. What is the purpose of identity and access management (IAM) in cloud environments?

- A. Backing up all cloud data to local on-premises servers for redundancy
- B. Monitoring the physical security of data centers operated by cloud providers
- C. Optimizing the performance of applications running on cloud infrastructure
- D. Managing who can access cloud resources and what actions they can perform

Answer: D

Q267. What is data sovereignty in cloud computing?

- A. The cloud provider having complete ownership of all customer data stored
- B. Data being subject to the laws of the country where it is physically stored
- C. Users having the ability to access their data from any country worldwide
- D. Data being automatically encrypted by the cloud provider at all times

Answer: B

Q268. What is the purpose of encryption at rest in cloud storage?

- A. Reducing the overall cost of cloud storage by compressing encrypted data
- B. Speeding up data retrieval from cloud storage by compressing encrypted files
- C. Preventing cloud administrators from modifying data stored in the cloud
- D. Protecting stored data from unauthorized access even if storage is compromised

Answer: D

Q269. What is a virtual private cloud (VPC)?

- A. An isolated section of cloud infrastructure dedicated to a single customer
- B. A private data center that does not connect to any public cloud service
- C. A cloud-based VPN service for encrypting all internet traffic globally
- D. A virtual machine running antivirus software in the cloud environment

Answer: A

Q270. What is shadow IT in the context of cloud security?

- A. Employees using unauthorized cloud services without IT department approval
- B. IT staff working remotely from home offices instead of the corporate campus
- C. Cloud services that operate only during nighttime hours for cost savings
- D. Backup cloud infrastructure that remains inactive until primary systems fail

Answer: A

Q271. What is digital forensics?

- A. The technique of building databases for storing criminal record information
- B. The process of collecting and analyzing digital evidence from electronic devices
- C. The method of encrypting court documents for secure legal proceedings
- D. The practice of designing user interfaces for law enforcement applications

Answer: B

Q272. Why is preserving the chain of custody important in digital forensics?

- A. It ensures evidence integrity and admissibility in legal proceedings
- B. It speeds up the analysis process by organizing evidence chronologically
- C. It prevents investigators from accessing evidence until trial begins
- D. It reduces the cost of forensic investigations by limiting evidence scope

Answer: A

Q273. What is a forensic image of a hard drive?

- A. A compressed backup of only the active files on the hard drive
- B. A log file recording all read and write operations on the drive
- C. A bit-for-bit exact copy of the entire drive including deleted data
- D. A photograph taken of the physical hard drive for documentation

Answer: C

Q274. What is a write blocker used for in digital forensics?

- A. Limiting the number of files that can be saved on a USB drive
- B. Stopping malware from writing malicious files to the hard drive
- C. Preventing any modification to evidence media during examination
- D. Blocking users from writing documents on shared network drives

Answer: C

Q275. What type of evidence can be found in computer RAM?

- A. Permanent files that remain stored even after the computer is completely shut down
- B. Hardware serial numbers and manufacturer information for all installed components
- C. Running processes, encryption keys, and temporary data that disappears when powered off
- D. Operating system installation files that are needed only during the initial setup

Answer: C

Q276. What is the purpose of hashing in digital forensics?

- A. Compressing evidence data to save storage space on forensic servers
- B. Verifying that evidence has not been altered by comparing hash values
- C. Converting binary evidence data into human-readable text documents
- D. Encrypting evidence files to prevent unauthorized access by others

Answer: B

Q277. What is volatile data in forensic investigations?

- A. Data that is stored in cloud services and accessible from anywhere
- B. Data that is lost when a device is powered off such as RAM contents
- C. Data that is permanently stored on hard drives and never changes
- D. Data that is encrypted and cannot be accessed without proper keys

Answer: B

Q278. What are log files used for in forensic analysis?

- A. Managing software licenses for forensic tools used during analysis
- B. Storing user passwords in an encrypted format for secure retrieval
- C. Recording system events that help reconstruct activities and timelines
- D. Tracking the physical location of all devices on the network map

Answer: C

Q279. What is metadata in the context of digital evidence?

- A. Encrypted data that requires a special key to read and understand
- B. Data about data, such as file creation dates, authors, and modification times
- C. Backup copies of files stored on a separate external storage device
- D. The main content of a document file like the text or images within it

Answer: B

Q280. What is the first step a forensic investigator should take at a crime scene?

- A. Immediately turning off all computers to preserve the current state
- B. Securing the scene and documenting the state of all devices present
- C. Deleting unnecessary files to focus the investigation on key evidence
- D. Connecting all devices to the internet for remote forensic analysis

Answer: B

Q281. What is an incident response plan?

- A. A training syllabus for teaching new employees about organizational policies at work
- B. A schedule for performing regular system maintenance and software update installations
- C. A financial plan for budgeting cyber security spending across all fiscal year quarters
- D. A documented strategy for detecting, responding to, and recovering from security incidents

Answer: D

Q282. What is the first phase of the incident response lifecycle according to NIST?

- A. Preparation
- B. Eradication
- C. Containment
- D. Recovery

Answer: A

Q283. What is the purpose of incident containment?

- A. Shutting down the entire organization's network permanently until the threat is gone
- B. Deleting all data on affected systems to remove any traces of the attack completely
- C. Limiting the spread and impact of a security incident to prevent further damage
- D. Notifying the media about the security incident for public awareness and transparency

Answer: C

Q284. What is a CSIRT?

- A. Central Server Infrastructure Review Tool
- B. Cyber Security Integration and Reporting Technology
- C. Computer Security Incident Response Team
- D. Cloud Service Infrastructure Recovery Technique

Answer: C

Q285. What is the purpose of a lessons learned review after an incident?

- A. Assigning blame to the individuals who caused or failed to prevent the incident
- B. Deleting all records of the incident to protect the organization's public reputation
- C. Calculating the exact financial bonus for team members who resolved the incident
- D. Identifying improvements to prevent similar incidents and enhance response processes

Answer: D

Q286. What is the difference between an event and an incident in cyber security?

- A. An event is always malicious while an incident is always a harmless system occurrence
- B. An event is any observable occurrence while an incident is an event that harms security
- C. An event requires investigation while an incident is resolved automatically by tools
- D. An event only happens on servers while an incident only happens on user workstations

Answer: B

Q287. What is the role of incident triage?

- A. Automatically resolving all incidents using predefined scripts without human input
- B. Prioritizing incidents based on severity and impact to allocate resources effectively
- C. Forwarding all incidents to external law enforcement for criminal investigation
- D. Permanently closing all incident tickets without any investigation or resolution

Answer: B

Q288. What is eradication in incident response?

- A. Notifying affected users about the incident and providing credit monitoring services
- B. Removing the root cause of the incident and any attacker artifacts from systems
- C. Documenting the incident for future reference and compliance reporting purposes
- D. Restoring systems to normal operation after the threat has been fully eliminated

Answer: B

Q289. What is the purpose of an incident response communication plan?

- A. Scheduling regular team meetings for discussing non-security project deliverables
- B. Creating social media posts about the organization's daily business operations
- C. Marketing the organization's security capabilities to attract potential customers
- D. Defining who to notify, when, and how during a security incident for coordination

Answer: D

Q290. What is the recovery phase in incident response?

- A. Documenting all evidence collected during the investigation for legal review
- B. Identifying the initial attack vector used by the threat actor to gain access
- C. Purchasing new hardware to replace all systems affected by the security breach
- D. Restoring affected systems to normal operation and verifying they are secure

Answer: D

Q291. What is a SIEM system?

- A. A tool that collects and analyzes security event data from across the network
- B. A protocol for encrypting email communications between users securely
- C. A physical device that blocks malware at the network perimeter gateway
- D. A type of firewall specifically designed for protecting cloud environments

Answer: A

Q292. What is the purpose of security log monitoring?

- A. Deleting old log files to free up storage space on the server hard drives
- B. Converting log files into PDF documents for printing and physical archival
- C. Detecting suspicious activities and security incidents by reviewing system logs
- D. Creating backup copies of log files for disaster recovery planning purposes

Answer: C

Q293. What is a security alert?

- A. A notification generated when a monitoring system detects potentially suspicious activity
- B. A marketing email from a security vendor promoting their latest product features
- C. A scheduled reminder for IT staff to change their passwords at regular intervals
- D. A system notification about available software updates that need to be installed

Answer: A

Q294. What is a false positive in security monitoring?

- A. A system error that prevents the monitoring tool from generating any alerts
- B. A genuine security incident that was correctly detected by the monitoring system
- C. An alert triggered by normal activity that is incorrectly identified as malicious
- D. A disabled alert rule that no longer triggers on any type of security event

Answer: C

Q295. What is network traffic analysis used for in security?

- A. Testing network cable quality to ensure reliable physical connections work
- B. Monitoring network communications to identify anomalies and potential threats
- C. Designing new network architectures for improved organizational connectivity
- D. Increasing network bandwidth by optimizing data packet routing efficiency

Answer: B

Q296. What is endpoint detection and response (EDR)?

- A. A process for repairing damaged endpoint hardware components like keyboards and screens
- B. A method for deploying software updates to all endpoint devices simultaneously
- C. A system for tracking the physical location of all laptop devices issued to employees
- D. A security tool that monitors endpoints for threats and provides investigation capabilities

Answer: D

Q297. What is log aggregation?

- A. Distributing log data across multiple servers for redundant backup storage
- B. Converting log files from text format to binary format for faster reading
- C. Deleting duplicate log entries to reduce the overall volume of stored data
- D. Collecting logs from multiple sources into a centralized location for analysis

Answer: D

Q298. What is a security dashboard?

- A. A physical panel of buttons used to arm and disarm building security alarms
- B. A software application for managing employee access badges and ID cards
- C. A visual display showing security metrics, alerts, and system status in real time
- D. A printed report summarizing monthly security statistics for executive review

Answer: C

Q299. What is vulnerability scanning?

- A. Testing network cable connections for signal quality and potential interference issues
- B. Automated scanning of systems to identify known security weaknesses and misconfigurations
- C. Physically inspecting server hardware for signs of tampering or unauthorized modifications
- D. Manually reviewing source code to find programming errors and logic flaws in software

Answer: B

Q300. What is the purpose of a security operations center (SOC)?

- A. Providing technical support to employees experiencing computer problems
- B. Developing new software applications for the organization's customers
- C. Managing the physical security of the building including locks and guards
- D. Centrally monitoring and responding to security events across the organization

Answer: D

Q301. What is the primary purpose of data protection laws?

- A. Setting minimum salary requirements for IT professionals in organizations
- B. Increasing internet speeds for all citizens within a country's borders
- C. Regulating the manufacturing standards for computer hardware products
- D. Protecting individuals' personal data from misuse and unauthorized processing

Answer: D

Q302. What does GDPR stand for?

- A. General Digital Privacy Regulation
- B. Global Digital Privacy Requirement
- C. General Data Protection Regulation
- D. Government Data Processing Rules

Answer: C

Q303. What is intellectual property in the context of cyber law?

- A. Employee skills and knowledge that are gained through professional training programs
- B. Network bandwidth that is allocated to a specific organization by an internet provider
- C. Physical computer hardware that is owned by an organization and stored in data centers
- D. Creations of the mind like inventions, designs, and software that are legally protected

Answer: D

Q304. What is the purpose of a privacy policy on a website?

- A. Displaying advertisements that are relevant to the user's browsing history
- B. Informing users how their personal data is collected, used, and protected
- C. Preventing users from accessing certain pages on the website based on age
- D. Encrypting all data transmitted between the user's browser and the server

Answer: B

Q305. What is ethical hacking?

- A. Hacking into systems without permission to demonstrate security weaknesses publicly
- B. Using social engineering to test employee awareness without organizational approval
- C. Creating malware for research purposes without deploying it in real environments
- D. Authorized testing of systems to find vulnerabilities before malicious hackers exploit them

Answer: D

Q306. What is a non-disclosure agreement (NDA) used for in cyber security?

- A. Allowing employees to share company secrets with competitors for personal benefit
- B. Disclosing all security vulnerabilities publicly to raise awareness about threats
- C. Legally binding parties to keep shared confidential information private and secure
- D. Granting customers full access to the organization's proprietary source code

Answer: C

Q307. What does the term 'compliance' mean in cyber security?

- A. Completing all security training courses within the required time period
- B. Competing with other organizations to achieve the highest security ratings
- C. Following established laws, regulations, and standards for information security
- D. Purchasing the most expensive security tools available on the market today

Answer: C

Q308. What is responsible disclosure in cyber security?

- A. Publishing all discovered vulnerabilities immediately on social media platforms
- B. Ignoring discovered vulnerabilities to avoid any potential legal consequences
- C. Selling vulnerability information to the highest bidder on dark web forums
- D. Reporting vulnerabilities to the vendor privately before making them public

Answer: D

Q309. What is the purpose of cyber crime laws?

- A. Providing free internet access to all citizens as a fundamental digital right
- B. Defining illegal cyber activities and establishing penalties for those who commit them
- C. Mandating that all organizations must use open-source software exclusively
- D. Regulating the prices of cyber security software products sold in the market

Answer: B

Q310. What is digital consent in data privacy?

- A. Allowing any organization to access user data without requiring authorization
- B. Obtaining user permission before collecting and processing their personal data
- C. Storing user data indefinitely regardless of whether consent was ever provided
- D. Automatically collecting user data without informing them about the practice

Answer: B

Q311. What is the Internet of Things (IoT) in cyber security?

- A. A cloud storage service that allows unlimited data storage for connected devices
- B. A security protocol designed to protect web browsers from malicious website content
- C. A new type of internet connection that is faster than traditional broadband service
- D. Network of connected devices that collect and exchange data creating security challenges

Answer: D

Q312. What is artificial intelligence's role in cyber security?

- A. Enhancing threat detection, automating responses, and analyzing large security datasets
- B. Replacing all human security professionals with fully autonomous robot defenders
- C. Creating new types of encryption that are impossible to break by any method
- D. Eliminating all cyber threats permanently through advanced predictive algorithms

Answer: A

Q313. What is blockchain technology's relevance to cyber security?

- A. Eliminating the need for encryption because blockchain is inherently secure
- B. Providing tamper-resistant record-keeping and decentralized trust mechanisms
- C. Replacing all existing databases with faster and cheaper storage solutions
- D. Creating untraceable communications that cannot be monitored by anyone

Answer: B

Q314. What is quantum computing's potential impact on cyber security?

- A. Eliminating all cyber threats because quantum computers cannot be compromised
- B. Making all existing security tools obsolete and completely useless immediately
- C. Threatening current encryption methods by potentially breaking widely used algorithms
- D. Having no impact on cyber security because quantum computing is only theoretical

Answer: C

Q315. What is zero trust architecture?

- A. A network design that eliminates all firewalls to simplify security management
- B. A security model that trusts no one by default and verifies every access request
- C. A framework that trusts all internal users and only verifies external connections
- D. A policy requiring zero passwords for user authentication across all systems

Answer: B

Q316. What is DevSecOps?

- A. Integrating security practices into the DevOps software development pipeline
- B. A cloud service that automatically secures deployed applications and databases
- C. A specialized operating system designed for security-focused development work
- D. A certification for developers who specialize in building secure applications

Answer: A

Q317. What is ransomware-as-a-service (RaaS)?

- A. A legitimate cloud service that helps organizations recover from ransomware attacks
- B. A government program providing free ransomware decryption tools to affected organizations
- C. A business model where ransomware developers sell or lease their tools to other criminals
- D. A cybersecurity insurance product that covers ransomware payment costs for businesses

Answer: C

Q318. What is edge computing and its security implications?

- A. A computing approach that only works with wired connections and cannot use wireless links
- B. A method of strengthening network perimeter defenses at the edge of the corporate network
- C. A technique for storing backup data at the geographical edges of a country's territory
- D. Processing data closer to where it is generated, creating new distributed security challenges

Answer: D

Q319. What is a deepfake?

- A. A backup copy of data that is stored in a deeply encrypted format for maximum security
- B. A social media account that pretends to be a real person for legitimate marketing goals
- C. A type of encryption that creates fake data to confuse attackers during a breach event
- D. AI-generated synthetic media that can convincingly impersonate real people in video or audio

Answer: D

Q320. What is cyber resilience?

- A. The speed at which an internet connection recovers after a temporary service outage
- B. The physical durability of computer hardware against environmental damage threats
- C. A software feature that automatically restarts applications after an unexpected crash
- D. An organization's ability to prepare for, respond to, and recover from cyber incidents

Answer: D

Q321. What does the term 'cyber hygiene' refer to?

- A. Cleaning computer hardware regularly
- B. Routine practices to maintain system health and security
- C. Installing only free software
- D. Using the internet only during business hours

Answer: B

Q322. Which of the following is an example of a cyber attack?

- A. Backing up files to a cloud server
- B. Sending an encrypted email
- C. Deploying ransomware on a network
- D. Installing a security patch

Answer: C

Q323. What is the primary goal of information security?

- A. Making systems run faster
- B. Protecting information from unauthorized access, use, or destruction
- C. Reducing hardware costs
- D. Increasing internet bandwidth

Answer: B

Q324. What does the term 'exploit' mean in cyber security?

- A. A security certification program
- B. A piece of software or technique that takes advantage of a vulnerability
- C. A type of antivirus software
- D. A network monitoring tool

Answer: B

Q325. Which professional is responsible for protecting an organization's computer systems?

- A. Database administrator
- B. Cyber security analyst
- C. Graphic designer
- D. Help desk technician

Answer: B

Q326. What is a 'patch' in the context of cyber security?

- A. A physical repair to damaged hardware
- B. A software update that fixes security vulnerabilities
- C. A type of network cable
- D. A backup storage device

Answer: B

Q327. What does 'authentication' verify in cyber security?

- A. The speed of a network connection
- B. The identity of a user or system
- C. The size of a file
- D. The cost of a software license

Answer: B

Q328. Which of the following is a common indicator of a phishing email?

- A. The email comes from a known colleague
- B. The email has a professional signature
- C. The email contains urgent language and suspicious links
- D. The email is about a scheduled meeting

Answer: C

Q329. What is a 'risk' in cyber security?

- A. Any computer connected to the internet
- B. The potential for loss or damage when a threat exploits a vulnerability
- C. A type of encryption algorithm
- D. A network protocol

Answer: B

Q330. What is the purpose of a security awareness program?

- A. To train employees on recognizing and responding to security threats
- B. To install firewalls on every computer
- C. To replace antivirus software
- D. To encrypt all company emails automatically

Answer: A

Q331. What is a security incident?

- A. A scheduled system update
- B. An event that threatens the confidentiality, integrity, or availability of information
- C. A routine password change
- D. A planned network maintenance window

Answer: B

Q332. What is the purpose of a firewall in network security?

- A. To increase internet speed
- B. To monitor and control incoming and outgoing network traffic based on security rules
- C. To store backup files
- D. To manage email accounts

Answer: B

Q333. What is the difference between a threat and a vulnerability?

- A. They are the same thing
- B. A threat is a potential danger while a vulnerability is a weakness that can be exploited
- C. A vulnerability is more dangerous than a threat
- D. Threats only exist online while vulnerabilities are physical

Answer: B

Q334. What does 'non-repudiation' ensure in information security?

- A. That data is always available
- B. That a user cannot deny having performed a specific action
- C. That passwords are never reused
- D. That firewalls block all traffic

Answer: B

Q335. What is a security policy?

- A. A type of antivirus software
- B. A document that outlines an organization's rules and procedures for protecting information
- C. A hardware device for encrypting files
- D. A programming language for security tools

Answer: B

Q336. Which of the following is a preventive security control?

- A. Security camera
- B. Intrusion detection system
- C. Access control lock on a door
- D. Audit log review

Answer: C

Q337. What is data classification in information security?

- A. Sorting data alphabetically
- B. Categorizing data based on its sensitivity level to apply appropriate protection
- C. Deleting old data from servers
- D. Compressing data to save storage space

Answer: B

Q338. What does the term 'least privilege' mean in security?

- A. Giving all users administrator access
- B. Granting users only the minimum access necessary to perform their job functions
- C. Removing all access permissions from users
- D. Using the cheapest security software available

Answer: B

Q339. What is two-factor authentication (2FA)?

- A. Using two different passwords
- B. A security method requiring two different types of verification to prove identity
- C. Logging in from two different devices
- D. Having two user accounts

Answer: B

Q340. What is the purpose of an acceptable use policy (AUP)?

- A. To define how employees may use organizational IT resources
- B. To list all software installed on company computers
- C. To track employee internet browsing history
- D. To set pricing for IT services

Answer: A

Q341. What is the difference between encryption and hashing?

- A. They are the same process
- B. Encryption is reversible with a key while hashing is a one-way process
- C. Hashing is always faster than encryption
- D. Encryption does not use keys

Answer: B

Q342. What is a private key in asymmetric cryptography?

- A. A key shared with everyone publicly
- B. A key kept secret by the owner and used for decryption or signing
- C. A key used only for hashing
- D. A password used to log into websites

Answer: B

Q343. What is the purpose of SSL/TLS in web communications?

- A. To speed up website loading times
- B. To encrypt communications between a web browser and web server
- C. To compress images on websites
- D. To block advertisements on web pages

Answer: B

Q344. Which of the following is an example of a hash algorithm?

- A. AES
- B. RSA
- C. SHA-256
- D. Diffie-Hellman

Answer: C

Q345. What does 'key length' refer to in cryptography?

- A. The physical length of a USB security key
- B. The number of bits in a cryptographic key, which affects encryption strength
- C. The number of characters in a password
- D. The duration a key remains valid

Answer: B

Q346. What is a digital certificate used for?

- A. To store encrypted files permanently
- B. To verify the identity of a website or entity and bind a public key to that identity
- C. To block malware from downloading
- D. To increase internet connection speed

Answer: B

Q347. What does symmetric encryption mean?

- A. Different keys are used for encryption and decryption
- B. The same key is used for both encryption and decryption
- C. No key is needed for encryption
- D. Only the sender needs a key

Answer: B

Q348. What is a cryptographic protocol?

- A. A type of computer virus
- B. A set of rules that governs how cryptographic operations are performed in communications
- C. A hardware device for encryption
- D. A programming language for writing security software

Answer: B

Q349. Why should encryption keys be kept secret?

- A. Because keys are expensive to generate
- B. Because anyone with the key can decrypt the protected data
- C. Because keys expire after one use
- D. Because keys take up storage space

Answer: B

Q350. What is end-to-end encryption?

- A. Encrypting only the first and last packets of a transmission
- B. Encrypting data at the sender's end so that only the intended recipient can decrypt it
- C. Encrypting data only when stored on a server
- D. Using two firewalls at each end of a network

Answer: B

Q351. What is an IP address used for in networking?

- A. To encrypt data on a network
- B. To uniquely identify a device on a network
- C. To increase network speed
- D. To store files on a server

Answer: B

Q352. What is a router's role in network security?

- A. It only provides wireless internet access
- B. It directs network traffic between networks and can enforce security policies through access control lists
- C. It stores all network passwords
- D. It replaces the need for firewalls

Answer: B

Q353. What is the purpose of network address translation (NAT) in security?

- A. To speed up internet connections significantly
- B. To hide internal IP addresses from external networks
- C. To encrypt all outgoing network packets
- D. To replace the need for antivirus software

Answer: B

Q354. What does the term 'bandwidth' refer to in networking?

- A. The physical width of a network cable
- B. The maximum amount of data that can be transmitted over a network connection in a given time
- C. The number of computers on a network
- D. The strength of a WiFi signal

Answer: B

Q355. What is the purpose of a network switch in a local area network?

- A. To connect a network to the internet
- B. To connect multiple devices within a network and forward data to the correct destination device
- C. To encrypt all network traffic
- D. To scan for viruses on the network

Answer: B

Q356. What is network monitoring used for?

- A. To increase the speed of all network connections
- B. To observe and analyze network traffic for performance issues and security threats
- C. To replace all security controls
- D. To generate encryption keys

Answer: B

Q357. What does DNS stand for and what is its primary function?

- A. Data Network Storage; stores files on a network
- B. Domain Name System; translates domain names into IP addresses
- C. Digital Network Security; encrypts network traffic
- D. Direct Network Service; manages network connections

Answer: B

Q358. What is a network protocol?

- A. A hardware device used to connect networks
- B. A set of rules governing how data is transmitted and received over a network
- C. A type of network cable
- D. A software program for browsing the internet

Answer: B

Q359. What is the function of an Intrusion Prevention System (IPS)?

- A. To provide wireless internet access
- B. To detect and actively block malicious network traffic in real time
- C. To create backups of network data
- D. To assign IP addresses to devices

Answer: B

Q360. What is a VLAN used for in network security?

- A. To increase the physical range of a WiFi network
- B. To logically segment a network into separate broadcast domains for improved security and management
- C. To encrypt all data on the network
- D. To replace physical firewalls

Answer: B

Q361. What is a one-time pad in cryptography?

- A. A cipher that uses a random key as long as the message and is used only once
- B. A reusable encryption key for multiple messages
- C. A type of hash function
- D. A digital certificate format

Answer: A

Q362. Which type of encryption is faster for large amounts of data: symmetric or asymmetric?

- A. Asymmetric encryption
- B. Both are equally fast
- C. Neither can handle large data
- D. Symmetric encryption

Answer: D

Q363. What does the term 'key pair' refer to in asymmetric cryptography?

- A. Two identical keys used for encryption
- B. A public key and a corresponding private key
- C. Two symmetric keys shared between parties
- D. A key and its backup copy

Answer: B

Q364. What is the purpose of Base64 encoding?

- A. To encrypt data securely
- B. To compress data for storage
- C. To represent binary data in an ASCII string format
- D. To generate cryptographic hashes

Answer: C

Q365. What does the acronym AES stand for?

- A. Asymmetric Encryption System
- B. Advanced Encryption Standard
- C. Automated Encoding Scheme
- D. Applied Encryption Software

Answer: B

Q366. What is a cryptographic hash collision?

- A. When two different inputs produce the same hash output
- B. When a hash function fails to produce output
- C. When encryption and decryption keys match
- D. When two users share the same password

Answer: A

Q367. What is the role of a random number generator in cryptography?

- A. To create user passwords automatically
- B. To generate unpredictable values for keys, nonces, and IVs
- C. To speed up encryption algorithms
- D. To compress data before encryption

Answer: B

Q368. What is the difference between encoding and encryption?

- A. They are the same thing
- B. Encoding transforms data for usability while encryption transforms data for confidentiality
- C. Encoding is more secure than encryption
- D. Encryption is faster than encoding

Answer: B

Q369. Which of the following is NOT a symmetric encryption algorithm?

- A. AES
- B. DES
- C. Blowfish
- D. RSA

Answer: D

Q370. What is a digital envelope in cryptography?

- A. A physical container for cryptographic keys
- B. A method combining symmetric and asymmetric encryption to securely transmit data
- C. A type of email encryption only
- D. A digital signature format

Answer: B

Q371. What is the purpose of a firewall built into an operating system?

- A. To speed up internet connections
- B. To filter incoming and outgoing network traffic based on security rules
- C. To defragment the hard drive
- D. To manage user passwords

Answer: B

Q372. What is the principle of least privilege in operating system security?

- A. Giving all users administrator access
- B. Users and programs should only have the minimum permissions needed to perform their tasks
- C. Disabling all user accounts except root
- D. Removing all security software

Answer: B

Q373. What is a software update in the context of OS security?

- A. A new version of a video game
- B. A patch or fix released to address security vulnerabilities or bugs in the OS
- C. A change to the desktop wallpaper
- D. An increase in storage capacity

Answer: B

Q374. What does antivirus software do on an operating system?

- A. Increases internet speed
- B. Detects, prevents, and removes malicious software
- C. Manages file storage
- D. Creates system backups

Answer: B

Q375. Why should users avoid running programs as administrator unnecessarily?

- A. It makes the computer slower
- B. Programs running with admin privileges can make system-wide changes that could be harmful if compromised
- C. Admin accounts have fewer features
- D. There is no reason to avoid it

Answer: B

Q376. What is a strong password policy for OS user accounts?

- A. Using the word 'password' for all accounts
- B. Requiring passwords with minimum length, complexity, and regular changes
- C. Allowing blank passwords for convenience
- D. Using the same password for all accounts

Answer: B

Q377. What is a boot password in OS security?

- A. A password required before the operating system loads
- B. The default password for all applications
- C. A password used only for email
- D. A password for internet browsing

Answer: A

Q378. What happens when automatic updates are disabled on an OS?

- A. The system becomes faster
- B. The system may miss critical security patches and remain vulnerable to known threats
- C. Nothing changes
- D. The system automatically becomes more secure

Answer: B

Q379. What is a guest account on an operating system?

- A. The main administrator account
- B. A limited-privilege account for temporary users with restricted access
- C. An account with full system permissions
- D. A hidden account used by hackers

Answer: B

Q380. Why is it important to lock your computer screen when stepping away?

- A. To save electricity only
- B. To prevent unauthorized physical access to your active session and data
- C. It is not important
- D. To improve display quality

Answer: B

Q381. What is a web browser's address bar padlock icon used to indicate?

- A. The website is free of malware
- B. The connection to the website is encrypted using HTTPS
- C. The website content is verified as accurate
- D. The website loads faster than others

Answer: B

Q382. What is the purpose of the robots.txt file on a website?

- A. To block all hackers from accessing the site
- B. To instruct search engine crawlers which parts of the site to avoid indexing
- C. To encrypt website data
- D. To manage user passwords

Answer: B

Q383. What is a URL redirect vulnerability?

- A. When a website loads too slowly
- B. When a website redirects users to a malicious site using unvalidated redirect parameters
- C. When a website's URL is too long
- D. When a website changes its domain name

Answer: B

Q384. Why should sensitive forms on websites use POST requests instead of GET?

- A. POST requests are faster
- B. GET requests include data in the URL which can be cached, logged, and visible in browser history
- C. POST requests do not require a server
- D. GET requests cannot carry data

Answer: B

Q385. What is the purpose of rate limiting on a web application?

- A. To make the website faster
- B. To restrict the number of requests a user can make in a given time period to prevent abuse
- C. To increase server storage
- D. To improve website appearance

Answer: B

Q386. What is a Content Delivery Network (CDN) and does it improve security?

- A. A type of encryption algorithm
- B. A distributed network of servers that can improve performance and provide basic DDoS protection
- C. A database management system
- D. A web programming language

Answer: B

Q387. What is an HTTP cookie used for in web applications?

- A. To encrypt web pages
- B. To store small pieces of data on the client's browser for session management, preferences, and tracking
- C. To speed up DNS resolution
- D. To compress web traffic

Answer: B

Q388. What is cross-origin resource sharing (CORS)?

- A. A type of web attack
- B. A mechanism that allows web pages to request resources from a different domain than the one that served the page
- C. A database query language
- D. A server-side scripting language

Answer: B

Q389. Why is it important to use prepared statements when interacting with databases in web applications?

- A. They make queries run faster
- B. They prevent SQL injection by separating SQL code from user data
- C. They reduce database storage usage
- D. They are required by all programming languages

Answer: B

Q390. What does the HttpOnly flag on a cookie do?

- A. Makes the cookie work only over HTTP, not HTTPS
- B. Prevents the cookie from being accessed by client-side JavaScript
- C. Encrypts the cookie value
- D. Deletes the cookie after the browser closes

Answer: B

Q391. What is a password manager and why should you use one?

- A. A tool that remembers only one password
- B. A tool that generates and securely stores unique complex passwords for all your accounts
- C. A tool that removes password requirements
- D. A tool that shares passwords with others

Answer: B

Q392. What does 'something you know' refer to as an authentication factor?

- A. A fingerprint scan
- B. A smart card
- C. Knowledge-based credentials such as a password, PIN, or security question answer
- D. A one-time code from an app

Answer: C

Q393. What is the difference between a PIN and a password?

- A. There is no difference
- B. A PIN is typically a short numeric code while a password is usually longer and can contain letters, numbers, and symbols
- C. A PIN is more secure than a password
- D. A password can only contain numbers

Answer: B

Q394. What is session timeout and why is it important for security?

- A. When a website permanently deletes your account
- B. Automatically ending a user's session after a period of inactivity to prevent unauthorized access
- C. When the server crashes from too many users
- D. When your internet connection drops

Answer: B

Q395. What is two-step verification?

- A. Creating two separate accounts
- B. An authentication process that requires two separate verification steps, typically a password and a code sent to your device
- C. Logging in twice with the same password
- D. Using two different browsers

Answer: B

Q396. What is the purpose of a security question during account recovery?

- A. To make the login process slower
- B. To verify identity by asking a question that only the legitimate account owner should be able to answer
- C. To test the user's general knowledge
- D. To encrypt the user's data

Answer: B

Q397. What is the difference between logging in and logging out?

- A. They are the same action
- B. Logging in authenticates a user and creates a session; logging out ends the session and revokes access
- C. Logging out gives more access than logging in
- D. Only administrators can log out

Answer: B

Q398. Why should you not share your passwords with others?

- A. Shared passwords use more server resources
- B. Sharing passwords means others can access your accounts, and you lose control over who does what with your credentials
- C. Passwords stop working when shared
- D. It is only a recommendation, not important

Answer: B

Q399. What is a brute-force attack on a login page?

- A. A physical attack on the server
- B. An automated attack that systematically tries all possible password combinations until the correct one is found
- C. Refreshing the login page repeatedly
- D. Typing the password very quickly

Answer: B

Q400. What is an authenticator app used for?

- A. To browse the web securely
- B. To generate time-based one-time passwords (TOTP) for two-factor authentication
- C. To manage email accounts
- D. To encrypt files on your phone

Answer: B

Q401. What is a code vulnerability?

- A. A feature that makes code run faster
- B. A weakness or flaw in software code that could be exploited by an attacker
- C. A type of programming language
- D. A software license agreement

Answer: B

Q402. Why should developers avoid hardcoding secrets like API keys in source code?

- A. Hardcoded keys make the code too long
- B. Hardcoded secrets can be exposed in version control systems, making them accessible to anyone with code access
- C. Hardcoded keys improve performance
- D. There is no reason to avoid it

Answer: B

Q403. What is the purpose of logging in application development?

- A. To slow down the application
- B. To record events, errors, and user activities for debugging, monitoring, and security auditing
- C. To encrypt application data
- D. To manage database connections

Answer: B

Q404. What is dependency management in software development?

- A. Managing the development team
- B. Tracking and managing the external libraries and frameworks a project relies on to ensure they are secure and up-to-date
- C. Managing database dependencies
- D. Organizing code files into folders

Answer: B

Q405. What is a security requirement in software development?

- A. A request for more developers
- B. A specification that defines the security features and controls a software application must implement
- C. A requirement to use a specific programming language
- D. A deadline for project completion

Answer: B

Q406. Why is it important to handle errors properly in secure coding?

- A. Error handling makes code longer
- B. Proper error handling prevents sensitive information from being exposed in error messages and maintains application stability
- C. Error handling is only for debugging
- D. Error handling slows down the application

Answer: B

Q407. What is the purpose of unit testing in secure development?

- A. To test the entire application at once
- B. To test individual components or functions in isolation to verify they behave correctly, including security-related behavior
- C. To test network performance
- D. To test user interface design

Answer: B

Q408. What is the concept of 'defense in depth' in application development?

- A. Using one very strong security control
- B. Implementing multiple layers of security controls so that if one layer fails, others still provide protection
- C. Defending only the database
- D. Developing applications quickly without testing

Answer: B

Q409. What is the difference between authentication and input validation in secure coding?

- A. They are the same concept
- B. Authentication verifies user identity while input validation ensures data meets expected format and constraints before processing
- C. Input validation replaces the need for authentication
- D. Authentication validates all input automatically

Answer: B

Q410. Why should developers use parameterized queries instead of string concatenation for database queries?

- A. Parameterized queries are shorter to write
- B. Parameterized queries separate SQL code from data, preventing SQL injection attacks that string concatenation enables
- C. String concatenation is faster
- D. There is no practical difference

Answer: B

Q411. What is airplane mode on a mobile device?

- A. A mode that makes the phone look like an airplane
- B. A setting that disables all wireless communications including cellular, WiFi, and Bluetooth
- C. A mode that increases battery life by 10 times
- D. A special mode for use during flights only

Answer: B

Q412. Why should you verify WiFi network names before connecting?

- A. To ensure the fastest connection
- B. Attackers can create fake networks with similar names to legitimate ones to intercept your data
- C. WiFi names affect download speeds
- D. Network names determine the security level automatically

Answer: B

Q413. What is the purpose of app permissions on mobile devices?

- A. To make apps run faster
- B. To control which device resources and data an app can access, such as camera, location, and contacts
- C. To manage app storage size
- D. To determine which users can install the app

Answer: B

Q414. What is a hotspot on a mobile device?

- A. A device that gets physically hot
- B. A feature that shares the device's cellular data connection with other devices via WiFi
- C. A location with the strongest cell signal
- D. A type of malware

Answer: B

Q415. Why should you download apps only from official app stores?

- A. Official apps are always free
- B. Official app stores review apps for malware and security issues, reducing the risk of installing malicious software
- C. Unofficial apps have better features
- D. It makes no difference where you download apps

Answer: B

Q416. What is NFC on a mobile device?

- A. New Firewall Configuration
- B. Near Field Communication, a short-range wireless technology used for contactless payments and data transfer
- C. Network Frequency Controller
- D. Next-gen File Compression

Answer: B

Q417. What does encryption of mobile device storage protect against?

- A. App crashes
- B. Unauthorized access to data on the device if it is lost, stolen, or physically accessed by an attacker
- C. Slow internet speeds
- D. Battery drain

Answer: B

Q418. What is a wireless access point?

- A. A wired ethernet port
- B. A hardware device that allows wireless devices to connect to a wired network using WiFi
- C. A type of mobile application
- D. A satellite internet receiver

Answer: B

Q419. Why is it important to keep your mobile device's operating system updated?

- A. Updates only add new emojis
- B. Updates include security patches that fix known vulnerabilities that attackers could exploit
- C. Updates always make the device slower
- D. Updates are optional and unimportant

Answer: B

Q420. What is a SIM card in a mobile phone?

- A. A security camera
- B. A small chip that identifies the subscriber and allows the phone to connect to the cellular network
- C. A type of mobile storage for photos
- D. A screen protector

Answer: B

Q421. What is a cloud storage service?

- A. A physical warehouse for storing computers
- B. An online service that allows users to store, access, and share files over the internet
- C. A type of local hard drive
- D. A mobile application for photography

Answer: B

Q422. What is the difference between a public cloud and a private cloud?

- A. There is no difference
- B. A public cloud shares infrastructure among multiple organizations while a private cloud is dedicated to a single organization
- C. Public clouds are free while private clouds are paid
- D. Private clouds do not use the internet

Answer: B

Q423. What is a hybrid cloud environment?

- A. A cloud that only works during certain hours
- B. A combination of public and private cloud infrastructure that allows data and applications to be shared between them
- C. A cloud service that does not use encryption
- D. A backup-only cloud solution

Answer: B

Q424. Why is it important to use strong passwords for cloud accounts?

- A. Cloud services do not support strong passwords
- B. Weak passwords can be easily guessed or cracked, giving attackers access to all your cloud-stored data and services
- C. Strong passwords are only needed for local accounts
- D. Password strength does not affect cloud security

Answer: B

Q425. What is a cloud service level agreement (SLA)?

- A. A type of cloud encryption
- B. A contract between the cloud provider and customer that defines the expected level of service, availability, and security responsibilities
- C. A programming language for cloud apps
- D. A cloud storage format

Answer: B

Q426. What is data backup in cloud computing?

- A. Deleting old data from the cloud
- B. Creating copies of data stored in the cloud to protect against data loss from accidental deletion, corruption, or attacks
- C. Moving all data to a local hard drive
- D. Encrypting data at rest

Answer: B

Q427. What is the role of encryption in transit for cloud services?

- A. It makes data transfer faster
- B. It protects data while it is being transmitted between your device and the cloud server, preventing eavesdropping
- C. It compresses data for storage
- D. It is only used for email

Answer: B

Q428. What is a cloud region in cloud computing?

- A. A marketing term with no technical meaning
- B. A geographic area containing data centers where cloud resources are hosted, affecting latency and data residency compliance
- C. A type of cloud pricing model
- D. The cloud provider's headquarters location

Answer: B

Q429. What is multi-factor authentication's importance for cloud services?

- A. MFA is not useful for cloud services
- B. MFA adds extra security layers beyond passwords for cloud accounts, significantly reducing the risk of unauthorized access even if passwords are compromised
- C. MFA slows down cloud performance
- D. MFA is only for on-premises systems

Answer: B

Q430. What is a cloud compliance requirement?

- A. A requirement to use only one cloud provider
- B. Regulatory standards and laws that organizations must follow when storing and processing data in the cloud, such as data protection and privacy regulations
- C. A requirement to back up data daily
- D. A cloud provider's internal policy only

Answer: B

Q431. What is the purpose of taking photographs at a digital crime scene?

- A. For social media posts
- B. To document the state of evidence including screen displays, cable connections, and device locations before any changes are made
- C. To test the camera equipment
- D. For marketing materials

Answer: B

Q432. What is a forensic copy different from a regular file copy?

- A. They are exactly the same thing
- B. A forensic copy is a bit-for-bit exact duplicate of an entire storage device including deleted files and empty space, while a regular copy only copies visible files
- C. A forensic copy is smaller in size
- D. A regular copy includes more data than a forensic copy

Answer: B

Q433. What role does a hash value play in digital forensics?

- A. It encrypts the evidence
- B. It creates a unique digital fingerprint of evidence that can be used to verify the evidence has not been altered
- C. It compresses evidence files
- D. It translates evidence into different languages

Answer: B

Q434. What is a forensic workstation?

- A. Any regular office computer
- B. A specialized computer configured for analyzing digital evidence with forensic tools, write-blocking capabilities, and proper security controls
- C. A computer used only for word processing
- D. A server that stores websites

Answer: B

Q435. Why is it important to document every step during a forensic investigation?

- A. For billing purposes only
- B. To maintain a detailed record that supports the integrity of evidence and can be presented in legal proceedings
- C. Documentation is optional in forensics
- D. To create a user manual for the software

Answer: B

Q436. What are the common sources of digital evidence in a computer investigation?

- A. Only the hard drive
- B. Hard drives, RAM, network logs, email, browser history, USB devices, cloud accounts, and mobile devices
- C. Only printed documents
- D. Only internet browsing history

Answer: B

Q437. What is the difference between logical and physical acquisition in digital forensics?

- A. They are the same method
- B. Logical acquisition copies files and folders accessible by the OS, while physical acquisition copies the entire storage media bit-by-bit including deleted data
- C. Logical acquisition is always better
- D. Physical acquisition only copies visible files

Answer: B

Q438. What is an evidence bag used for in digital forensics?

- A. To carry personal items
- B. An anti-static, tamper-evident container used to store and transport physical digital evidence while maintaining chain of custody
- C. A regular plastic bag
- D. A bag for storing paper documents

Answer: B

Q439. What is deleted file recovery in digital forensics?

- A. Permanently destroying files
- B. The process of recovering files that have been deleted by users, as the data may still exist on the storage device until overwritten
- C. Downloading files from the internet
- D. Creating backup copies of files

Answer: B

Q440. What is the role of an expert witness in digital forensics?

- A. To hack into the suspect's computer
- B. A qualified professional who presents and explains digital evidence and forensic findings in court in a way that judges and juries can understand
- C. To destroy evidence after the trial
- D. To represent the defendant

Answer: B

Q441. What is the goal of incident response in cybersecurity?

- A. To prevent all incidents from ever occurring
- B. To systematically handle security incidents to minimize damage, reduce recovery time, and learn from the experience
- C. To blame individuals for security failures
- D. To shut down all systems permanently after an attack

Answer: B

Q442. Who should be notified when a security incident is detected?

- A. Only the IT department
- B. The incident response team, management, and potentially affected parties as defined in the incident response plan
- C. No one, to avoid causing panic
- D. Only external media

Answer: B

Q443. What is the purpose of an incident response plan?

- A. To create work for the IT team
- B. To provide a structured, pre-defined approach for handling security incidents so the team can respond quickly and effectively
- C. To document past projects
- D. To track employee attendance

Answer: B

Q444. What should an employee do if they receive a suspicious email?

- A. Forward it to all colleagues to warn them
- B. Report it to the IT security team and do not click any links or open attachments
- C. Delete it and forget about it
- D. Reply to the sender asking if it is legitimate

Answer: B

Q445. What is incident containment?

- A. Putting all computers in a sealed room
- B. Taking immediate actions to limit the scope and damage of a security incident, such as isolating affected systems from the network
- C. Ignoring the incident until it resolves itself
- D. Deleting all data from affected systems

Answer: B

Q446. What is the recovery phase of incident response?

- A. Recovering the cost of the incident from insurance
- B. Restoring affected systems and services to normal operation after the threat has been eliminated
- C. Recovering deleted emails
- D. Recovering employee passwords

Answer: B

Q447. Why should an organization conduct post-incident reviews?

- A. To assign blame to individuals
- B. To analyze what happened, identify what worked well and what needs improvement, and update procedures to better handle future incidents
- C. Post-incident reviews are a waste of time
- D. To create a public news report about the incident

Answer: B

Q448. What is the role of backup systems in incident response?

- A. Backups are not related to incident response
- B. Backups provide clean copies of data and systems that can be used to restore operations after an incident like ransomware or data corruption
- C. Backups only store old, unnecessary data
- D. Backups are used only for testing purposes

Answer: B

Q449. What is a security incident log?

- A. A wooden log used for physical security
- B. A record that documents the details of a security incident including timeline, actions taken, evidence collected, and people involved
- C. A log of employee login times
- D. A record of software purchases

Answer: B

Q450. What is the difference between a security event and a security incident?

- A. They mean exactly the same thing
- B. A security event is any observable occurrence in a system; a security incident is an event that actually threatens or breaches security policies
- C. An event is more serious than an incident
- D. An incident always involves data loss

Answer: B

Q451. What is the purpose of an intrusion detection system (IDS)?

- A. To speed up network performance
- B. To monitor network traffic or system activity for malicious behavior or policy violations and generate alerts
- C. To encrypt all network traffic
- D. To manage user passwords

Answer: B

Q452. What is a security baseline in monitoring?

- A. The lowest level of security an organization can have
- B. A documented standard of normal system behavior and configuration that deviations from can indicate security issues
- C. The first security tool purchased
- D. A baseline measurement of network speed

Answer: B

Q453. What is the purpose of monitoring failed login attempts?

- A. To count how many employees forget their passwords
- B. To detect potential brute-force attacks, unauthorized access attempts, or compromised accounts
- C. Failed logins do not need to be monitored
- D. To measure system performance

Answer: B

Q454. What is a security information and event management (SIEM) alert?

- A. A marketing email from a security vendor
- B. A notification generated when the SIEM detects activity matching predefined rules or patterns that may indicate a security threat
- C. A reminder to update passwords
- D. An error message in the SIEM software

Answer: B

Q455. Why is it important to monitor both inbound and outbound network traffic?

- A. Only inbound traffic needs monitoring
- B. Inbound monitoring detects incoming attacks while outbound monitoring detects data exfiltration, malware communication, and compromised systems beaconing to attacker infrastructure
- C. Outbound traffic is always safe
- D. Monitoring both directions is too expensive to be worthwhile

Answer: B

Q456. What is a false negative in security monitoring?

- A. A false alarm about a security threat
- B. A real security threat that the monitoring system fails to detect, allowing the attack to proceed without alerting the security team
- C. A negative review of security software
- D. A test alert used during security drills

Answer: B

Q457. What is the purpose of monitoring privileged account activity?

- A. Privileged accounts do not need monitoring
- B. Privileged accounts have elevated access that can cause significant damage if misused; monitoring their activity detects unauthorized use, insider threats, and compromised admin accounts
- C. Monitoring privileged accounts violates privacy
- D. Only guest accounts need monitoring

Answer: B

Q458. What is real-time monitoring versus periodic monitoring?

- A. They are the same approach with different names
- B. Real-time monitoring continuously analyzes events as they occur for immediate detection, while periodic monitoring reviews data at scheduled intervals
- C. Real-time monitoring is less effective
- D. Periodic monitoring catches more threats

Answer: B

Q459. What is the role of antivirus alerts in security monitoring?

- A. Antivirus alerts are always false positives
- B. Antivirus alerts notify security teams when malware is detected on endpoints, enabling investigation and response to potential infections
- C. Antivirus alerts only matter for personal computers
- D. Antivirus alerts replace the need for other monitoring

Answer: B

Q460. What is unauthorized access to a computer system?

- A. Using your own computer at home
- B. Accessing a computer system or network without permission from the owner, which is illegal in most jurisdictions
- C. Installing software with admin approval
- D. Browsing a public website

Answer: B

Q461. What is the purpose of a terms of service agreement for online services?

- A. To make registration more complicated
- B. To define the rules, rights, and responsibilities for using an online service, forming a legal agreement between the user and the provider
- C. To collect user email addresses
- D. To slow down the sign-up process

Answer: B

Q462. What is cyber harassment?

- A. Asking someone a question online
- B. Using digital communications to threaten, intimidate, or repeatedly harass another person, which is a punishable offense under cyber laws
- C. Sending a friend request on social media
- D. Posting a restaurant review online

Answer: B

Q463. What is the purpose of a privacy notice on a website?

- A. To decorate the website footer
- B. To inform users about what personal data is collected, how it is used, stored, and shared, and what rights users have regarding their data
- C. To increase website traffic
- D. To prevent users from leaving the website

Answer: B

Q464. What is digital copyright?

- A. The right to copy any digital content freely
- B. Legal protection that gives creators exclusive rights to their original digital works such as software, music, videos, and written content
- C. A license to hack into copyrighted systems
- D. A type of Creative Commons license only

Answer: B

Q465. Why is it important to obtain consent before collecting personal data?

- A. Consent is only a recommendation, not a requirement
- B. Data protection laws require organizations to obtain informed consent before collecting and processing personal data to respect individual privacy rights
- C. Consent is only needed for government organizations
- D. Collecting data without consent is always allowed

Answer: B

Q466. What is an acceptable use policy (AUP)?

- A. A marketing document for software products
- B. A set of rules that define how an organization's IT resources may be used, covering permitted activities, prohibited behaviors, and consequences for violations
- C. A software installation guide
- D. A network speed guarantee

Answer: B

Q467. What is the legal consequence of sending spam emails in many jurisdictions?

- A. There are no legal consequences for spam
- B. Sending unsolicited commercial emails can result in fines and penalties under anti-spam legislation such as CAN-SPAM Act, GDPR, or PECA 2016
- C. Spam is only illegal if it contains malware
- D. Only governments can send bulk emails

Answer: B

Q468. What does it mean to report a cybercrime?

- A. Posting about the crime on social media
- B. Formally notifying law enforcement authorities (like FIA in Pakistan) about a cyber crime so they can investigate and take legal action
- C. Telling your friends about the incident
- D. Writing a blog post about the experience

Answer: B

Q469. What is a smart device in the context of cybersecurity?

- A. Any device that uses electricity
- B. A device connected to the internet that can collect, send, and receive data, such as smart speakers, thermostats, and cameras
- C. A device that is physically large
- D. A computer without internet access

Answer: B

Q470. What is the concept of zero trust in simple terms?

- A. Trusting no technology at all and using only paper
- B. A security model based on the principle of 'never trust, always verify' where every access request is authenticated and authorized regardless of location
- C. Trusting all internal users but not external ones
- D. A model where security is not needed

Answer: B

Q471. What is a supply chain attack in cybersecurity?

- A. An attack on physical delivery trucks
- B. An attack that targets a less-secure element in the supply chain (like a software vendor or service provider) to gain access to a larger target organization
- C. An attack that only affects manufacturers
- D. Stealing products from a warehouse

Answer: B

Q472. What is automation in cybersecurity?

- A. Replacing all security staff with robots
- B. Using technology to automatically perform security tasks like scanning for vulnerabilities, responding to alerts, and updating security rules without manual intervention
- C. Making all passwords automatic
- D. Automating the creation of cyber attacks

Answer: B

Q473. What is a digital twin in technology?

- A. A twin sibling who works in technology
- B. A virtual replica of a physical system, process, or device that can be used for simulation, testing, and monitoring
- C. A backup copy of a digital file
- D. A second computer monitor

Answer: B

Q474. What is the role of machine learning in detecting cyber threats?

- A. Machine learning creates cyber threats
- B. Machine learning can analyze large volumes of data to identify patterns and anomalies that may indicate cyber threats, helping detect attacks that traditional rule-based systems might miss
- C. Machine learning replaces all cybersecurity professionals
- D. Machine learning only works for email filtering

Answer: B

Q475. What is the dark web?

- A. The internet when your screen brightness is low
- B. A part of the internet that requires special software (like Tor) to access and is not indexed by standard search engines, often associated with illegal activities
- C. Any website with a dark color scheme
- D. A private corporate network

Answer: B

Q476. What is multi-cloud strategy?

- A. Using many computers in one office
- B. Using services from multiple cloud providers to avoid vendor lock-in, improve resilience, and leverage different providers' strengths
- C. Running the same application multiple times
- D. Having multiple internet connections

Answer: B

Q477. What is an intrusion prevention system (IPS) capable of doing beyond detection?

- A. Only generating reports
- B. Automatically blocking or preventing detected malicious traffic in real-time before it reaches the target
- C. Encrypting all network traffic
- D. Managing user accounts

Answer: B

Q478. What is online fraud in the context of cyber law?

- A. Selling products online at a discount
- B. Using deceptive practices on the internet to illegally obtain money, data, or other benefits from victims
- C. Creating a website for a legitimate business
- D. Posting product reviews online

Answer: B

Q479. What is wearable technology and what security concerns does it raise?

- A. Clothing made from special fabrics
- B. Internet-connected devices worn on the body like smartwatches and fitness trackers that collect personal health and location data, raising privacy and data security concerns
- C. Any technology that is portable
- D. Protective equipment for construction workers

Answer: B

Q480. What is the significance of 5G technology for cybersecurity?

- A. 5G only improves download speeds with no security impact
- B. 5G introduces new attack surfaces due to network slicing, massive IoT connectivity, and edge computing, but also provides improved security features over 4G
- C. 5G eliminates all cybersecurity concerns
- D. 5G technology is identical to WiFi

Answer: B

Cyber Security — Medium

480 questions

Q481. Which of the following best describes 'defense in depth'?

- A. Using only encryption as the single security method
- B. Layering multiple security controls throughout a system
- C. Depending solely on firewalls for perimeter protection
- D. Relying on only one strong security control measure

Answer: B

Q482. What is the difference between a threat and a risk in cyber security?

- A. A risk is a type of malware designed for compromising system integrity
- B. They are the same thing with no meaningful distinction between them
- C. A threat only applies to hardware targeting enterprise network infrastructure
- D. A threat is a potential danger while risk is the likelihood and impact of that threat

Answer: D

Q483. Which of the following is an example of a physical security control?

- A. Intrusion detection system
- B. Data-at-rest symmetric encryption
- C. Biometric access to server room
- D. Network firewall rule configuration

Answer: C

Q484. What is the purpose of a security policy in an organization?

- A. To define rules and guidelines for protecting information assets
- B. To minimize infrastructure and hardware expenditures
- C. To expand network bandwidth allocation and throughput
- D. To design and build user-facing application interfaces

Answer: A

Q485. Which cyber security principle states that users should only have the minimum access necessary?

- A. Principle of least privilege
- B. Defense in depth
- C. Security by obscurity
- D. Separation of duties

Answer: A

Q486. What is social engineering in cyber security?

- A. Manipulating people into revealing confidential information
- B. Engineering software for social platforms
- C. Building social media applications
- D. Designing social networks within enterprise security environments

Answer: A

Q487. Which of the following is a component of the NIST Cybersecurity Framework?

- A. Identify, Protect, Detect, Respond, Recover
- B. Design, Build, Test, Deploy lifecycle
- C. Input, Process, Output data flow model
- D. Plan, Do, Check, Act continuous cycle

Answer: A

Q488. What is the purpose of a risk assessment in cyber security?

- A. To design new websites for enterprise computing environments
- B. To identify, analyze, and evaluate security risks
- C. To install antivirus software and management
- D. To write application code and management

Answer: B

Q489. What does 'non-repudiation' mean in information security?

- A. Ensuring a party cannot deny having performed an action
- B. Denying access to all users regardless of the specific situation or context
- C. Blocking network traffic within enterprise security environments
- D. Encrypting all messages regardless of the specific situation or context

Answer: A

Q490. Which of the following best describes an 'attack surface'?

- A. The total sum of vulnerabilities accessible to an attacker
- B. A strain of self-replicating malicious software programs
- C. A security certification for mobile network professionals
- D. The physical area of a computer across computing environments

Answer: A

Q491. What is the difference between symmetric and asymmetric encryption?

- A. Symmetric uses two keys, asymmetric uses one across computing environments
- B. There is no difference in any deployment scenario or context
- C. Symmetric is always stronger regardless of the specific situation or context
- D. Symmetric uses one key for both encryption and decryption, asymmetric uses a key pair

Answer: D

Q492. What is a hash function used for in security?

- A. Applying symmetric ciphers for secure data transfer
- B. Generating a fixed-size output from input data for integrity verification
- C. Generating redundant backup copies of system data
- D. Compressing files to reduce disk storage consumption

Answer: B

Q493. Which is an example of a detective security control?

- A. Intrusion Detection System (IDS)
- B. Firewall within enterprise security environments
- C. Data-at-rest symmetric encryption
- D. Access control list in security contexts

Answer: A

Q494. What is the purpose of an access control list (ACL)?

- A. To define which users or systems are granted access to specific resources
- B. To encrypt data using symmetric cipher algorithms
- C. To compress files for reducing disk storage consumption
- D. To generate comprehensive network topology diagrams

Answer: A

Q495. What is the difference between identification and authentication?

- A. Neither is used in security within enterprise security environments
- B. They are fundamentally the same thing in security
- C. Identification claims an identity, authentication proves it
- D. Authentication comes before identification

Answer: C

Q496. What is a security token in authentication?

- A. A backup device for managing enterprise data resources
- B. A physical or digital device that generates one-time passwords for authentication
- C. A network firewall rule for filtering inbound traffic
- D. A software application used for enterprise computing operations

Answer: B

Q497. What is the purpose of security auditing?

- A. To deploy and install application software across enterprise computing systems
- B. To architect and design new information systems and management
- C. To increase available bandwidth for improved download speeds
- D. To systematically evaluate the security of a system by testing against established criteria

Answer: D

Q498. Which security principle involves dividing critical tasks among multiple people?

- A. Need to know
- B. Least privilege
- C. Defense in depth
- D. Separation of duties

Answer: D

Q499. What is a security baseline?

- A. A next-generation firewall security appliance
- B. A backup schedule for creating regular recovery snapshots
- C. The fastest network speed within enterprise security environments
- D. A minimum set of security controls required for a system

Answer: D

Q500. What type of attack targets the availability component of the CIA triad?

- A. Network eavesdropping attack
- B. Denial of Service (DoS)
- C. Spear phishing email attack
- D. Credential data theft attack

Answer: B

Q501. What is the key size of AES-256?

- A. 256 bits
- B. 192 bits
- C. 512 bits
- D. 128 bits

Answer: A

Q502. What is a block cipher?

- A. A cipher that encrypts one bit at a time
- B. A cryptographic algorithm used for protecting sensitive data
- C. A cipher that encrypts fixed-size blocks of data at a time
- D. A cipher that uses no key applied to data protection workflows

Answer: C

Q503. What is a stream cipher?

- A. A cipher that encrypts entire files at once
- B. A cipher that encrypts data one bit or byte at a time
- C. A cipher that uses block processing
- D. A cipher that only works with video

Answer: B

Q504. What is the Diffie-Hellman key exchange used for?

- A. Hashing passwords within enterprise security environments
- B. Compressing data files for reduced storage space consumption
- C. Encrypting data directly within enterprise security environments
- D. Securely exchanging cryptographic keys over an insecure channel

Answer: D

Q505. Which hash algorithm produces a 256-bit output?

- A. SHA-256
- B. SHA-512
- C. MD5
- D. SHA-1

Answer: A

Q506. What is a digital certificate?

- A. A cryptographic algorithm used for protecting sensitive data
- B. An electronic document that uses a digital signature to bind a public key with an identity
- C. A software application used for enterprise computing operations
- D. A physical security measure for protecting building infrastructure

Answer: B

Q507. What is the role of a Certificate Authority (CA)?

- A. To design websites for enterprise computing environments
- B. To develop software across enterprise computing systems
- C. To design and distribute malicious software programs
- D. To issue, manage, and revoke digital certificates

Answer: D

Q508. Why is MD5 considered insecure for cryptographic purposes?

- A. It requires too much memory within enterprise security environments
- B. It is too slow within enterprise security environments
- C. It is vulnerable to collision attacks where two different inputs produce the same hash
- D. It produces too long an output within enterprise security environments

Answer: C

Q509. What is the purpose of a nonce in cryptography?

- A. A number used only once to prevent replay attacks
- B. To compress files for reducing disk storage consumption
- C. To create automated backup copies of user data
- D. To encrypt data using symmetric cipher algorithms

Answer: A

Q510. What is PKI (Public Key Infrastructure)?

- A. A next-generation firewall for filtering network traffic flows
- B. A framework for managing digital certificates and public-key encryption
- C. A category of self-replicating malicious software
- D. A standard network communication protocol for data transfer

Answer: B

Q511. What is the difference between an IDS and an IPS?

- A. IDS only detects and alerts while IPS can also block malicious traffic
- B. They are the same thing with no meaningful distinction between them
- C. IPS is slower than IDS within enterprise security environments
- D. IDS blocks traffic while IPS only detects

Answer: A

Q512. What is network segmentation?

- A. Deleting network components within enterprise security environments
- B. A type of network attack used in enterprise network infrastructure
- C. Dividing a network into smaller segments to improve security and performance
- D. Combining all networks into one regardless of the specific situation or context

Answer: C

Q513. What is ARP spoofing?

- A. An attack where fake ARP messages link an attacker's MAC address with a legitimate IP
- B. A symmetric key data encryption algorithm applied to data protection workflows
- C. A firewall configuration deployed across enterprise environments
- D. A legitimate network technique used in enterprise network infrastructure

Answer: A

Q514. What is the purpose of network access control (NAC)?

- A. To speed up the network across the enterprise network infrastructure
- B. To restrict access to a network based on device compliance and user identity
- C. To install network cables across the enterprise network infrastructure
- D. To generate comprehensive network topology diagrams

Answer: B

Q515. What is a honeypot in network security?

- A. A decoy system designed to attract attackers and study their methods
- B. A network switch used in enterprise network infrastructure
- C. A strain of self-replicating malicious software programs
- D. A type of firewall for filtering wireless network traffic

Answer: A

Q516. What is SSL/TLS used for?

- A. Optimal network routing and efficient packet forwarding across systems
- B. Persistent data storage and streamlined data retrieval management
- C. Providing encrypted communication between a client and server over a network
- D. Lossless data file compression techniques for long-term storage optimization

Answer: C

Q517. What is a VLAN and how does it improve security?

- A. A Virtual LAN that logically segments a network, isolating traffic between groups
- B. A virtual private network encrypted tunnel connection
- C. A next-generation firewall for filtering network traffic flows
- D. A software application used for enterprise computing operations

Answer: A

Q518. What is port scanning?

- A. Sending packets to specific ports to discover which services are running
- B. A cryptographic algorithm used for protecting sensitive data
- C. A physical inspection of ports within modern computing environments
- D. A backup method for managing enterprise data resources

Answer: A

Q519. What is a stateful firewall?

- A. A firewall without rules deployed across enterprise environments
- B. A firewall that tracks the state of active connections and makes decisions based on context
- C. A software-only firewall deployed across enterprise environments
- D. A firewall that only checks packet headers deployed across enterprise environments

Answer: B

Q520. What is DNS security and why is it important?

- A. Continuous monitoring is not important for security for modern enterprise security environments
- B. It is only about encrypting DNS without any additional considerations needed
- C. Protecting DNS infrastructure from attacks like DNS spoofing to ensure correct domain name resolution
- D. DNS security only affects speed without any additional considerations needed

Answer: C

Q521. What is mandatory access control (MAC) in operating systems?

- A. The OS enforces access rules based on security labels that users cannot override
- B. Users set their own permissions within enterprise security environments
- C. All users have equal access with no meaningful distinction between them
- D. No access control is needed in any deployment scenario or context

Answer: A

Q522. What is Address Space Layout Randomization (ASLR)?

- A. A standard network communication protocol for data transmission
- B. A file management technique for organizing directories used in enterprise computing environments
- C. A symmetric key data encryption algorithm applied to data protection workflows
- D. A security technique that randomly arranges memory address space of processes to prevent exploitation

Answer: D

Q523. What is the purpose of SELinux?

- A. To provide mandatory access control security policies in Linux
- B. To install and manage software packages efficiently
- C. To optimize and speed up the Linux kernel performance
- D. To create and manage virtual machine environments

Answer: A

Q524. What is a chroot jail in Linux security?

- A. An operation that changes the root directory for a process, isolating it from the rest of the file system
- B. A physical jail or correctional facility structure within modern computing environments
- C. A network configuration for firewall rule settings deployed across enterprise environments
- D. A specific type of user account with limited access within the identity management system

Answer: A

Q525. What is the purpose of Windows Group Policy?

- A. To centrally manage and configure OS settings, user permissions, and security policies
- B. To create social media groups for enterprise communication
- C. To logically group related files within directories and management
- D. To organize and arrange desktop icons into folders and management

Answer: A

Q526. What is Data Execution Prevention (DEP)?

- A. An automated feature for scheduling data backups for managing enterprise data resources
- B. A security feature that marks memory regions as non-executable to prevent code execution from those areas
- C. A built-in file encryption tool for data protection applied to data protection workflows
- D. A network traffic monitoring feature for analysis used in enterprise network infrastructure

Answer: B

Q527. What is the Windows Registry and why is it important for security?

- A. An automated backup solution for enterprise data recovery needs
- B. A user account type with specifically assigned access permissions
- C. A hierarchical database storing OS and application settings that if compromised can affect system security
- D. A next-generation firewall security appliance deployed across enterprise environments

Answer: C

Q528. What is process isolation in operating systems?

- A. Keeping each process's memory space separate to prevent unauthorized access between processes
- B. A specific type of preemptive multitasking method used in enterprise computing environments
- C. Running all system processes in shared memory space across computing environments
- D. Immediately stopping and terminating all processes across computing environments

Answer: A

Q529. What is the purpose of audit logging in an OS?

- A. To record security-relevant events for monitoring, investigation, and compliance
- B. To identify and remove obsolete system files and management
- C. To add computational overhead slowing the system and management
- D. To reduce data sizes through compression methods and management

Answer: A

Q530. What is sandboxing in OS security?

- A. Playing in a physical sandbox recreation area across computing environments
- B. A type of data encryption applied to data protection workflows
- C. Running applications in an isolated environment to limit their access to system resources
- D. A next-generation firewall for filtering network traffic flows

Answer: C

Q531. What is Cross-Site Scripting (XSS)?

- A. A responsive web design technique used for structuring and organizing page layouts
- B. A front-end JavaScript framework commonly used for building interactive web applications
- C. A vulnerability where malicious scripts are injected into trusted websites and executed in browsers
- D. A written record or logbook used by teams for tracking daily operational activities

Answer: C

Q532. What is SQL injection?

- A. An attack that inserts malicious SQL code through user input to manipulate the database
- B. A database management system for storing structured records
- C. A software application used for enterprise computing operations
- D. An optimization technique for improving SQL query speed used in enterprise computing environments

Answer: A

Q533. What is Cross-Site Request Forgery (CSRF)?

- A. An attack that tricks a browser into making unintended requests to a site where the user is authenticated
- B. A form validation technique for checking user inputs within the identity management system
- C. A standard type of user login authentication system within the identity management system
- D. A type of HTTP cookie used for session tracking within modern computing environments

Answer: A

Q534. What is the Same-Origin Policy?

- A. A web browser application for accessing internet-hosted content
- B. A security mechanism restricting scripts from one origin from accessing resources of another origin
- C. An intellectual property copyright protection law within modern computing environments
- D. A common website design pattern for page layout within modern computing environments

Answer: B

Q535. What is Content Security Policy (CSP)?

- A. An HTTP header specifying which content sources are allowed to be loaded by a web page
- B. A cascading style sheets framework for responsive page layouts
- C. A front-end JavaScript library for dynamic web development
- D. A content management system for organizing digital resources

Answer: A

Q536. What is the purpose of HTTP security headers?

- A. To format and style web content for visual presentation and management
- B. To compress and optimize images for web page loading and management
- C. To instruct browsers to enable security features protecting against common web attacks
- D. To make websites load faster with better performance and management

Answer: C

Q537. What is session hijacking?

- A. Properly logging out of an active user session across computing environments
- B. Creating a new user session for web interaction across computing environments
- C. An attack where an attacker takes over a valid user session by stealing the session ID
- D. An automated session timeout after inactivity period used in enterprise computing environments

Answer: C

Q538. What is the OWASP Top 10?

- A. A ranked list of the most widely used web browsers
- B. A programming framework for building web app front-ends
- C. A curated list of the top ten most popular websites
- D. A regularly updated list of the most critical web application security risks

Answer: D

Q539. What is clickjacking?

- A. A software application used for enterprise computing operations
- B. A gaming technique for improving response speed used in enterprise computing environments
- C. An attack tricking users into clicking hidden elements by layering invisible frames
- D. A user account type with specifically assigned access permissions

Answer: C

Q540. What is the purpose of parameterized queries?

- A. To separate SQL code from user data, ensuring input is treated as data not code
- B. To compress and reduce the size of database stored data
- C. To improve and optimize query execution performance speed
- D. To format and style the output of database query results

Answer: A

Q541. What is a keylogger?

- A. A tool for managing and organizing cryptographic keys
- B. Software or hardware that records keystrokes to capture sensitive information
- C. A software application used for enterprise computing operations
- D. A cryptographic algorithm used for protecting sensitive data

Answer: B

Q542. What is a botnet?

- A. A helpful automated robot network for task assistance used in enterprise computing environments
- B. A chat bot service providing automated customer support used in enterprise computing environments
- C. A network monitoring tool for tracking bandwidth utilization
- D. A network of compromised computers controlled remotely for coordinated malicious activities

Answer: D

Q543. How does a DDoS attack differ from DoS?

- A. DDoS attacks are generally considered less dangerous than standard single-source DoS attacks
- B. DDoS uses multiple compromised systems to flood the target, making it harder to mitigate
- C. They are functionally identical attack frameworks with no meaningful differences between them
- D. DoS attacks typically use significantly more compromised systems than DDoS attacks

Answer: B

Q544. What is a rootkit?

- A. A disk utility for managing storage partitions used in enterprise computing environments
- B. Malware designed to gain unauthorized root-level access and hide its presence
- C. A legitimate system administration tool for configuration
- D. A standard operating system boot loader for initialization

Answer: B

Q545. What is social engineering?

- A. A software application suite used for enterprise computing operations and communications
- B. Building and developing social media networking platforms for public user interaction
- C. Psychological manipulation to trick people into making security mistakes or revealing information
- D. Engineering and designing interactive social interaction systems for enterprise organizations

Answer: C

Q546. What is a drive-by download attack?

- A. A software application used for enterprise computing operations
- B. A standard file transfer method between connected systems used in enterprise computing environments
- C. Downloading files while driving in a moving vehicle
- D. Automatic download of malware when visiting a compromised website without user interaction

Answer: D

Q547. What is a watering hole attack?

- A. A water cooling attack damaging hardware cooling systems
- B. Attacking municipal water supply infrastructure systems
- C. Compromising websites frequently visited by a targeted group to infect their computers
- D. A network flooding attack using volumetric traffic used in enterprise computing environments

Answer: C

Q548. What is fileless malware?

- A. A clean program verified by security code audit analysis
- B. Malware that operates without any source code at all
- C. Malware that operates entirely in memory without writing files to disk
- D. A type of antivirus program for real-time scanning

Answer: C

Q549. What is a man-in-the-middle (MITM) attack?

- A. A professional mediator in business negotiations within modern computing environments
- B. A software application used for enterprise computing operations
- C. An attack where the attacker secretly intercepts and possibly alters communication between two parties
- D. A proxy server that forwards requests between systems used in enterprise computing environments

Answer: C

Q550. What are indicators of compromise (IOCs)?

- A. Performance metrics for measuring system throughput
- B. Signs indicating system improvement and optimization
- C. Software licensing keys for verifying installations
- D. Observable artifacts or evidence suggesting a system has been breached

Answer: D

Q551. What is the difference between authentication and authorization?

- A. Neither process is used in modern security frameworks
- B. Authentication verifies identity, authorization determines permissions
- C. Authorization always comes before the authentication phase
- D. They are functionally identical frameworks with no differences

Answer: B

Q552. What is LDAP used for in access control?

- A. A file format used for structured data storage for managing enterprise data resources
- B. A high-level language used for development within modern computing environments
- C. A software application used for enterprise computing operations
- D. A protocol for accessing distributed directory information services for centralized authentication

Answer: D

Q553. What is attribute-based access control (ABAC)?

- A. Access control decisions based solely on user age and demographics
- B. Access control evaluating attributes of users, resources, actions, and environment
- C. Randomized access control without any defined criteria or policies
- D. Access control based on file system attributes exclusively without context

Answer: B

Q554. What is a federated identity?

- A. A physical security measure for protecting building infrastructure
- B. A fake identity created for fraudulent purposes used in enterprise computing environments
- C. A temporary identity assigned for a single session used in enterprise computing environments
- D. A system allowing users to use the same identity credentials across multiple organizations

Answer: D

Q555. What is the purpose of a RADIUS server?

- A. To provide centralized authentication, authorization, and accounting for network access
- B. To measure and calculate distances between network nodes and management
- C. To increase and optimize overall network throughput speed
- D. To create and deploy enterprise wireless network infrastructure

Answer: A

Q556. What is privilege escalation?

- A. Installing new software applications on the system
- B. Gaining elevated access rights beyond what was initially authorized
- C. Receiving a job promotion or advancement opportunity
- D. Creating a new user account with default permissions

Answer: B

Q557. What is the purpose of access control matrices?

- A. To define access rights of subjects to objects in a structured format
- B. To encrypt data using symmetric cipher algorithms
- C. To compress files for reducing disk storage consumption
- D. To create and format data management spreadsheets

Answer: A

Q558. What is SAML (Security Assertion Markup Language)?

- A. A high-level language used for development within modern computing environments
- B. A software application used for enterprise computing operations
- C. An XML-based standard for exchanging authentication and authorization data between providers
- D. A database management system for storing structured records

Answer: C

Q559. What is the purpose of session management in authentication?

- A. To schedule tasks within enterprise computing infrastructure
- B. To securely maintain a user's authenticated state throughout their interaction
- C. To manage network sessions across the enterprise network infrastructure
- D. To manage computer memory within enterprise computing infrastructure

Answer: B

Q560. What is adaptive authentication?

- A. A biometric method within enterprise computing environments
- B. An approach adjusting security requirements based on risk factors like location and behavior
- C. A credential management mechanism for user authentication flows
- D. Fixed authentication rules within enterprise security environments

Answer: B

Q561. What is the OWASP Secure Coding Practices guide?

- A. A high-level language used for development within modern computing environments
- B. A database design guide for managing enterprise data resources
- C. A comprehensive checklist of secure coding practices organized by vulnerability category
- D. A software application used for enterprise computing operations

Answer: C

Q562. What is threat modeling in software development?

- A. Testing application performance under heavy load conditions
- B. Creating threat actors for penetration testing exercises
- C. Running antivirus scans on development machine environments
- D. A structured approach to identifying and addressing security threats during design

Answer: D

Q563. What is static application security testing (SAST)?

- A. Testing network performance under heavy traffic loads
- B. Testing user interfaces for usability and accessibility
- C. Analyzing source code without executing it to find security vulnerabilities
- D. Testing the application while it is actively running

Answer: C

Q564. What is dynamic application security testing (DAST)?

- A. Testing database query performance under heavy loads
- B. Testing a running application by simulating attacks to find vulnerabilities
- C. Testing source code without running it across computing environments
- D. Testing code compilation for syntax errors and warnings

Answer: B

Q565. What is the principle of fail-safe defaults?

- A. Logging all defaults regardless of the specific situation or context
- B. Ignoring security failures within enterprise security environments
- C. Always granting access by default in security contexts
- D. Denying access by default and requiring explicit permission grants

Answer: D

Q566. What is dependency management in secure development?

- A. Managing and coordinating team members across projects
- B. Tracking, updating, and securing third-party libraries and components
- C. Managing and configuring enterprise server infrastructure
- D. Managing database servers and optimizing query performance

Answer: B

Q567. What is the purpose of security testing in the SDLC?

- A. To deliberately delay the project delivery timeline
- B. To create comprehensive technical documentation materials
- C. To identify and fix security vulnerabilities before deployment to production
- D. To test and validate hardware components for compatibility

Answer: C

Q568. What is 'shift left' in security?

- A. Integrating security practices earlier in the development lifecycle
- B. Moving project deadlines earlier in the release timeline
- C. Moving physical servers to the left of the data center
- D. Changing code alignment and formatting in source files

Answer: A

Q569. What is secure session management?

- A. Properly creating, maintaining, and destroying sessions to prevent hijacking and fixation
- B. Sharing sessions between multiple users simultaneously
- C. Deleting all cookies immediately after each page request
- D. Never creating sessions for any user interactions at all regardless of the deployment context or scenario

Answer: A

Q570. What is the purpose of output encoding?

- A. Making output look visually pretty and well-formatted
- B. Compressing output data for reduced bandwidth consumption
- C. Encrypting output using symmetric cipher key algorithms
- D. Converting output to a safe format to prevent injection attacks like XSS

Answer: D

Q571. What is WPA3?

- A. A web application framework for building online services
- B. A mobile application for managing device Wi-Fi settings
- C. The latest Wi-Fi security protocol with stronger encryption and forward secrecy
- D. A Bluetooth version for short-range wireless communication

Answer: C

Q572. What is an evil twin attack?

- A. A physical hardware component used in computing infrastructure
- B. A mirrored display for screen sharing purposes used in enterprise computing environments
- C. A twin SIM card used for dual number support used in enterprise computing environments
- D. A rogue access point mimicking a legitimate Wi-Fi network to intercept traffic

Answer: D

Q573. What is Mobile Device Management (MDM)?

- A. A physical hardware component used within enterprise computing infrastructure systems
- B. A standard software application used for routine enterprise computing operations
- C. A mobile device application designed for portable computing operations and tasks
- D. Software allowing organizations to remotely manage, secure, and enforce policies on mobile devices

Answer: D

Q574. What are the risks of jailbreaking or rooting a mobile device?

- A. It improves battery life and extends usage time
- B. It removes built-in security protections and exposes the device to malware
- C. It makes the phone processor run significantly faster
- D. There are no security risks at all from this practice

Answer: B

Q575. What is a rogue access point?

- A. An officially authorized network infrastructure device
- B. A Bluetooth device used for short-range data exchange
- C. An unauthorized wireless access point installed without administrator knowledge
- D. A mobile device application for portable computing operations

Answer: C

Q576. What is WEP and why is it insecure?

- A. An outdated wireless encryption protocol with known vulnerabilities crackable in minutes
- B. A physical hardware component used in computing infrastructure
- C. A cryptographic algorithm used for protecting sensitive data
- D. A next-generation firewall for filtering network traffic flows

Answer: A

Q577. What is app sandboxing on mobile devices?

- A. Playing games in a sandbox within enterprise security environments
- B. A testing method for validating application functionality
- C. Isolating each app in its own environment to prevent unauthorized data access
- D. A game development technique for creating mobile games

Answer: C

Q578. What is SIM swapping?

- A. Upgrading SIM cards to a newer generation of mobile network technology standard
- B. Sharing SIM cards between multiple mobile phone devices for network access
- C. An attack convincing a carrier to transfer a victim's number to a new SIM for account takeover
- D. Changing phone cases for a different physical appearance and improved protection

Answer: C

Q579. What is the purpose of a VPN on a mobile device?

- A. To encrypt internet traffic when using public or untrusted networks
- B. To make phone calls cheaper through VoIP routing
- C. To speed up mobile data transfer download bandwidth
- D. To improve camera quality and photo capture resolution

Answer: A

Q580. What is BYOD and its security implications?

- A. A software application used for enterprise computing operations
- B. A policy allowing personal devices for work, creating data separation and security challenges
- C. A physical hardware component used in computing infrastructure
- D. A music streaming service platform for audio content used in enterprise computing environments

Answer: B

Q581. What is the difference between IaaS, PaaS, and SaaS security responsibilities?

- A. Customer always manages everything in every cloud model
- B. Security is not needed in any cloud computing environment for modern enterprise security environments
- C. In IaaS customer manages most; in PaaS provider manages more; in SaaS provider manages most
- D. Provider manages everything in all cloud service models

Answer: C

Q582. What is cloud workload protection?

- A. A backup solution for creating redundant data recovery copies
- B. A load balancing technique for distributing network traffic used in enterprise computing environments
- C. Security solutions protecting workloads including VMs, containers, and serverless functions
- D. Physical security of data center server hardware infrastructure

Answer: C

Q583. What is DLP in cloud environments?

- A. Encrypting all data using symmetric cipher algorithm keys
- B. Compressing data files for reduced storage space consumption
- C. Creating redundant copies of data for backup recovery
- D. Technologies preventing sensitive data from being inappropriately shared or exposed

Answer: D

Q584. What is cloud security posture management (CSPM)?

- A. A standard software application used for routine enterprise computing operations
- B. A cloud infrastructure provider offering a range of core computing service options
- C. An automated solution monitoring cloud infrastructure for misconfigurations and compliance violations
- D. A cloud storage manager designed for organizing and managing hosted data resources

Answer: C

Q585. What is server-side encryption in cloud storage?

- A. The cloud provider encrypts data at rest on the server before storing it
- B. Encrypting data on the client device before transmission
- C. A next-generation firewall for filtering network traffic flows
- D. A compression method for reducing cloud storage data sizes

Answer: A

Q586. What is the purpose of cloud audit logging?

- A. To record all activities and API calls for security monitoring and compliance
- B. To manage and administer user accounts and access rights
- C. To add computational overhead slowing the system and management
- D. To increase storage usage for expanded data capacity

Answer: A

Q587. What is a virtual private cloud (VPC)?

- A. A logically isolated section of public cloud where resources launch in a customer-defined virtual network
- B. A physical hardware component used in computing infrastructure
- C. A virtual private network encrypted tunnel connection used in enterprise computing environments
- D. A physical security measure for protecting building infrastructure

Answer: A

Q588. What is container security in cloud environments?

- A. An automated backup solution designed for enterprise data recovery needs and processes
- B. Protecting containerized apps through image scanning, runtime protection, and secure orchestration
- C. Securing physical shipping containers during transportation across global supply chains
- D. A physical security measure designed for protecting building infrastructure and premises

Answer: B

Q589. What are cloud security groups?

- A. User groups for managing organizational access permissions
- B. Social media groups for enterprise team communication
- C. A type of cloud storage for archiving large data volumes
- D. Virtual firewalls controlling inbound and outbound traffic to cloud resources

Answer: D

Q590. What is least privilege in cloud IAM?

- A. Using shared credentials for all users in the environment
- B. Granting only the minimum permissions necessary for specific tasks
- C. Completely blocking all access to cloud resources
- D. Giving everyone administrator access to all resources

Answer: B

Q591. What is volatile evidence in digital forensics?

- A. Evidence that is explosive within enterprise security environments
- B. Evidence that never changes in any deployment scenario or context
- C. Physical evidence within enterprise security environments
- D. Data in temporary storage like RAM that is lost when the system is powered off

Answer: D

Q592. What is the order of volatility in evidence collection?

- A. Collect backup data first within enterprise security environments
- B. The order does not matter in any deployment scenario or context
- C. Collect most volatile data first: registers, cache, RAM, disk, then remote logs
- D. Collect hard drive data first within enterprise security environments

Answer: C

Q593. What is steganography analysis in digital forensics?

- A. Detecting and extracting hidden data concealed within files like images or audio
- B. Network analysis within enterprise security environments
- C. Analyzing dinosaur fossils within enterprise security environments
- D. Photo editing within enterprise security environments

Answer: A

Q594. What is network forensics?

- A. Designing networks within enterprise security environments
- B. Capture, recording, and analysis of network traffic to investigate security incidents
- C. Installing network cables within enterprise security environments
- D. Configuring routers within enterprise security environments

Answer: B

Q595. What is a forensic toolkit?

- A. A physical toolbox used in enterprise computing environments
- B. A development environment within modern computing environments
- C. A collection of software tools for digital evidence collection, analysis, and reporting
- D. A repair kit within enterprise computing environments

Answer: C

Q596. What is timeline analysis in digital forensics?

- A. A project management technique within modern computing environments
- B. Creating project schedules within enterprise security environments
- C. Reconstructing a chronological sequence of events using timestamps from multiple sources
- D. A time management tool used in enterprise computing environments

Answer: C

Q597. What is email forensics?

- A. Writing and composing emails within enterprise security environments for communication
- B. Examining email headers, content, attachments, and metadata to trace origin and authenticity
- C. Reading and reviewing emails within enterprise security environments for monitoring
- D. Deleting and archiving emails within enterprise security environments for compliance

Answer: B

Q598. What is the role of a forensic examiner's report?

- A. A detailed document presenting methodology, findings, and conclusions for legal proceedings
- B. A blog post published online for broad public readership review and engagement
- C. A news article published within enterprise computing environments for staff awareness
- D. A personal diary used for recording daily reflections and activities for reference

Answer: A

Q599. What is memory forensics?

- A. Testing memory speed and latency within enterprise security environments for capacity
- B. Analysis of RAM contents to find evidence of malware, connections, and encryption keys
- C. A memory stress test within enterprise computing environments to evaluate stability
- D. Adding more RAM modules within enterprise security environments for performance

Answer: B

Q600. What is anti-forensics?

- A. A type of forensic analysis technique within enterprise computing environments
- B. A standard software application used for enterprise computing operations and tasks
- C. Techniques used to prevent or obstruct forensic investigation, such as data wiping and timestamp manipulation
- D. Good forensic practices applied within enterprise security environments for compliance

Answer: C

Q601. What are the six phases of the NIST incident response lifecycle?

- A. Design, Develop, Test, Release, Maintain, Retire across computing environments
- B. Preparation, Detection and Analysis, Containment, Eradication, Recovery, Post-Incident Activity
- C. None of these in any deployment scenario or context across computing environments
- D. Plan, Build, Test, Deploy, Monitor, Retire within enterprise security environments

Answer: B

Q602. What is triage in incident response?

- A. A network tool used in enterprise network infrastructure
- B. Prioritizing incidents based on severity, impact, and urgency to allocate resources
- C. A strain of self-replicating malicious software programs
- D. Medical treatment within enterprise security environments

Answer: B

Q603. What is the eradication phase?

- A. Deleting the incident report within enterprise security environments
- B. Removing the root cause including malware, compromised accounts, and exploited vulnerabilities
- C. Erasing all data regardless of the specific situation or context
- D. Shutting down all systems regardless of the specific situation or context

Answer: B

Q604. What is the recovery phase?

- A. Restoring affected systems to normal operation and monitoring for recurrence
- B. Recovering deleted emails within enterprise security environments
- C. A data backup process for managing enterprise data resources
- D. Finding lost items within enterprise security environments

Answer: A

Q605. What is a lessons learned review?

- A. A post-incident analysis of what happened, what worked, what failed, and how to improve
- B. A security audit deployed across enterprise environments used in enterprise computing environments
- C. A training course within enterprise computing environments
- D. A school exam within enterprise computing environments

Answer: A

Q606. What is the role of a CISO during a major incident?

- A. To write code within enterprise computing infrastructure and management
- B. To provide strategic leadership, coordinate response, and make critical containment decisions
- C. To fix computers within enterprise computing infrastructure and management
- D. To design websites for enterprise computing environments and management

Answer: B

Q607. What is a playbook in incident response?

- A. A game manual within modern computing environments
- B. A software manual used in enterprise computing environments
- C. A children's book within modern computing environments
- D. Predefined procedures for responding to specific types of security incidents

Answer: D

Q608. What is the purpose of incident classification?

- A. To categorize incidents by type and severity for appropriate response and resource allocation
- B. To file paperwork within the data management framework and management
- C. To rank team members within enterprise computing infrastructure and management
- D. To organize files within the data management framework and management

Answer: A

Q609. What is threat hunting?

- A. A recreational entertainment application for consumer devices
- B. Hunting animals within enterprise security environments
- C. Proactively searching through networks to detect threats that evaded existing controls
- D. Installing antivirus software on the development machine

Answer: C

Q610. What is the importance of communication during incident response?

- A. Communication should wait until after resolution
- B. Clear, timely communication with stakeholders is essential for effective coordination
- C. Only technical communication matters without any additional considerations needed
- D. Communication is not needed in any deployment scenario or context

Answer: B

Q611. What is a SIEM system?

- A. A physical hardware component used in computing infrastructure
- B. Security Information and Event Management: aggregates, correlates, and analyzes security data
- C. A next-generation firewall security appliance deployed across enterprise environments
- D. A physical cable used for network connections used in enterprise network infrastructure

Answer: B

Q612. What is the difference between signature-based and anomaly-based detection?

- A. Anomaly-based detection only works effectively in offline analysis and forensic modes
- B. Signature-based detection is always considered better than anomaly-based detection methods
- C. They are functionally identical detection frameworks with no meaningful differences at all
- D. Signature-based matches known patterns; anomaly-based detects deviations from normal behavior

Answer: D

Q613. What is a Security Operations Center (SOC)?

- A. A software company that develops security products deployed across enterprise environments
- B. A physical hardware component used in computing infrastructure
- C. A centralized facility where a team continuously monitors, detects, and responds to security incidents
- D. A cloud computing platform for hosting enterprise workloads

Answer: C

Q614. What is log correlation?

- A. Deleting old logs to free up storage space on servers
- B. Sorting logs alphabetically for easier navigation across computing environments
- C. Comparing log file sizes for storage capacity planning
- D. Analyzing and connecting related events across multiple sources to identify threat patterns

Answer: D

Q615. What is UEBA?

- A. Security analytics using machine learning to establish baselines and detect anomalous user behavior
- B. A social media management tool used for content scheduling tasks and engagement tracking
- C. A user interface design tool used for creating web application page layouts and mockups
- D. An email analytics tool used for tracking message delivery metrics and campaign performance

Answer: A

Q616. What is the purpose of vulnerability scanning?

- A. To automatically identify known security weaknesses in systems and configurations
- B. To compress files for reducing disk storage consumption
- C. To create new vulnerabilities in systems for testing and management
- D. To scan paper documents and convert them to digital format

Answer: A

Q617. What is threat detection in security monitoring?

- A. A recreational entertainment application for consumer devices
- B. Identifying potential security threats through analysis of security data, patterns, and behaviors
- C. A weather detection system for forecasting atmospheric events used in enterprise computing environments
- D. Creating new threats to test system resilience capabilities

Answer: B

Q618. What is the role of a SOC analyst?

- A. Writing application source code for building new software features and functionality
- B. Monitoring alerts, investigating potential incidents, performing triage, and escalating threats
- C. Managing database servers and optimizing query performance for application workloads
- D. Architecting and building responsive enterprise web applications and user interfaces

Answer: B

Q619. What is a honeypot in security monitoring?

- A. A VPN service for encrypting internet traffic connections used in enterprise computing environments
- B. A decoy system designed to attract attackers and provide intelligence about attack methods
- C. A next-generation firewall for filtering network traffic flows
- D. A jar of honey used for food and cooking purposes used in enterprise computing environments

Answer: B

Q620. What is the importance of log retention policies?

- A. Logs should be deleted immediately after they are created
- B. Logs should never be kept or retained for any period regardless of the deployment context or scenario
- C. Ensuring historical data availability for investigation, compliance, and trend analysis
- D. Retention is only about managing physical storage capacity

Answer: C

Q621. What are the main offenses covered under PECA 2016?

- A. Only hacking is covered as a cybercrime offense under PECA
- B. Unauthorized access, data damage, electronic fraud, cyber terrorism, spamming, and spoofing
- C. Only online shopping fraud is covered under PECA across computing environments
- D. Only spam emails are covered as offenses under the PECA act

Answer: B

Q622. What is FIA's role in cybercrime in Pakistan?

- A. FIA only handles immigration cases and border control
- B. The designated agency for investigating and prosecuting cybercrimes under PECA 2016
- C. FIA only handles customs and trade regulation enforcement
- D. FIA has no role in cybercrime investigation or prosecution

Answer: B

Q623. What is the GDPR?

- A. A Pakistani law governing domestic trade and commerce
- B. An EU regulation providing comprehensive data protection rights for EU citizens
- C. A US trade law governing international commerce and tariffs
- D. A UN resolution addressing global peacekeeping and diplomacy

Answer: B

Q624. What is computer forensics evidence admissibility?

- A. Digital evidence is never admissible in any court proceedings regardless of the deployment context or scenario
- B. Evidence must meet standards including authenticity, integrity, chain of custody, and relevance
- C. All digital evidence is automatically admissible without conditions
- D. Only email evidence is admissible while other digital evidence is excluded

Answer: B

Q625. What is the difference between ethical and illegal hacking?

- A. There is no difference between ethical and illegal hacking or notable impact in any deployment scenario
- B. Ethical hacking is authorized security testing with permission; illegal hacking is unauthorized access
- C. Illegal hacking is faster than ethical hacking in all scenarios
- D. Ethical hacking uses better tools than illegal hacking methods

Answer: B

Q626. What is cyber defamation?

- A. Publishing false or damaging statements about a person through digital media
- B. A cryptographic algorithm used for protecting sensitive data
- C. A standard network communication protocol for data transfer
- D. Building a good reputation through positive online interactions

Answer: A

Q627. What is the right to be forgotten?

- A. Forgetting your password and requesting an account reset
- B. A memory improvement technique for better data recall used in enterprise computing environments
- C. An individual's right to request deletion of their personal data under certain conditions
- D. A data backup policy for creating redundant recovery copies

Answer: C

Q628. What are the penalties for cybercrime under PECA 2016?

- A. No penalties exist under PECA for cybercrime offenses regardless of the deployment context or scenario
- B. Only verbal warnings are issued for cybercrime violations
- C. Penalties range from fines to imprisonment up to 14 years depending on offense severity
- D. Only monetary fines are imposed without imprisonment penalties

Answer: C

Q629. What is the concept of data sovereignty?

- A. The principle that data is subject to the laws of the country where it is stored or processed
- B. Data belongs to everyone equally and cannot be controlled by any single entity
- C. Data is always free and not subject to any jurisdictional laws or regulations at all
- D. Data has its own independent government and governance structure for management

Answer: A

Q630. What is responsible disclosure?

- A. Privately reporting vulnerabilities to the vendor and allowing time for patching before public disclosure
- B. Publishing vulnerabilities immediately for public disclosure
- C. Never reporting discovered vulnerabilities to anyone in any deployment scenario or context
- D. Selling discovered vulnerabilities to the highest bidder across computing environments

Answer: A

Q631. How is AI enhancing cyber security defenses?

- A. AI is not used in cybersecurity defenses in any capacity regardless of the deployment context or scenario
- B. AI is only used for creating malicious viruses and malware
- C. AI enhances threat detection through behavioral analytics, automates response, and identifies patterns
- D. AI completely replaces all human security staff permanently

Answer: C

Q632. What are the security challenges of edge computing?

- A. There are no security challenges with this approach in any deployment scenario or context
- B. Edge computing completely eliminates all security threats across computing environments
- C. Edge computing is inherently more secure than cloud computing across computing environments
- D. Distributed processing creates challenges including physical security, limited resources, and managing many nodes

Answer: D

Q633. What is quantum computing's potential impact on cybersecurity?

- A. Quantum computers could break current public-key encryption like RSA and ECC
- B. Quantum computing makes all existing encryption much stronger
- C. Quantum computing has no impact on cybersecurity at all
- D. Quantum computing only affects hardware and not software security

Answer: A

Q634. What is zero trust network access (ZTNA)?

- A. A VPN replacement designed for establishing encrypted network tunnel connections
- B. A model verifying identity and context before granting access to specific applications
- C. A type of firewall designed for filtering wireless network traffic and connections
- D. Trusting all users and devices without any verification or authentication needed

Answer: B

Q635. What is the security concern with smart home devices?

- A. Smart homes are completely secure without any vulnerabilities
- B. Vulnerable devices could be used for surveillance, network entry, or botnet recruitment
- C. Smart homes have no security issues or concerns whatsoever
- D. Only cost is a concern with smart home devices not security

Answer: B

Q636. What is DevSecOps as an emerging trend?

- A. Integration of security into DevOps pipelines, automating security testing throughout development
- B. A high-level language used for development within modern computing environments
- C. A database management system for storing structured records
- D. An operating system for managing system resources used in enterprise computing environments

Answer: A

Q637. What is Security Mesh Architecture?

- A. A chain-link barrier for physical boundary demarcation purposes
- B. A physical perimeter fence for building boundary security
- C. A mesh Wi-Fi network for extending wireless home coverage used in enterprise computing environments
- D. A distributed security approach deploying controls closer to assets for composable, scalable security

Answer: D

Q638. What are the security implications of autonomous vehicles?

- A. There are no implications for this technology whatsoever regardless of the deployment context or scenario
- B. They are completely safe and have no vulnerabilities regardless of the deployment context or scenario
- C. Risks including remote hijacking, sensor manipulation, data privacy, and V2X communication security
- D. Only traffic violations are a concern not cybersecurity regardless of the deployment context or scenario

Answer: C

Q639. What is privacy-enhancing technology (PET)?

- A. A social media privacy setting for managing profile visibility used in enterprise computing environments
- B. A physical hardware component used in computing infrastructure
- C. Technologies protecting privacy while enabling data use, like homomorphic encryption and differential privacy
- D. Pet care technology for monitoring animal health activity across computing environments

Answer: C

Q640. What is the convergence of IT and OT security?

- A. A standard software application used for enterprise computing operations and system management workflows
- B. Integration of information technology and operational technology security as industrial systems connect to IT networks
- C. A physical network cable used for connecting and linking enterprise infrastructure devices together
- D. Merging two companies through a corporate acquisition deal within enterprise security environments

Answer: B

Q641. How does a risk assessment differ from a vulnerability assessment in cyber security?

- A. Risk assessment only examines hardware while vulnerability assessment examines only software components
- B. Risk assessment is performed annually while vulnerability assessment is performed on a daily recurring basis
- C. Risk assessment evaluates likelihood and impact of threats while vulnerability assessment identifies weaknesses
- D. Risk assessment uses automated tools while vulnerability assessment relies solely on manual review processes

Answer: C

Q642. What is the primary difference between a threat and a vulnerability?

- A. Threats are potential dangers while vulnerabilities are exploitable weaknesses in systems
- B. Threats only affect hardware while vulnerabilities only affect software applications
- C. Threats are always external while vulnerabilities are exclusively internal system issues
- D. Threats require physical access while vulnerabilities require remote network connectivity

Answer: A

Q643. Which security model provides access based on sensitivity labels assigned to data and users?

- A. Discretionary Access Control model
- B. Attribute-Based Access Control model
- C. Role-Based Access Control model
- D. Mandatory Access Control model

Answer: D

Q644. What is the concept of 'least privilege' in cyber security?

- A. Granting users maximum access rights for operational efficiency and user convenience
- B. Restricting all users from accessing any systems outside of regular business hours
- C. Allowing temporary administrator rights to all employees during onboarding processes
- D. Providing users only the minimum access necessary to perform their specific job duties

Answer: D

Q645. What is the purpose of a security audit?

- A. Removing outdated hardware from the organization data center facilities
- B. Training employees on new software features and application updates
- C. Installing new security software on all systems throughout the organization
- D. Evaluating how well security policies and controls are being implemented

Answer: D

Q646. Which of the following best describes 'non-repudiation' in information security?

- A. Preventing unauthorized users from accessing any classified information assets
- B. Ensuring the sender cannot deny having sent a particular message or transaction
- C. Verifying the physical identity of users through biometric scanning technology
- D. Guaranteeing that data remains available during scheduled maintenance windows

Answer: B

Q647. What is a 'zero-day vulnerability'?

- A. A flaw known to attackers but unknown to the vendor with no patch
- B. A weakness that requires zero user interaction to fully remediate
- C. A vulnerability that has been patched within zero days of discovery
- D. A vulnerability that only exists in systems less than one day old

Answer: A

Q648. How does 'security through obscurity' differ from proper security measures?

- A. It involves frequent penetration testing together with regular comprehensive code reviews
- B. It uses the latest encryption algorithms combined with multi-layered network segmentation
- C. It enforces strict password policies alongside mandatory multi-factor authentication rules
- D. It relies on keeping system design secret rather than implementing robust security controls

Answer: D

Q649. What is the main objective of a business continuity plan in relation to cyber security?

- A. Recruiting additional security staff for the incident response team
- B. Maximizing profit margins during normal business operating conditions
- C. Ensuring critical operations continue during and after a security incident
- D. Replacing all legacy systems with modern cloud-based infrastructure

Answer: C

Q650. Which framework is commonly used for managing and reducing cyber security risk?

- A. Agile Development Framework
- B. ITIL Service Management Framework
- C. NIST Cybersecurity Framework
- D. PMBOK Project Management Framework

Answer: C

Q651. What is the key difference between identification, authentication, and authorization?

- A. Identification encrypts data, authentication decrypts data, and authorization transfers data
- B. They are three identical processes that serve the same purpose in every security system
- C. Identification grants access, authentication logs activity, and authorization claims identity
- D. Identification claims identity, authentication verifies it, and authorization grants permissions

Answer: D

Q652. Which security principle states that systems should fail in a secure manner?

- A. Separation of duties
- B. Open design
- C. Defense in depth
- D. Fail-secure design

Answer: D

Q653. What is the purpose of separation of duties in security?

- A. Ensuring no single person has complete control over a critical process or transaction
- B. Separating development and production servers into distinct physical data centers
- C. Assigning each employee exactly one security tool to manage and maintain daily
- D. Dividing the network into multiple segments for improved overall performance speed

Answer: A

Q654. How does a hash function contribute to data integrity?

- A. It creates redundant copies of data across multiple geographic locations
- B. It produces a fixed-size digest that changes if the original data is modified
- C. It encrypts data so that only authorized users can access and read the content
- D. It compresses data to reduce storage space requirements on disk drives

Answer: B

Q655. What is the concept of 'need to know' in information security?

- A. Access to information is limited to those who require it for their duties
- B. Users need to know all system administrator passwords for emergencies
- C. All employees should know everything about the organization security posture
- D. Security teams must share all threat intelligence with every staff member

Answer: A

Q656. Which type of security control aims to discourage potential attackers?

- A. Corrective control
- B. Deterrent control
- C. Recovery control
- D. Detective control

Answer: B

Q657. What is the purpose of a security classification scheme?

- A. Ranking employees by their performance scores during annual reviews
- B. Sorting hardware inventory by purchase date for warranty tracking
- C. Categorizing data based on sensitivity to determine protection levels
- D. Organizing network cables by color codes for physical identification

Answer: C

Q658. What does the principle of 'complete mediation' require?

- A. System backups must be created before any configuration change is applied
- B. Security policies must be reviewed by every employee before implementation
- C. All network traffic must be encrypted using the strongest available algorithms
- D. Every access request must be checked against access control policies each time

Answer: D

Q659. What is a compensating control in security?

- A. A redundant backup system that activates during scheduled maintenance
- B. An alternative control used when a primary control cannot be implemented
- C. A monitoring tool that compensates for network latency issues automatically
- D. A financial payment made to users affected by a security breach event

Answer: B

Q660. How does the principle of 'economy of mechanism' improve security?

- A. By limiting the number of employees with access to security dashboards
- B. By automating all security processes to eliminate any human involvement
- C. By keeping security designs simple and small to reduce potential flaws
- D. By reducing costs through outsourcing all security operations and functions

Answer: C

Q661. What is the main advantage of elliptic curve cryptography over traditional RSA?

- A. ECC is immune to all known quantum computing attacks on encryption
- B. ECC provides equivalent security with significantly smaller key sizes than RSA
- C. ECC does not require any mathematical computations for key generation
- D. ECC is easier to implement in software compared to RSA algorithm libraries

Answer: B

Q662. How does a message authentication code (MAC) differ from a digital signature?

- A. MACs use symmetric keys shared between parties while digital signatures use asymmetric keys
- B. MACs can only be used for email while digital signatures work across all protocols
- C. MACs are longer in byte length than digital signatures for all algorithm types
- D. MACs provide confidentiality while digital signatures provide only availability protection

Answer: A

Q663. What is a key exchange protocol used to securely share keys over an insecure channel?

- A. File Transfer Protocol
- B. Diffie-Hellman protocol
- C. Simple Mail Transfer Protocol
- D. Address Resolution Protocol

Answer: B

Q664. What is a rainbow table attack in cryptography?

- A. An attack using precomputed hash values to reverse password hashes quickly
- B. A social engineering attack using colorful phishing emails to attract attention
- C. A method of intercepting encrypted traffic using spectrum analysis techniques
- D. A brute-force attack that tries every possible character combination one at a time

Answer: A

Q665. What is the purpose of adding a salt to password hashing?

- A. To compress the hash output into a shorter string for efficient storage
- B. To increase the computational speed of the hashing algorithm execution
- C. To encrypt the hash output so it cannot be read from the database directly
- D. To add random data preventing identical passwords from producing identical hashes

Answer: D

Q666. Which mode of AES encryption uses an initialization vector and chains blocks together?

- A. Cipher Block Chaining mode
- B. Output Feedback Block mode
- C. Electronic Codebook mode
- D. Counter Frequency mode

Answer: A

Q667. What is the role of a public key infrastructure (PKI)?

- A. Managing the lifecycle of digital certificates including issuance and revocation
- B. Storing all encryption keys in a single centralized public-facing database
- C. Generating one-time passwords for multi-factor authentication processes
- D. Providing public internet access to organizations through dedicated gateways

Answer: A

Q668. What is a known-plaintext attack?

- A. An attack where the attacker guesses the encryption key using random brute force tries
- B. An attack where the attacker has access to both plaintext and its corresponding ciphertext
- C. An attack where the attacker can only observe encrypted data passing over the network
- D. An attack where the attacker modifies plaintext before it reaches the encryption system

Answer: B

Q669. What does perfect forward secrecy guarantee?

- A. That compromise of long-term keys does not compromise past session keys
- B. That all future encryption keys are derived from a single master key
- C. That messages are guaranteed to arrive in the exact order they were sent
- D. That encrypted messages can never be decrypted even by the intended recipient

Answer: A

Q670. What is steganography?

- A. An encryption algorithm that uses steganographic keys for cipher operations
- B. A protocol for securely transmitting keys between two authenticated parties
- C. A technique for breaking encrypted messages using statistical analysis methods
- D. A method of hiding data within other non-secret data like images or audio

Answer: D

Q671. What is the difference between an IDS and an IPS?

- A. IDS operates at the application layer while IPS operates at the physical layer only
- B. IDS is hardware-based while IPS is exclusively deployed as a software solution
- C. IDS detects and alerts on threats while IPS can also actively block malicious traffic
- D. IDS blocks threats automatically while IPS only generates alerts for manual review

Answer: C

Q672. How does a stateful firewall differ from a stateless packet filter?

- A. A stateful firewall tracks active connections and makes decisions based on connection state
- B. A stateless filter provides more security because it examines every packet independently
- C. A stateless filter remembers previous packets while stateful firewalls process in isolation
- D. A stateful firewall only inspects packet headers while stateless filters inspect payloads

Answer: A

Q673. What is ARP spoofing and what risk does it pose?

- A. Sending fake ARP messages to link an attacker's MAC address with a legitimate IP address
- B. Intercepting DNS queries to redirect users to malicious websites for credential theft
- C. Exploiting TCP three-way handshake to create half-open connections exhausting resources
- D. Flooding a switch with random MAC addresses to force it into hub mode for broadcasting

Answer: A

Q674. What is the purpose of DNS Security Extensions (DNSSEC)?

- A. Increasing the speed of DNS resolution through distributed caching mechanisms
- B. Authenticating DNS responses to prevent DNS spoofing and cache poisoning attacks
- C. Encrypting all DNS query traffic between clients and DNS resolver servers
- D. Blocking malicious domain names from being resolved by any DNS resolver server

Answer: B

Q675. What is network address translation's security benefit?

- A. It hides internal IP addresses from external networks making them harder to target
- B. It automatically patches vulnerabilities on all devices connected to the network
- C. It blocks all incoming traffic regardless of any configured firewall rule policies
- D. It encrypts all outgoing traffic automatically before reaching the internet gateway

Answer: A

Q676. What is a honeynet in network security?

- A. A network of honeypots designed to attract and study attacker behavior and techniques
- B. A high-speed encrypted network used exclusively for secure financial data transfers
- C. A mesh network topology that provides redundant paths for critical data transmission
- D. A backup network that automatically activates when the primary network fails entirely

Answer: A

Q677. How does port security help protect a network switch?

- A. By encrypting all traffic passing through individual switch ports automatically
- B. By increasing the bandwidth available on each switch port for better performance
- C. By monitoring port temperatures to prevent overheating and hardware failure events
- D. By limiting the number of MAC addresses allowed on a port to prevent MAC flooding

Answer: D

Q678. What does the term 'east-west traffic' refer to in network security?

- A. Traffic flowing between cloud service providers and on-premises data centers
- B. Traffic flowing between the internal network and external internet destinations
- C. Traffic flowing between the organization headquarters and remote branch offices
- D. Traffic flowing between internal servers and systems within the same network

Answer: D

Q679. What is the role of a network tap in security monitoring?

- A. A device that copies network traffic for monitoring without disrupting data flow
- B. A protocol that encrypts monitoring data before sending it to analysis systems
- C. A software agent installed on endpoints to collect local network usage metrics
- D. A tool that terminates suspicious network connections automatically in real time

Answer: A

Q680. What is the purpose of 802.1X network access control?

- A. Providing port-based authentication to control device access to the network
- B. Encrypting wireless traffic between access points and connected user devices
- C. Managing IP address allocation through dynamic host configuration services
- D. Monitoring network performance metrics like latency and packet loss rates

Answer: A

Q681. How does Address Space Layout Randomization (ASLR) improve OS security?

- A. It encrypts all memory contents to prevent unauthorized data access by programs
- B. It randomizes memory addresses making buffer overflow exploits harder to execute
- C. It allocates more memory to security processes to improve threat detection speed
- D. It defragments memory to prevent crashes caused by memory fragmentation issues

Answer: B

Q682. What is the security purpose of chroot in Linux?

- A. Automatically rotating log files to prevent disk space from being exhausted
- B. Scheduling system updates to run during off-peak hours for minimal impact
- C. Isolating a process by changing its apparent root directory to limit access
- D. Granting root access to all users temporarily during maintenance periods

Answer: C

Q683. What is the purpose of Data Execution Prevention (DEP) in modern operating systems?

- A. Preventing programs from executing code stored in non-executable memory regions
- B. Encrypting executable files on disk to prevent unauthorized code modification
- C. Stopping users from deleting critical system files and configuration settings
- D. Blocking network traffic from reaching applications running on protected ports

Answer: A

Q684. How does mandatory access control (MAC) differ from discretionary access control (DAC) in OS security?

- A. MAC is used only in Windows while DAC is used exclusively in Linux environments
- B. MAC uses system-enforced policies based on labels while DAC lets owners set permissions
- C. MAC is less secure than DAC because it gives users more control over their resources
- D. MAC allows resource owners to set permissions while DAC uses system-enforced policies

Answer: B

Q685. What is the role of SELinux in operating system security?

- A. Scheduling automatic system updates and security patches for Linux distributions
- B. Providing mandatory access control policies for Linux kernel security enforcement
- C. Managing network connections and firewall rules for Linux-based server systems
- D. Creating encrypted virtual machines for running untrusted applications safely

Answer: B

Q686. What is privilege escalation in the context of OS security?

- A. An attacker gaining higher privileges than originally authorized on the system
- B. An automated process that upgrades user accounts during scheduled maintenance
- C. A legitimate administrator granting additional permissions to a user upon request
- D. A security feature that temporarily elevates privileges for approved operations

Answer: A

Q687. What is the purpose of the Windows Security Event Log?

- A. Recording login attempts, policy changes, and security-related system events
- B. Maintaining a list of installed programs and their current version numbers
- C. Tracking hardware performance metrics like CPU temperature and fan speeds
- D. Storing application crash reports and software compatibility error messages

Answer: A

Q688. What is sandboxing in the context of OS security?

- A. Storing sensitive data in encrypted containers on external storage devices
- B. Running applications in an isolated environment to limit their system access
- C. Testing network connections in a simulated environment before deployment
- D. Backing up system files to a separate partition for disaster recovery use

Answer: B

Q689. How does process isolation improve operating system security?

- A. It makes all processes run faster by allocating equal CPU time to each one
- B. It automatically terminates any process that has been running too long
- C. It prevents one process from accessing the memory space of another process
- D. It allows processes to share memory freely for improved data collaboration

Answer: C

Q690. What is the security benefit of using a minimal OS installation?

- A. It increases system performance by using all available disk space for caching data
- B. It automatically configures all security settings without administrator intervention
- C. It provides more user-friendly features for non-technical administrative staff
- D. It reduces the attack surface by installing only necessary components and services

Answer: D

Q691. How does Content Security Policy (CSP) help prevent XSS attacks?

- A. By encrypting all script files before they are sent to the client browser
- B. By requiring users to manually approve each script before it executes
- C. By specifying which content sources the browser should trust and execute
- D. By automatically removing all JavaScript code from web page responses

Answer: C

Q692. What is the difference between stored XSS and reflected XSS?

- A. Stored XSS uses SQL queries while reflected XSS uses JavaScript code exclusively
- B. Stored XSS requires physical access while reflected XSS requires network level access
- C. Stored XSS only affects administrators while reflected XSS targets all regular users
- D. Stored XSS persists on the server while reflected XSS is returned in the immediate response

Answer: D

Q693. What is an insecure direct object reference (IDOR) vulnerability?

- A. When a web server returns a 404 error because the requested resource was not found
- B. When an application exposes internal object references allowing unauthorized data access
- C. When JavaScript code references DOM elements that have not been loaded on the page
- D. When a database query fails because of incorrect table reference in the SQL statement

Answer: B

Q694. How do anti-CSRF tokens protect web applications?

- A. By embedding unique tokens in forms that the server validates on submission
- B. By encrypting all form data before submission to the server for processing
- C. By blocking all cross-origin requests regardless of their source or purpose
- D. By requiring users to re-enter their password before every form submission

Answer: A

Q695. What is the purpose of HTTP security headers like X-Frame-Options?

- A. Defining the caching duration for static resources like images and style sheets
- B. Controlling whether a browser can render a page inside a frame to prevent clickjacking
- C. Setting the default character encoding for all text displayed on the web page
- D. Increasing the maximum file size that can be uploaded through web application forms

Answer: B

Q696. What is a Server-Side Request Forgery (SSRF) attack?

- A. An attack where the client forges server certificates to intercept encrypted communications
- B. An attack where database queries are modified to return unauthorized data to the attacker
- C. An attack where session cookies are stolen through cross-site scripting vulnerabilities
- D. An attack where the server is tricked into making requests to unintended internal resources

Answer: D

Q697. What is the security risk of exposing detailed error messages to users?

- A. Detailed errors increase bandwidth usage because they are larger than generic messages
- B. Detailed errors slow down the web application because they consume more server memory
- C. Detailed errors may reveal system architecture, paths, and technology stack to attackers
- D. Detailed errors cause browsers to crash when they contain too many special characters

Answer: C

Q698. How does parameterized querying prevent SQL injection?

- A. By encrypting all SQL queries before they are sent to the database server
- B. By separating SQL code from user data so input is treated as data not commands
- C. By limiting the number of queries a user can execute within a given time period
- D. By automatically detecting and removing SQL keywords from all user input fields

Answer: B

Q699. What is the purpose of the Strict-Transport-Security (HSTS) header?

- A. Limiting the number of concurrent connections a browser can make to the server
- B. Requiring users to authenticate before accessing any page on the web application
- C. Compressing HTTP responses to reduce bandwidth consumption for mobile devices
- D. Forcing browsers to only communicate with the server using HTTPS connections

Answer: D

Q700. What is DOM-based XSS?

- A. An XSS attack that targets the server-side rendering engine of the web application
- B. An XSS attack that modifies DNS records to redirect users to malicious websites
- C. An XSS attack that only affects web applications using document object models
- D. An XSS attack where the payload is executed through client-side DOM manipulation

Answer: D

Q701. How does polymorphic malware evade antivirus detection?

- A. By changing its code structure with each infection while maintaining its core functionality
- B. By disguising itself as a legitimate system process visible in the task manager window
- C. By encrypting network traffic to prevent antivirus from scanning its communications data
- D. By running only during times when antivirus software is scheduled for daily scan updates

Answer: A

Q702. What is a watering hole attack?

- A. Placing malware on USB drives and leaving them in public places for people to find
- B. Flooding a server with HTTP requests to make the website unavailable to all users
- C. Sending mass phishing emails to random recipients hoping some will click the links
- D. Compromising websites frequently visited by a target group to infect their devices

Answer: D

Q703. What is the difference between spear phishing and regular phishing?

- A. Spear phishing only targets executives while regular phishing only targets entry-level employees
- B. Spear phishing uses phone calls while regular phishing exclusively uses email messages for targeting
- C. Spear phishing targets specific individuals with personalized messages while phishing is generic mass emails
- D. Spear phishing is legal while regular phishing is considered illegal under all global cyber laws

Answer: C

Q704. What is a logic bomb in malware?

- A. An encryption algorithm that self-destructs after a single use to prevent key reuse
- B. A type of virus that destroys computer hardware by overloading electrical components
- C. A network attack that sends logically malformed packets to crash target router devices
- D. Malicious code that activates when specific conditions or triggers are met at a set time

Answer: D

Q705. How does a drive-by download attack work?

- A. An attacker physically inserts a USB drive with malware into the target computer
- B. An attacker drives near a building and exploits weak WiFi to download sensitive data
- C. Malware is automatically downloaded when a user visits a compromised website page
- D. A user intentionally downloads pirated software that contains hidden malware files

Answer: C

Q706. What is credential stuffing and how does it differ from brute force?

- A. Credential stuffing is slower than brute force because it validates each credential manually
- B. Credential stuffing targets only email accounts while brute force targets all application types
- C. Credential stuffing uses previously stolen username-password pairs while brute force guesses randomly
- D. Credential stuffing requires physical access while brute force is conducted entirely remotely

Answer: C

Q707. What is a supply chain attack in cyber security?

- A. Intercepting purchase orders to redirect payments to attacker-controlled bank accounts
- B. Stealing shipping information to track the location of valuable technology equipment
- C. Attacking the physical supply chain to prevent delivery of hardware to data centers
- D. Compromising a vendor or supplier to gain access to their customers' systems and data

Answer: D

Q708. What distinguishes a zero-day exploit from a known exploit?

- A. A zero-day exploit is less dangerous because it has not been tested in real attacks
- B. A zero-day exploit targets a vulnerability for which no patch or fix currently exists
- C. A zero-day exploit can only be used once before it becomes completely ineffective
- D. A zero-day exploit requires zero technical knowledge to successfully execute remotely

Answer: B

Q709. What is DNS spoofing?

- A. Registering domain names similar to legitimate ones to trick users into visiting them
- B. Encrypting DNS traffic to prevent eavesdropping on domain resolution network queries
- C. Corrupting DNS cache to redirect domain lookups to malicious IP addresses for phishing
- D. Blocking DNS queries to prevent users from resolving any domain names on the network

Answer: C

Q710. What is a fileless malware attack?

- A. An attack that only targets files stored on removable USB drives and external storage
- B. An attack that hides malware inside image files that appear normal to the viewer
- C. An attack that operates entirely in memory without writing any files to the disk drive
- D. An attack that deletes all files on the system before demanding a ransom payment

Answer: C

Q711. How does SAML enable single sign-on across different web applications?

- A. By encrypting browser cookies so they can be shared between different website domains
- B. By requiring users to create identical credentials across every participating application
- C. By storing all user passwords in a shared centralized database accessible to all applications
- D. By exchanging authentication and authorization data between identity and service providers

Answer: D

Q712. What is the difference between authentication and authorization?

- A. Authentication determines access rights while authorization verifies the user's identity
- B. Authentication verifies who the user is while authorization determines what they can access
- C. Authentication and authorization are identical processes with different names in security
- D. Authentication is used for external users while authorization is only for internal users

Answer: B

Q713. What is the primary advantage of hardware security tokens over SMS-based two-factor authentication?

- A. Hardware tokens are resistant to SIM swapping and interception attacks that affect SMS codes
- B. Hardware tokens are cheaper to deploy than SMS-based authentication across all organizations
- C. Hardware tokens do not require any batteries or charging to function and generate codes
- D. Hardware tokens provide faster authentication than SMS because they work without networks

Answer: A

Q714. What is OAuth 2.0 primarily designed for?

- A. Providing a universal username and password standard across all web applications
- B. Delegated authorization allowing third-party applications limited access to user resources
- C. Encrypting all data stored in databases used by web applications and mobile apps
- D. Replacing traditional firewalls with application-level access control mechanisms

Answer: B

Q715. What is the purpose of an identity provider (IdP) in federated identity management?

- A. Developing custom authentication protocols for each individual web application
- B. Creating and managing user identities and authenticating users for service providers
- C. Providing internet connectivity to all users within a federated network system
- D. Storing all application data and user files in a centralized cloud storage system

Answer: B

Q716. What is privileged access management (PAM)?

- A. A tool for creating user accounts in bulk during organizational onboarding events
- B. A method of granting all employees administrator access for operational efficiency
- C. A protocol for resetting forgotten passwords through automated self-service portals
- D. A framework for managing and monitoring accounts with elevated system access privileges

Answer: D

Q717. How does passwordless authentication work?

- A. It uses very short passwords of one or two characters for faster login processes
- B. It stores passwords in the browser so users do not need to type them each time
- C. It automatically generates and fills in passwords without any user involvement
- D. It replaces passwords with alternatives like biometrics, security keys, or magic links

Answer: D

Q718. What is the purpose of access reviews in identity management?

- A. Automatically granting additional permissions to users who request them through helpdesk
- B. Periodically reviewing and validating user access rights to ensure they remain appropriate
- C. Removing all user access permissions at the end of each fiscal quarter for renewal
- D. Creating new user accounts for employees who join the organization each calendar month

Answer: B

Q719. What is the FIDO2 authentication standard?

- A. A protocol for encrypting data stored in cloud computing environments and databases
- B. A framework for managing firewall rules across multiple network security appliances
- C. A specification for designing user interfaces in mobile banking applications only
- D. A standard enabling strong passwordless authentication using public key cryptography

Answer: D

Q720. What is just-in-time (JIT) access provisioning?

- A. Pre-provisioning all possible access rights to users during their first day of employment
- B. Granting elevated access only when needed and automatically revoking it after a set period
- C. Allowing users to permanently keep any elevated access they have ever been granted
- D. Manually reviewing and approving every access request within ninety business days

Answer: B

Q721. How does dynamic application security testing (DAST) differ from SAST?

- A. DAST requires source code access while SAST only needs the compiled application binary files
- B. DAST is only for mobile applications while SAST works exclusively on web-based applications
- C. DAST tests running applications from the outside while SAST analyzes source code without execution
- D. DAST analyzes source code while SAST tests running applications by sending network requests

Answer: C

Q722. What is threat modeling in secure software development?

- A. Creating 3D models of physical security threats for visual presentation to stakeholders
- B. Systematically identifying and evaluating potential threats to an application during design
- C. Documenting all past security incidents in a database for historical trending analysis
- D. Monitoring production environments for active threats and ongoing security incidents

Answer: B

Q723. What is the STRIDE threat model used for?

- A. Rating software developers on their security knowledge, training, and certification levels
- B. Measuring the speed, throughput, reliability, integrity, durability, and efficiency of systems
- C. Categorizing threats into Spoofing, Tampering, Repudiation, Information Disclosure, DoS, and Elevation
- D. Defining six phases of the software development lifecycle from planning through deployment

Answer: C

Q724. What is software composition analysis (SCA)?

- A. Identifying vulnerabilities in third-party libraries and open-source components used in software
- B. Analyzing the performance composition of software to optimize memory and CPU utilization
- C. Composing new software by combining multiple commercial off-the-shelf application products
- D. Creating detailed architectural diagrams of software systems for documentation purposes

Answer: A

Q725. What is the purpose of security requirements in the SDLC?

- A. Specifying the programming languages and frameworks that developers must use exclusively
- B. Documenting the team structure and roles assigned for the software development project effort
- C. Defining specific security features and controls that the software must implement from the start
- D. Listing the hardware requirements needed to run the software on production server environments

Answer: C

Q726. What is the concept of 'shift left' in DevSecOps?

- A. Integrating security testing earlier in the development pipeline rather than only at the end
- B. Moving all development operations to a different time zone for round-the-clock development
- C. Shifting security responsibility entirely from developers to the dedicated security team
- D. Postponing security testing until after deployment to avoid slowing down development speed

Answer: A

Q727. What is a secure coding standard?

- A. A set of rules and guidelines for writing code that minimizes security vulnerabilities
- B. A certification program for developers who complete an advanced security course
- C. A programming language designed specifically for writing security-focused applications
- D. A testing framework that automatically generates test cases for security validation

Answer: A

Q728. What is fuzzing in security testing?

- A. Testing software performance under heavy load conditions to find stability issues
- B. Blurring sensitive data in screenshots to prevent information disclosure publicly
- C. Reviewing code documentation for unclear or ambiguous security requirement specifications
- D. Providing random, unexpected, or malformed input to software to discover vulnerabilities

Answer: D

Q729. What is the OWASP Secure Coding Practices guide?

- A. A programming language designed for building security-focused web applications
- B. A proprietary software tool for scanning applications for known security defects
- C. A certification exam that developers must pass before writing production code
- D. A checklist of secure coding practices to help developers avoid common vulnerabilities

Answer: D

Q730. What is the purpose of a security champion program in development teams?

- A. Replacing developers with security professionals to write all application source code
- B. Hiring external consultants to perform all security testing on behalf of the team
- C. Creating a competition between teams to determine which team has the fewest bugs
- D. Embedding security-focused developers within teams to promote secure coding practices

Answer: D

Q731. How does WPA3 improve security over WPA2?

- A. WPA3 uses shorter encryption keys for faster wireless communication performance
- B. WPA3 uses Simultaneous Authentication of Equals preventing offline dictionary attacks
- C. WPA3 requires physical USB connections between all devices on the wireless network
- D. WPA3 eliminates the need for passwords entirely by using open authentication mode

Answer: B

Q732. What is the KRACK attack and which protocol does it target?

- A. An attack that cracks WEP encryption using statistical analysis of captured packets
- B. An attack exploiting NFC protocols to steal contactless payment card information
- C. An attack targeting Bluetooth pairing to intercept data between connected devices
- D. An attack exploiting WPA2's four-way handshake to reinstall encryption keys

Answer: D

Q733. What is the purpose of network access control (NAC) for wireless networks?

- A. Increasing wireless signal strength throughout the building for better coverage
- B. Ensuring only compliant and authorized devices can connect to the wireless network
- C. Providing guest users with permanent unrestricted access to corporate resources
- D. Reducing the number of available wireless channels to minimize signal interference

Answer: B

Q734. What is mobile application containerization?

- A. Compressing mobile applications to reduce their download size from app stores
- B. Isolating work applications and data from personal content on a mobile device
- C. Grouping multiple applications into a single installation package for convenience
- D. Converting desktop applications into mobile-compatible versions automatically

Answer: B

Q735. What is a deauthentication attack in wireless networks?

- A. Changing the wireless network password to lock out all currently connected users
- B. Preventing new devices from authenticating by overloading the DHCP lease pool
- C. Sending forged deauth frames to disconnect clients from a wireless access point
- D. Disabling the authentication server to prevent all users from logging in remotely

Answer: C

Q736. What security feature does certificate pinning provide in mobile applications?

- A. Encrypting stored application data using the server's public certificate key
- B. Creating self-signed certificates for development testing environments only
- C. Automatically updating expired certificates without requiring user interaction
- D. Preventing man-in-the-middle attacks by validating the server's specific certificate

Answer: D

Q737. What is the security concern with NFC (Near Field Communication) on mobile devices?

- A. NFC signals interfere with WiFi and Bluetooth connections on the same device
- B. Attackers in close proximity can intercept or modify NFC communications and data
- C. NFC technology is incompatible with modern mobile operating system versions
- D. NFC connections consume excessive battery power causing devices to shut down

Answer: B

Q738. What is the purpose of a wireless intrusion prevention system (WIPS)?

- A. Encrypting all wireless traffic between access points and the core network
- B. Managing the distribution of IP addresses for all wireless connected devices
- C. Monitoring wireless networks for unauthorized access points and malicious activity
- D. Increasing the range and signal strength of legitimate wireless access points

Answer: C

Q739. How does mobile threat defense (MTD) protect enterprise mobile devices?

- A. By detecting device, network, and application-level threats on mobile endpoints continuously
- B. By requiring users to connect to the corporate VPN before enabling any application
- C. By replacing the mobile operating system with a custom hardened version for security
- D. By blocking all internet access on mobile devices to prevent any possible threats

Answer: A

Q740. What is SIM swapping and why is it a security concern?

- A. An attacker uses a modified SIM card to intercept all cellular traffic in a geographic area
- B. An attacker convinces a carrier to transfer a victim's number to a new SIM for account takeover
- C. An attacker physically removes the SIM card from a device to prevent it from making calls
- D. An attacker clones a SIM card to use two identical phone numbers simultaneously on the network

Answer: B

Q741. How does the security responsibility differ between IaaS, PaaS, and SaaS?

- A. Customer responsibility decreases from IaaS to SaaS as the provider manages more layers
- B. Customer responsibility increases from IaaS to SaaS as applications become more complex
- C. Security responsibility is identical across all three models with no practical differences
- D. The cloud provider has no security responsibility in any of the three service model types

Answer: A

Q742. What is cloud security posture management (CSPM)?

- A. A training program that teaches employees how to securely use cloud applications at work
- B. A certification framework for evaluating the security capabilities of cloud service providers
- C. A physical security system protecting the data center buildings of cloud service providers
- D. Tools that continuously monitor cloud environments for misconfigurations and compliance violations

Answer: D

Q743. What is the security risk of excessive IAM permissions in cloud environments?

- A. Over-privileged accounts automatically trigger account suspension by the cloud provider
- B. Too many permissions cause billing increases because each permission has a monthly fee
- C. Excessive permissions make cloud services run slower due to additional authorization checks
- D. Over-privileged accounts increase blast radius if credentials are compromised by attackers

Answer: D

Q744. What is a cloud workload protection platform (CWPP)?

- A. A tool that monitors employee productivity when working on cloud-based applications
- B. A platform for managing cloud service billing and cost optimization across accounts
- C. A framework for distributing workloads evenly across multiple cloud provider regions
- D. A solution protecting server workloads including VMs, containers, and serverless functions

Answer: D

Q745. What is the purpose of cloud-native application protection platforms (CNAPP)?

- A. Protecting only legacy applications that have been migrated from on-premises to the cloud
- B. Managing the deployment and scaling of cloud-native applications across multiple regions
- C. Providing network connectivity between different cloud providers for hybrid deployments
- D. Unifying CSPM, CWPP, and other cloud security capabilities into a single integrated platform

Answer: D

Q746. What is the security concern with serverless computing?

- A. Serverless functions cannot be encrypted so all data processed is exposed in plaintext
- B. Reduced visibility into the execution environment makes traditional security monitoring difficult
- C. Serverless computing eliminates all security risks because the provider manages everything
- D. Serverless functions always run with unlimited permissions that cannot be restricted at all

Answer: B

Q747. How does cloud key management service (KMS) enhance security?

- A. By providing unlimited free encryption keys to all users across cloud provider accounts
- B. By eliminating the need for encryption by using secure physical storage in data centers
- C. By automatically encrypting all data without requiring any configuration from customers
- D. By centrally managing encryption keys with access controls, rotation, and audit logging

Answer: D

Q748. What is the purpose of VPC peering in cloud networking security?

- A. Sharing virtual machines between different cloud provider accounts for collaboration
- B. Duplicating VPC configurations across regions for disaster recovery backup purposes
- C. Enabling private network connectivity between VPCs without traversing the public internet
- D. Creating public endpoints for cloud services accessible from anywhere on the internet

Answer: C

Q749. What is a container escape vulnerability?

- A. A configuration error that causes containers to restart repeatedly without stopping
- B. A flaw allowing a process inside a container to break out and access the host system
- C. A storage limitation that prevents containers from saving data to persistent volumes
- D. A network issue that prevents containers from communicating with external services

Answer: B

Q750. What is the role of security groups in cloud environments?

- A. Creating user groups for shared access to cloud management console dashboards
- B. Grouping security team members for project management and task assignment purposes
- C. Acting as virtual firewalls controlling inbound and outbound traffic to cloud resources
- D. Organizing cloud resources into categories for billing and cost allocation tracking

Answer: C

Q751. What is the order of volatility and why is it important in forensics?

- A. A ranking of hard drives by age to determine which should be imaged first during analysis
- B. A guideline for collecting evidence from most volatile to least volatile to preserve critical data
- C. A method for organizing case files by the severity of the crime being investigated
- D. A standard for labeling evidence bags based on the type of device they contain

Answer: B

Q752. What is file carving in digital forensics?

- A. Converting file formats from proprietary to open standards for analysis compatibility
- B. Splitting large files into smaller pieces for easier transfer between forensic systems
- C. Removing metadata from files to protect the privacy of investigation subjects
- D. Recovering files from unallocated disk space using file signatures and structure analysis

Answer: D

Q753. What is timeline analysis in digital forensics?

- A. Scheduling forensic team meetings and deadlines for completing investigation milestones
- B. Measuring how long it takes to complete each step of the forensic investigation process
- C. Creating a chronological sequence of events from multiple evidence sources to reconstruct activities
- D. Tracking the expiration dates of forensic software licenses and tool subscriptions

Answer: C

Q754. How does live forensics differ from traditional dead-box forensics?

- A. Live forensics uses automated tools while dead-box forensics requires entirely manual analysis
- B. Live forensics is performed in real-time during an attack while dead-box is done months afterward
- C. Live forensics analyzes running systems to capture volatile data while dead-box analyzes powered-off devices
- D. Live forensics only applies to servers while dead-box forensics is exclusively for desktop computers

Answer: C

Q755. What is steganographic analysis in digital forensics?

- A. Recovering encrypted files by testing common passwords against encryption algorithms
- B. Scanning network traffic logs for unusual patterns indicating data exfiltration attempts
- C. Analyzing the physical damage to storage media caused by fire, water, or impact events
- D. Detecting and extracting hidden data concealed within images, audio, or other media files

Answer: D

Q756. What is the role of email header analysis in forensic investigations?

- A. Tracing the origin and path of emails by examining routing information in headers
- B. Counting the total number of emails sent by a suspect during a specific period
- C. Formatting email evidence for presentation in court using standardized templates
- D. Reading the content of encrypted emails without needing the decryption password

Answer: A

Q757. What is the significance of slack space in disk forensics?

- A. Slack space is where the operating system stores its temporary cache files during boot
- B. Slack space is reserved by the file system for future use and always contains zero data
- C. Slack space is unused memory that should be defragmented to improve disk performance
- D. Slack space may contain remnants of previously deleted files that can serve as evidence

Answer: D

Q758. What is network forensics?

- A. Managing network device configurations and firmware updates across the organization
- B. Designing and building secure network architectures for enterprise organizations
- C. Optimizing network performance by identifying and resolving bandwidth bottlenecks
- D. Capturing and analyzing network traffic to investigate security incidents and gather evidence

Answer: D

Q759. What is the purpose of a forensic report?

- A. Providing real-time alerts about ongoing security incidents to the response team
- B. Documenting findings, methodology, and conclusions in a clear format for stakeholders
- C. Automatically generating remediation steps for all security vulnerabilities discovered
- D. Creating backups of all evidence files for long-term archival storage purposes

Answer: B

Q760. What is the purpose of a forensic toolkit?

- A. A collection of specialized software tools used for evidence collection and analysis
- B. A physical kit containing screwdrivers and tools for disassembling computer hardware
- C. A set of legal documents required before beginning any forensic investigation
- D. A training manual for new forensic investigators joining the digital forensics team

Answer: A

Q761. How should an incident response team handle evidence during a ransomware attack?

- A. Immediately paying the ransom to recover files before collecting any forensic evidence
- B. Deleting the ransom note to prevent panic among employees and organizational leadership
- C. Formatting all affected systems right away to eliminate the ransomware infection quickly
- D. Preserving encrypted files and ransom notes as evidence before attempting any recovery

Answer: D

Q762. What is the difference between short-term and long-term containment?

- A. Short-term involves rebuilding systems while long-term involves monitoring for threat recurrence
- B. Short-term takes days to implement while long-term is applied within the first few minutes
- C. Short-term stops immediate damage while long-term implements durable fixes allowing investigation
- D. Short-term is performed by management while long-term is handled by the technical team

Answer: C

Q763. What is the purpose of tabletop exercises in incident response?

- A. Testing network bandwidth by sending large amounts of simulated attack traffic
- B. Simulating incident scenarios through discussion to test plans and identify gaps
- C. Training new employees on how to use desktop computers and office applications
- D. Reviewing the physical layout of office furniture to optimize workspace ergonomics

Answer: B

Q764. What is an indicator of compromise (IoC)?

- A. A financial indicator showing the cost of recovering from a security breach event
- B. Observable evidence that a system or network may have been breached by an attacker
- C. A metric measuring the overall compromise between security and user convenience
- D. A performance metric tracking system uptime percentage across all business hours

Answer: B

Q765. When should law enforcement be notified during an incident response?

- A. When the incident involves criminal activity, data breaches with legal requirements, or national security
- B. Only after the incident has been fully resolved and all systems have been restored to normal
- C. Law enforcement should never be notified as it could compromise the internal investigation
- D. Immediately for every security event regardless of severity or type of incident detected

Answer: A

Q766. What is the purpose of incident severity classification?

- A. Categorizing incidents by impact level to determine appropriate response and resource allocation
- B. Ranking incident response team members by their seniority within the organizational hierarchy
- C. Sorting incident tickets alphabetically by the name of the person who reported them
- D. Classifying incidents by the time of day they occurred for shift scheduling optimization

Answer: A

Q767. What is the role of threat intelligence in incident response?

- A. Providing context about threats, attacker tactics, and IoCs to improve detection and response
- B. Generating marketing reports about the organization's security posture for stakeholders
- C. Replacing the need for incident response teams by using artificial intelligence for defense
- D. Automatically blocking all threats without requiring any human intervention or analysis

Answer: A

Q768. What is a playbook in incident response?

- A. A predefined set of procedures for handling specific types of security incidents consistently
- B. A report template used for documenting the final results of completed investigations
- C. A catalog of all security tools and their license keys used by the response team
- D. A training manual for new employees covering general workplace policies and procedures

Answer: A

Q769. What is the purpose of an incident response retainer with a third-party provider?

- A. Hiring permanent full-time security staff through a third-party recruitment agency partner
- B. Ensuring expert incident response resources are available on-demand when a major incident occurs
- C. Purchasing cyber insurance to cover the financial costs of future data breach events
- D. Outsourcing all daily security monitoring operations to a third-party managed service provider

Answer: B

Q770. What is a war room in incident response?

- A. A dedicated space where the response team coordinates and manages a major incident together
- B. A secure server room where all critical infrastructure is housed during normal operations
- C. A virtual meeting room used for daily stand-up meetings about project status and updates
- D. A training facility where employees practice responding to simulated physical emergencies

Answer: A

Q771. How does user and entity behavior analytics (UEBA) enhance security monitoring?

- A. By monitoring only privileged user accounts and ignoring standard employee activities
- B. By replacing SIEM systems entirely with machine learning based threat detection tools
- C. By blocking all user activities that deviate from a predefined list of approved actions
- D. By establishing behavioral baselines and detecting anomalies that indicate potential threats

Answer: D

Q772. What is the difference between signature-based and anomaly-based detection?

- A. Signature-based matches known patterns while anomaly-based detects deviations from normal behavior
- B. Signature-based requires more computing resources than anomaly-based detection methods do
- C. Signature-based is used for network monitoring while anomaly-based is used only for endpoints
- D. Signature-based detects unknown threats while anomaly-based only detects previously seen attacks

Answer: A

Q773. What is the purpose of log correlation in SIEM systems?

- A. Connecting related events from different sources to identify complex attack patterns
- B. Converting all logs into a single standardized format for easier visual reading
- C. Backing up log data to secondary storage for disaster recovery preparedness
- D. Removing duplicate log entries to reduce storage space requirements on servers

Answer: A

Q774. What is the role of threat intelligence feeds in security monitoring?

- A. Automatically patching all vulnerabilities found across the organization's infrastructure
- B. Generating monthly compliance reports for regulatory auditors and board presentations
- C. Providing up-to-date indicators of compromise to enhance detection rules and alert accuracy
- D. Replacing human analysts by automatically investigating and resolving all security alerts

Answer: C

Q775. What is a honeypot used for in security monitoring?

- A. Storing encrypted passwords securely in a protected database for authentication use
- B. Providing backup internet connectivity when the primary connection fails completely
- C. Distributing security patches to all endpoints across the organizational network
- D. Attracting attackers to a decoy system to study their techniques and detect intrusions

Answer: D

Q776. What is the challenge of alert fatigue in security operations?

- A. Alerts being displayed in colors that are difficult for analysts to distinguish on screens
- B. Alerts arriving too slowly for analysts to respond before the threat window has closed
- C. Overwhelming analysts with too many alerts causing them to miss genuine threats in the volume
- D. Alert systems consuming too much network bandwidth reducing application performance speed

Answer: C

Q777. What is the purpose of a security baseline in monitoring?

- A. Establishing normal behavior patterns so deviations can be identified as potential threats
- B. Setting the minimum hardware requirements for running security monitoring software tools
- C. Defining the maximum number of security alerts allowed per day before system shutdown
- D. Creating a template for security reports that must be submitted to regulatory authorities

Answer: A

Q778. What is the role of packet capture (PCAP) in security monitoring?

- A. Recording raw network packets for detailed analysis of network communications and attacks
- B. Compressing network traffic to reduce bandwidth usage across organizational network links
- C. Encrypting network packets to protect data confidentiality during transit between systems
- D. Blocking malicious packets from reaching their intended destination on the network

Answer: A

Q779. What is extended detection and response (XDR)?

- A. A unified platform integrating detection across endpoints, network, cloud, and email sources
- B. A compliance tool that extends audit reporting to cover international regulatory frameworks
- C. An advanced firewall that extends network protection to include wireless access points
- D. A backup system that extends data retention periods beyond standard policy requirements

Answer: A

Q780. What is the purpose of dark web monitoring for organizations?

- A. Purchasing threat intelligence tools that are exclusively available on dark web forums
- B. Blocking all organizational users from accessing dark web sites through network filters
- C. Detecting if organizational data, credentials, or assets appear on dark web marketplaces
- D. Monitoring the dark web to recruit security researchers who operate on hidden platforms

Answer: C

Q781. How does GDPR's 'right to be forgotten' impact organizations?

- A. Organizations can ignore deletion requests if the data is stored in encrypted backup archives
- B. Organizations must delete all data about a person including legally required financial records
- C. Organizations must delete personal data upon request when there is no legitimate reason to retain it
- D. The right to be forgotten only applies to social media companies and not other organizations

Answer: C

Q782. What is the difference between data privacy and data security?

- A. Privacy is a technical control while security is a legal requirement enforced by regulators
- B. Privacy only applies to digital data while security only applies to physical document records
- C. Privacy governs how data should be handled while security implements protections against unauthorized access
- D. Privacy and security are identical concepts with no meaningful distinction between them in practice

Answer: C

Q783. What is a Data Protection Impact Assessment (DPIA)?

- A. An assessment evaluating privacy risks of data processing activities before implementation
- B. A financial audit calculating the total cost of data protection measures for budgeting
- C. A training evaluation assessing employee knowledge of organizational privacy policies
- D. A performance test measuring how fast data protection systems process user requests

Answer: A

Q784. What is the Computer Fraud and Abuse Act (CFAA)?

- A. An international treaty establishing global standards for ethical hacking practices
- B. A state-level law in California that requires breach notification within 24 hours
- C. A European regulation that mandates encryption for all cross-border data transfers
- D. A US federal law that criminalizes unauthorized access to protected computer systems

Answer: D

Q785. What is the role of a Data Protection Officer (DPO)?

- A. Managing the physical security of the organization's data center facilities full time
- B. Selling the organization's data to third parties for approved marketing purposes
- C. Overseeing compliance with data protection regulations and serving as a point of contact
- D. Developing and maintaining all software applications used by the organization directly

Answer: C

Q786. What is the purpose of PCI DSS?

- A. Establishing security standards for organizations that handle credit card payment data
- B. Regulating the manufacturing and distribution of personal computer hardware devices
- C. Defining standards for physical security of government classified information systems
- D. Setting requirements for environmental sustainability in data center construction

Answer: A

Q787. What is the concept of data minimization in privacy law?

- A. Collecting only the minimum personal data necessary for the specified legitimate purpose
- B. Minimizing the number of employees who know about the organization's privacy practices
- C. Compressing personal data to minimize the storage space required on organizational servers
- D. Deleting all personal data immediately after collection regardless of business requirements

Answer: A

Q788. What are bug bounty programs and their legal considerations?

- A. Programs that penalize employees financially for introducing bugs into production code
- B. Programs that pay hackers to attack competitor organizations to find their security weaknesses
- C. Programs rewarding researchers for finding vulnerabilities with clear legal scope and authorization
- D. Programs offering rewards for reporting software bugs related to user interface design only

Answer: C

Q789. What is the purpose of HIPAA in the United States?

- A. Establishing standards for highway infrastructure protection against cyber attacks
- B. Protecting the privacy and security of patient health information in healthcare organizations
- C. Defining rules for international trade of technology products between countries
- D. Regulating the hiring practices of technology companies across the United States market

Answer: B

Q790. What is the legal concept of 'reasonable security measures'?

- A. Security controls that are appropriate and proportionate to the risk and data sensitivity involved
- B. Security measures dictated entirely by the IT department without legal guidance or oversight
- C. The maximum possible security measures regardless of cost or impact on business operations
- D. Only the most basic security measures such as passwords without any additional protections

Answer: A

Q791. How does the convergence of IT and OT create new security challenges?

- A. OT systems were designed for isolated networks and connecting them to IT increases their attack surface
- B. IT and OT convergence eliminates all security risks by combining the strengths of both domains
- C. IT and OT convergence only affects manufacturing companies and has no impact on other sectors
- D. OT systems are inherently more secure than IT systems and improve the overall security posture

Answer: A

Q792. What is the security concern with large language models (LLMs) in cyber security?

- A. LLMs can generate phishing content, discover vulnerabilities, and create malicious code at scale
- B. LLMs eliminate all social engineering threats by educating users automatically at all times
- C. LLMs cannot process security-related queries and are completely useless for cyber attacks
- D. LLMs are only used for defensive security purposes and have no offensive applications whatsoever

Answer: A

Q793. What is Secure Access Service Edge (SASE)?

- A. A physical security perimeter around data centers using advanced biometric access controls
- B. A software development methodology focused on creating secure edge computing applications
- C. A network protocol designed to replace TCP/IP with more secure communication mechanisms
- D. A cloud architecture combining network security and WAN capabilities into a single service model

Answer: D

Q794. How does 5G technology introduce new cyber security challenges?

- A. 5G networks are slower than 4G making them less attractive targets for cyber attackers
- B. 5G only affects mobile phone security and has no impact on enterprise network security
- C. Increased device density, network slicing complexity, and expanded attack surface from IoT proliferation
- D. 5G eliminates all existing cyber threats through its built-in advanced security architecture

Answer: C

Q795. What is the concept of security mesh architecture?

- A. A physical mesh network used for building security camera systems in large corporate offices
- B. A decorative pattern used in security badge design for employee identification purposes
- C. A distributed security approach that extends controls around individuals and assets regardless of location
- D. A single centralized security platform that manages all security controls from one location

Answer: C

Q796. What is the security impact of digital twins in industrial environments?

- A. Digital twins can be used to simulate attacks and test defenses without risking physical systems
- B. Digital twins automatically patch vulnerabilities in physical systems they are connected to
- C. Digital twins are identical copies of malware used by security researchers in sandboxed environments
- D. Digital twins eliminate all physical security requirements for industrial control systems completely

Answer: A

Q797. What is privacy-enhancing technology (PET)?

- A. Software that automatically deletes all browsing history and cookies after each web session
- B. Physical barriers installed around servers to prevent unauthorized personnel from viewing screens
- C. Technologies that enable data processing while minimizing personal data exposure and privacy risks
- D. Traditional encryption methods that have been rebranded with a more modern marketing name

Answer: C

Q798. How does autonomous vehicle security present unique cyber security challenges?

- A. Autonomous vehicles use isolated systems with no network connectivity eliminating all cyber risks
- B. Autonomous vehicle security is identical to traditional computer security with no unique requirements
- C. Compromised vehicle systems could endanger physical safety, requiring real-time security with minimal latency
- D. Autonomous vehicles are immune to cyber attacks because they use proprietary operating systems

Answer: C

Q799. What is the concept of cyber-physical systems security?

- A. Securing the physical locks and barriers that protect server rooms from unauthorized entry
- B. Protecting integrated systems where digital components interact with and control physical processes
- C. Installing physical firewalls in the walls of data centers to prevent electromagnetic leaks
- D. Developing software applications that run on both mobile phones and desktop computers

Answer: B

Q800. What is the emerging concept of security-as-code?

- A. Defining and managing security policies and controls as code within the development pipeline
- B. Replacing all security hardware appliances with software-only solutions running on general servers
- C. Writing malware using programming languages instead of using automated malware creation tools
- D. Teaching security professionals how to write code for developing custom vulnerability scanners

Answer: A

Q801. What is the primary distinction between a vulnerability scan and a penetration test?

- A. Vulnerability scans are illegal while penetration tests are legal
- B. Vulnerability scans identify weaknesses while penetration tests actively exploit them
- C. Vulnerability scans are more expensive than penetration tests
- D. Penetration tests only check for viruses

Answer: B

Q802. In the context of cyber security, what is 'due diligence'?

- A. Ignoring minor security incidents
- B. The practice of thoroughly investigating and understanding security risks before making decisions
- C. Using only open-source security tools
- D. Delegating all security to third parties

Answer: B

Q803. What distinguishes a 'grey hat' hacker from a 'white hat' and 'black hat' hacker?

- A. Grey hats only hack government systems
- B. Grey hats may find vulnerabilities without authorization but do not have malicious intent
- C. Grey hats only use automated tools
- D. Grey hats exclusively perform social engineering

Answer: B

Q804. What is the purpose of a cyber security maturity model?

- A. To measure internet speed across an organization
- B. To assess an organization's security capabilities and identify areas for improvement
- C. To rank employees by technical skill
- D. To determine which antivirus to purchase

Answer: B

Q805. How does 'defense in depth' differ from relying on a single security control?

- A. Defense in depth uses only physical controls
- B. Defense in depth employs multiple layers of security so that if one fails, others still protect
- C. Single security controls are always more effective
- D. Defense in depth only applies to cloud environments

Answer: B

Q806. What role does asset management play in cyber security?

- A. It only tracks the financial value of equipment
- B. It helps organizations identify what needs protecting and ensures proper security controls are applied
- C. It replaces the need for access controls
- D. It is only relevant for physical security

Answer: B

Q807. What is the difference between a proactive and reactive security approach?

- A. Proactive security responds after an incident while reactive security prevents them
- B. Proactive security anticipates and prevents threats before they occur, while reactive responds after an incident
- C. There is no difference between the two approaches
- D. Reactive security is always more cost-effective

Answer: B

Q808. What is the significance of compliance frameworks like ISO 27001 in cyber security?

- A. They eliminate all cyber threats automatically
- B. They provide standards and guidelines for establishing information security management systems
- C. They are only applicable to government organizations
- D. They replace the need for technical security controls

Answer: B

Q809. What is a security control in the context of cyber security?

- A. A device used to lock server rooms only
- B. A safeguard or countermeasure to avoid, detect, or minimize security risks
- C. A type of malware detection algorithm
- D. A firewall brand name

Answer: B

Q810. Why is third-party risk management important in cyber security?

- A. Third parties never pose security risks
- B. Vendors and partners with access to your systems can introduce vulnerabilities if not properly managed
- C. It is only needed for financial institutions
- D. Third-party risks only affect large enterprises

Answer: B

Q811. What is the difference between a corrective and a compensating security control?

- A. They are identical in function
- B. A corrective control restores systems after an incident, while a compensating control provides an alternative when a primary control cannot be implemented
- C. Corrective controls prevent incidents while compensating controls detect them
- D. Compensating controls are always more expensive than corrective controls

Answer: B

Q812. How does the principle of 'defense in depth' apply to data protection?

- A. By using only one very strong encryption algorithm
- B. By applying multiple layers of security controls such as encryption, access controls, monitoring, and backups
- C. By relying solely on physical security measures
- D. By giving all employees access to all data for transparency

Answer: B

Q813. What is the purpose of a business impact analysis (BIA) in information security?

- A. To determine the salary of security staff
- B. To identify critical business functions and the impact of disruptions on the organization
- C. To select antivirus software vendors
- D. To audit employee attendance records

Answer: B

Q814. What distinguishes a technical control from an administrative control in security?

- A. Technical controls are always more effective
- B. Technical controls are implemented through technology while administrative controls are implemented through policies and procedures
- C. Administrative controls are not used in modern security
- D. Technical controls do not require any maintenance

Answer: B

Q815. What is the concept of 'security by design' in information security?

- A. Adding security features only after deployment
- B. Integrating security considerations into every phase of system design and development from the beginning
- C. Designing systems with no security to keep them simple
- D. Using only open-source security tools in design

Answer: B

Q816. How does quantitative risk analysis differ from qualitative risk analysis?

- A. Quantitative analysis uses numerical values and financial metrics while qualitative uses descriptive categories like high, medium, and low
- B. Qualitative analysis is always more accurate
- C. Quantitative analysis does not consider financial impact
- D. They produce identical results using different terminology

Answer: A

Q817. What is the purpose of a data retention policy?

- A. To keep all data indefinitely for compliance
- B. To define how long data should be stored, when it should be deleted, and how disposal should occur
- C. To prevent any data from being deleted
- D. To maximize storage utilization on servers

Answer: B

Q818. What is the 'need to know' principle and how does it complement least privilege?

- A. It means everyone needs to know everything for transparency
- B. It restricts access to information based on job necessity, working alongside least privilege to limit both permissions and information access
- C. It only applies to classified government information
- D. It replaces the need for access control lists

Answer: B

Q819. What is the role of a security operations center (SOC) in an organization?

- A. To develop new software applications
- B. To centrally monitor, detect, analyze, and respond to security incidents in real time
- C. To manage human resources records
- D. To handle customer billing inquiries

Answer: B

Q820. What is the difference between data at rest, data in transit, and data in use?

- A. They all refer to the same state of data
- B. Data at rest is stored, data in transit is being transmitted, and data in use is actively being processed in memory
- C. Data in use is always more secure than data at rest
- D. Data in transit cannot be encrypted

Answer: B

Q821. What is the primary difference between a block cipher and a stream cipher in terms of data processing?

- A. Block ciphers are always more secure
- B. Block ciphers encrypt fixed-size blocks of data while stream ciphers encrypt data one bit or byte at a time
- C. Stream ciphers cannot use keys
- D. Block ciphers do not use initialization vectors

Answer: B

Q822. What is a certificate revocation list (CRL) used for?

- A. To list all valid certificates in use
- B. To publish a list of digital certificates that have been revoked before their expiration date
- C. To generate new cryptographic keys
- D. To store encrypted email messages

Answer: B

Q823. How does the Diffie-Hellman key exchange enable secure communication without prior shared secrets?

- A. It sends the encryption key in plaintext
- B. It allows two parties to jointly establish a shared secret over an insecure channel using mathematical operations
- C. It requires a trusted third party to distribute keys
- D. It only works on encrypted networks

Answer: B

Q824. What is the purpose of a message digest in cryptography?

- A. To compress messages for faster transmission
- B. To produce a fixed-length fingerprint of data that can verify its integrity
- C. To encrypt messages using symmetric keys
- D. To generate random encryption keys

Answer: B

Q825. What is the Online Certificate Status Protocol (OCSP) and how does it differ from CRL?

- A. OCSP replaces encryption entirely
- B. OCSP provides real-time certificate validation by querying the CA directly, unlike CRLs which are periodically published lists
- C. OCSP is a type of symmetric encryption
- D. OCSP and CRL are identical mechanisms

Answer: B

Q826. Why is AES considered more secure than DES for modern encryption needs?

- A. AES uses shorter keys than DES
- B. AES supports key lengths of 128, 192, and 256 bits while DES uses only 56-bit keys, making DES vulnerable to brute-force attacks
- C. DES is newer than AES
- D. AES is an asymmetric algorithm while DES is symmetric

Answer: B

Q827. What is key escrow and what security concern does it raise?

- A. Key escrow means destroying keys after use
- B. Key escrow involves storing copies of encryption keys with a trusted third party, raising concerns about unauthorized access to those keys
- C. Key escrow is a method of key generation
- D. Key escrow only applies to physical locks

Answer: B

Q828. What is a chosen-plaintext attack in cryptanalysis?

- A. An attack where the attacker can only observe ciphertext
- B. An attack where the attacker can choose arbitrary plaintexts and obtain their corresponding ciphertexts to deduce the key
- C. An attack that only targets hash functions
- D. An attack that requires physical access to the encryption device

Answer: B

Q829. What is the role of an initialization vector (IV) in encryption?

- A. It replaces the encryption key
- B. It adds randomness to the encryption process so that identical plaintexts produce different ciphertexts
- C. It determines the key length
- D. It is used only in hash functions

Answer: B

Q830. What is envelope encryption and where is it commonly used?

- A. Encrypting physical mail envelopes
- B. A technique where data is encrypted with a data key, and the data key is then encrypted with a master key, commonly used in cloud services
- C. Using two different symmetric algorithms simultaneously
- D. Encrypting only email attachments

Answer: B

Q831. What is the difference between a network-based IDS and a host-based IDS?

- A. They monitor the same traffic in the same way
- B. A network-based IDS monitors network traffic on a network segment, while a host-based IDS monitors activity on an individual host system
- C. Host-based IDS is always more effective
- D. Network-based IDS can only monitor wireless traffic

Answer: B

Q832. How does network address translation (NAT) provide a layer of security?

- A. NAT encrypts all outgoing traffic
- B. NAT hides internal IP addresses from external networks, making it harder for attackers to directly target internal devices
- C. NAT replaces the need for firewalls entirely
- D. NAT increases network bandwidth

Answer: B

Q833. What is the purpose of a network demilitarized zone (DMZ) architecture?

- A. To eliminate the need for internal firewalls
- B. To place public-facing services in an isolated network segment between the external and internal networks
- C. To directly expose internal servers to the internet
- D. To increase internal network speeds

Answer: B

Q834. What is SSL stripping and how does it compromise network security?

- A. Removing physical cables from network equipment
- B. A man-in-the-middle technique that downgrades HTTPS connections to HTTP, exposing data in plaintext
- C. A method of improving SSL performance
- D. A technique for updating SSL certificates

Answer: B

Q835. What is the purpose of network flow analysis in security monitoring?

- A. To increase network throughput
- B. To collect and analyze metadata about network connections (source, destination, ports, protocols, volume) to detect anomalies and threats
- C. To encrypt all network traffic
- D. To replace packet capture entirely

Answer: B

Q836. How does a proxy firewall (application-level gateway) differ from a packet-filtering firewall?

- A. Proxy firewalls are always slower and less secure
- B. A proxy firewall inspects traffic at the application layer and acts as an intermediary, while a packet filter only examines packet headers
- C. Packet-filtering firewalls provide more granular inspection
- D. Proxy firewalls cannot filter web traffic

Answer: B

Q837. What is MAC address spoofing and why is it a security concern?

- A. It is a method of encrypting MAC addresses
- B. An attacker changes their device's MAC address to impersonate another device, potentially bypassing MAC-based access controls
- C. MAC addresses cannot be changed
- D. MAC spoofing only affects wireless networks

Answer: B

Q838. What is the security benefit of implementing network segmentation with micro-segmentation?

- A. It eliminates the need for any firewalls
- B. It limits lateral movement by creating granular security zones around individual workloads, even within the same network segment
- C. Micro-segmentation only applies to cloud environments
- D. It increases network latency without security benefits

Answer: B

Q839. What is DNS cache poisoning and what risk does it pose?

- A. Clearing the DNS cache for performance
- B. An attack that inserts fraudulent DNS entries into a resolver's cache, redirecting users to malicious websites
- C. A method of improving DNS performance
- D. DNS caches cannot be manipulated

Answer: B

Q840. What is the purpose of implementing 802.1Q VLAN tagging?

- A. To encrypt VLAN traffic
- B. To identify which VLAN a frame belongs to as it traverses trunk links between switches, enabling logical network separation
- C. To replace IP addressing on the network
- D. To increase the maximum number of physical ports on a switch

Answer: B

Q841. What is the primary difference between CBC and CTR modes of operation in block ciphers?

- A. CBC encrypts blocks independently while CTR chains them together
- B. CTR mode turns a block cipher into a stream cipher allowing parallel encryption
- C. CBC is faster than CTR in all cases
- D. CTR requires a larger key size than CBC

Answer: B

Q842. What is the purpose of key derivation functions like HKDF?

- A. To compress encryption keys for storage
- B. To derive one or more cryptographic keys from a source of key material
- C. To generate public-private key pairs
- D. To verify digital signatures

Answer: B

Q843. How does authenticated encryption differ from standard encryption?

- A. Authenticated encryption is slower but uses smaller keys
- B. Authenticated encryption requires two separate algorithms always
- C. Authenticated encryption provides both confidentiality and integrity/authenticity in a single operation
- D. Authenticated encryption only works with asymmetric algorithms

Answer: C

Q844. What is the security implication of using a predictable initialization vector (IV)?

- A. It has no security impact
- B. It can enable chosen-plaintext attacks and leak information about encrypted data
- C. It only affects performance, not security
- D. It makes decryption impossible

Answer: B

Q845. What is Galois/Counter Mode (GCM) and why is it preferred for modern encryption?

- A. A hash function that replaces SHA-256
- B. An authenticated encryption mode providing both confidentiality and integrity with high performance
- C. A key exchange protocol replacing Diffie-Hellman
- D. A digital signature algorithm

Answer: B

Q846. What is the purpose of a cryptographic nonce and how does it differ from an IV?

- A. They are identical concepts with no difference
- B. A nonce is used only once and may not need to be random, while an IV typically needs to be unpredictable
- C. A nonce is always longer than an IV
- D. An IV is used in symmetric encryption while a nonce is for asymmetric only

Answer: B

Q847. What is the Diffie-Hellman key exchange vulnerable to without authentication?

- A. Brute force attacks
- B. Man-in-the-middle attacks
- C. Replay attacks
- D. Dictionary attacks

Answer: B

Q848. What is the role of a Merkle tree in cryptography?

- A. To store encryption keys hierarchically
- B. To efficiently verify data integrity using a tree of hashes
- C. To generate random numbers
- D. To perform key exchange between multiple parties

Answer: B

Q849. Why is SHA-1 considered deprecated for security purposes?

- A. It produces output that is too long
- B. It is too slow for modern systems
- C. Practical collision attacks have been demonstrated against it
- D. It only works with symmetric encryption

Answer: C

Q850. What is the concept of crypto-agility?

- A. The ability to switch between encryption algorithms quickly without major system changes
- B. Using multiple encryption algorithms simultaneously on all data
- C. Encrypting data faster than real-time
- D. The ability to break any encryption algorithm

Answer: A

Q851. What is the role of AppArmor in Linux security?

- A. A firewall management tool
- B. A mandatory access control system that restricts programs' capabilities based on per-program profiles
- C. A disk encryption utility
- D. A network monitoring tool

Answer: B

Q852. What is the difference between discretionary access control (DAC) and role-based access control (RBAC)?

- A. DAC and RBAC are identical
- B. In DAC, the resource owner sets permissions; in RBAC, permissions are assigned based on organizational roles
- C. DAC is more secure than RBAC in all cases
- D. RBAC allows users to share permissions freely

Answer: B

Q853. What is a privilege escalation attack and what are its two types?

- A. An attack that only affects network devices, divided into internal and external
- B. An attack that gains elevated access, divided into horizontal (accessing other users' resources) and vertical (gaining higher privileges)
- C. An attack that targets passwords only, divided into online and offline
- D. An attack on physical security, divided into tailgating and piggybacking

Answer: B

Q854. What is Windows BitLocker and what does it protect against?

- A. A network firewall for Windows
- B. Full disk encryption that protects data on lost or stolen devices by encrypting the entire volume
- C. An antivirus program
- D. A password manager

Answer: B

Q855. How does the Linux sudo command enhance security compared to logging in as root?

- A. sudo is less secure than root login
- B. sudo provides temporary elevated privileges with logging and accountability, reducing the risk of accidental system-wide damage
- C. sudo grants permanent root access
- D. sudo disables all security features

Answer: B

Q856. What is the purpose of System Integrity Protection (SIP) in macOS?

- A. To encrypt user files
- B. To restrict the root account from modifying protected system files and processes
- C. To manage network connections
- D. To install system updates

Answer: B

Q857. What are cgroups in Linux and how do they contribute to security?

- A. A type of firewall rule
- B. Control groups that limit, account for, and isolate the resource usage of process groups
- C. A user authentication mechanism
- D. A file encryption method

Answer: B

Q858. What is the security purpose of UEFI Secure Boot?

- A. To speed up the boot process
- B. To ensure only trusted, digitally signed software can run during the boot process, preventing bootkits
- C. To encrypt the hard drive
- D. To manage user accounts at boot time

Answer: B

Q859. What is the purpose of audit policies in Windows operating systems?

- A. To track software licenses
- B. To define which security events are recorded in the event log for monitoring and forensics
- C. To manage desktop appearances
- D. To control internet bandwidth

Answer: B

Q860. How does memory protection through W^X (Write XOR Execute) policy improve OS security?

- A. It doubles available memory
- B. It ensures memory pages are either writable or executable but never both, preventing code injection attacks
- C. It encrypts all memory contents
- D. It speeds up memory access

Answer: B

Q861. What is the security purpose of the X-Content-Type-Options header?

- A. To encrypt content between browser and server
- B. To prevent browsers from MIME-sniffing a response away from the declared content-type, stopping content-type confusion attacks
- C. To compress HTTP responses
- D. To cache web pages more effectively

Answer: B

Q862. How does a web application firewall (WAF) differ from a traditional network firewall?

- A. They are identical in function
- B. A WAF inspects HTTP/HTTPS traffic at the application layer to detect attacks like XSS and SQL injection, while network firewalls operate at lower layers
- C. A WAF only blocks IP addresses
- D. Network firewalls can inspect application-layer content better

Answer: B

Q863. What is the security risk of exposing source maps in a production web application?

- A. Source maps slow down the server
- B. Source maps reveal original source code structure and logic, aiding attackers in finding vulnerabilities
- C. Source maps corrupt the database
- D. Source maps have no security impact

Answer: B

Q864. What is a Server-Side Template Injection (SSTI) attack?

- A. Injecting CSS into server templates
- B. Injecting malicious code into server-side template engines that gets executed on the server, potentially leading to remote code execution
- C. Injecting JavaScript into the client browser
- D. Modifying HTML templates in a text editor

Answer: B

Q865. What is the purpose of the SameSite cookie attribute and what values can it take?

- A. It determines cookie expiration time with values of Short, Medium, and Long
- B. It controls when cookies are sent with cross-site requests, with values Strict, Lax, and None, helping prevent CSRF attacks
- C. It sets the cookie's encryption strength
- D. It determines which users can see the cookie

Answer: B

Q866. What is an XML External Entity (XXE) attack?

- A. A cross-site scripting attack using XML
- B. An attack exploiting XML parsers that process external entity references, potentially leading to file disclosure, SSRF, or denial of service
- C. An attack that replaces XML with JSON
- D. A SQL injection through XML queries

Answer: B

Q867. What is the security concern with JWT tokens stored in localStorage?

- A. localStorage is too small for JWT tokens
- B. JWTs in localStorage are accessible to JavaScript and vulnerable to XSS attacks, unlike HttpOnly cookies
- C. localStorage automatically encrypts JWTs
- D. There are no concerns with this approach

Answer: B

Q868. What is a subdomain takeover vulnerability?

- A. When a subdomain loads too slowly
- B. When an attacker claims a subdomain that points to an external service the organization no longer uses, enabling phishing or cookie theft
- C. When a subdomain uses a different TLS certificate
- D. When subdomains share the same database

Answer: B

Q869. How does Content Security Policy (CSP) report-only mode help in deploying security headers?

- A. It blocks all violations immediately
- B. It logs policy violations without enforcing them, allowing developers to test and refine CSP rules before enforcement
- C. It only works in development environments
- D. It disables all scripts on the page

Answer: B

Q870. What is a broken access control vulnerability in web applications?

- A. When the login page does not load properly
- B. When users can access resources or perform actions beyond their intended permissions due to improper authorization checks
- C. When CSS styles are not applied correctly
- D. When the server cannot handle multiple users

Answer: B

Q871. What is credential stuffing and how does it differ from brute-force attacks?

- A. They are the same type of attack
- B. Credential stuffing uses stolen username-password pairs from data breaches to try on other services, while brute-force tries random combinations
- C. Credential stuffing only targets email accounts
- D. Brute-force uses stolen credentials while credential stuffing does not

Answer: B

Q872. How does TOTP (Time-Based One-Time Password) authentication work?

- A. It sends a password via email each time
- B. It uses a shared secret and current time to generate a unique code that is valid for a short period, typically 30 seconds
- C. It uses facial recognition technology
- D. It generates a permanent second password

Answer: B

Q873. What is the difference between RBAC and ABAC in terms of flexibility?

- A. RBAC is more flexible than ABAC
- B. ABAC is more flexible because it can use multiple attributes (user, resource, environment, action) for access decisions, while RBAC is based only on predefined roles
- C. They are equally flexible
- D. Neither is flexible

Answer: B

Q874. What is the purpose of a challenge-response authentication protocol?

- A. To test the user's typing speed
- B. To verify identity by requiring the client to correctly respond to a random challenge from the server, proving knowledge without transmitting the secret
- C. To challenge users with security questions only
- D. To respond to denial-of-service attacks

Answer: B

Q875. What is identity federation and what problem does it solve?

- A. Creating multiple identities for one user
- B. Allowing users to authenticate across multiple organizations using a single identity from a trusted identity provider, reducing credential sprawl
- C. Combining all passwords into one
- D. Disabling authentication for external users

Answer: B

Q876. What is the security risk of using SMS-based two-factor authentication?

- A. SMS 2FA has no security risks
- B. SMS messages can be intercepted through SIM swapping, SS7 protocol vulnerabilities, or phone number porting, compromising the second factor
- C. SMS 2FA is the most secure method available
- D. SMS 2FA only works on smartphones

Answer: B

Q877. What is the concept of separation of duties in access control?

- A. Giving all duties to one person
- B. Dividing critical tasks among multiple users so no single person has complete control over a sensitive process, preventing fraud and errors
- C. Separating work and personal accounts
- D. Dividing the network into segments

Answer: B

Q878. What is an access token in the context of API authentication?

- A. A physical token used to enter a building
- B. A digital credential that represents the authorization granted to a client to access specific API resources on behalf of a user
- C. A password stored in plain text
- D. A certificate installed on the server

Answer: B

Q879. How does multi-factor authentication using a hardware security key work?

- A. The key stores the user's password
- B. The key uses public-key cryptography to create a unique credential per site, signing challenges without transmitting secrets
- C. The key generates random passwords
- D. The key connects to the internet to verify identity

Answer: B

Q880. What is the purpose of an identity governance and administration (IGA) platform?

- A. To manage website content
- B. To automate identity lifecycle management, access certifications, and policy enforcement across an organization
- C. To encrypt all user data
- D. To monitor network bandwidth

Answer: B

Q881. What is the DREAD threat rating model used for?

- A. Ranking programming languages by security
- B. Assessing and prioritizing threats based on Damage, Reproducibility, Exploitability, Affected Users, and Discoverability
- C. Rating the performance of security tools
- D. Evaluating developer skill levels

Answer: B

Q882. What is the purpose of a security code review and how does it differ from a regular code review?

- A. They are identical processes
- B. A security code review specifically focuses on identifying security vulnerabilities, insecure patterns, and compliance issues in addition to regular code quality concerns
- C. Security code reviews only look at encryption code
- D. Regular code reviews already cover all security concerns

Answer: B

Q883. What is the principle of fail-secure versus fail-open in software design?

- A. They mean the same thing
- B. Fail-secure denies access when a failure occurs, maintaining security; fail-open allows access during failures, prioritizing availability over security
- C. Fail-secure means the system never fails
- D. Fail-open means the system is always secure

Answer: B

Q884. How does a software composition analysis (SCA) tool help secure development?

- A. By writing code automatically
- B. By identifying known vulnerabilities in open-source dependencies and third-party libraries used in the project
- C. By testing network security
- D. By managing development team schedules

Answer: B

Q885. What is the security benefit of implementing Content Security Policy headers during development?

- A. CSP speeds up page loading
- B. CSP restricts which resources the browser can load, reducing the impact of XSS attacks by preventing execution of unauthorized scripts
- C. CSP encrypts HTTP traffic
- D. CSP manages user sessions

Answer: B

Q886. What is the role of a CI/CD security gate and what checks should it include?

- A. It blocks all deployments permanently
- B. It enforces automated security checks in the build pipeline including SAST, dependency scanning, and secret detection before code can be deployed
- C. It only checks code formatting
- D. It is a physical security checkpoint

Answer: B

Q887. What is the OWASP Application Security Verification Standard (ASVS)?

- A. A programming language standard
- B. A framework providing a basis for testing web application security controls through three levels of security verification requirements
- C. A network protocol standard
- D. A hardware security specification

Answer: B

Q888. What is the security concern with using eval() or similar dynamic code execution functions?

- A. eval() is too slow for production use
- B. eval() executes strings as code, and if user input reaches eval(), it enables arbitrary code execution attacks
- C. eval() only works in specific languages
- D. eval() causes memory leaks

Answer: B

Q889. What is the security purpose of input allowlisting versus blocklisting?

- A. Blocklisting is always more secure than allowlisting
- B. Allowlisting defines what input IS permitted (more secure), while blocklisting defines what IS NOT permitted (prone to bypasses through new attack patterns)
- C. Allowlisting blocks all input
- D. They provide identical security

Answer: B

Q890. What is the purpose of security regression testing in the SDLC?

- A. Testing if the application runs on older systems
- B. Verifying that previously fixed security vulnerabilities have not been reintroduced by new code changes
- C. Testing the application's speed under load
- D. Checking if old features still work

Answer: B

Q891. What is the security difference between WPA2-Personal and WPA2-Enterprise?

- A. There is no security difference
- B. WPA2-Personal uses a shared passphrase for all users while WPA2-Enterprise uses individual credentials authenticated through a RADIUS server, providing better accountability
- C. WPA2-Personal is more secure
- D. WPA2-Enterprise is only for home networks

Answer: B

Q892. What is a captive portal and what security risks does it present?

- A. A portal that captures all network traffic permanently
- B. A web page that requires user interaction before granting network access; risks include credential theft on fake portals and unencrypted initial connections
- C. A firewall configuration tool
- D. A type of network encryption

Answer: B

Q893. How does mobile application sandboxing protect the operating system?

- A. It runs all apps in a virtual sandbox visual environment
- B. Each app runs in its own isolated environment with restricted access to system resources and other apps' data, containing any malicious behavior
- C. It prevents apps from using the internet
- D. It only protects pre-installed apps

Answer: B

Q894. What is a wireless deauthentication attack and how does it work?

- A. An attack that changes WiFi passwords
- B. An attack that sends forged deauthentication frames to disconnect clients from a WiFi network, often used as a precursor to evil twin attacks
- C. An attack that disables Bluetooth only
- D. An attack that overheats wireless routers

Answer: B

Q895. What is the security purpose of mobile device attestation?

- A. Verifying the user's identity
- B. Cryptographically verifying the integrity and security state of a mobile device (that it has not been rooted, jailbroken, or tampered with) before granting access to resources
- C. Attesting to the device's warranty status
- D. Checking the device's battery health

Answer: B

Q896. What is the role of 802.1X in wireless network security?

- A. It defines WiFi frequency bands
- B. It provides port-based network access control requiring devices to authenticate before being granted network access, using EAP methods and a RADIUS server
- C. It sets maximum WiFi speeds
- D. It determines wireless signal range

Answer: B

Q897. What are the security implications of using public USB charging stations for mobile devices?

- A. Public USB chargers are always safe
- B. They pose a risk of 'juice jacking' where modified charging stations can install malware or steal data through the USB data connection
- C. They charge devices faster than private chargers
- D. They only affect older devices

Answer: B

Q898. What is WiFi Protected Setup (WPS) and why is it considered a security risk?

- A. WPS provides the highest WiFi security available
- B. WPS simplifies WiFi setup but its PIN-based method is vulnerable to brute-force attacks due to a design flaw that splits the 8-digit PIN into two halves
- C. WPS only works with WPA3
- D. WPS is required for all modern routers

Answer: B

Q899. How does a mobile VPN protect data on public WiFi networks?

- A. It makes the WiFi network faster
- B. It creates an encrypted tunnel between the mobile device and the VPN server, protecting all data from eavesdropping on the local network
- C. It blocks all incoming calls
- D. It only protects web browsing, not apps

Answer: B

Q900. What is the purpose of MAC address randomization on mobile devices?

- A. To improve WiFi speed
- B. To prevent tracking of the device across different WiFi networks by changing the hardware address used during scanning and connecting
- C. To authenticate to WiFi networks
- D. To encrypt wireless traffic

Answer: B

Q901. What is the principle of shared responsibility in cloud security and how does it vary by service model?

- A. The cloud provider is responsible for all security
- B. In IaaS, customers manage OS and application security; in PaaS, the provider manages the platform; in SaaS, the provider handles nearly everything except user access and data classification
- C. The customer is responsible for all security
- D. Shared responsibility means both parties do the same tasks

Answer: B

Q902. What is the security risk of overly permissive S3 bucket policies in AWS?

- A. S3 buckets cannot be made public
- B. Overly permissive policies can expose sensitive data to the public internet, leading to data breaches as seen in numerous high-profile incidents
- C. Permissive policies improve performance
- D. S3 bucket policies do not affect security

Answer: B

Q903. What is cloud-native logging and monitoring and why is it critical for security?

- A. It is the same as traditional on-premises logging
- B. Cloud-native logging aggregates logs from distributed cloud services (API calls, access events, resource changes) for security monitoring, threat detection, and compliance auditing
- C. It only monitors server uptime
- D. It replaces the need for security controls

Answer: B

Q904. What is a service mesh in cloud-native architecture and how does it enhance security?

- A. A physical network of cloud servers
- B. An infrastructure layer that handles service-to-service communication with built-in security features like mutual TLS, access policies, and traffic encryption without application code changes
- C. A type of cloud storage
- D. A mesh WiFi network for cloud data centers

Answer: B

Q905. What are cloud access security brokers (CASBs) and what four pillars of functionality do they provide?

- A. CASBs only block cloud access
- B. CASBs provide visibility, data security, threat protection, and compliance for cloud services by acting as intermediaries between users and cloud providers
- C. CASBs are a type of cloud storage
- D. CASBs only monitor bandwidth usage

Answer: B

Q906. What is infrastructure as code (IaC) security scanning and why is it important?

- A. It scans physical infrastructure for defects
- B. It analyzes IaC templates (Terraform, CloudFormation) for security misconfigurations before deployment, preventing insecure infrastructure from being provisioned
- C. It scans code for programming errors only
- D. It is only used for cost optimization

Answer: B

Q907. What is the blast radius concept in cloud architecture and how can it be minimized?

- A. The physical distance a cloud data center's explosion can reach
- B. The extent of damage that can result from a security incident; minimized through network segmentation, separate accounts, least privilege, and micro-segmentation
- C. The WiFi signal range of cloud servers
- D. The number of users affected by a cloud outage

Answer: B

Q908. What is the security purpose of a cloud-native web application firewall versus a traditional WAF?

- A. They are identical in functionality
- B. Cloud-native WAFs are designed for dynamic cloud environments with auto-scaling, API protection, bot management, and integration with cloud provider services and DevOps pipelines
- C. Cloud-native WAFs are less capable than traditional WAFs
- D. Traditional WAFs work better in cloud environments

Answer: B

Q909. What is a landing zone in cloud architecture and how does it relate to security?

- A. A physical location where cloud servers are installed
- B. A pre-configured, secure baseline environment with account structure, networking, IAM, logging, and security controls that serves as the foundation for cloud deployments
- C. A backup storage location
- D. A cloud provider's customer support portal

Answer: B

Q910. What is the security risk of using long-lived access keys for cloud service accounts?

- A. Long-lived keys are the most secure option
- B. Long-lived access keys that are not rotated can be leaked or stolen, providing persistent access; short-lived credentials and role-based access with temporary tokens are preferred
- C. Long-lived keys automatically rotate
- D. There is no risk with long-lived keys

Answer: B

Q911. What is the role of timestamps (MAC times) in forensic timeline reconstruction?

- A. Timestamps are unreliable and never used
- B. Modified, Accessed, and Created timestamps on files help establish when events occurred, reconstruct user activities, and build a chronological timeline of events
- C. Timestamps only show the current date
- D. MAC times refer to Apple computer forensics only

Answer: B

Q912. What is the difference between volatile and non-volatile evidence, and why does collection order matter?

- A. All evidence has the same priority for collection
- B. Volatile evidence (RAM, running processes, network connections) is lost when power is removed and must be collected first; non-volatile evidence (hard drives) persists and can be collected later
- C. Non-volatile evidence must always be collected first
- D. The collection order does not affect the investigation

Answer: B

Q913. How does file carving work and when is it necessary in forensic analysis?

- A. File carving is a wood-working term not related to forensics
- B. File carving recovers files from unallocated disk space by searching for file signatures (headers and footers) without relying on file system metadata, useful when files are deleted or file system is damaged
- C. File carving only works on image files
- D. File carving requires the original file names

Answer: B

Q914. What is a forensic triage and when is it performed?

- A. The final step of a forensic investigation
- B. A rapid preliminary assessment of digital evidence to identify the most relevant devices and data, prioritize investigation efforts, and determine the scope of a full forensic examination
- C. A medical procedure unrelated to forensics
- D. A method of permanently deleting evidence

Answer: B

Q915. What is registry analysis in Windows forensics and what type of evidence can it reveal?

- A. Registry analysis only shows software license keys
- B. Windows Registry analysis reveals system configuration, recently accessed files, USB device history, installed software, user accounts, network connections, and user activity patterns
- C. The registry contains no useful forensic data
- D. Registry analysis is only possible on Linux systems

Answer: B

Q916. What is the purpose of using EnCase or FTK in digital forensics?

- A. They are video editing software
- B. They are comprehensive digital forensic suites that provide evidence acquisition, analysis, search, bookmark, and reporting capabilities for forensic investigations
- C. They are antivirus programs
- D. They are network monitoring tools

Answer: B

Q917. What is network packet capture (PCAP) analysis in forensic investigations?

- A. A method of capturing physical evidence
- B. Analysis of recorded network traffic data to identify communications, data transfers, malware command-and-control traffic, and evidence of network-based attacks
- C. A technique for capturing screenshots
- D. A method of printing network diagrams

Answer: B

Q918. What is the significance of examining browser artifacts in a forensic investigation?

- A. Browser artifacts only show bookmarks
- B. Browser artifacts including history, cookies, cache, downloads, saved passwords, autofill data, and session data can reveal user activities, communications, and intent
- C. Browser data is automatically deleted and cannot be recovered
- D. Only the last visited website can be determined

Answer: B

Q919. What is the role of hash sets in forensic analysis?

- A. Hash sets encrypt evidence for storage
- B. Known hash sets (like NSRL) help forensic investigators quickly identify and filter known-good files (operating system files) and known-bad files (malware) from the evidence
- C. Hash sets are random number generators
- D. Hash sets delete duplicate files

Answer: B

Q920. What is the difference between a forensic investigation for civil versus criminal cases?

- A. There is no difference in forensic methodology
- B. Criminal cases require higher standards of evidence (beyond reasonable doubt), stricter chain of custody, and may involve law enforcement; civil cases use preponderance of evidence and may be conducted by private firms
- C. Civil cases require more evidence than criminal cases
- D. Digital forensics is only used in criminal cases

Answer: B

Q921. What is the role of threat intelligence in improving incident response capabilities?

- A. Threat intelligence is not useful for incident response
- B. Threat intelligence provides context about adversary tactics, techniques, and procedures (TTPs) that helps IR teams detect, attribute, and respond to incidents more effectively
- C. Threat intelligence only helps with marketing
- D. Threat intelligence replaces the need for incident response

Answer: B

Q922. How do tabletop exercises improve incident response preparedness?

- A. They test physical security of table-mounted servers
- B. They simulate incident scenarios through discussion-based exercises, testing communication, decision-making, and plan effectiveness without disrupting actual systems
- C. They are physical fitness exercises for the IR team
- D. They only test technical controls

Answer: B

Q923. What is the importance of establishing communication channels before an incident occurs?

- A. Communication planning is not important for incident response
- B. Pre-established out-of-band communication channels ensure the IR team can communicate securely during an incident, even if the attacker has compromised normal communication systems
- C. Only email communication is needed
- D. Communication should only be planned during the incident

Answer: B

Q924. What is the difference between eradication and remediation in incident response?

- A. They are identical concepts
- B. Eradication removes the immediate threat (malware, attacker access) while remediation addresses the underlying vulnerability or weakness that allowed the incident to occur
- C. Eradication is a permanent solution while remediation is temporary
- D. Remediation happens before eradication

Answer: B

Q925. What is a cyber incident severity classification system and why is it important?

- A. It classifies incidents by the day of the week they occur
- B. A framework that categorizes incidents by impact level to determine response priority, resource allocation, escalation requirements, and notification obligations
- C. It only applies to government organizations
- D. Severity classification slows down the response

Answer: B

Q926. How should evidence be handled during incident response to ensure it is admissible in court?

- A. Evidence handling procedures do not matter for legal proceedings
- B. Evidence must be collected following proper procedures including maintaining chain of custody, using write-protected copies, documenting all actions, and preserving original evidence integrity
- C. Only digital copies of evidence are needed in court
- D. Evidence should be modified to make it clearer for the judge

Answer: B

Q927. What is the role of a crisis communications plan in incident response?

- A. It handles technical remediation steps
- B. It defines how the organization communicates about the incident to stakeholders, media, customers, and regulators, managing reputation and meeting notification obligations
- C. It is only needed for public companies
- D. Communication is not part of incident response

Answer: B

Q928. What is the purpose of maintaining an asset inventory for incident response?

- A. To track office furniture
- B. An up-to-date inventory of all IT assets helps IR teams quickly identify affected systems, understand their criticality, determine blast radius, and prioritize response efforts
- C. Asset inventories are only for accounting
- D. It is not relevant to incident response

Answer: B

Q929. What is the concept of 'containment before eradication' in incident response?

- A. Eradication should always come before containment
- B. The incident must be contained (preventing further spread or damage) before eradication begins, because premature eradication may alert the attacker and lose evidence
- C. Containment and eradication happen simultaneously always
- D. Neither containment nor eradication is necessary

Answer: B

Q930. What is log normalization and why is it important for SIEM effectiveness?

- A. Log normalization deletes unnecessary log entries
- B. Log normalization converts logs from different sources into a consistent format, enabling effective correlation, analysis, and searching across heterogeneous data sources in a SIEM
- C. Log normalization encrypts log data
- D. Normalization is only needed for network logs

Answer: B

Q931. What is the MITRE ATT&CK framework's role in creating SIEM detection rules?

- A. MITRE ATT&CK is not related to SIEM detection
- B. ATT&CK provides a comprehensive matrix of adversary tactics and techniques that can be mapped to specific SIEM detection rules, helping identify coverage gaps and prioritize detection development
- C. ATT&CK replaces SIEM systems entirely
- D. ATT&CK only covers network-level attacks

Answer: B

Q932. How does network flow analysis (NetFlow/sFlow) complement full packet capture for security monitoring?

- A. Flow analysis and packet capture provide identical information
- B. Flow analysis provides metadata about communications (who talked to whom, when, how much data) at scale, while full packet capture provides content details; together they provide both breadth and depth of visibility
- C. Flow analysis replaces the need for packet capture
- D. Packet capture is always superior to flow analysis

Answer: B

Q933. What is the concept of security monitoring use cases and how should they be prioritized?

- A. Use cases are user stories for software development
- B. Security monitoring use cases define specific threat scenarios to detect (e.g., brute force, lateral movement), and should be prioritized based on threat likelihood, business impact, and available log sources
- C. All use cases should be implemented simultaneously
- D. Use cases are only needed for compliance

Answer: B

Q934. What is the difference between agent-based and agentless monitoring for endpoints?

- A. They produce identical results with no trade-offs
- B. Agent-based monitoring installs software on endpoints for deep visibility and real-time detection, while agentless monitoring uses network traffic or remote queries with less endpoint impact but potentially less visibility
- C. Agent-based monitoring is always less secure
- D. Agentless monitoring provides better endpoint visibility

Answer: B

Q935. What is a SIEM correlation rule and how does it reduce false positives?

- A. Correlation rules only forward raw logs
- B. Correlation rules combine multiple individual events across different sources to identify attack patterns, reducing false positives by requiring multiple conditions to be met before triggering an alert
- C. Correlation rules increase false positives
- D. Correlation is only used for compliance reporting

Answer: B

Q936. What is threat hunting and how does it differ from traditional alert-based security monitoring?

- A. Threat hunting and alert-based monitoring are identical
- B. Threat hunting is a proactive approach where analysts actively search for hidden threats that may have evaded automated detection, using hypotheses and data analysis rather than waiting for alerts
- C. Threat hunting only looks for known malware signatures
- D. Threat hunting replaces the need for SIEM

Answer: B

Q937. What is the purpose of a SOC analyst playbook for specific alert types?

- A. Playbooks are scripts that automatically fix all security issues
- B. Playbooks provide standardized investigation and response procedures for specific alert types, ensuring consistent analysis, reducing response time, and enabling junior analysts to handle complex alerts
- C. Playbooks are only used for documentation
- D. Playbooks replace the need for skilled analysts

Answer: B

Q938. What is the significance of DNS monitoring in security operations?

- A. DNS monitoring only measures internet speed
- B. DNS monitoring detects malicious domains, DNS tunneling for data exfiltration, domain generation algorithms (DGA) used by malware, and DNS-based command-and-control communications
- C. DNS is too basic to be useful for security
- D. DNS monitoring only applies to web servers

Answer: B

Q939. What is the role of data loss prevention (DLP) in security monitoring?

- A. DLP only prevents accidental file deletion
- B. DLP monitors and controls data movement to detect and prevent unauthorized transmission of sensitive data outside the organization, covering email, web, endpoints, and cloud services
- C. DLP replaces encryption
- D. DLP only works for physical documents

Answer: B

Q940. What is the extraterritorial jurisdiction challenge in cybercrime prosecution?

- A. Cybercrime only occurs within one country
- B. Cybercrimes often cross national boundaries, creating challenges in determining which country's laws apply, obtaining evidence from foreign jurisdictions, and securing cooperation between different legal systems
- C. Extraterritorial jurisdiction is not relevant to cybercrime
- D. All countries have identical cybercrime laws

Answer: B

Q941. What is the difference between data controller and data processor under data protection laws?

- A. They are the same entity with different names
- B. A data controller determines the purposes and means of data processing, while a data processor processes data on behalf of the controller according to their instructions
- C. A data processor has more authority than a controller
- D. Only data controllers are regulated by law

Answer: B

Q942. What is the principle of data minimization in privacy law?

- A. Minimizing the quality of data collected
- B. Organizations should only collect and process the minimum amount of personal data necessary for the specified purpose, avoiding excessive data collection
- C. Collecting as much data as possible for future use
- D. Minimizing the storage cost of data

Answer: B

Q943. What obligations do organizations have under breach notification laws?

- A. Organizations have no obligation to disclose breaches
- B. Organizations must notify affected individuals and/or regulatory authorities within specified timeframes when personal data breaches occur, with details about the breach and mitigation measures
- C. Only breaches involving financial data require notification
- D. Notification is only required if data is published publicly

Answer: B

Q944. What is the legal concept of reasonable security measures in cybersecurity?

- A. There is no legal standard for security measures
- B. The legal standard requiring organizations to implement security measures appropriate to the sensitivity of data they handle and the risks they face, considered in negligence and liability cases
- C. Only government agencies must implement security measures
- D. Reasonable security means using the most expensive solutions

Answer: B

Q945. What is the safe harbor provision in cybersecurity law?

- A. A physical safe for storing digital evidence
- B. Legal protections that shield organizations from liability if they follow specific security frameworks, standards, or practices as defined by applicable law
- C. A harbor where cyber criminals are safe from prosecution
- D. A type of data encryption standard

Answer: B

Q946. What are the legal implications of employee monitoring in the workplace?

- A. Employers can monitor employees without any restrictions
- B. Employee monitoring must balance the employer's legitimate security interests with employee privacy rights, often requiring notice, consent, and proportionality under applicable labor and privacy laws
- C. Employee monitoring is illegal in all jurisdictions
- D. Only IT staff can be monitored

Answer: B

Q947. What is the legal status of ethical hacking and penetration testing?

- A. All hacking is illegal regardless of intent
- B. Ethical hacking and penetration testing are legal when performed with explicit written authorization from the system owner, defining scope, methods, and timeframes
- C. Ethical hackers never need permission
- D. Penetration testing is illegal in all countries

Answer: B

Q948. What are the regulatory requirements of PCI DSS for organizations handling payment card data?

- A. PCI DSS is optional for all organizations
- B. PCI DSS mandates security requirements including network segmentation, encryption of cardholder data, access controls, vulnerability management, and regular security testing for organizations that process, store, or transmit payment card data
- C. PCI DSS only applies to banks
- D. PCI DSS only covers physical card transactions

Answer: B

Q949. What is the role of the Federal Investigation Agency (FIA) in cybercrime enforcement in Pakistan?

- A. FIA has no authority over cybercrimes
- B. FIA's National Response Centre for Cyber Crime (NR3C) is responsible for investigating and prosecuting cybercrimes under PECA 2016, including unauthorized access, data theft, online fraud, and cyber harassment
- C. FIA only handles physical crimes
- D. FIA delegates all cybercrime cases to provincial police

Answer: B

Q950. How does Secure Access Service Edge (SASE) architecture change traditional network security?

- A. SASE replaces the internet with private networks
- B. SASE converges network security functions (firewall, CASB, ZTNA, SWG) with WAN capabilities into a cloud-delivered service, providing security at the edge closer to users and devices regardless of location
- C. SASE is a type of VPN
- D. SASE only works for on-premises networks

Answer: B

Q951. What is the security concern with generative AI tools like large language models in enterprise environments?

- A. Generative AI has no security concerns
- B. Risks include data leakage through prompts, prompt injection attacks, generation of convincing phishing content, AI hallucination producing incorrect security advice, and employees sharing sensitive data with external AI services
- C. Generative AI is perfectly secure for all enterprise use
- D. Only the AI developer faces security risks

Answer: B

Q952. What is the concept of software-defined networking (SDN) and its security implications?

- A. SDN is a type of physical network cable
- B. SDN separates the network control plane from the data plane, enabling programmatic network management; security implications include centralized security policy enforcement but also a single point of failure if the controller is compromised
- C. SDN has no impact on network security
- D. SDN eliminates the need for firewalls

Answer: B

Q953. How do deepfakes pose a threat to cybersecurity beyond misinformation?

- A. Deepfakes are only used for entertainment
- B. Deepfakes enable advanced social engineering attacks including voice cloning for CEO fraud, video impersonation for identity verification bypass, and synthetic media for blackmail and manipulation
- C. Deepfakes can only create images, not video or audio
- D. Deepfakes are easily detected by all security systems

Answer: B

Q954. What is the security challenge of operational technology (OT) and IT convergence?

- A. OT and IT convergence has no security challenges
- B. OT systems were designed for isolated environments with different priorities (availability over confidentiality), and connecting them to IT networks exposes them to cyber threats they were not designed to withstand, while patching and updating is difficult due to uptime requirements
- C. OT systems are naturally more secure than IT systems
- D. IT security tools work identically in OT environments

Answer: B

Q955. What is the 'harvest now, decrypt later' threat in quantum computing?

- A. A quantum computing farming technique
- B. Adversaries are collecting and storing encrypted data today with the expectation that future quantum computers will be able to decrypt it, threatening long-term data confidentiality
- C. A data backup strategy
- D. A machine learning training approach

Answer: B

Q956. What is extended detection and response (XDR) and how does it evolve beyond EDR?

- A. XDR is just a marketing term for EDR
- B. XDR extends EDR by correlating and analyzing security data across multiple security layers (endpoints, network, cloud, email) to provide unified threat detection and response with broader visibility than endpoint-only EDR
- C. XDR only monitors network traffic
- D. XDR replaces all other security tools

Answer: B

Q957. What is the emerging concept of cybersecurity mesh architecture (CSMA)?

- A. A physical mesh network for security devices
- B. CSMA is a composable architecture approach where security controls are deployed as modular, interoperable services that can be distributed across the IT environment, enabling consistent security policy regardless of asset location
- C. CSMA is a type of encryption
- D. CSMA only applies to wireless networks

Answer: B

Q958. What is the role of threat intelligence platforms (TIPs) in modern cybersecurity?

- A. TIPs generate cyber attacks for testing
- B. TIPs aggregate, correlate, and operationalize threat intelligence from multiple sources, enabling organizations to contextualize threats, share intelligence, and integrate IoCs into security controls for proactive defense
- C. TIPs only provide news articles about cyber threats
- D. TIPs replace the need for security analysts

Answer: B

Q959. What is the security implication of edge computing for data protection?

- A. Edge computing eliminates all security concerns
- B. Edge computing processes data closer to the source, creating challenges in securing distributed processing nodes, ensuring consistent security policies across many edge locations, and protecting data at locations with potentially less physical security
- C. Edge computing is more secure than cloud computing
- D. Edge computing does not handle sensitive data

Answer: B

Q960. What is the purpose of conducting a gap analysis of the incident response plan?

- A. To find physical gaps in server room security
- B. To identify weaknesses and areas for improvement in the current IR plan by comparing it against best practices and frameworks
- C. To measure network bandwidth gaps
- D. To find gaps in employee schedules

Answer: B

Cyber Security — Hard

480 questions

Q961. In the STRIDE threat model, what does the 'E' stand for?

- A. Elevation of Privilege
- B. Exploitation in security contexts
- C. Enumeration in security contexts
- D. Data-at-rest symmetric encryption

Answer: A

Q962. Which is a key difference between ISO 27001 and ISO 27002?

- A. ISO 27001 specifies requirements for an ISMS, ISO 27002 provides implementation guidelines
- B. ISO 27001 is for networks, ISO 27002 is for applications
- C. ISO 27001 is outdated within enterprise security environments
- D. They are identical standards with no meaningful distinction between them

Answer: A

Q963. What is the primary purpose of the MITRE ATT&CK framework?

- A. To design websites for enterprise computing environments
- B. To develop antivirus software across enterprise computing systems
- C. To provide a knowledge base of adversary tactics, techniques, and procedures
- D. To generate comprehensive network topology diagrams

Answer: C

Q964. In cyber security, what does APT stand for?

- A. Active Port Tunneling
- B. Application Protocol Transfer
- C. Advanced Persistent Threat
- D. Automated Penetration Testing

Answer: C

Q965. Which best describes the concept of 'zero trust' architecture?

- A. Using zero encryption within enterprise security environments
- B. Trusting all internal network traffic regardless of the specific situation or context
- C. Never trusting any entity by default and always verifying regardless of location
- D. Blocking all external connections regardless of the specific situation or context

Answer: C

Q966. What is the purpose of a threat intelligence platform (TIP)?

- A. To manage employee records within enterprise computing infrastructure
- B. To create backup systems for enterprise computing environments
- C. To collect, aggregate, and analyze threat data from multiple sources
- D. To design and build user-facing application interfaces

Answer: C

Q967. Which regulation specifically addresses data protection for EU citizens?

- A. PCI DSS
- B. SOX
- C. HIPAA
- D. GDPR

Answer: D

Q968. What is the 'kill chain' model in cyber security?

- A. A network topology used in enterprise network infrastructure
- B. A method to physically destroy hardware installed within computing infrastructure
- C. A type of encryption algorithm applied to data protection workflows
- D. A framework describing the stages of a cyber attack from reconnaissance to exfiltration

Answer: D

Q969. What is the role of a Security Operations Center (SOC)?

- A. To continuously monitor, detect, analyze, and respond to security incidents
- B. To design network hardware across the enterprise network infrastructure
- C. To develop new software products across enterprise computing systems
- D. To sell security products within enterprise computing infrastructure

Answer: A

Q970. In Pakistan, which law primarily addresses cybercrime?

- A. Industrial Relations Act in security contexts
- B. Prevention of Electronic Crimes Act (PECA) 2016
- C. Foreign Exchange Act within enterprise security environments
- D. Pakistan Penal Code only in security contexts

Answer: B

Q971. What is the Bell-LaPadula security model primarily designed to protect?

- A. Confidentiality
- B. Non-repudiation
- C. Integrity
- D. Availability

Answer: A

Q972. Which security model uses 'no read down, no write up' to protect integrity?

- A. Brewer-Nash
- B. Clark-Wilson
- C. Biba Model
- D. Bell-LaPadula

Answer: C

Q973. What is the Clark-Wilson integrity model based on?

- A. Discretionary access control in security contexts
- B. Mandatory access control within enterprise security environments
- C. Well-formed transactions and separation of duties
- D. Role-based access control in security contexts

Answer: C

Q974. In security, what is a 'rainbow table'?

- A. A precomputed table for reversing cryptographic hash functions
- B. A type of firewall configuration for security management
- C. A network topology map used in enterprise network infrastructure
- D. A colorful network diagram used in enterprise network infrastructure

Answer: A

Q975. What is the purpose of 'salting' in password hashing?

- A. Making passwords taste better within enterprise security environments
- B. Compressing the password within enterprise security environments
- C. Adding random data to the password before hashing to prevent rainbow table attacks
- D. Encrypting the password twice within enterprise security environments

Answer: C

Q976. What is the Kerckhoffs principle in cryptography?

- A. Encryption is unnecessary within enterprise security environments
- B. A system should be secure even if everything except the key is public knowledge
- C. Keys should be shared publicly within enterprise security environments
- D. All algorithms should be secret regardless of the specific situation or context

Answer: B

Q977. What is the difference between DAC and MAC access control models?

- A. MAC allows users to share freely within enterprise security environments
- B. DAC allows owners to set permissions, MAC enforces system-wide policies based on classification labels
- C. They are fundamentally identical concepts with no meaningful differences
- D. DAC is more restrictive than MAC within enterprise security environments

Answer: B

Q978. Which describes 'security through obscurity'?

- A. Relying on secrecy of implementation rather than sound design for security
- B. Implementing zero trust within enterprise security environments
- C. Using strong encryption within enterprise security environments
- D. Using multiple firewalls within enterprise security environments

Answer: A

Q979. What is a Common Vulnerability Scoring System (CVSS)?

- A. A cryptographic algorithm used for protecting sensitive data
- B. A standard network communication protocol for data transfer
- C. A type of malware scanner designed for compromising system integrity
- D. A standardized framework for rating the severity of security vulnerabilities

Answer: D

Q980. What does TCB (Trusted Computing Base) refer to?

- A. An automated backup solution designed for enterprise-level data recovery and restoration
- B. A physical network cable used for connecting devices within the network infrastructure
- C. The totality of protection mechanisms within a computer system responsible for enforcing security policy
- D. A cloud computing platform used for hosting and managing distributed enterprise workloads

Answer: C

Q981. What mathematical problem does RSA encryption rely on?

- A. The traveling salesman optimization problem
- B. The difficulty of factoring large prime numbers
- C. The discrete logarithm mathematical problem
- D. Elliptic curve mathematical computation

Answer: B

Q982. What is an Initialization Vector (IV) in block cipher modes?

- A. A type of hash function within modern computing environments
- B. A random value used with a key to ensure identical plaintexts produce different ciphertexts
- C. The first encryption key within enterprise security environments
- D. A decryption algorithm within enterprise computing environments

Answer: B

Q983. Which block cipher mode is considered insecure for encrypting multiple blocks?

- A. CBC (Cipher Block Chaining)
- B. ECB (Electronic Codebook)
- C. GCM (Galois/Counter Mode)
- D. CTR (Counter) in security contexts

Answer: B

Q984. What is elliptic curve cryptography (ECC)?

- A. A data compression technique that reduces file sizes within enterprise computing environments
- B. A cryptographic hashing algorithm used within enterprise computing environments for integrity
- C. A symmetric block cipher algorithm widely used for protecting sensitive data at rest
- D. An asymmetric approach using elliptic curves over finite fields for smaller key sizes with equivalent security

Answer: D

Q985. What is a man-in-the-middle attack on key exchange?

- A. A brute force attack targeting enterprise network infrastructure used in enterprise computing environments
- B. A dictionary attack targeting enterprise network infrastructure used in enterprise computing environments
- C. An attacker intercepting and altering communication between two parties who believe they are communicating directly
- D. Physically stealing keys within enterprise security environments

Answer: C

Q986. What is perfect forward secrecy (PFS)?

- A. Using only symmetric encryption without any additional considerations needed
- B. Using the same key forever with no meaningful distinction between them
- C. Never changing encryption keys in any deployment scenario or context
- D. A property ensuring that compromise of long-term keys does not compromise past session keys

Answer: D

Q987. What is the purpose of HMAC?

- A. To reduce data sizes through compression methods and management
- B. To verify both data integrity and authenticity using a hash function and secret key
- C. To encrypt messages using established cryptographic standards
- D. To generate random numbers within enterprise computing infrastructure

Answer: B

Q988. Which is a post-quantum cryptographic approach?

- A. Lattice-based cryptography
- B. AES-128 symmetric block cipher
- C. SHA-256 cryptographic hashing
- D. RSA-2048 key exchange scheme

Answer: A

Q989. What is the purpose of key stretching algorithms like PBKDF2 and bcrypt?

- A. To speed up encryption using established cryptographic standards
- B. To compress encryption keys using established cryptographic standards
- C. To make brute-force attacks on passwords computationally expensive by adding iterations
- D. To make keys shorter within enterprise computing infrastructure

Answer: C

Q990. What is homomorphic encryption?

- A. Encryption that only works on text without any additional considerations needed
- B. A method to compress encrypted data for managing enterprise data resources
- C. Encryption that allows computations on ciphertext without decrypting it first
- D. A type of symmetric encryption applied to data protection workflows

Answer: C

Q991. What is a next-generation firewall (NGFW)?

- A. Same as a traditional firewall with no meaningful distinction between them regardless of the deployment context or scenario
- B. Only works with IPv6 without any additional considerations needed
- C. Combines traditional firewall with application awareness, deep packet inspection, and integrated threat intelligence
- D. Does not filter traffic in any deployment scenario or context regardless of the deployment context or scenario

Answer: C

Q992. What is the purpose of 802.1X network authentication?

- A. To increase and optimize overall network throughput speed and management
- B. To create and deploy enterprise wireless network infrastructure
- C. To provide port-based network access control requiring authentication before granting access
- D. To compress network traffic across the enterprise network infrastructure

Answer: C

Q993. What is deep packet inspection (DPI)?

- A. Checking only packet headers without any additional considerations needed
- B. Examining the full content of network packets including the data payload for threats
- C. A type of compression within modern computing environments
- D. A routing protocol used in enterprise network infrastructure

Answer: B

Q994. What is network forensics?

- A. Designing and deploying new network topologies across enterprise security infrastructure
- B. The capture, recording, and analysis of network events to discover the source of security attacks
- C. Configuring and managing enterprise routers across enterprise security infrastructure
- D. Installing and configuring network cables across enterprise security infrastructure environments

Answer: B

Q995. What is the purpose of a SIEM system in network security?

- A. To speed up network traffic across the enterprise network infrastructure
- B. To provide real-time analysis of security alerts from network hardware and applications
- C. To compress log files within the data management framework and management
- D. To generate comprehensive network topology diagrams and management

Answer: B

Q996. What is microsegmentation in network security?

- A. A type of network cable used in enterprise network infrastructure
- B. A standard network communication protocol for data transmission
- C. Creating fine-grained security zones to isolate workloads and apply granular security policies
- D. Dividing networks into very large segments within enterprise security environments

Answer: C

Q997. What is a network tap used for in security monitoring?

- A. A network routing device for managing enterprise traffic flows
- B. A way to steal water within modern computing environments
- C. A passive device that copies network traffic for monitoring without affecting data flow
- D. A wireless access point within modern computing environments

Answer: C

Q998. What is BGP hijacking?

- A. A legitimate routing practice within modern computing environments
- B. A symmetric key data encryption algorithm applied to data protection workflows
- C. An attack where an AS falsely announces ownership of IP prefixes to redirect internet traffic
- D. A next-generation firewall for filtering network traffic flows

Answer: C

Q999. What is the purpose of NetFlow in security analysis?

- A. To encrypt traffic using established cryptographic standards and management
- B. To collect and record IP traffic flow data for analysis of patterns and anomaly detection
- C. To block websites within enterprise computing infrastructure and management
- D. To increase available bandwidth for improved download speeds

Answer: B

Q1000. What is a zero-day vulnerability?

- A. A vulnerability that has been patched within modern computing environments
- B. A previously unknown vulnerability exploited before the vendor has released a fix
- C. A vulnerability that only affects old networks used in enterprise computing environments
- D. A vulnerability in outdated software used in enterprise computing environments

Answer: B

Q1001. What is a kernel-level rootkit?

- A. A next-generation firewall security appliance deployed across enterprise environments
- B. A legitimate administrative system utility tool used in enterprise computing environments
- C. A standard user-space application for management within the identity management system
- D. Malware that operates at the kernel level, hiding its presence and having unrestricted system access

Answer: D

Q1002. What is Trusted Platform Module (TPM)?

- A. A wired network interface adapter for connectivity used in enterprise computing environments
- B. A next-generation firewall for filtering network traffic flows
- C. A hardware-based security chip that provides cryptographic functions and secure key storage
- D. A type of volatile random access memory module used in enterprise computing environments

Answer: C

Q1003. What is Secure Boot?

- A. A UEFI feature ensuring only signed and trusted software loads during boot, preventing bootkits
- B. A symmetric key data encryption algorithm applied to data protection workflows
- C. An automated feature for creating data backups for managing enterprise data resources
- D. An option to boot the system more quickly within modern computing environments

Answer: A

Q1004. What is the purpose of Control Flow Integrity (CFI)?

- A. To ensure program execution follows the intended control flow graph, preventing code-reuse attacks
- B. To manage file systems within the data management framework and management
- C. To control user access within enterprise computing infrastructure and management
- D. To control traffic flow on networks across the enterprise network infrastructure

Answer: A

Q1005. What is a race condition vulnerability in OS security?

- A. A concurrency competition between processes commonly found within modern computing environments
- B. A type of scheduling algorithm used to manage processes within enterprise computing environments
- C. A flaw where the outcome depends on timing, allowing exploitation of the window between check and use
- D. A fast parallel processing technique used within enterprise computing environments for tasks

Answer: C

Q1006. What is namespace isolation in Linux containers?

- A. Naming convention for files within enterprise security environments in security contexts
- B. A kernel feature providing isolated views of system resources for processes, forming the basis of container security
- C. A DNS configuration within modern computing environments for security management
- D. A programming concept used in enterprise computing environments for security management

Answer: B

Q1007. What is integrity measurement architecture (IMA) in Linux?

- A. Detecting unauthorized file changes by maintaining and verifying cryptographic hashes
- B. Measuring and reporting available disk storage capacity on server devices
- C. Improving overall system performance throughput and resource utilization
- D. Compressing files to reduce disk storage consumption across system drives

Answer: A

Q1008. What is credential guard in Windows 10/11?

- A. A standard software application used for routine enterprise computing operation tasks
- B. A user account type with specifically assigned and managed access permissions
- C. A feature using virtualization-based security to isolate and protect credential secrets from theft
- D. A next-generation firewall solution for filtering and monitoring network traffic

Answer: C

Q1009. What is eBPF and how is it used in OS security?

- A. A standard network communication protocol for data transmission
- B. A symmetric key data encryption algorithm applied to data protection workflows
- C. An in-kernel virtual machine allowing sandboxed programs for security monitoring without modifying kernel source
- D. A file format used for structured data storage for managing enterprise data resources

Answer: C

Q1010. What is the difference between Type 1 and Type 2 hypervisors in security?

- A. Type 1 runs directly on hardware providing better isolation, Type 2 runs on a host OS adding extra attack surface
- B. Type 1 is software-only without any additional considerations needed
- C. Type 2 is more secure within enterprise security environments across computing environments
- D. No security difference in any deployment scenario or context or notable impact in any deployment scenario

Answer: A

Q1011. What is Server-Side Request Forgery (SSRF)?

- A. A type of load balancing technique for traffic distribution used in enterprise computing environments
- B. A server performance optimization technique for scaling within modern computing environments
- C. An attack that abuses server functionality to make requests to internal resources the attacker cannot directly access
- D. A server configuration method for managing network access used in enterprise network infrastructure

Answer: C

Q1012. What is a JSON Web Token (JWT) and its security considerations?

- A. A database management system for storing structured records
- B. A compact token format for secure claims transfer requiring proper validation and strong algorithms
- C. A CSS preprocessor for advanced stylesheet development used in enterprise computing environments
- D. A web browser application for accessing internet-hosted content

Answer: B

Q1013. What is the purpose of Subresource Integrity (SRI)?

- A. To improve and optimize page load speed performance and management
- B. To compress and minify JavaScript and CSS scripts within enterprise computing infrastructure
- C. To allow browsers to verify fetched resources have not been tampered with using cryptographic hashes
- D. To organize and manage web page static resources within enterprise computing infrastructure

Answer: C

Q1014. What is insecure deserialization?

- A. A database schema problem causing data integrity errors for managing enterprise data resources
- B. A vulnerability where untrusted data abuses deserialization logic, potentially leading to remote code execution
- C. Slow and inefficient data loading performance issues within enterprise security environments
- D. A data format compatibility issue between API versions for managing enterprise data resources

Answer: B

Q1015. What is a race condition vulnerability in web applications?

- A. A performance optimization for improving application speed
- B. A flaw where concurrent requests exploit timing gaps in security checks
- C. A caching problem causing stale data to be served
- D. A load balancing issue affecting resource distribution

Answer: B

Q1016. What is HTTP Request Smuggling?

- A. A load balancing technique used for efficiently distributing incoming network traffic
- B. A server-side caching mechanism designed for improving web page loading performance
- C. A content delivery method used for efficiently distributing static web assets globally
- D. An attack exploiting differences in how front-end and back-end servers parse HTTP requests

Answer: D

Q1017. What is a blind SQL injection attack?

- A. A properly secured and parameterized SQL database query for managing enterprise data resources
- B. An SQL injection where the attacker infers information by observing application behavior rather than direct output
- C. A database backup technique for creating data snapshots for managing enterprise data resources
- D. A standard SQL query that returns no data results for managing enterprise data resources

Answer: B

Q1018. What is the purpose of the HSTS header?

- A. To compress and reduce the size of HTTP request headers
- B. To force browsers to only use HTTPS, preventing protocol downgrade attacks
- C. To block and prevent all incoming and outgoing traffic
- D. To improve and speed up web connection establishment

Answer: B

Q1019. What is DOM-based XSS?

- A. It is identical in behavior to reflected cross-site scripting across computing environments
- B. Reflected XSS is exclusively a client-side vulnerability within enterprise security environments
- C. DOM-based XSS is a server-side vulnerability entirely within enterprise security environments
- D. XSS that executes entirely in the browser by manipulating the DOM, unlike reflected XSS which involves the server

Answer: D

Q1020. What is the purpose of OAuth 2.0 in web security?

- A. To provide delegated authorization allowing third-party apps limited access without sharing credentials
- B. To compress and reduce the size of transmitted web data and management
- C. To completely block all unauthorized users from access and management
- D. To encrypt all web traffic using symmetric cipher algorithms and management

Answer: A

Q1021. What is a polymorphic virus?

- A. A virus designed for running on multiple hardware platforms
- B. A virus that infects only once and does not replicate further
- C. Malware that changes its code signature each time it replicates to evade detection
- D. A benign virus that enhances system security posture overall

Answer: C

Q1022. What is a supply chain attack?

- A. A written record or logbook for tracking daily operational activities
- B. An attack compromising a trusted vendor or software update mechanism to distribute malware
- C. A procurement process for purchasing IT equipment used in enterprise computing environments
- D. Attacking physical supply chains and logistics routes

Answer: B

Q1023. What is an APT lifecycle?

- A. A system update cycle for deploying maintenance patches within modern computing environments
- B. A backup schedule for creating regular recovery snapshots for managing enterprise data resources
- C. A multi-stage attack process involving reconnaissance, initial access, persistence, lateral movement, and exfiltration
- D. A standard software development lifecycle methodology used in enterprise computing environments

Answer: C

Q1024. What is living-off-the-land (LOTL) technique?

- A. Environmental computing initiatives for reducing power usage
- B. A green IT practice focused on sustainable computing used in enterprise computing environments
- C. Agricultural computing systems for managing farming operations
- D. Using legitimate system tools already present on the target system to carry out malicious activities

Answer: D

Q1025. What is a logic bomb?

- A. Malicious code that remains dormant until triggered by a specific condition like a date or event
- B. A physical hardware component used in computing infrastructure
- C. A written record or logbook for tracking daily operational activities
- D. A software application used for enterprise computing operations

Answer: A

Q1026. What is DNS tunneling used for in attacks?

- A. A DNS caching technique for reducing query response time used in enterprise computing environments
- B. Encoding data within DNS queries to establish a covert communication channel bypassing firewalls
- C. A DNS optimization technique for faster name resolution used in enterprise computing environments
- D. Improving DNS resolution speed and performance latency

Answer: B

Q1027. What is steganography in cyber attacks?

- A. A type of prehistoric dinosaur classification study used in enterprise computing environments
- B. A printing technique for high-resolution image output used in enterprise computing environments
- C. Hiding malicious data or communications within ordinary-looking files like images or audio
- D. A photography method for capturing wide-angle images used in enterprise computing environments

Answer: C

Q1028. What is a metamorphic virus?

- A. A virus that migrates and spreads between different host operating systems and platforms
- B. A virus that executes only once on a system and then immediately self-terminates
- C. Malware that completely rewrites its own code with each iteration while maintaining functionality
- D. A benign virus variant that improves overall system security posture and performance

Answer: C

Q1029. What is the MITRE ATT&CK technique T1055 (Process Injection)?

- A. A standard software development pattern used for organizing code into modules
- B. A performance optimization technique for accelerating overall application speed
- C. A technique where malicious code is injected into the address space of a legitimate process
- D. A runtime debugging technique used for identifying and resolving code defects

Answer: C

Q1030. What is command and control (C2) infrastructure?

- A. A network management tool used in enterprise network infrastructure
- B. The communication framework attackers use to maintain control over compromised systems
- C. A software development platform for building applications
- D. A military headquarters facility for coordinating operations

Answer: B

Q1031. What is Kerberos authentication protocol?

- A. A software application used for enterprise computing operations
- B. A ticket-based network authentication protocol using symmetric key cryptography and a trusted third party
- C. A standard web browser for accessing internet sites within modern computing environments
- D. A standard network communication protocol for data transmission

Answer: B

Q1032. What is the difference between RBAC and ABAC in scalability?

- A. Neither is scalable within enterprise security environments
- B. RBAC is always more scalable regardless of the specific situation or context
- C. ABAC is more scalable for complex environments as it uses attributes rather than requiring new roles
- D. They scale identically with no meaningful distinction between them

Answer: C

Q1033. What is the FIDO2 authentication standard?

- A. A passwordless authentication standard using public-key cryptography with hardware authenticators
- B. A standard network communication protocol for data transmission
- C. A credential management mechanism for user authentication flows
- D. A file format used for structured data storage for managing enterprise data resources

Answer: A

Q1034. What is just-in-time (JIT) access provisioning?

- A. A type of SSO used across multiple services within enterprise computing environments
- B. Permanent access granted for all users regardless of the specific situation or context
- C. Fast login systems used for authentication within enterprise security environments
- D. Granting privileged access only when needed for a specific duration, then automatically revoking it

Answer: D

Q1035. What is the OAuth 2.0 authorization code flow?

- A. A flow where the client receives an authorization code exchanged for tokens via a back-channel
- B. A file transfer process within enterprise computing environments
- C. A simple password exchange within the identity management system
- D. A database query method for managing enterprise data resources

Answer: A

Q1036. What is the purpose of Privileged Access Management (PAM)?

- A. To create user accounts for enterprise computing environments
- B. To manage email accounts within enterprise computing infrastructure
- C. To secure, manage, and monitor privileged accounts and access to critical systems
- D. To design websites for enterprise computing environments and management

Answer: C

Q1037. What is a pass-the-hash attack?

- A. A hashing algorithm used for data integrity within enterprise computing environments
- B. Sharing passwords openly across teams within enterprise security environments for access
- C. A credential management mechanism designed for enterprise user authentication flows
- D. An attack where captured password hashes are used directly to authenticate without knowing the password

Answer: D

Q1038. What is continuous authentication?

- A. Logging into the system repeatedly at regular intervals across computing environments
- B. A type of multi-factor authentication using OTP tokens used in enterprise computing environments
- C. Continuously verifying identity throughout a session using behavioral biometrics and contextual signals
- D. A session timeout feature that logs users out within the identity management system

Answer: C

Q1039. What is claim-based identity?

- A. A type of insurance policy covering liability damages used in enterprise computing environments
- B. Using assertions about a user made by a trusted identity provider for authentication and authorization
- C. A file management system for organizing stored documents used in enterprise computing environments
- D. Filing legal claims in a court of law or tribunal within enterprise security environments

Answer: B

Q1040. What is certificate-based authentication?

- A. A training certification program for development used in enterprise computing environments
- B. Using digital certificates (X.509) to verify identity, preferred for machine-to-machine communication
- C. A structured file format used for data storage and exchange
- D. Using paper certificates for physical identity verification

Answer: B

Q1041. What is the Microsoft Security Development Lifecycle (SDL)?

- A. A Microsoft commercial product for endpoint security used in enterprise computing environments
- B. A testing framework for automated unit testing of code used in enterprise computing environments
- C. A high-level language used for development within modern computing environments
- D. A process integrating security into every SDLC phase including training, design, and verification

Answer: D

Q1042. What is a Software Bill of Materials (SBOM)?

- A. A project plan for scheduling development milestones used in enterprise computing environments
- B. A software application used for enterprise computing operations
- C. A software license for managing application access rights
- D. A comprehensive inventory of all components, libraries, and dependencies in software

Answer: D

Q1043. What is Interactive Application Security Testing (IAST)?

- A. Manual code review conducted by human security reviewers
- B. A software application used for enterprise computing operations
- C. A hybrid combining SAST and DAST using instrumentation agents within the running application
- D. A type of unit test for verifying individual code functions used in enterprise computing environments

Answer: C

Q1044. What is Runtime Application Self-Protection (RASP)?

- A. A programming pattern used in enterprise computing environments
- B. Security technology built into an application that detects and prevents attacks in real-time
- C. A self-replicating strain of malicious software targeting systems
- D. A software application used for enterprise computing operations

Answer: B

Q1045. What is the purpose of fuzz testing (fuzzing)?

- A. Load testing application performance under heavy traffic
- B. Providing random, unexpected, or malformed data as input to discover vulnerabilities
- C. Testing user experience through usability research sessions
- D. Testing application inputs with soft expected normal values

Answer: B

Q1046. What is taint analysis in secure development?

- A. Tracking untrusted data through an application to identify where it reaches sensitive operations unsanitized
- B. A color analysis tool for evaluating interface themes used in enterprise computing environments
- C. Source code formatting and style standardization practices across computing environments
- D. A code obfuscation method for protecting intellectual property used in enterprise computing environments

Answer: A

Q1047. What is the concept of 'secure defaults'?

- A. Having no security settings or controls enabled at all regardless of the deployment context or scenario
- B. Using default vendor passwords for all system accounts across computing environments
- C. Shipping applications with the most secure configuration, requiring users to explicitly reduce security
- D. Applications require no configuration at all to operate regardless of the deployment context or scenario

Answer: C

Q1048. What is a security champion program in DevSecOps?

- A. Embedding security-trained developers within teams to advocate for security practices
- B. A competitive security skills competition between teams used in enterprise computing environments
- C. A hiring initiative for recruiting security professionals
- D. A certification program for professional security credentials

Answer: A

Q1049. What is the purpose of a bug bounty program?

- A. Paying developers to write application source code faster and more efficiently
- B. Incentivizing external researchers to find and responsibly report vulnerabilities for rewards
- C. An automated software testing service for quality assurance and code validation
- D. A code quality improvement program focused on long-term maintainability goals

Answer: B

Q1050. What is DevSecOps?

- A. Integrating security into DevOps pipelines through automation, making security a shared responsibility
- B. A software application used for enterprise computing operations
- C. A next-generation firewall security appliance deployed across enterprise environments
- D. A high-level language used for development within modern computing environments

Answer: A

Q1051. What is the KRACK vulnerability?

- A. A software application used for enterprise computing operations
- B. A defect in wireless network adapter hardware components
- C. A type of physical screen damage on mobile device displays
- D. A vulnerability in WPA2's four-way handshake allowing nonce reuse and traffic decryption

Answer: D

Q1052. What is 802.11w (Protected Management Frames)?

- A. A wireless speed standard for improving data throughput used in enterprise computing environments
- B. A physical network cable used for connecting infrastructure devices
- C. A physical hardware component used in computing infrastructure
- D. An amendment providing integrity protection for management frames, preventing deauthentication attacks

Answer: D

Q1053. What is mobile application wrapping?

- A. Gift wrapping services for physical phone accessories and mobile device peripherals
- B. Encrypting app names for the purpose of obscuring installed applications on devices
- C. Adding a management layer around apps to enforce security policies without modifying source code
- D. Compressing mobile apps for reduced storage space consumption on user devices

Answer: C

Q1054. What is BLE security vulnerability tracking?

- A. A fitness tracker feature for monitoring health activity
- B. Monitoring BLE implementations for vulnerabilities like BlueBorne, KNOB, and BIAS
- C. A battery monitoring tool for optimizing power consumption
- D. Tracking the location of lost Bluetooth headphones

Answer: B

Q1055. What is certificate pinning in mobile applications?

- A. A user account type with specifically assigned access permissions
- B. Physically pinning paper certificates to a bulletin board
- C. A file attachment method for sending documents via email used in enterprise computing environments
- D. Hardcoding a host's expected certificate to prevent MITM attacks using fraudulent certificates

Answer: D

Q1056. What is the security risk of SS7 protocol vulnerabilities?

- A. There is no risk at all from this vulnerability in any deployment scenario or context
- B. A physical hardware component used in computing infrastructure
- C. A mobile device application for portable computing operations
- D. SS7 flaws allow interception of calls, SMS messages, and location tracking of mobile users globally

Answer: D

Q1057. What is containerization in enterprise mobile security?

- A. A storage method for archiving large data file volumes used in enterprise computing environments
- B. Physical shipping containers for transporting goods
- C. A charging technique for optimizing battery power cycles used in enterprise computing environments
- D. Creating isolated encrypted workspaces separating corporate and personal data on devices

Answer: D

Q1058. What is a man-in-the-disk attack on Android?

- A. An attack exploiting insecure external storage use by apps to maliciously modify data
- B. A network attack exploiting wireless protocol vulnerabilities
- C. A disk cleaning tool for removing temporary cached files
- D. A hardware attack targeting physical disk drive components

Answer: A

Q1059. What is a Wireless Intrusion Prevention System (WIPS)?

- A. A mobile device application used for managing and configuring Wi-Fi network settings
- B. A system monitoring wireless spectrum for unauthorized access and automatically taking countermeasures
- C. A network routing device used for managing enterprise traffic flows across infrastructure
- D. A Bluetooth peripheral device used for short-range data communication between systems

Answer: B

Q1060. What is the security significance of baseband processor vulnerabilities?

- A. A battery concern related to excessive power consumption used in enterprise computing environments
- B. A display issue causing visual glitches and rendering problems used in enterprise computing environments
- C. Baseband vulnerabilities can allow remote code execution bypassing all OS-level security controls
- D. Supply chain attacks have no significance in software security regardless of the deployment context or scenario

Answer: C

Q1061. What is a confused deputy problem in cloud security?

- A. A confused employee who cannot follow security procedures used in enterprise computing environments
- B. A next-generation firewall for filtering network traffic flows
- C. A privilege escalation where a trusted service is tricked into performing unauthorized actions
- D. A DNS issue causing incorrect domain name resolution used in enterprise computing environments

Answer: C

Q1062. What is CNAPP?

- A. A web development framework designed for building scalable application frontend interfaces
- B. An integrated security platform combining CSPM, CWPP, and application security for cloud-native apps
- C. A mobile application store platform for downloading and distributing software packages
- D. A cloud computing platform used for hosting and managing distributed enterprise workloads

Answer: B

Q1063. What is the NIST Cloud Computing Reference Architecture?

- A. A framework defining five major actors and their roles in cloud computing
- B. A cloud provider offering infrastructure as a service
- C. A security tool for scanning and detecting vulnerabilities
- D. A programming standard for writing cloud application code

Answer: A

Q1064. What are the security implications of serverless computing?

- A. No security is needed because there are no significant threats regardless of the deployment context or scenario
- B. This is completely secure by default without configuration across computing environments
- C. Same security profile as traditional server hosting with no meaningful distinction between them
- D. Reduced OS attack surface but increased function-level risks including injection and insecure dependencies

Answer: D

Q1065. What is cloud key management service (KMS)?

- A. A managed service for creating and managing cryptographic keys for cloud data encryption
- B. A music streaming service platform for audio content used in enterprise computing environments
- C. A file management tool for organizing cloud storage resources
- D. A network routing service for directing cloud data traffic

Answer: A

Q1066. What is cloud infrastructure entitlements management (CIEM)?

- A. Managing cloud storage volumes and tracking data capacity limits across regions
- B. Creating and provisioning new cloud user accounts across multiple environments
- C. Managing cloud billing and implementing cost optimization strategies for budgets
- D. Detecting and remediating excessive or unused permissions across multi-cloud environments

Answer: D

Q1067. What is CSA STAR certification?

- A. An astronomy certification for studying celestial objects used in enterprise computing environments
- B. A web browser application for accessing internet-hosted content
- C. A movie rating classification for content age suitability used in enterprise computing environments
- D. A third-party assessment of a cloud provider's security posture based on the Cloud Controls Matrix

Answer: D

Q1068. What is the blast radius concept in cloud security?

- A. A network speed measurement using bandwidth throughput used in enterprise computing environments
- B. The potential scope of damage if a security component is compromised, minimized through segmentation
- C. A storage capacity metric for measuring disk volume sizes used in enterprise computing environments
- D. A physical security measure for protecting building infrastructure

Answer: B

Q1069. What are immutable infrastructure security benefits?

- A. There are no security benefits from this approach regardless of the deployment context or scenario
- B. Faster server performance through hardware optimization
- C. Permanent servers that never change with no security benefit regardless of the deployment context or scenario
- D. Servers are never modified after deployment, reducing configuration drift and persistent threats

Answer: D

Q1070. What is the security challenge of multi-cloud environments?

- A. Managing consistent security policies and visibility across multiple providers with different tools
- B. Multi-cloud eliminates all security risks through redundancy
- C. There are no challenges with this approach at all in any deployment scenario or context
- D. Multi-cloud is inherently more secure than single-cloud

Answer: A

Q1071. What is a YARA rule?

- A. A next-generation firewall for filtering network traffic flows
- B. A programming language rule used in enterprise computing environments
- C. A database management system for storing structured records
- D. A pattern-matching tool for describing malware families based on textual or binary patterns

Answer: D

Q1072. What is the Sleuth Kit and Autopsy platform?

- A. A security scanner deployed across enterprise environments for security management
- B. An open-source digital forensics framework for file system analysis, timeline creation, and keyword searching
- C. A detective game within modern computing environments for security management
- D. A network monitor used in enterprise network infrastructure for security management

Answer: B

Q1073. What is file carving in digital forensics?

- A. Physically cutting a hard drive within enterprise security environments
- B. Wood carving with a computer within enterprise security environments
- C. Editing file names within enterprise security environments
- D. Recovering files from unallocated space by identifying file headers and footers without metadata

Answer: D

Q1074. What is the difference between live and dead forensics?

- A. Live forensics analyzes a running system for volatile data; dead forensics examines a powered-off system
- B. One involves living organisms within enterprise security environments
- C. There is no difference in any deployment scenario or context or notable impact in any deployment scenario
- D. One is more dangerous within enterprise security environments

Answer: A

Q1075. What is Windows Registry forensics?

- A. Fixing Registry errors and resolving system conflicts within enterprise security environments
- B. Registering Windows products and managing software licenses within enterprise security environments
- C. Creating Registry backups and restoration points within enterprise security environments
- D. Analyzing the Registry to extract evidence of user activities, installed software, and USB history

Answer: D

Q1076. What is the significance of slack space?

- A. Unused RAM within enterprise security environments across computing environments
- B. Empty space on a disk within enterprise security environments
- C. Space between end of a file and end of disk cluster, which may contain remnants of previous data
- D. A software application used for enterprise computing operations

Answer: C

Q1077. What is artifact analysis in mobile forensics?

- A. Examining mobile-specific data like SMS databases, call logs, app caches, and location data
- B. Analyzing phone hardware within enterprise security environments
- C. Repairing mobile devices within enterprise security environments
- D. Studying ancient artifacts within enterprise security environments

Answer: A

Q1078. What is the Volatility framework?

- A. A database tool used in enterprise computing environments
- B. A network scanner used in enterprise network infrastructure
- C. Measuring system performance within enterprise security environments
- D. An advanced memory forensics framework for extracting digital artifacts from RAM dumps

Answer: D

Q1079. What is evidence spoliation?

- A. A chain of custody step within modern computing environments
- B. Intentional or negligent destruction or alteration of evidence, leading to legal sanctions
- C. Proper evidence handling within enterprise security environments
- D. A forensic technique within enterprise computing environments

Answer: B

Q1080. What is cloud forensics and its challenges?

- A. A standard software application used for enterprise computing operations and workflows
- B. Weather analysis and atmospheric monitoring within enterprise security environments
- C. An automated backup solution designed for enterprise data recovery and restoration needs
- D. Forensic investigation in cloud environments facing data distribution, multi-jurisdiction, and limited access

Answer: C

Q1081. How does the SANS incident response framework differ from NIST?

- A. SANS has only 3 steps within enterprise security environments without additional considerations
- B. SANS emphasizes Identification vs. NIST's Detection and Analysis, and is more practitioner-oriented
- C. They are fundamentally identical concepts with no meaningful differences between them at all
- D. NIST has 10 distinct steps within enterprise security environments for incident handling

Answer: B

Q1082. What is a CSIRT and its key functions?

- A. A specialized team handling incident monitoring, triage, analysis, coordination, and advisory services
- B. A software application used for enterprise computing operations
- C. A user account type with specifically assigned access permissions
- D. A network administration team managing infrastructure used in enterprise computing environments

Answer: A

Q1083. What is cyber insurance?

- A. An automated backup solution designed for enterprise data recovery and restoration needs
- B. Insurance covering financial losses from cyber incidents including forensics, legal fees, and notification
- C. Car insurance for covering vehicle damage and repair costs resulting from accidents
- D. Health insurance covering IT staff medical expenses, benefits, and wellness programs

Answer: B

Q1084. What is the role of threat intelligence in incident response?

- A. A type of self-replicating malicious software designed for system infiltration attacks
- B. Generating and distributing threats against specifically targeted computing systems
- C. Providing context about threat actors, TTPs, and IOCs to accelerate detection and guide response
- D. A compliance reporting tool designed for generating audit documentation and reports

Answer: C

Q1085. What is SOAR?

- A. A next-generation firewall security appliance deployed across enterprise environments
- B. A software application used for enterprise computing operations
- C. A technology stack integrating security tools, automating response tasks, and orchestrating workflows
- D. A music platform for streaming and listening to audio used in enterprise computing environments

Answer: C

Q1086. What are the legal considerations during incident response?

- A. Evidence preservation, regulatory notification requirements, privacy laws, and law enforcement coordination
- B. Only criminal law applies without any specific legislation across computing environments
- C. Only privacy laws matter during incident response without any additional considerations needed
- D. No legal considerations exist during incident response regardless of the deployment context or scenario

Answer: A

Q1087. What is the purpose of tabletop exercises?

- A. Playing board games for team building recreation purposes across computing environments
- B. Discussion-based exercises to test plans, identify gaps, and improve coordination without operational impact
- C. A physical security measure for protecting building infrastructure
- D. Testing table strength and durability for furniture quality across computing environments

Answer: B

Q1088. What is the 'assume breach' concept?

- A. Accepting all risks without any mitigation efforts across computing environments
- B. Planning with the assumption that breaches will occur, focusing on detection, response, and recovery
- C. Disabling all security controls for maximum performance across computing environments
- D. Ignoring security entirely without any protective measures

Answer: B

Q1089. What is the role of digital forensics in incident response?

- A. An activity reserved only for law enforcement investigators used in enterprise computing environments
- B. A separate unrelated discipline with no connection within modern computing environments
- C. Completely replacing incident response with alternatives across computing environments
- D. Providing scientific examination of evidence to understand attack vector, scope, timeline, and attribution

Answer: D

Q1090. What is the difference between an incident and a data breach?

- A. They are functionally identical frameworks with no differences in any deployment scenario or context
- B. A breach is less serious than a standard incident within modern computing environments
- C. An incident only involves malware and no other threats designed for compromising system integrity
- D. An incident is any event threatening security; a breach specifically involves confirmed unauthorized access to sensitive data

Answer: D

Q1091. What is a SOC maturity model?

- A. A project management tool for tracking development milestones
- B. A software development model for iterative feature delivery
- C. A framework for assessing and improving SOC capabilities across people, processes, and technology
- D. A hiring framework for recruiting security team personnel used in enterprise computing environments

Answer: C

Q1092. What is SOAR in security monitoring?

- A. A software application used for enterprise computing operations
- B. A flight control system used in aviation navigation within modern computing environments
- C. A platform integrating security tools, automating response workflows, and orchestrating incident handling
- D. A cloud computing platform for hosting enterprise workloads

Answer: C

Q1093. What is MITRE ATT&CK's role in security monitoring?

- A. A next-generation firewall security appliance deployed across enterprise environments
- B. A vulnerability scanner for identifying system weaknesses used in enterprise computing environments
- C. A software application used for enterprise computing operations
- D. Providing a matrix of adversary tactics and techniques to guide detection rule creation and coverage assessment

Answer: D

Q1094. What is Extended Detection and Response (XDR)?

- A. A display resolution specification for mobile devices installed within computing infrastructure
- B. A unified platform integrating data from endpoints, networks, cloud, and email for holistic threat detection
- C. A network routing device for managing enterprise traffic flows
- D. A physical hardware component used in computing infrastructure

Answer: B

Q1095. What is deception technology?

- A. Social media manipulation campaigns designed for spreading misinformation and propaganda
- B. A magic show performance with illusion tricks for entertainment and audience engagement
- C. A VPN technology used for creating encrypted tunnel connections across networks securely
- D. Using decoys, breadcrumbs, and traps to detect attackers who bypassed perimeter defenses

Answer: D

Q1096. What are MTTD and MTTR?

- A. Time to reboot systems within enterprise security environments
- B. Average time to build software within enterprise security environments
- C. Time to install updates regardless of the specific situation or context
- D. Key SOC metrics measuring average time to detect (MTTD) and to contain and resolve (MTTR) incidents

Answer: D

Q1097. What is a purple team exercise?

- A. A standard software application commonly used for enterprise computing operations and tasks
- B. A collaborative exercise where offensive and defensive teams work together to improve detection
- C. A training exercise specifically designed for improving team coordination and basic skills
- D. A color-themed social event designed for team-building and recreational group activities

Answer: B

Q1098. What is network detection and response (NDR)?

- A. A network routing device for managing enterprise traffic flows
- B. A DNS service for resolving domain names to IP addresses used in enterprise computing environments
- C. A solution monitoring network traffic using behavioral analytics and ML to detect and respond to threats
- D. A network speed test for measuring bandwidth throughput used in enterprise computing environments

Answer: C

Q1099. What is the role of machine learning in security monitoring?

- A. Replacing all human security analysts with automation across computing environments
- B. Machine learning is used only for spam filtering without any additional considerations needed
- C. Enhancing detection of novel threats, reducing false positives, and automating large-scale data analysis
- D. Making systems slower through additional processing overhead

Answer: C

Q1100. What is a detection engineering program?

- A. Building physical detectors for environmental monitoring
- B. An electrical engineering course covering power distribution used in enterprise computing environments
- C. A systematic approach to developing, testing, and measuring effectiveness of security detection rules
- D. A physical hardware component used in computing infrastructure

Answer: C

Q1101. How does PECA 2016 address cyber terrorism?

- A. Only monetary fines are imposed for cyber terrorism under PECA across computing environments
- B. Only verbal warnings are issued for cyber terrorism under PECA across computing environments
- C. Section 10 criminalizes using information systems for terrorism with penalties up to 14 years and 50 million rupees
- D. PECA does not address terrorism in any of its provisions in any deployment scenario or context

Answer: C

Q1102. What is the Budapest Convention on Cybercrime?

- A. A European trade agreement governing international commerce used in enterprise computing environments
- B. A military alliance treaty for coordinating national defense used in enterprise computing environments
- C. The first international treaty addressing cybercrime with a framework for international cooperation
- D. A climate agreement for addressing global environmental change used in enterprise computing environments

Answer: C

Q1103. What are the challenges of cross-border cybercrime investigation?

- A. There are no challenges with this approach at all or notable impact in any deployment scenario
- B. Only language barriers present challenges for investigation
- C. Only time zone differences present challenges for investigation
- D. Jurisdictional conflicts, varying laws, evidence preservation across borders, and MLAT delays

Answer: D

Q1104. What is the legal framework for digital evidence in Pakistan?

- A. Qanun-e-Shahadat Order 1984, PECA 2016, and Electronic Transactions Ordinance 2002 collectively govern it
- B. Only criminal law applies without any specific legislation
- C. No legal framework exists for digital evidence in Pakistan regardless of the deployment context or scenario
- D. Only PECA applies without any other relevant legislation across computing environments

Answer: A

Q1105. What is the legal principle of proportionality in cyber security law?

- A. Minimum security is always sufficient regardless of threat across computing environments
- B. No security is needed because there are no significant threats regardless of the deployment context or scenario
- C. Maximum security should always be applied regardless of risk
- D. Security measures and penalties should be proportionate to the actual risk, balancing security with rights

Answer: D

Q1106. What is the legal status of encryption in different jurisdictions?

- A. Encryption is mandatory everywhere in the world without exception
- B. Legality varies: some countries mandate it, others restrict or require key escrow
- C. There are no laws about encryption in any country worldwide
- D. Encryption is illegal everywhere in the world without exception

Answer: B

Q1107. What is the NIS2 Directive?

- A. A physical hardware component widely used in enterprise computing infrastructure systems
- B. A standard software application used for routine enterprise computing operations tasks
- C. A standard network communication protocol used for transmitting data across systems
- D. An EU directive expanding cybersecurity requirements with risk management and incident reporting mandates

Answer: D

Q1108. What is 'duty of care' in cybersecurity?

- A. The legal obligation to implement reasonable security measures to protect stakeholders from foreseeable harm
- B. Only governments have a duty of care not private organizations regardless of the deployment context or scenario
- C. Duty of care is only a medical concept with no legal relevance regardless of the deployment context or scenario
- D. Having no responsibility for security is the accepted standard regardless of the deployment context or scenario

Answer: A

Q1109. What are the implications of the Schrems II decision?

- A. There are no implications for this technology whatsoever regardless of the deployment context or scenario
- B. It invalidated EU-US Privacy Shield and requires assessment of destination country data protection adequacy
- C. It only affects social media platforms and no other services without impacting any other system components
- D. It only affects banking institutions and no other organizations without impacting any other system components

Answer: B

Q1110. What is Pakistan's Personal Data Protection Bill?

- A. An education policy for governing school curriculum standards used in enterprise computing environments
- B. It has been fully enacted and is currently in force as law across computing environments
- C. A banking regulation governing financial institution operations used in enterprise computing environments
- D. A proposed legislation establishing data protection rights, consent requirements, and a regulatory authority

Answer: D

Q1111. What is post-quantum cryptography?

- A. Encryption methods used after quantum computers become obsolete across computing environments
- B. A standard cryptographic algorithm used for protecting sensitive data in transit and at rest
- C. Algorithms resistant to quantum attacks; NIST is standardizing lattice-based algorithms like CRYSTALS-Kyber
- D. Current encryption methods that are already widely deployed across enterprise computing environments

Answer: C

Q1112. What is confidential computing?

- A. A privacy policy document for governing data handling used in enterprise computing environments
- B. Hardware-based technology protecting data in use through trusted execution environments (TEEs)
- C. Keeping computer use private from other household members
- D. A secret language used for encoding confidential communications

Answer: B

Q1113. What is the significance of supply chain attacks in software?

- A. Compromising trusted development tools or dependencies to distribute malware through legitimate channels
- B. Supply chain attacks only affect physical goods and shipping without impacting any other system components
- C. Supply chain attacks have no significance in software security regardless of the deployment context or scenario
- D. Supply chain attacks only affect shipping and transportation without impacting any other system components

Answer: A

Q1114. What is cyber-physical systems security?

- A. A gym security system for monitoring facility access points used in enterprise computing environments
- B. Securing physical buildings with locks and access controls across computing environments
- C. Protecting systems where computational elements control physical processes, where attacks cause physical damage
- D. A fitness tracker for monitoring personal health activity used in enterprise computing environments

Answer: C

Q1115. What is adversarial machine learning?

- A. Training ML models faster using distributed computing across computing environments
- B. Techniques exploiting ML model vulnerabilities through adversarial inputs causing misclassification
- C. A competitive tournament between different ML implementations used in enterprise computing environments
- D. A type of supervised learning for classification tasks used in enterprise computing environments

Answer: B

Q1116. What is digital sovereignty in cybersecurity?

- A. Owning a domain name for a personal website registration across computing environments
- B. A nation's ability to control its digital infrastructure, data, and technology without foreign dependency
- C. Online voting rights for participating in digital elections
- D. A type of digital currency for online financial transactions used in enterprise computing environments

Answer: B

Q1117. What is the role of STIX/TAXII in threat intelligence?

- A. Email services for sending and receiving electronic messages
- B. Social media platforms for sharing posts and content within enterprise security environments
- C. Standardized formats and protocols for sharing structured cyber threat intelligence between organizations
- D. File sharing platforms for distributing documents and media

Answer: C

Q1118. What are the security implications of quantum key distribution (QKD)?

- A. QKD weakens security by introducing new attack vectors across computing environments
- B. There are no implications for this technology whatsoever regardless of the deployment context or scenario
- C. QKD uses quantum mechanics for theoretically unbreakable key exchange, as eavesdropping is detectable
- D. QKD replaces all existing encryption methods entirely across computing environments

Answer: C

Q1119. What is security chaos engineering?

- A. Creating chaos and deliberate disruption in security team operations and workflow
- B. Disabling all security controls to test overall system resilience under attack
- C. Intentionally injecting security failures to proactively identify weaknesses and validate controls
- D. Random penetration testing performed without any defined methodology or test plan

Answer: C

Q1120. What is the emerging threat of AI-powered social engineering?

- A. AI improving social skills through virtual communication across computing environments
- B. Using AI for convincing phishing at scale, deepfake impersonation, and personalized attacks harder to detect
- C. AI creating automated social media accounts for marketing across computing environments
- D. AI managing social media accounts for content scheduling across computing environments

Answer: B

Q1121. An organization discovers that an employee has been exfiltrating data for months undetected. Which security principle failure is MOST directly responsible?

- A. Failure in conducting regular penetration testing against external perimeters
- B. Failure in deploying sufficient network bandwidth for threat detection systems
- C. Failure in implementing proper security monitoring and audit logging controls
- D. Failure in applying timely software patches to all organizational endpoints

Answer: C

Q1122. A company implements multiple overlapping security controls. Which cyber security concept does this BEST demonstrate?

- A. Defense in depth using layered protections across multiple levels
- B. Least privilege limiting individual user permissions and access
- C. Security through obscurity relying on hidden system implementations
- D. Single point of failure with centralized management of controls

Answer: A

Q1123. During a risk assessment, the team identifies a threat with low probability but catastrophic impact. How should this risk be classified?

- A. Medium risk since probability and impact partially offset each other
- B. Low risk because the probability of occurrence is minimal
- C. High risk because catastrophic impact outweighs the low probability
- D. Negligible risk as low probability events should be safely ignored

Answer: C

Q1124. An attacker exploits a zero-day vulnerability before the vendor releases a patch. Which response strategy is MOST effective immediately?

- A. Waiting for the vendor to release an official patch before taking action
- B. Completely disconnecting all systems from every network until fully resolved
- C. Implementing compensating controls like network segmentation and monitoring
- D. Reinstalling the operating system on every affected endpoint in the network

Answer: C

Q1125. A security team must justify budget for new security tools to executive leadership. Which approach is MOST effective?

- A. Presenting the total number of blocked attacks from the previous fiscal year
- B. Highlighting technical specifications and vendor certifications of new tools
- C. Quantifying risk reduction in financial terms using established risk frameworks
- D. Comparing the organization's tool count with those of industry competitors

Answer: C

Q1126. In a mature security program, how should threat intelligence be integrated into operations?

- A. Shared exclusively with executive management during annual board review meetings
- B. Only used for generating quarterly reports for compliance and audit purposes
- C. Stored in offline archives for reference during post-incident forensic investigations
- D. Fed into SIEM, vulnerability management, and incident response processes continuously

Answer: D

Q1127. A nation-state actor targets critical infrastructure using advanced persistent threats. What classification does this attacker fall under?

- A. Opportunistic criminal seeking quick financial gain from random targets
- B. Hactivist motivated primarily by political or social activist causes
- C. Script kiddie with limited technical skill and basic attack toolkits
- D. Advanced Persistent Threat actor with significant resources and funding

Answer: D

Q1128. When implementing a security program, why is it critical to align security objectives with business goals?

- A. To reduce the overall complexity of network architecture within the organization systems
- B. To guarantee full compliance with every international security regulation and standard
- C. To ensure security spending directly supports organizational risk tolerance and priorities
- D. To minimize the total number of security staff required across all business departments

Answer: C

Q1129. A company wants to measure the effectiveness of its security program. Which metric is MOST meaningful?

- A. Mean time to detect and respond to confirmed security incidents over time
- B. Number of security certifications held by individual team members on staff
- C. Total count of firewall rules currently configured across all network devices
- D. Total annual budget allocated to the information security department budget

Answer: A

Q1130. An organization adopts a risk transfer strategy for a specific cyber threat. What does this typically involve?

- A. Purchasing cyber insurance to shift the financial burden of a potential breach
- B. Implementing additional technical controls to fully eliminate the identified risk
- C. Accepting the risk without any changes to current operations and security posture
- D. Ignoring the identified risk entirely because the likelihood is considered minimal

Answer: A

Q1131. An organization implements RBAC but discovers that a junior analyst can access executive financial reports. What is the MOST likely cause?

- A. The analyst discovered a zero-day exploit in the access control subsystem
- B. The RBAC system has a software bug that randomly grants elevated permissions
- C. Network segmentation failure allows unauthorized traffic to reach the server
- D. Role definitions are too broad and include permissions beyond job requirements

Answer: D

Q1132. A security architect must choose between preventive and detective controls for a limited budget. What is the BEST strategy?

- A. Invest entirely in preventive controls since prevention eliminates the need for detection
- B. Defer all investment until the budget allows for implementing both control types fully
- C. Balance both control types since prevention reduces incidents and detection catches gaps
- D. Invest entirely in detective controls since detection is always cheaper than prevention

Answer: C

Q1133. When applying the Clark-Wilson integrity model, what mechanism ensures data consistency?

- A. Periodic deletion of old data items to maintain storage efficiency across servers
- B. Well-formed transactions through constrained data items and transformation procedures
- C. Unrestricted access to data items by any authenticated user in the system
- D. Mandatory encryption of all data items at rest and in transit across all systems

Answer: B

Q1134. An organization finds that employees share credentials to bypass access restrictions. Which combination of controls BEST addresses this?

- A. Increasing the maximum number of concurrent sessions allowed for each user account
- B. Multi-factor authentication combined with behavioral analytics and session monitoring
- C. Stronger password complexity rules combined with more frequent password rotation policies
- D. Implementing longer password expiration periods with reduced login attempt thresholds

Answer: B

Q1135. In the Bell-LaPadula model, what does the 'no write down' rule prevent?

- A. Users from reading data at a higher classification level than their clearance
- B. Applications from creating temporary files on shared network storage volumes
- C. Users from writing data to a lower classification level causing data leakage
- D. Administrators from deleting files that are marked as system-critical assets

Answer: C

Q1136. A company merges with another organization that uses different security standards. What is the FIRST step for security integration?

- A. Merging all user accounts into one directory without modifying access permissions
- B. Immediately applying the stricter security standards across both organizations
- C. Conducting a gap analysis to identify differences in security controls and policies
- D. Replacing all security tools in both organizations with a single vendor solution

Answer: C

Q1137. Which scenario BEST illustrates a violation of the separation of duties principle?

- A. A security analyst monitors alerts while an incident responder handles confirmed breaches
- B. A developer writes code while a separate quality team reviews and approves the deployment
- C. A project manager assigns tasks while team leads independently track milestone progress
- D. A single administrator both creates user accounts and approves their own access requests

Answer: D

Q1138. An organization's quantitative risk analysis calculates an ALE of \$500,000 for a specific threat. The proposed countermeasure costs \$600,000 annually. What is the BEST decision?

- A. Defer the decision until the annualized loss expectancy increases above the threshold
- B. Implement the countermeasure and increase the security budget to cover the difference
- C. Implement the countermeasure because any protection is worth the investment overall
- D. Reject the countermeasure because its cost exceeds the annualized loss expectancy

Answer: D

Q1139. What is the primary advantage of using attribute-based access control over role-based access control?

- A. ABAC provides finer-grained access decisions based on multiple contextual attributes
- B. ABAC is simpler to implement and requires significantly less administrative overhead
- C. ABAC requires fewer computing resources and scales better on minimal hardware
- D. ABAC eliminates the need for any user authentication before granting system access

Answer: A

Q1140. How does the Biba integrity model differ from the Bell-LaPadula confidentiality model?

- A. Biba focuses on availability while Bell-LaPadula focuses on authentication mechanisms
- B. Biba allows unrestricted access while Bell-LaPadula enforces mandatory access controls
- C. Biba is only applicable to military systems while Bell-LaPadula is used commercially
- D. Biba uses no read down and no write up to protect integrity of data classifications

Answer: D

Q1141. An organization must protect data against future quantum computing attacks. Which cryptographic approach should they adopt?

- A. Switching from AES-256 to AES-128 for faster encryption processing speed
- B. Implementing post-quantum cryptographic algorithms like lattice-based schemes
- C. Increasing RSA key sizes to 4096 bits for stronger conventional encryption
- D. Using triple DES instead of AES for backward compatibility with systems

Answer: B

Q1142. A developer uses ECB mode to encrypt user profile images. What vulnerability does this introduce?

- A. ECB mode is too slow for image encryption causing application timeouts
- B. ECB mode requires keys that are too long for practical image encryption use
- C. ECB mode produces identical ciphertext for identical plaintext blocks revealing patterns
- D. ECB mode cannot handle binary data formats like images and only works with text

Answer: C

Q1143. During a TLS handshake, what is the purpose of the server's digital certificate?

- A. To establish the symmetric session key used for bulk data encryption directly
- B. To authenticate the server's identity and provide its public key to the client
- C. To encrypt all subsequent data transmitted between the client and the server
- D. To verify the client's identity before allowing any connection to be established

Answer: B

Q1144. An attacker performs a birthday attack against a hash function. What is the attacker exploiting?

- A. Side-channel information leaked through timing of the hash computation
- B. Buffer overflow vulnerabilities in the hash function software implementation
- C. Weak password policies that allow users to set easily guessable passwords
- D. The probability that two different inputs produce the same hash output value

Answer: D

Q1145. Why is key stretching used in password-based key derivation functions like PBKDF2?

- A. To reduce the length of the derived key for efficient storage in databases
- B. To make brute-force attacks slower by increasing computational cost per attempt
- C. To convert asymmetric keys into symmetric keys for hybrid encryption schemes
- D. To enable multiple users to share the same derived key without coordination

Answer: B

Q1146. In a hybrid encryption scheme, how are symmetric and asymmetric encryption combined?

- A. Symmetric encryption is used for authentication while asymmetric handles data integrity
- B. Asymmetric encryption secures the symmetric key which then encrypts the bulk data
- C. Both algorithms encrypt the same data independently for redundancy and verification
- D. Asymmetric encryption protects the bulk data while symmetric encryption protects the keys

Answer: B

Q1147. What is homomorphic encryption and why is it significant for cloud computing?

- A. Encryption that allows computations on ciphertext producing results matching plaintext operations
- B. Encryption that only works within a single cloud provider's proprietary infrastructure
- C. Encryption that uses identical keys across all cloud servers for simplified key management
- D. Encryption that automatically scales key sizes based on the current computational workload

Answer: A

Q1148. A security team discovers that their certificate authority's private key has been compromised. What is the MOST critical immediate action?

- A. Notifying end users to temporarily ignore certificate warnings in their browsers
- B. Revoking all certificates issued by the compromised CA and reissuing from a new CA
- C. Generating new public keys for all end-user certificates across the organization
- D. Increasing the key length of the compromised CA certificate to strengthen security

Answer: B

Q1149. What is the primary security concern with using MD5 for integrity verification today?

- A. MD5 is vulnerable to collision attacks making it unreliable for integrity checks
- B. MD5 requires excessive computational resources compared to newer hash algorithms
- C. MD5 can only hash text data and cannot process binary files or media content
- D. MD5 produces output that is too long for efficient storage in modern databases

Answer: A

Q1150. How does a hardware security module (HSM) enhance cryptographic key management?

- A. By converting all asymmetric keys to symmetric keys for faster processing speeds
- B. By automatically distributing encryption keys to all devices on the local network
- C. By compressing encryption keys to reduce the required storage space significantly
- D. By storing keys in tamper-resistant hardware that prevents unauthorized key extraction

Answer: D

Q1151. An organization detects lateral movement within their network after an initial breach. Which network control would MOST effectively limit this?

- A. Implementing micro-segmentation with strict inter-segment access control policies
- B. Upgrading the external firewall to a newer model with higher throughput capacity
- C. Deploying additional wireless access points throughout the building for coverage
- D. Increasing the bandwidth of the core network switches to handle more traffic loads

Answer: A

Q1152. During a DDoS attack, the security team notices traffic from thousands of spoofed source IPs. Which mitigation is MOST effective?

- A. Disabling all network interfaces until the attack subsides and traffic normalizes
- B. Increasing server hardware resources to absorb the additional malicious traffic load
- C. Using upstream provider scrubbing services with BGP flowspec to filter attack traffic
- D. Blocking each individual spoofed IP address manually in the perimeter firewall rules

Answer: C

Q1153. A penetration tester discovers that VLAN hopping is possible on the network. What misconfiguration is MOST likely responsible?

- A. Spanning tree protocol enabled with default priority values on all switch devices
- B. Trunk ports configured with native VLAN matching user access VLAN assignments
- C. DHCP snooping disabled on trunk ports connecting distribution and core switches
- D. Access ports configured with the correct VLAN but incorrect speed auto-negotiation

Answer: B

Q1154. What is the primary advantage of implementing a zero trust network architecture?

- A. Eliminating the need for any network firewalls or intrusion prevention systems
- B. Reducing network complexity by consolidating all traffic through a single gateway
- C. Automatically encrypting all data at rest without requiring application-level changes
- D. Verifying every access request regardless of whether it originates inside the network

Answer: D

Q1155. An analyst notices DNS tunneling in network logs. What is the attacker MOST likely trying to achieve?

- A. Improving network performance by bypassing the organization's proxy server
- B. Speeding up DNS resolution by caching responses on the local DNS server
- C. Testing the resilience of the DNS infrastructure against denial of service
- D. Exfiltrating data or establishing command-and-control channels via DNS queries

Answer: D

Q1156. A company implements network detection and response (NDR). What capability does NDR primarily add beyond traditional IDS?

- A. NDR replaces the need for endpoint detection and response tools on workstations
- B. NDR provides faster packet forwarding speeds than traditional IDS appliances can
- C. NDR uses behavioral analytics and machine learning to detect unknown threat patterns
- D. NDR eliminates false positive alerts entirely through deterministic rule matching

Answer: C

Q1157. What is BGP hijacking and why is it dangerous?

- A. Exploiting BGP to advertise false routes, redirecting internet traffic through attacker-controlled networks
- B. Attacking the BGP daemon process to crash border routers and cause widespread network service outages
- C. Intercepting BGP keepalive messages to prevent routers from maintaining their established peer sessions
- D. Using BGP messages to flood internal routing tables causing memory exhaustion on core switch devices

Answer: A

Q1158. An organization uses deep packet inspection (DPI) but encrypted traffic is increasing. What is the BEST approach to maintain visibility?

- A. Deploying TLS inspection proxies that decrypt, inspect, and re-encrypt the traffic
- B. Downgrading encryption standards to weaker ciphers that are easier to inspect
- C. Banning all encrypted traffic on the corporate network to maintain full inspection
- D. Switching entirely to metadata analysis and abandoning payload inspection efforts

Answer: A

Q1159. What is the security risk of running network services on default ports?

- A. Default ports cannot be protected by firewalls due to protocol specification limits
- B. Attackers can easily identify and target services running on well-known default ports
- C. Default ports consume more bandwidth than non-standard ports on network devices
- D. Default ports are inherently less secure than non-standard ports at the protocol level

Answer: B

Q1160. How does software-defined networking (SDN) improve network security management?

- A. SDN centralizes control enabling dynamic, programmable security policy enforcement
- B. SDN automatically encrypts all traffic without requiring any additional configuration
- C. SDN replaces all traditional security tools including firewalls and IDS solutions
- D. SDN eliminates the need for physical network infrastructure entirely in all cases

Answer: A

Q1161. A Linux server is compromised via a kernel exploit that bypasses all userspace security controls. Which hardening mechanism would have BEST mitigated this?

- A. Enabling Kernel Address Space Layout Randomization and Secure Boot with signed kernels
- B. Installing additional antivirus software with real-time scanning enabled on the server
- C. Configuring iptables with strict ingress and egress filtering rules on all interfaces
- D. Implementing disk quotas to limit the amount of storage each user account can consume

Answer: A

Q1162. An attacker uses a return-oriented programming (ROP) attack. Which OS security mechanisms specifically counter this technique?

- A. Disk encryption and secure boot processes that verify operating system integrity
- B. File permission checks and user account control prompts before executing programs
- C. Network firewall rules that block incoming connections from suspicious IP addresses
- D. Control Flow Integrity and Shadow Stack implementations in the processor and compiler

Answer: D

Q1163. A containerized application escapes its container and gains host access. What is the MOST effective prevention mechanism?

- A. Using rootless containers with user namespaces and mandatory access control policies
- B. Running containers with root privileges to ensure all security modules are accessible
- C. Disabling all container networking to prevent communication with the host system
- D. Allocating more CPU and memory resources to the container for improved isolation

Answer: A

Q1164. An organization discovers a rootkit embedded in their server OS. What makes rootkits particularly dangerous compared to other malware?

- A. Rootkits only target mobile operating systems and cannot infect desktop computers
- B. Rootkits spread faster than worms across networks using standard network protocols
- C. Rootkits modify the OS kernel or firmware to hide their presence from security tools
- D. Rootkits are larger in file size than other malware making them consume more disk space

Answer: C

Q1165. What is the security advantage of using immutable infrastructure for OS deployments?

- A. Immutable systems are faster because they do not need to load any security modules
- B. Immutable systems never require updates because they are inherently secure by design
- C. Immutable systems are replaced entirely rather than patched, preventing persistent compromise
- D. Immutable systems allow administrators to modify configurations at any time without risk

Answer: C

Q1166. A system administrator needs to detect fileless malware that operates entirely in memory. Which approach is MOST effective?

- A. Scanning network traffic logs for unusual DNS queries originating from external servers
- B. Using endpoint detection and response tools with memory analysis and behavioral monitoring
- C. Checking file integrity using checksums against a known-good baseline of all system files
- D. Running traditional signature-based antivirus scans on all files stored on disk

Answer: B

Q1167. What is the security risk of symlink race conditions in Unix-like operating systems?

- A. They consume excessive disk space by duplicating files across multiple directory paths
- B. They prevent legitimate users from accessing their home directories during peak usage
- C. They allow attackers to redirect privileged operations to unintended files via symbolic links
- D. They cause system slowdowns by creating circular references in the filesystem structure

Answer: C

Q1168. How does Windows Credential Guard protect authentication credentials?

- A. By storing credentials in an encrypted file on the system drive protected by BitLocker
- B. By requiring all users to change their passwords every seven days automatically
- C. By isolating credential processes in a virtualization-based security container from the OS
- D. By disabling all remote authentication protocols to prevent credential interception

Answer: C

Q1169. A security team must secure a system running legacy software that cannot be patched. What is the BEST compensating strategy?

- A. Replacing all other systems on the network with the same legacy software for consistency
- B. Isolating the system with strict network segmentation, monitoring, and application whitelisting
- C. Ignoring the risk since the legacy software has been stable for many years without issues
- D. Granting administrator access to all users so they can manually address security concerns

Answer: B

Q1170. What is the security significance of Trusted Platform Module (TPM) in OS security?

- A. TPM increases CPU processing speed to enable faster encryption and decryption operations
- B. TPM automatically installs operating system updates without requiring administrator input
- C. TPM replaces the need for software-based firewalls by filtering traffic in hardware only
- D. TPM provides a hardware root of trust for secure boot, key storage, and platform integrity

Answer: D

Q1171. A web application uses JWT tokens for authentication. An attacker changes the algorithm header to 'none'. What vulnerability does this exploit?

- A. Insecure session management allowing unlimited concurrent sessions for each user account
- B. Cross-site request forgery enabling unauthorized actions on behalf of authenticated users
- C. JWT algorithm confusion attack bypassing signature verification when none is accepted
- D. Server-side template injection allowing arbitrary code execution on the web application

Answer: C

Q1172. A penetration tester discovers a blind SQL injection vulnerability. How does blind SQL injection differ from standard SQL injection?

- A. Blind SQL injection requires physical access to the database server for exploitation
- B. Blind SQL injection infers data from application behavior rather than direct query output
- C. Blind SQL injection cannot extract any data from the database regardless of technique
- D. Blind SQL injection only works against NoSQL databases and not relational databases

Answer: B

Q1173. An application is vulnerable to server-side template injection (SSTI). What is the primary risk?

- A. Attackers can execute arbitrary code on the server through template engine exploitation
- B. Users can modify the visual layout and CSS styling of the application pages
- C. The application performance degrades because templates are rendered on every request
- D. Template files are exposed to search engines causing information disclosure publicly

Answer: A

Q1174. A security team discovers that their web application's deserialization process is vulnerable. What is the MOST severe potential impact?

- A. Remote code execution through crafted serialized objects processed by the application
- B. Loss of CSS styling information causing visual degradation on mobile device browsers
- C. Slightly increased response times when processing large serialized data payloads
- D. The application displays incorrect date formats in the user interface components

Answer: A

Q1175. How does a race condition vulnerability manifest in web applications?

- A. Two concurrent requests exploit timing gaps to bypass validation or duplicate operations
- B. Page loading speed varies based on the number of concurrent users on the platform
- C. The application crashes when multiple users attempt to log in at the same exact time
- D. Database queries return incorrect results when executed during high traffic periods

Answer: A

Q1176. A web application uses OAuth 2.0 for authentication. What is the primary risk of the 'open redirect' vulnerability in this context?

- A. It allows attackers to steal authorization codes by redirecting to attacker-controlled URLs
- B. It causes the OAuth server to crash when processing redirect URLs with special characters
- C. It exposes the client secret in the URL parameters visible in the browser address bar
- D. It prevents legitimate users from completing the authentication flow on mobile browsers

Answer: A

Q1177. What is a prototype pollution vulnerability in JavaScript web applications?

- A. An attack that modifies the Object prototype to inject properties affecting all objects
- B. An issue where deprecated JavaScript functions cause compatibility errors in browsers
- C. A vulnerability where JavaScript files are served without proper content type headers
- D. A memory leak caused by creating too many JavaScript objects without cleanup routines

Answer: A

Q1178. A web application allows file uploads. Which combination of controls BEST prevents malicious file upload attacks?

- A. Limiting file size to one megabyte and allowing only uploads during business hours daily
- B. Validating file type, scanning content, storing outside webroot, and renaming uploaded files
- C. Only checking the file extension on the client side before allowing the upload to proceed
- D. Compressing all uploaded files into ZIP archives and storing them on a shared network drive

Answer: B

Q1179. What is the security impact of HTTP request smuggling?

- A. It exploits discrepancies between frontend and backend HTTP parsing to inject requests
- B. It downgrades HTTPS connections to HTTP by modifying the request protocol header field
- C. It causes web pages to load slower because requests are processed in an incorrect order
- D. It prevents the server from processing legitimate user requests during peak traffic hours

Answer: A

Q1180. How does Subresource Integrity (SRI) protect web applications that use CDN-hosted scripts?

- A. By caching CDN resources locally so they load faster regardless of CDN server status
- B. By verifying that fetched resources match expected cryptographic hashes before execution
- C. By automatically updating CDN-hosted scripts when new versions become available online
- D. By encrypting the communication channel between the browser and CDN server endpoints

Answer: B

Q1181. An organization is hit by ransomware that also exfiltrates data before encryption. What is this attack technique called?

- A. Crypto-jacking where computing resources are hijacked to mine cryptocurrency secretly
- B. Triple extortion where customers of the victim are also contacted for ransom payments
- C. Double extortion where data is stolen and encrypted to pressure victims into paying
- D. Single extortion where data is encrypted and a ransom is demanded for decryption

Answer: C

Q1182. A threat actor uses living-off-the-land techniques (LOLBins) during an attack. Why is this approach effective?

- A. Because using legitimate system tools avoids triggering signature-based security detections
- B. Because system binaries can be modified without administrator privileges on any system
- C. Because custom malware tools are faster than legitimate system binaries for attacks
- D. Because legitimate tools provide encryption capabilities not available in custom malware

Answer: A

Q1183. An APT group maintains persistence on a compromised system for months. Which technique is MOST commonly used for long-term persistence?

- A. Physically accessing the server room weekly to reinstall their malware on the server
- B. Continuously running brute force attacks against the same system to maintain access
- C. Creating scheduled tasks and modifying registry run keys to survive system reboots
- D. Sending daily phishing emails to the same users to re-establish compromised access

Answer: C

Q1184. During malware analysis, a sample is identified as metamorphic. How does metamorphic malware differ from polymorphic malware?

- A. Metamorphic malware only changes file names while polymorphic malware changes the entire file structure
- B. Metamorphic malware is exclusive to mobile devices while polymorphic malware targets desktop systems
- C. Metamorphic malware spreads faster than polymorphic malware across networks due to its smaller size
- D. Metamorphic malware completely rewrites its own code while polymorphic malware only encrypts its payload

Answer: D

Q1185. A company discovers that attackers used a compromised software update mechanism to distribute malware. What type of attack is this?

- A. Man-in-the-middle attack intercepting downloads between the vendor and customer networks
- B. Supply chain attack leveraging trusted software distribution channels for malware delivery
- C. Watering hole attack targeting employees who visit the software vendor's support website
- D. Brute force attack against the software vendor's authentication system and user accounts

Answer: B

Q1186. An incident responder identifies that malware communicates using DNS TXT records for command and control. Why is this technique effective?

- A. DNS TXT records can carry arbitrary data and DNS traffic is often allowed through firewalls
- B. DNS TXT records are not logged by any DNS server making forensic investigation impossible
- C. DNS TXT records travel faster than other DNS record types due to priority routing protocols
- D. DNS TXT records are encrypted by default making them invisible to all security monitoring tools

Answer: A

Q1187. What is the MITRE ATT&CK framework and how does it help in understanding malware attacks?

- A. A vulnerability scanner that automatically detects and patches malware on infected systems
- B. A firewall configuration standard that blocks all known malware communication protocols
- C. An encryption standard used by government agencies to protect classified communications
- D. A knowledge base of adversary tactics and techniques based on real-world attack observations

Answer: D

Q1188. An organization's EDR detects PowerShell executing encoded commands at 3 AM. What type of attack behavior does this MOST likely indicate?

- A. A scheduled system maintenance script running automated update and cleanup operations
- B. A developer testing deployment scripts in the production environment during quiet hours
- C. Malicious activity using encoded PowerShell for obfuscation during low-monitoring periods
- D. An automated backup process that requires elevated PowerShell execution permissions

Answer: C

Q1189. What is process injection and why do attackers use it?

- A. Injecting malicious code into a legitimate running process to evade detection and gain its privileges
- B. Creating new malicious processes with random names to confuse system administrators during analysis
- C. Modifying the process scheduler to give malware higher priority than legitimate system applications
- D. Injecting monitoring code into malware processes to observe their behavior for research purposes

Answer: A

Q1190. A threat intelligence report describes malware that uses domain generation algorithms (DGA). What is the purpose of DGA?

- A. Creating legitimate websites that appear in search engine results to attract potential victims
- B. Generating secure domain names for the attacker's personal websites and email services
- C. Automatically registering domain names that are about to expire for resale profit purposes
- D. Generating random domain names for C2 communication making it difficult to block all domains

Answer: D

Q1191. An organization implements a zero trust model. How should authentication change compared to traditional perimeter-based security?

- A. Authentication is only required once at the network perimeter and then trusted throughout
- B. Authentication is only required for external users while internal users are auto-trusted
- C. Authentication is eliminated entirely because the zero trust model makes it unnecessary
- D. Continuous authentication and verification is required for every resource access request

Answer: D

Q1192. A company discovers that an attacker used a golden ticket attack in Active Directory. What does this attack achieve?

- A. It disables all group policies allowing unrestricted software installation on endpoints
- B. It modifies DNS records to redirect all domain traffic to attacker-controlled servers
- C. It resets all user passwords in the domain forcing everyone to create new credentials
- D. It creates a forged Kerberos TGT granting unrestricted access to any domain resource

Answer: D

Q1193. What is the security risk of using bearer tokens without additional binding in OAuth 2.0?

- A. Bearer tokens cannot be revoked once issued requiring server restarts to invalidate
- B. Bearer tokens expire too quickly making them impractical for long-running sessions
- C. Bearer tokens are too large in size causing performance issues in network requests
- D. Anyone possessing the token can use it, making stolen tokens immediately exploitable

Answer: D

Q1194. An attacker performs a pass-the-hash attack. What makes this attack possible?

- A. LDAP queries return password hashes to any authenticated user who requests directory data
- B. NTLM authentication allows authentication using the password hash without the actual password
- C. DNS service records expose password hashes when queried with specific malformed requests
- D. Kerberos tickets are stored in plaintext on the domain controller's hard drive permanently

Answer: B

Q1195. How does risk-based adaptive authentication improve security?

- A. It eliminates all authentication requirements to improve user experience and speed
- B. It dynamically adjusts authentication requirements based on contextual risk signals
- C. It uses the same authentication method regardless of the risk level of the access
- D. It requires maximum authentication strength for all access requests at all times

Answer: B

Q1196. An organization deploys FIDO2 hardware keys for authentication. What is the primary attack vector this eliminates?

- A. Physical theft attacks because FIDO2 keys cannot be used by anyone other than the owner
- B. Phishing attacks because FIDO2 keys are bound to specific origins and resist credential theft
- C. Malware attacks because FIDO2 keys include built-in antivirus scanning for connected devices
- D. Denial of service attacks because FIDO2 keys provide faster authentication to all services

Answer: B

Q1197. What is the security challenge of implementing SSO across an organization?

- A. SSO cannot work with cloud applications and is limited to on-premises systems only
- B. A compromised SSO credential grants access to all connected applications simultaneously
- C. SSO does not support multi-factor authentication and relies only on password access
- D. SSO requires separate passwords for each application making it complex to manage

Answer: B

Q1198. How does certificate-based authentication provide stronger security than password-based authentication?

- A. Certificates are shorter than passwords making them faster to process during authentication
- B. Certificates use asymmetric cryptography and cannot be phished or replayed like passwords
- C. Certificates work without any network connection making them suitable for offline access
- D. Certificates do not expire so they never need to be renewed or rotated by administrators

Answer: B

Q1199. An organization needs to implement step-up authentication. In what scenario is this MOST appropriate?

- A. When a system administrator performs routine maintenance on non-critical services
- B. When a user initially logs in to access their basic email and calendar application
- C. When a new employee creates their initial account during the onboarding process
- D. When an already authenticated user attempts to access a highly sensitive resource

Answer: D

Q1200. What is Kerberoasting and how does it exploit Active Directory authentication?

- A. Modifying Kerberos configuration files to disable ticket encryption on the domain controllers
- B. Intercepting Kerberos tickets in transit by performing ARP spoofing on the network segment
- C. Requesting service tickets for service accounts and cracking them offline to obtain passwords
- D. Flooding the Key Distribution Center with ticket requests to cause a denial of service

Answer: C

Q1201. A development team discovers a critical vulnerability in a third-party library used across all their applications. What is the MOST effective response?

- A. Rewriting all applications from scratch without using any third-party library dependencies
- B. Assessing impact, applying patches or mitigations, and implementing SCA in the CI/CD pipeline
- C. Removing the library immediately without considering functionality impact on applications
- D. Ignoring the vulnerability because third-party libraries are the vendor's sole responsibility

Answer: B

Q1202. How does interactive application security testing (IAST) combine benefits of SAST and DAST?

- A. IAST only works on interpreted languages while SAST and DAST work on compiled languages
- B. IAST replaces both SAST and DAST entirely by using artificial intelligence for scanning
- C. IAST runs SAST and DAST tools simultaneously in separate processes for speed improvement
- D. IAST instruments the application to analyze code execution during runtime testing activities

Answer: D

Q1203. A CI/CD pipeline has no security gates. What risks does this introduce and what should be implemented?

- A. Vulnerable code reaches production; implement SAST, DAST, SCA, and secret scanning gates
- B. No risk since CI/CD automation inherently eliminates all security vulnerabilities in code
- C. Only compliance risks exist; implement audit logging at the deployment stage exclusively
- D. Only performance risks exist; implement load testing gates to validate application speed

Answer: A

Q1204. What is the security risk of hardcoded secrets in source code?

- A. Hardcoded secrets only pose a risk if the application is written in interpreted languages
- B. Hardcoded secrets make the code run slower because encryption is computed at every startup
- C. Secrets in code are exposed in version control history even after removal from current files
- D. Secrets in code are automatically protected by the compiler during the build optimization

Answer: C

Q1205. How does runtime application self-protection (RASP) provide security?

- A. RASP scans source code before compilation to identify potential security vulnerabilities early
- B. RASP monitors network traffic outside the application to filter malicious request patterns
- C. RASP instruments the application to detect and block attacks from within the running application
- D. RASP encrypts all application data at rest to prevent unauthorized access to stored files

Answer: C

Q1206. A development team uses microservices architecture. What unique security challenges does this introduce?

- A. No unique challenges since microservices security is identical to monolithic application security
- B. Only performance challenges exist since microservices do not introduce any new security concerns
- C. Increased attack surface from inter-service communications requiring mutual authentication and encryption
- D. Reduced attack surface because microservices are inherently more secure than monolithic applications

Answer: C

Q1207. What is the security significance of Software Bill of Materials (SBOM)?

- A. SBOM is a financial document listing the costs of all software licenses for budget management
- B. SBOM provides a complete inventory of software components enabling vulnerability tracking and response
- C. SBOM is a testing report showing the results of all security scans performed on the software
- D. SBOM is a deployment guide listing the steps required to install software on production servers

Answer: B

Q1208. A penetration tester finds that the application is vulnerable to mass assignment. What is this vulnerability?

- A. An attacker modifies object properties by injecting unexpected parameters into API requests
- B. An attacker assigns administrator roles to all users by exploiting a database trigger flaw
- C. An attacker overwhelms the server by sending thousands of simultaneous assignment operations
- D. An attacker copies large amounts of data by exploiting a flaw in the file download feature

Answer: A

Q1209. What is the purpose of security regression testing?

- A. Verifying that previously fixed security vulnerabilities are not reintroduced by new code changes
- B. Scanning the production environment for new zero-day vulnerabilities not found during development
- C. Testing the application performance under heavy load to identify potential denial of service risks
- D. Reviewing the application source code for compliance with organizational coding style guidelines

Answer: A

Q1210. How does a security-focused infrastructure as code (IaC) scanning tool improve deployment security?

- A. It encrypts all infrastructure configuration files to prevent unauthorized access to server settings
- B. It detects misconfigurations and security policy violations in infrastructure definitions before deployment
- C. It replaces the need for network firewalls by implementing security rules within the code itself
- D. It automatically fixes all application code vulnerabilities found during the build compilation process

Answer: B

Q1211. An organization discovers that employees' mobile devices are connecting to an evil twin access point in their parking lot. What is the MOST comprehensive solution?

- A. Simply changing the corporate WiFi password and notifying employees via company-wide email
- B. Banning all wireless device usage on the company premises to eliminate wireless attack surface
- C. Deploying WIPS with rogue AP detection, enforcing VPN usage, and implementing 802.1X authentication
- D. Installing signal jammers in the parking lot to prevent all wireless connections from working

Answer: C

Q1212. A mobile application stores sensitive data in shared preferences without encryption. What is the primary attack vector this enables?

- A. Data extraction from the device's unencrypted shared preferences via backup or root access
- B. Credential theft through man-in-the-middle attacks on the application's API communications
- C. Denial of service against the application by filling shared preferences with random data
- D. Remote exploitation of the application through the mobile operating system's network stack

Answer: A

Q1213. What is the security implication of 5G network slicing from a cyber security perspective?

- A. 5G slicing reduces bandwidth making traditional wireless attacks completely ineffective
- B. 5G slicing eliminates all wireless security concerns by design through quantum encryption
- C. 5G slicing is only relevant for consumer devices and has no enterprise security implications
- D. Compromise of one slice could potentially affect other slices if isolation controls are insufficient

Answer: D

Q1214. An attacker uses a Stingray device near a corporate office. What type of attack is this?

- A. A Bluetooth sniffing attack that captures data from nearby paired mobile device connections
- B. An IMSI catcher attack that intercepts mobile communications by impersonating a cell tower
- C. A WiFi jamming attack that disrupts all wireless network signals within a building area
- D. A GPS spoofing attack that provides false location data to mobile navigation applications

Answer: B

Q1215. A company implements a zero trust approach for mobile devices. What is the MOST critical component?

- A. Allowing unrestricted access once the device passes an initial security check at enrollment
- B. Trusting all devices on the corporate WiFi network and blocking only external connections
- C. Requiring biometric authentication only for the initial device unlock at the start of day
- D. Continuous device posture assessment and risk-based conditional access for every request

Answer: D

Q1216. What is the security risk of mobile deep links and how can they be exploited?

- A. Deep links expose the application source code to reverse engineering through URL scheme analysis
- B. Deep links increase application size making mobile devices slower and consuming excessive storage
- C. Attackers craft malicious deep links to redirect users to phishing pages or trigger unauthorized actions
- D. Deep links prevent the application from receiving push notifications from the backend server

Answer: C

Q1217. How does a Wi-Fi pineapple device facilitate wireless attacks?

- A. It generates random WiFi networks to confuse nearby devices and prevent them from connecting
- B. It automates evil twin, deauth, and man-in-the-middle attacks on wireless networks for penetration testing
- C. It increases WiFi signal range allowing attackers to connect to distant corporate wireless networks
- D. It blocks all wireless signals in an area creating a denial of service for all wireless devices

Answer: B

Q1218. An enterprise deploys EMM (Enterprise Mobility Management). How does EMM differ from basic MDM?

- A. EMM only manages device hardware while MDM manages both hardware and installed applications
- B. EMM replaces all security controls while MDM supplements existing security infrastructure
- C. EMM includes MDM plus mobile application management, content management, and identity management
- D. EMM is exclusively for iOS devices while MDM supports only Android mobile operating systems

Answer: C

Q1219. What is the security concern with wireless mesh networks in IoT deployments?

- A. Each mesh node is a potential attack point and compromise can propagate through the entire network
- B. Mesh networks provide too much bandwidth making it easy for attackers to exfiltrate large data
- C. Mesh networks cannot be encrypted because the routing protocol requires plaintext communication
- D. Mesh networks are immune to all wireless attacks because they use frequency hopping technology

Answer: A

Q1220. A mobile app development team implements runtime application self-protection. How does this specifically benefit mobile security?

- A. RASP detects and prevents tampering, debugging, and exploitation attempts within the running app
- B. RASP automatically updates the mobile application without requiring app store review approval
- C. RASP replaces the need for encryption by preventing all unauthorized access at the OS level
- D. RASP eliminates the need for any server-side security controls by handling everything on device

Answer: A

Q1221. An organization discovers that an attacker accessed their cloud environment using stolen API keys from a public GitHub repository. What series of actions is MOST appropriate?

- A. Banning all developers from using version control systems to prevent future key exposure
- B. Migrating all workloads to a different cloud provider to prevent similar future incidents
- C. Immediately rotating compromised keys, auditing access logs, implementing secret scanning, and reviewing damage
- D. Only deleting the exposed keys from the GitHub repository and continuing normal operations

Answer: C

Q1222. How does a cloud-native SIEM differ from a traditional on-premises SIEM?

- A. Cloud SIEM is identical to traditional SIEM except it runs on virtual machines in the cloud
- B. Cloud SIEM provides less security visibility because it cannot access on-premises network traffic
- C. Cloud SIEM only works with a single cloud provider and cannot ingest logs from other sources
- D. Cloud SIEM scales elastically, integrates with cloud APIs, and reduces infrastructure management overhead

Answer: D

Q1223. What is the primary security risk of cross-account access in multi-account cloud environments?

- A. Cross-account access always requires physical network connections between cloud data centers
- B. Cross-account access is inherently secure because cloud providers enforce strict isolation
- C. Cross-account access eliminates all identity management because users share a single identity
- D. Overly permissive trust policies between accounts can enable lateral movement across the organization

Answer: D

Q1224. A company uses Kubernetes in production. What is the MOST critical security concern for the cluster?

- A. Disabling all logging to improve cluster performance and reduce storage costs for log files
- B. Allowing all pods to run as root to simplify application deployment and avoid permission issues
- C. Ensuring the cluster uses the maximum number of nodes to handle any distributed denial of service
- D. Securing the API server, implementing RBAC, network policies, and scanning container images for vulnerabilities

Answer: D

Q1225. What is the confused deputy problem in cloud security?

- A. A network routing issue where traffic intended for one VPC is accidentally sent to a different one
- B. A vulnerability where a trusted service is tricked into performing unauthorized actions on behalf of an attacker
- C. A bug in cloud billing systems that charges the wrong customer account for resource consumption
- D. A situation where multiple cloud administrators have conflicting security policies applied simultaneously

Answer: B

Q1226. How does infrastructure as code (IaC) introduce security risks in cloud deployments?

- A. IaC only affects development environments and has no impact on production security posture
- B. IaC templates can codify misconfigurations that are then consistently deployed across all environments
- C. IaC templates are automatically scanned by cloud providers preventing any security misconfigurations
- D. IaC eliminates all security risks because automated deployments are inherently more secure

Answer: B

Q1227. An organization implements a multi-cloud strategy. What is the PRIMARY security challenge this introduces?

- A. Reducing the total cost of cloud services by negotiating volume discounts with providers
- B. Synchronizing time zones between different cloud provider regions for consistent logging
- C. Maintaining consistent security policies and visibility across different cloud provider environments
- D. Ensuring all cloud providers use identical hardware specifications in their data centers

Answer: C

Q1228. What is the security implication of instance metadata services (IMDS) in cloud environments?

- A. IMDS is only accessible from the cloud provider's management console and not from instances
- B. SSRF attacks can access IMDS to retrieve instance credentials and escalate privileges in the cloud
- C. IMDS automatically rotates all credentials making them useless even if they are intercepted
- D. IMDS provides no security-relevant information and is only used for instance performance metrics

Answer: B

Q1229. What is the purpose of cloud security benchmarks like CIS Benchmarks for cloud providers?

- A. Comparing the pricing and cost structures of competing cloud service provider offerings
- B. Providing prescriptive security configuration guidelines specific to each cloud provider's services
- C. Measuring the network performance and latency of different cloud provider data center regions
- D. Rating the customer support quality of different cloud providers based on user surveys

Answer: B

Q1230. A cloud architect needs to protect sensitive workloads from the cloud provider's own administrators. What technology BEST addresses this?

- A. Cloud provider managed keys which give the provider full access to encrypted data
- B. Standard server-side encryption which protects data at rest from external attackers only
- C. Confidential computing using hardware-based trusted execution environments for data in use
- D. Network encryption using TLS for all data in transit between cloud services and users

Answer: C

Q1231. A forensic investigator encounters full disk encryption on a suspect's device. What is the MOST effective approach to access the data?

- A. Ignoring the encrypted drive and relying solely on other unencrypted evidence sources
- B. Capturing memory while the device is running to extract encryption keys before shutdown
- C. Using brute force to crack the encryption key which is guaranteed to succeed quickly
- D. Contacting the encryption software vendor to request a master decryption backdoor key

Answer: B

Q1232. During a forensic investigation, anti-forensic techniques are discovered. Which technique makes timestamp analysis unreliable?

- A. Timestomping which modifies file timestamps to mislead investigators about event timing
- B. Disk wiping which securely overwrites all data making recovery completely impossible
- C. File encryption which prevents investigators from reading the content of seized files
- D. Steganography which hides data within image files to prevent content-based detection

Answer: A

Q1233. A forensic team must analyze a cloud-based system. What unique challenge does cloud forensics present compared to traditional forensics?

- A. Cloud forensics requires no specialized tools because standard disk imaging tools always work
- B. Limited physical access to infrastructure, multi-tenancy, and jurisdiction complexities across regions
- C. Cloud systems always store data in plaintext making the analysis process significantly faster
- D. Cloud providers automatically preserve all forensic evidence eliminating the need for imaging

Answer: B

Q1234. An investigator analyzes Windows registry hives. What type of forensic evidence can be found in the NTUSER.DAT file?

- A. System-wide network configuration settings including IP addresses and DNS server addresses
- B. User-specific data including recent documents, typed URLs, mounted devices, and application history
- C. Operating system installation date, service pack level, and licensed software product keys
- D. Hardware inventory data including processor model, memory capacity, and disk serial numbers

Answer: B

Q1235. How does memory forensics help in analyzing fileless malware attacks?

- A. Memory analysis only works on Linux systems and cannot be applied to Windows-based attacks
- B. Memory forensics is unnecessary for fileless malware since it leaves traces on the hard drive
- C. Memory analysis can reveal injected code, suspicious processes, and network connections invisible on disk
- D. Memory forensics requires the suspect device to be powered off before analysis can begin

Answer: C

Q1236. A forensic investigation involves analyzing a compromised Docker container. What specific challenges does container forensics present?

- A. Container ephemeral nature means evidence is lost when containers are destroyed or recreated
- B. Containers cannot be compromised because they run in completely isolated security sandboxes
- C. Containers always persist their complete state to disk making forensic imaging straightforward
- D. Container forensics is identical to virtual machine forensics with no additional complexity

Answer: A

Q1237. What is the forensic significance of the Windows Event Log entry ID 4624?

- A. It records successful logon events including logon type, source address, and authentication details
- B. It records when new user accounts are created by administrators in the domain directory
- C. It records when a user's account is locked out after exceeding maximum login attempt limits
- D. It records failed logon attempts with the incorrect password that was entered by the user

Answer: A

Q1238. An investigator uses the Volatility framework for memory analysis. What primary capability does this tool provide?

- A. Creating forensic images of hard drives using bit-level copying with hash verification
- B. Generating automated forensic reports from evidence files without any manual analysis
- C. Analyzing memory dumps to extract processes, network connections, registry hives, and malware artifacts
- D. Scanning network traffic captures for signatures of known malware communication patterns

Answer: C

Q1239. How does browser forensics help in investigating cyber crimes?

- A. Browser data is automatically deleted when the browser is closed making forensics impossible
- B. Browser forensics requires the user's cooperation to provide their browsing history voluntarily
- C. Browser artifacts reveal browsing history, cached pages, cookies, downloaded files, and stored credentials
- D. Browser forensics can only recover the URLs of websites visited within the last twenty-four hours

Answer: C

Q1240. What is the Locard's Exchange Principle and how does it apply to digital forensics?

- A. All digital evidence must be exchanged between prosecution and defense before trial begins
- B. Evidence can only be collected from the suspect's primary device and not from any other source
- C. Every digital interaction leaves traces on both systems, providing evidence of contact and activity
- D. Digital evidence loses its value over time and must be analyzed within seventy-two hours

Answer: C

Q1241. During a major breach, the IR team discovers the attacker has compromised Active Directory. What is the MOST critical containment action?

- A. Resetting the KRBTGT account password twice and all privileged account passwords immediately
- B. Disconnecting the domain controller from the network and waiting for the vendor's support
- C. Simply changing the domain administrator password and continuing the ongoing investigation
- D. Rebuilding all workstations from scratch before addressing the domain controller compromise

Answer: A

Q1242. An organization experiences a supply chain compromise affecting a widely used library. How should the IR team prioritize their response?

- A. Waiting for the library vendor to release a patch before taking any response actions at all
- B. Only investigating systems that have already shown signs of compromise and ignoring others
- C. Immediately removing the library from all systems regardless of the impact on business operations
- D. Identifying all systems using the compromised library, assessing exposure, and implementing mitigations

Answer: D

Q1243. During incident response, the team suspects the attacker is monitoring their communications. What is the BEST approach?

- A. Switching to out-of-band communication channels not accessible to the attacker for coordination
- B. Broadcasting false information through compromised channels to mislead and confuse the attacker
- C. Stopping all communication until the attacker has been fully removed from all systems
- D. Continuing to use normal email and chat systems while being careful about what is discussed

Answer: A

Q1244. How should an IR team handle a situation where the attacker has deployed multiple backdoors across the network?

- A. Removing backdoors one at a time over several weeks to minimize disruption to operations
- B. Mapping all identified backdoors, planning simultaneous removal, and monitoring for re-establishment
- C. Negotiating with the attacker to voluntarily remove the backdoors from compromised systems
- D. Ignoring the backdoors and focusing solely on strengthening perimeter firewall rule sets

Answer: B

Q1245. An organization faces a data breach requiring notification under GDPR. What is the maximum timeframe for notifying the supervisory authority?

- A. Within 30 calendar days of discovering the personal data breach event
- B. Within 72 hours of becoming aware of the personal data breach event
- C. Within 7 business days of completing the full investigation of the breach
- D. Within 24 hours of the breach occurring regardless of discovery timing

Answer: B

Q1246. What is the primary benefit of implementing SOAR (Security Orchestration, Automation, and Response) in IR?

- A. Replacing all human analysts with automated systems that handle every type of incident alone
- B. Providing unlimited storage for security event logs without any cost or capacity limitations
- C. Eliminating the need for incident response plans because automation handles everything directly
- D. Automating repetitive response tasks and orchestrating tools to reduce response time and errors

Answer: D

Q1247. An IR team must decide whether to monitor an attacker or immediately contain the breach. What factors should guide this decision?

- A. Ongoing risk to data, attacker's current activity level, legal obligations, and intelligence value
- B. Only the cost of the monitoring equipment needed to track the attacker's network activities
- C. Whether the attack is occurring during business hours or after regular working time periods
- D. The personal preferences of the incident response team lead regarding investigation approach

Answer: A

Q1248. How does a threat hunting program complement traditional incident response?

- A. Replacing incident response entirely with continuous proactive threat elimination processes
- B. Proactively searching for threats that evade automated detection before they cause incidents
- C. Only hunting for threats after an incident has been detected and reported by monitoring
- D. Focusing exclusively on external threats while ignoring all potential insider threat actors

Answer: B

Q1249. During a breach investigation, the IR team finds the initial access occurred six months ago. What does this indicate about the organization's detection capabilities?

- A. Six months of undetected access is normal and expected for all organizations of similar size
- B. Significant detection gaps exist since the attacker maintained undetected access for an extended period
- C. The detection systems were working correctly but were intentionally configured to delay alerts
- D. The organization's detection capabilities are excellent because they eventually found the breach

Answer: B

Q1250. An organization's IR plan includes both technical and executive response procedures. Why is executive involvement critical during major incidents?

- A. Executives perform the technical analysis because they have the deepest technical expertise
- B. Executives authorize resource allocation, make business decisions, and manage external communications
- C. Executives are only needed to sign off on the final incident report after full resolution
- D. Executives should not be involved because their involvement slows down the response process

Answer: B

Q1251. A SOC team needs to reduce mean time to detect (MTTD) threats. Which approach is MOST effective?

- A. Increasing the alert threshold to generate fewer alerts so analysts can review each one carefully
- B. Hiring more analysts to manually review every single log entry generated across all systems
- C. Implementing automated detection with tuned correlation rules, ML models, and threat intelligence integration
- D. Reducing the number of monitored data sources to focus only on firewall logs for simplicity

Answer: C

Q1252. How does deception technology enhance security monitoring beyond traditional honeypots?

- A. Encrypting all network traffic to prevent attackers from understanding the network architecture
- B. Blocking all network traffic from unknown sources before it reaches any internal network system
- C. Replacing all production systems with decoy systems to eliminate the real attack surface completely
- D. Deploying decoy assets throughout the network that generate high-fidelity alerts on any interaction

Answer: D

Q1253. A SIEM generates thousands of alerts daily but only a small fraction are true positives. What is the BEST approach to improve alert quality?

- A. Tuning detection rules, implementing alert scoring, and using contextual enrichment to prioritize alerts
- B. Increasing the alert volume by adding more detection rules without evaluating existing ones
- C. Disabling all alert rules and relying entirely on manual log review by security analysts
- D. Forwarding all alerts directly to management without any analyst review or prioritization

Answer: A

Q1254. What is the primary challenge of monitoring encrypted traffic in a SOC?

- A. Encrypted traffic cannot be captured by any network monitoring tools available on the market today
- B. Encrypted traffic hides payload content requiring alternative approaches like metadata analysis or decryption
- C. Encrypted traffic is identical to unencrypted traffic from a monitoring perspective in all cases
- D. Encrypted traffic always indicates malicious activity and should be blocked by default at all times

Answer: B

Q1255. How should a SOC measure the effectiveness of its detection capabilities?

- A. Counting the total number of alerts generated per day regardless of their quality or accuracy
- B. Measuring only the number of incidents that resulted in data loss across the entire organization
- C. Tracking the number of security tools deployed without evaluating their actual effectiveness
- D. Using metrics like MTTD, MTTR, detection coverage mapped to ATT&CK, and false positive rates

Answer: D

Q1256. An organization implements a data lake for security analytics. What advantage does this provide over traditional SIEM?

- A. Eliminating the need for any structured queries because data lakes organize data automatically
- B. Providing real-time alerting capabilities that are not possible with any traditional SIEM tools
- C. Storing massive volumes of raw data at lower cost enabling long-term analysis and threat hunting
- D. Replacing all security analysts with automated systems that process data without human input

Answer: C

Q1257. What is the concept of 'purple teaming' and how does it improve security monitoring?

- A. Collaboration between red and blue teams to improve detection rules and response procedures together
- B. A compliance framework that requires organizations to conduct biannual security assessments only
- C. A third-party team that replaces both offensive and defensive teams with automated testing tools
- D. A training program exclusively for security operations center analysts to improve their soft skills

Answer: A

Q1258. A SOC analyst notices beaconing behavior in network traffic. What does this MOST likely indicate?

- A. A legitimate application checking for software updates from the vendor's update server
- B. Malware communicating with a command-and-control server at regular intervals for instructions
- C. Network equipment sending heartbeat messages to confirm device connectivity and status
- D. A user streaming video content which creates periodic network traffic burst patterns

Answer: B

Q1259. How does security monitoring need to adapt for serverless and containerized environments?

- A. Monitoring must shift to application-level telemetry, API calls, and runtime behavior analysis
- B. Serverless environments require no monitoring because cloud providers handle all security aspects
- C. Traditional host-based monitoring tools work identically in serverless and container environments
- D. Container monitoring only needs to check container image signatures at deployment time only

Answer: A

Q1260. What is the role of AI and machine learning in modern security monitoring?

- A. Completely replacing all human security analysts with fully autonomous threat response systems
- B. Detecting complex patterns and anomalies at scale that human analysts and rules cannot identify
- C. Only generating marketing reports about security posture for executive board presentations
- D. Slowing down threat detection because ML models require extensive computation time always

Answer: B

Q1261. An organization operates across multiple countries with different data protection laws. What is the MOST effective approach to compliance?

- A. Storing all data in a single country to avoid dealing with multiple legal jurisdictions entirely
- B. Ignoring all data protection laws because it is impossible to comply with all of them simultaneously
- C. Implementing the strictest applicable standard as a baseline and adding jurisdiction-specific requirements
- D. Complying only with the laws of the country where the organization's headquarters is located

Answer: C

Q1262. A security researcher discovers a critical vulnerability in widely-used software. Under what circumstances could disclosure become legally problematic?

- A. If the researcher is employed by a competing software company in the same industry sector
- B. If the vulnerability affects more than one hundred users across multiple different countries
- C. If the researcher uses automated scanning tools rather than performing manual code review only
- D. If disclosure occurs without vendor notification, outside a bug bounty scope, or violates CFAA provisions

Answer: D

Q1263. How does the concept of 'privacy by design' differ from traditional approaches to data privacy?

- A. Privacy by design embeds privacy into systems from the start rather than adding it after development
- B. Privacy by design only applies to mobile applications while traditional approaches cover all systems
- C. Privacy by design eliminates the need for privacy policies by making systems inherently compliant
- D. Privacy by design requires hiring a dedicated privacy team while traditional approaches do not

Answer: A

Q1264. An organization faces a conflict between a government's lawful data access request and GDPR data protection requirements. How should this be handled?

- A. Deleting all requested data to prevent both the government and regulators from accessing it
- B. Automatically complying with the government request and ignoring all data protection requirements
- C. Refusing all government requests regardless of their legal basis or jurisdictional authority
- D. Engaging legal counsel to evaluate the request, applying appropriate legal frameworks, and documenting decisions

Answer: D

Q1265. What is the legal significance of the Schrems II ruling for international data transfers?

- A. It created a new encryption standard that must be used for all international data transfers
- B. It permanently banned all data transfers between the European Union and the United States
- C. It established that cloud providers are solely responsible for all international data compliance
- D. It invalidated Privacy Shield and requires additional safeguards for EU-US personal data transfers

Answer: D

Q1266. How do whistleblower protection laws intersect with cyber security?

- A. They mandate that all security incidents be reported to the media for public transparency
- B. They require whistleblowers to have formal cyber security certifications before making reports
- C. They protect individuals who report security violations or illegal activities from employer retaliation
- D. They only protect whistleblowers in government organizations and not in private sector companies

Answer: C

Q1267. What legal challenges does the use of AI in cyber security decision-making present?

- A. AI in cyber security is universally prohibited by international law across all jurisdictions globally
- B. AI decisions may lack transparency, create liability issues, and potentially introduce discriminatory bias
- C. AI decisions are always legally defensible because they are based on objective data processing only
- D. AI decision-making eliminates all legal liability because responsibility shifts to the algorithm vendor

Answer: B

Q1268. An employee uses company resources to conduct unauthorized security testing on a third party. What legal liability does the organization face?

- A. The organization is only liable if the testing successfully finds vulnerabilities in the third party
- B. The organization may be vicariously liable for the employee's unauthorized actions using company resources
- C. The organization is automatically protected by its acceptable use policy regardless of circumstances
- D. The organization has no liability because unauthorized actions are solely the employee's responsibility

Answer: B

Q1269. How does the concept of 'digital sovereignty' affect cloud computing and data storage decisions?

- A. Digital sovereignty eliminates the need for data encryption because national borders provide protection
- B. Digital sovereignty only applies to government data and has no impact on commercial organizations
- C. Digital sovereignty is a theoretical concept with no practical legal implications for organizations
- D. Countries require data to be stored within their borders, affecting cloud architecture and provider selection

Answer: D

Q1270. What is the legal framework for active cyber defense measures and 'hack back' by private organizations?

- A. Hack-back is legal as long as the organization documents the attacker's IP address beforehand
- B. Private sector hack-back is generally illegal under most jurisdictions, with very limited exceptions
- C. International law provides blanket immunity for all defensive cyber operations by organizations
- D. Organizations have unrestricted legal authority to attack systems used to breach their networks

Answer: B

Q1271. How does quantum key distribution (QKD) fundamentally change secure communication?

- A. QKD eliminates the need for key management because quantum keys never expire or need rotation
- B. QKD replaces all existing encryption algorithms with faster quantum-based alternatives for performance
- C. QKD only works over distances shorter than one meter making it impractical for any real deployment
- D. QKD uses quantum mechanics to detect any eavesdropping attempt making interception theoretically detectable

Answer: D

Q1272. An organization considers implementing confidential computing. What specific security problem does this technology solve?

- A. Improving network transmission security by implementing quantum-resistant encryption protocols everywhere
- B. Protecting data during processing in hardware-isolated enclaves even from privileged system administrators
- C. Encrypting data at rest using stronger algorithms than currently available standard encryption methods
- D. Preventing physical theft of servers by implementing advanced biometric access controls on hardware

Answer: B

Q1273. How does the concept of 'shift everywhere' extend beyond traditional 'shift left' in DevSecOps?

- A. Security responsibility shifts entirely to developers with no involvement from security teams
- B. Security is applied at every stage including design, development, deployment, and runtime operations
- C. All security testing is moved to the earliest possible development stage and never done elsewhere
- D. Security testing shifts to production only because that is where real threats actually manifest

Answer: B

Q1274. What is the security implication of neuromorphic computing for future cyber threats?

- A. Neuromorphic computing has no relevance to cyber security and only affects medical applications
- B. Neuromorphic computers cannot be programmed for malicious purposes due to hardware constraints
- C. Brain-inspired computing could enable more sophisticated AI attacks that mimic human decision patterns
- D. Neuromorphic computing eliminates all cyber threats by processing data like a biological brain

Answer: C

Q1275. How does the concept of software-defined perimeter (SDP) improve upon traditional VPN security?

- A. SDP hides infrastructure from unauthorized users entirely and provides least-privilege application access
- B. SDP replaces all firewalls and IDS systems with a single unified network security appliance
- C. SDP provides faster network speeds than VPN by eliminating all encryption overhead completely
- D. SDP is only applicable to on-premises networks and cannot be used with cloud environments

Answer: A

Q1276. What are the security challenges of Web3 and decentralized applications?

- A. Decentralized applications are inherently secure because they have no single point of failure
- B. Web3 security is identical to Web2 security with no new threat models or attack surfaces
- C. Smart contract vulnerabilities, private key management, and irreversible transactions create unique risks
- D. Web3 eliminates all security risks through decentralization making traditional attacks impossible

Answer: C

Q1277. How does adversarial machine learning pose a threat to AI-powered security systems?

- A. Adversarial ML only affects image recognition systems and has no impact on security applications
- B. Adversarial ML improves security by training models to be more robust against future attacks
- C. Attackers craft inputs that deceive ML models into misclassifying malicious activity as benign traffic
- D. ML models are immune to adversarial inputs because they learn from millions of training examples

Answer: C

Q1278. What is the 'harvest now, decrypt later' threat in the context of quantum computing?

- A. Organizations harvest threat intelligence now to decrypt future attack patterns using AI analysis
- B. Security teams collect malware samples now for decryption and analysis at a later scheduled date
- C. Adversaries collect encrypted data now planning to decrypt it when quantum computers become available
- D. Cloud providers harvest encryption keys now to simplify key management processes in the future

Answer: C

Q1279. How does the concept of cyber threat intelligence platforms evolve with emerging technologies?

- A. Platforms only focus on historical threat data and cannot incorporate real-time intelligence feeds
- B. Platforms integrate AI for automated analysis, predict attack trends, and enable proactive defense strategies
- C. Platforms become obsolete because automated security tools eliminate the need for threat intelligence
- D. Platforms are replaced entirely by blockchain-based solutions that distribute intelligence automatically

Answer: B

Q1280. What is the emerging concept of cyber insurance and how does it impact organizational security posture?

- A. Cyber insurance only covers physical damage to hardware and does not cover data breach expenses
- B. Cyber insurance premiums are identical regardless of the organization's security maturity level
- C. Cyber insurance transfers financial risk but requires demonstrating minimum security controls for coverage
- D. Cyber insurance eliminates the need for security controls because all losses are financially covered

Answer: C

Q1281. An organization implements a risk-based approach to cyber security. How should residual risk be handled after applying security controls?

- A. Residual risk should be completely eliminated before proceeding
- B. Residual risk should be documented, accepted by management, and continuously monitored
- C. Residual risk does not exist if proper controls are applied
- D. Residual risk is only relevant during the initial risk assessment

Answer: B

Q1282. How does the Diamond Model of intrusion analysis differ from the Cyber Kill Chain?

- A. The Diamond Model focuses only on malware classification
- B. The Diamond Model analyzes intrusions using four core features (adversary, infrastructure, capability, victim) while the Kill Chain describes attack phases sequentially
- C. The Cyber Kill Chain is only applicable to insider threats
- D. The Diamond Model is a compliance framework

Answer: B

Q1283. What is the primary challenge of implementing a cyber security governance framework in a multinational organization?

- A. Multinational organizations are too small for governance frameworks
- B. Balancing global security standards with varying local regulations, cultural differences, and regional threat landscapes
- C. Governance frameworks are only designed for single-country operations
- D. The only challenge is language translation of policies

Answer: B

Q1284. In cyber security risk quantification, what does the FAIR (Factor Analysis of Information Risk) model provide that qualitative approaches do not?

- A. FAIR eliminates the need for risk assessments entirely
- B. FAIR provides a quantitative framework for measuring risk in financial terms using probability and loss magnitude
- C. FAIR only measures physical security risks
- D. FAIR replaces all other security frameworks

Answer: B

Q1285. An organization's CISO must present the return on security investment (ROSI) to the board. Which approach BEST demonstrates security value?

- A. Listing all security tools purchased
- B. Correlating security spending with reduction in incident frequency, severity, and potential financial losses avoided
- C. Comparing the number of employees in the security team to other departments
- D. Only showing compliance checkbox completions

Answer: B

Q1286. What is the key difference between cyber security and cyber resilience?

- A. They are identical concepts with different names
- B. Cyber security focuses on preventing and protecting against attacks, while cyber resilience encompasses the ability to continue operating during and recover quickly after an attack
- C. Cyber resilience only applies to cloud systems
- D. Cyber security is outdated and replaced by cyber resilience

Answer: B

Q1287. When conducting a cyber security gap analysis, what should be the primary benchmark?

- A. The security budget of competing organizations
- B. Industry-specific frameworks and regulatory requirements mapped against current security posture
- C. The number of security tools deployed
- D. Employee satisfaction surveys about security policies

Answer: B

Q1288. How does the concept of 'security debt' parallel 'technical debt' in software development?

- A. Security debt only affects open-source projects
- B. Deferred security fixes and shortcuts accumulate over time, increasing the cost and complexity of future remediation, similar to technical debt
- C. Security debt refers to financial debts from purchasing security tools
- D. Security debt is only relevant during audits

Answer: B

Q1289. What challenge does the convergence of Information Technology (IT) and Operational Technology (OT) create for cyber security programs?

- A. IT and OT systems have identical security requirements
- B. OT systems often have different lifecycles, patching constraints, and availability requirements than IT systems, requiring tailored security approaches
- C. Convergence eliminates all security risks
- D. OT systems are inherently more secure than IT systems

Answer: B

Q1290. A board of directors asks for a cyber risk appetite statement. What should this statement primarily define?

- A. The exact number of acceptable security incidents per year
- B. The level and types of cyber risk the organization is willing to accept in pursuit of its strategic objectives
- C. A list of all security tools the organization uses
- D. The cyber security team's annual training schedule

Answer: B

Q1291. An organization performs a quantitative risk analysis and calculates an SLE of \$200,000 and an ARO of 0.5. What is the Annual Loss Expectancy (ALE) and how should it guide security investment?

- A. ALE is \$400,000 and any control costing less should be implemented
- B. ALE is \$100,000 and security controls costing less than this amount may be justified
- C. ALE is \$200,000 because ARO is irrelevant
- D. ALE cannot be calculated from SLE and ARO alone

Answer: B

Q1292. How does the Brewer-Nash (Chinese Wall) model address conflicts of interest in access control?

- A. It prevents users from reading any data
- B. It dynamically restricts access based on a user's previous access history to prevent conflicts of interest
- C. It only applies to financial institutions
- D. It uses mandatory access control labels exclusively

Answer: B

Q1293. What is the security principle of 'open design' and why is it considered stronger than security through obscurity?

- A. Open design means making all passwords public
- B. Open design means a system's security should not depend on the secrecy of its implementation, as peer review strengthens security
- C. Open design prohibits the use of encryption
- D. Open design means using only open-source operating systems

Answer: B

Q1294. When implementing a defense-in-depth strategy, why is diversity of controls important across layers?

- A. Diverse controls are cheaper to implement
- B. Using different types of controls at each layer ensures that a single vulnerability or exploit technique cannot bypass multiple layers simultaneously
- C. Diverse controls are easier to manage
- D. Using identical controls at each layer provides better consistency

Answer: B

Q1295. An organization must choose between risk avoidance, risk mitigation, risk transfer, and risk acceptance. Under what circumstances is risk acceptance the most appropriate strategy?

- A. When the cost of mitigation exceeds the potential impact and the risk falls within the organization's risk appetite
- B. Risk acceptance is never appropriate in cyber security
- C. When regulatory requirements mandate specific controls
- D. When the risk involves critical infrastructure systems

Answer: A

Q1296. How does the Graham-Denning model address the secure creation and deletion of objects and subjects in access control?

- A. It only defines read and write permissions
- B. It defines eight protection rules governing how subjects and objects can be securely created, deleted, and how access rights can be transferred
- C. It is limited to network access control only
- D. It replaces the need for authentication mechanisms

Answer: B

Q1297. A security architect must evaluate the trade-off between usability and security. Which approach BEST balances these competing requirements?

- A. Always maximize security regardless of usability impact
- B. Implement risk-based controls that apply stronger security to higher-risk activities while minimizing friction for low-risk operations
- C. Always maximize usability regardless of security impact
- D. Apply the same level of security to all operations regardless of risk

Answer: B

Q1298. What is the Harrison-Ruzzo-Ullman (HRU) model's contribution to access control theory?

- A. It only addresses network segmentation
- B. It provides a formal framework for analyzing whether a given access control system can reach an unsafe state, proving that the general safety problem is undecidable
- C. It replaces all other access control models
- D. It only applies to physical access control systems

Answer: B

Q1299. Why is the concept of 'trust but verify' being replaced by 'never trust, always verify' in modern security architectures?

- A. Because trust but verify is easier to implement
- B. Because the traditional perimeter-based model assumed internal network trust, which modern threats like insider attacks and lateral movement have proven inadequate
- C. Because never trust always verify is less expensive
- D. Because trust but verify only applies to physical security

Answer: B

Q1300. An organization discovers that its security controls address individual risks but fail to account for compound or cascading risks. What concept addresses this gap?

- A. Single point of failure analysis
- B. Systemic risk analysis, which evaluates how individual risks can combine and cascade to create larger, emergent risks across interconnected systems
- C. Simple vulnerability scanning
- D. Individual risk acceptance for each identified risk

Answer: B

Q1301. A security architect must choose between RSA-2048 and ECC P-256 for a resource-constrained IoT deployment. Which is more suitable and why?

- A. RSA-2048 because it uses larger keys
- B. ECC P-256 because it provides equivalent security to RSA-2048 with much smaller keys and lower computational overhead
- C. Neither can be used in IoT devices
- D. RSA-2048 because it is newer than ECC

Answer: B

Q1302. What is the security vulnerability of using AES in GCM mode with a reused nonce?

- A. It has no effect on security
- B. Nonce reuse in AES-GCM can reveal the authentication key and allow forgery of ciphertexts, catastrophically breaking both confidentiality and authenticity
- C. It only affects performance, not security
- D. It causes the encryption to become stronger

Answer: B

Q1303. How does lattice-based cryptography provide resistance against quantum computing attacks?

- A. It uses longer RSA keys
- B. Lattice-based problems like Learning With Errors (LWE) are believed to be hard for both classical and quantum computers to solve
- C. It relies on the same mathematical problems as RSA
- D. It only works on quantum computers

Answer: B

Q1304. What is the primary security risk when using CBC mode encryption without a MAC (encrypt-only)?

- A. CBC mode cannot encrypt data properly
- B. It is vulnerable to padding oracle attacks, where an attacker can decrypt ciphertext by manipulating padding and observing error responses
- C. CBC mode without MAC uses too much bandwidth
- D. There is no security risk with encrypt-only CBC

Answer: B

Q1305. Why is the Dual_EC_DRBG random number generator considered compromised, and what broader lesson does it teach?

- A. It generates numbers that are too random
- B. It contained suspected NSA backdoor constants that could allow prediction of output, teaching that cryptographic standards must be transparent and verifiable
- C. It was too slow for practical use
- D. It only worked on specific hardware

Answer: B

Q1306. In a TLS 1.3 handshake, what fundamental change was made compared to TLS 1.2 regarding cipher suites?

- A. TLS 1.3 no longer uses encryption
- B. TLS 1.3 removed support for static RSA key exchange and non-AEAD ciphers, mandating forward secrecy and authenticated encryption
- C. TLS 1.3 only supports symmetric encryption
- D. TLS 1.3 increased the handshake from two to four round trips

Answer: B

Q1307. What is the security implication of Shor's algorithm for current public key cryptographic systems?

- A. It makes symmetric encryption obsolete
- B. It can efficiently factor large numbers and compute discrete logarithms on a quantum computer, breaking RSA and ECC
- C. It only affects hash functions
- D. It strengthens existing public key systems

Answer: B

Q1308. What is the difference between deterministic and probabilistic encryption, and why does it matter for security?

- A. They produce identical outputs
- B. Deterministic encryption always produces the same ciphertext for the same plaintext and key, while probabilistic encryption includes randomness producing different ciphertexts, which prevents pattern leakage
- C. Deterministic encryption is always more secure
- D. Probabilistic encryption cannot be decrypted

Answer: B

Q1309. What is the security purpose of key commitment in authenticated encryption, and what attacks does its absence enable?

- A. Key commitment is only about key storage efficiency
- B. Without key commitment, an attacker can craft a ciphertext that decrypts to valid but different plaintexts under different keys, enabling invisible salamander attacks
- C. Key commitment prevents brute force attacks
- D. Key commitment is required only for symmetric ciphers

Answer: B

Q1310. A cryptographic implementation passes all functional tests but is found vulnerable to a timing side-channel attack. What is the root cause and mitigation?

- A. The algorithm itself is broken and must be replaced
- B. The implementation takes different amounts of time for different inputs, leaking information. Mitigation requires constant-time implementation of cryptographic operations
- C. Timing attacks only affect hardware, not software
- D. Using a faster processor eliminates timing attacks

Answer: B

Q1311. An attacker performs a VLAN hopping attack using double tagging. What network misconfiguration enables this attack?

- A. Using encrypted VLANs
- B. Having the native VLAN of trunk ports be the same as a user VLAN, allowing double-tagged frames to traverse VLAN boundaries
- C. Using too many VLANs on the network
- D. Having DHCP enabled on the network

Answer: B

Q1312. How does a network detection and response (NDR) solution differ from traditional IDS/IPS systems?

- A. NDR only monitors email traffic
- B. NDR uses behavioral analytics and machine learning to detect unknown threats based on network behavior patterns, while traditional IDS/IPS primarily relies on signatures
- C. NDR replaces firewalls entirely
- D. Traditional IDS/IPS is always more effective than NDR

Answer: B

Q1313. What is the security risk of running recursive DNS resolvers open to the internet?

- A. Recursive DNS resolvers cannot be accessed from the internet
- B. Open recursive resolvers can be abused for DNS amplification DDoS attacks and DNS cache poisoning, and may leak information about internal queries
- C. Open resolvers improve DNS performance globally
- D. Recursive DNS resolvers are inherently secure

Answer: B

Q1314. A company implements TLS inspection (SSL decryption) on their network firewall. What privacy and security trade-offs must be considered?

- A. TLS inspection has no trade-offs
- B. TLS inspection enables detection of encrypted threats but breaks end-to-end encryption, requires careful certificate management, and raises privacy concerns for employee communications
- C. TLS inspection improves end-to-end encryption
- D. TLS inspection eliminates the need for endpoint security

Answer: B

Q1315. What makes a Slowloris attack effective against web servers, and how does it differ from volumetric DDoS attacks?

- A. Slowloris uses high bandwidth to overwhelm servers
- B. Slowloris keeps many connections open by sending partial HTTP requests slowly, exhausting the server's connection pool with minimal bandwidth, unlike volumetric attacks that flood with traffic
- C. Slowloris only targets DNS servers
- D. Slowloris attacks are always detectable by firewalls

Answer: B

Q1316. How does the QUIC protocol change the traditional network security monitoring approach?

- A. QUIC uses unencrypted UDP packets that are easier to monitor
- B. QUIC encrypts transport metadata that was previously visible in TCP+TLS, reducing the effectiveness of traditional network monitoring that relied on inspecting TCP headers and TLS handshake details
- C. QUIC only works on IPv4 networks
- D. QUIC eliminates the need for any encryption

Answer: B

Q1317. What is the security implication of IPv6 dual-stack network configurations if IPv6 security controls are not properly implemented?

- A. IPv6 is inherently secure and needs no additional controls
- B. Attackers can use IPv6 to bypass IPv4 security controls if the network has IPv6 enabled but not properly monitored or firewalled, creating a shadow network path
- C. Dual-stack configurations always improve security
- D. IPv6 cannot coexist with IPv4 on the same network

Answer: B

Q1318. What is a network covert channel and how can DNS be used to create one?

- A. A covert channel is an encrypted VPN tunnel
- B. A covert channel uses legitimate network protocols in unintended ways to secretly communicate. DNS tunneling encodes data within DNS queries and responses to bypass network controls
- C. Covert channels require dedicated hardware
- D. DNS cannot be used for covert communication

Answer: B

Q1319. An organization implements a software-defined perimeter (SDP). How does this differ from traditional VPN-based remote access?

- A. SDP and VPN are identical technologies
- B. SDP authenticates users before granting network visibility and creates individual, encrypted connections to specific resources, while VPNs grant broad network access after authentication
- C. SDP requires no authentication
- D. VPNs provide more granular access control than SDP

Answer: B

Q1320. What is the security risk of protocol downgrade attacks in network communications?

- A. Downgrade attacks improve security by using older, more tested protocols
- B. Attackers force communications to use weaker, older protocol versions with known vulnerabilities, bypassing the security of newer protocols even when both endpoints support them
- C. Downgrade attacks only affect physical layer protocols
- D. Modern protocols are immune to downgrade attacks

Answer: B

Q1321. In a padding oracle attack against CBC mode encryption, what information does the attacker exploit?

- A. The encryption key leaked through side channels
- B. The server's response indicating whether decrypted padding is valid or invalid
- C. The predictability of the initialization vector
- D. The weakness of the block cipher itself

Answer: B

Q1322. What is the security advantage of X25519 over traditional ECDH for key exchange?

- A. X25519 uses a larger key size
- B. X25519 is resistant to timing attacks by design and avoids common implementation pitfalls
- C. X25519 uses symmetric encryption internally
- D. X25519 does not require any computation

Answer: B

Q1323. What is the primary challenge of implementing threshold cryptography in a distributed system?

- A. It requires quantum computers
- B. The need to securely distribute key shares while ensuring no single party can reconstruct the full key alone
- C. It only works with RSA encryption
- D. It doubles the key length required

Answer: B

Q1324. How does a commitment scheme work in cryptographic protocols, and what two properties must it satisfy?

- A. Speed and efficiency
- B. Hiding (the committed value is secret) and binding (the committer cannot change the value after committing)
- C. Encryption and decryption
- D. Authentication and authorization

Answer: B

Q1325. What is the security risk of using AES-CBC with a MAC computed over the ciphertext versus over the plaintext?

- A. There is no difference between the two approaches
- B. MAC-then-encrypt can be vulnerable to padding oracle attacks, while encrypt-then-MAC is generally secure
- C. MAC over ciphertext is always insecure
- D. Both approaches are equally vulnerable

Answer: B

Q1326. What is the significance of the discrete logarithm problem in modern cryptography?

- A. It is only used in hash functions
- B. It is easily solvable with modern computers
- C. It provides the mathematical hardness underlying Diffie-Hellman, DSA, and elliptic curve cryptography
- D. It has been proven to be unsolvable

Answer: C

Q1327. A system uses ECDSA for digital signatures. What catastrophic failure occurs if the same random nonce k is used for two different signatures with the same private key?

- A. The signatures become too large to verify
- B. Nothing happens as the nonce does not affect security
- C. The private key can be mathematically recovered from the two signatures
- D. The public key becomes invalid

Answer: C

Q1328. What is the fundamental difference between zero-knowledge proofs and traditional authentication mechanisms?

- A. Zero-knowledge proofs are faster than password authentication
- B. Zero-knowledge proofs allow a prover to demonstrate knowledge of a secret without revealing any information about the secret itself
- C. Zero-knowledge proofs require biometric data
- D. Zero-knowledge proofs eliminate the need for cryptographic keys

Answer: B

Q1329. In post-quantum cryptography, why are lattice-based schemes considered promising candidates for standardization?

- A. They use simple XOR operations only
- B. They offer strong security proofs from worst-case hardness assumptions and support diverse functionalities including encryption, signatures, and FHE
- C. They require no computational resources
- D. They are identical to RSA but with larger keys

Answer: B

Q1330. What is format-preserving encryption (FPE) and in what scenario is it particularly useful?

- A. Encryption that always produces the same output format as the input, useful for encrypting data that must retain its format such as credit card numbers in legacy databases
- B. Encryption that compresses data before encrypting
- C. Encryption that formats output as JSON
- D. Encryption that preserves file extensions

Answer: A

Q1331. How does Kernel Address Space Layout Randomization (KASLR) differ from standard ASLR, and what are its limitations?

- A. KASLR and ASLR are identical with no differences
- B. KASLR randomizes kernel memory addresses but can be bypassed through information disclosure vulnerabilities that leak kernel pointers
- C. KASLR only applies to user-space programs
- D. KASLR provides perfect protection against all kernel attacks

Answer: B

Q1332. What is a TOCTOU (Time of Check to Time of Use) race condition, and how can it be exploited in OS security?

- A. A type of brute-force attack on passwords
- B. A vulnerability where the state of a resource changes between checking its properties and using it, allowing privilege escalation through symlink attacks
- C. A network timing attack on encryption
- D. A denial-of-service attack using timestamps

Answer: B

Q1333. A security team must harden a Linux server. What is the security benefit of implementing seccomp-bpf?

- A. It encrypts network traffic
- B. It filters system calls available to processes, reducing the kernel attack surface by restricting which syscalls a program can make
- C. It manages user passwords
- D. It monitors disk usage

Answer: B

Q1334. What is the Dirty COW vulnerability and what class of OS security issue does it represent?

- A. A malware variant targeting IoT devices
- B. A race condition in the Linux kernel's copy-on-write mechanism that allowed unprivileged users to write to read-only memory mappings for privilege escalation
- C. A Windows registry corruption bug
- D. A DNS spoofing technique

Answer: B

Q1335. How does hardware-based memory tagging (like ARM MTE) improve OS security compared to software-only solutions?

- A. It replaces the need for an operating system
- B. It assigns tags to memory regions and pointers, detecting use-after-free and buffer overflow at hardware speed with minimal performance overhead
- C. It only protects GPU memory
- D. It eliminates the need for encryption

Answer: B

Q1336. What is the security architecture of a microkernel-based OS and why is it considered more secure than a monolithic kernel?

- A. Microkernels are faster and thus more secure
- B. Microkernels run minimal code in kernel mode with drivers and services in user space, reducing the trusted computing base and limiting the impact of vulnerabilities
- C. Microkernels use more encryption
- D. Microkernels eliminate all vulnerabilities

Answer: B

Q1337. An organization detects a sophisticated rootkit using Direct Kernel Object Manipulation (DKOM). What makes this technique particularly dangerous?

- A. It corrupts the bootloader permanently
- B. DKOM modifies kernel data structures directly in memory to hide processes and connections without modifying files on disk, evading traditional detection methods
- C. It only affects network interfaces
- D. It can be detected easily by antivirus software

Answer: B

Q1338. What is the security purpose of Intel SGX (Software Guard Extensions) and what attacks has it proven vulnerable to?

- A. SGX accelerates encryption with no known weaknesses
- B. SGX creates hardware-encrypted enclaves for sensitive computation but has been shown vulnerable to side-channel attacks like Spectre, Foreshadow, and power analysis
- C. SGX is a network security protocol
- D. SGX only protects data at rest

Answer: B

Q1339. How does mandatory integrity control (MIC) in Windows protect against privilege escalation?

- A. It encrypts all system files
- B. It assigns integrity levels to processes and objects, preventing lower-integrity processes from writing to higher-integrity objects even with appropriate DACLs
- C. It disables all non-Microsoft software
- D. It monitors network traffic

Answer: B

Q1340. What is a Spectre-class vulnerability and why is it fundamentally difficult to mitigate at the OS level?

- A. It is a simple buffer overflow fixed by input validation
- B. Spectre exploits speculative execution in modern CPUs to leak data across security boundaries, and full mitigation requires microcode updates and significant performance trade-offs because the vulnerability is in hardware design
- C. It only affects 32-bit operating systems
- D. It is a type of malware that can be removed by antivirus

Answer: B

Q1341. What is a deserialization gadget chain and how is it used in insecure deserialization attacks?

- A. A blockchain verification mechanism
- B. A sequence of existing classes in an application whose methods can be chained together during deserialization to achieve arbitrary code execution
- C. A series of database queries optimized for performance
- D. A method of encrypting serialized objects

Answer: B

Q1342. How can a web cache poisoning attack be executed, and what makes it particularly dangerous?

- A. By deleting the server's cache files
- B. By manipulating unkeyed HTTP headers or parameters to store malicious responses in the cache, which are then served to all subsequent users
- C. By overloading the cache with too many requests
- D. By encrypting cached content

Answer: B

Q1343. What is a second-order SQL injection and why is it harder to detect than standard SQL injection?

- A. SQL injection performed by two attackers simultaneously
- B. Malicious input stored in the database and later executed when retrieved and used in another SQL query without sanitization
- C. SQL injection that only works on the second attempt
- D. A SQL injection that targets backup databases

Answer: B

Q1344. A web application implements CSP with 'unsafe-inline' for scripts. What attack vectors does this leave open and how can nonce-based CSP improve security?

- A. It has no impact on security
- B. 'unsafe-inline' allows any inline scripts to execute, defeating XSS protection. Nonce-based CSP allows only scripts with a matching server-generated nonce, blocking injected scripts
- C. Nonce-based CSP is less secure than unsafe-inline
- D. unsafe-inline only affects CSS, not scripts

Answer: B

Q1345. What is a Server-Side Request Forgery (SSRF) attack through DNS rebinding, and how does it bypass common SSRF mitigations?

- A. It exploits DNS caching to speed up the server
- B. The attacker controls a domain that first resolves to an allowed IP, passes validation, then resolves to an internal IP on the actual request, bypassing allowlist/blocklist checks
- C. It only works against DNS servers themselves
- D. It replaces the server's DNS configuration

Answer: B

Q1346. How does a prototype pollution vulnerability in JavaScript enable remote code execution in server-side applications?

- A. By crashing the JavaScript engine
- B. By modifying Object.prototype to inject properties that alter application logic, which in template engines or child process spawning can lead to command injection
- C. By changing the JavaScript language syntax
- D. By corrupting the package.json file

Answer: B

Q1347. What is HTTP request smuggling via CL.TE desync and what infrastructure conditions make it possible?

- A. It is a type of DDoS attack
- B. It occurs when a front-end server uses Content-Length and a back-end uses Transfer-Encoding, causing them to disagree on request boundaries, allowing an attacker to smuggle requests
- C. It requires the attacker to have server access
- D. It only affects HTTP/2 connections

Answer: B

Q1348. What is the security implication of GraphQL introspection being enabled in production and how can it be exploited?

- A. GraphQL introspection improves security by documenting the API
- B. Introspection reveals the entire API schema including types, fields, mutations, and relationships, giving attackers a complete map for targeted attacks on sensitive operations
- C. Introspection only affects performance
- D. GraphQL does not support introspection

Answer: B

Q1349. A security researcher finds a web application vulnerable to blind XSS. How does blind XSS differ from reflected XSS and why is it particularly dangerous?

- A. Blind XSS is less dangerous than reflected XSS
- B. Blind XSS payloads are stored and execute in a different application context (like an admin panel) that the attacker cannot directly access, potentially compromising privileged accounts
- C. Blind XSS only works in Internet Explorer
- D. Blind XSS requires physical access to the server

Answer: B

Q1350. What is a WebSocket hijacking attack and how does the lack of same-origin policy enforcement for WebSockets create a vulnerability?

- A. WebSockets cannot be hijacked due to built-in encryption
- B. Cross-site WebSocket hijacking occurs because WebSocket connections do not enforce same-origin policy; a malicious page can initiate a WebSocket connection to a vulnerable server using the victim's cookies
- C. WebSocket hijacking requires modifying network hardware
- D. WebSockets automatically validate all origins

Answer: B

Q1351. How does the WebAuthn protocol provide phishing-resistant authentication?

- A. By using longer passwords
- B. By binding credentials to the origin (domain) so that credentials created for one site cannot be used on a phishing site with a different domain
- C. By requiring users to type the URL manually
- D. By encrypting the login page

Answer: B

Q1352. What is a token binding and how does it prevent token theft attacks?

- A. Binding tokens to a physical location
- B. Cryptographically binding security tokens to the TLS connection so that stolen tokens cannot be used from a different TLS session
- C. Using stronger passwords for token generation
- D. Limiting the number of tokens a user can have

Answer: B

Q1353. An organization implements a zero trust architecture. How should the authentication model change from traditional perimeter-based security?

- A. Authentication is only needed at the perimeter
- B. Every access request must be authenticated, authorized, and continuously validated regardless of network location, assuming no implicit trust
- C. Internal users should not need authentication
- D. Authentication frequency should be reduced for convenience

Answer: B

Q1354. What is a silver ticket attack in Active Directory and how does it differ from a golden ticket attack?

- A. Silver tickets are less harmful versions of golden tickets
- B. A silver ticket forges a service ticket for a specific service using the service account's hash, while a golden ticket forges a TGT using the KRBTGT hash granting access to all services
- C. Silver tickets target Linux systems while golden tickets target Windows
- D. Silver tickets expire faster but golden tickets never expire

Answer: B

Q1355. How does continuous adaptive risk and trust assessment (CARTA) improve access control beyond static policies?

- A. By removing all access controls
- B. By continuously evaluating risk signals during sessions and dynamically adjusting access levels based on changing context and behavior, not just at the point of initial authentication
- C. By requiring re-authentication every minute
- D. By using only biometric authentication

Answer: B

Q1356. What are the security implications of the OAuth 2.0 implicit flow and why was it deprecated for SPAs?

- A. Implicit flow is the most secure OAuth flow
- B. The implicit flow returns tokens in the URL fragment, exposing them to browser history, referrer headers, and potential token leakage; PKCE-enhanced authorization code flow is now recommended for SPAs
- C. Implicit flow was deprecated because it is too slow
- D. SPAs cannot use OAuth at all

Answer: B

Q1357. What is the security risk of JWT algorithm confusion attacks and how do they work?

- A. They slow down JWT verification
- B. An attacker changes the JWT header algorithm from RS256 to HS256, causing the server to verify the signature using the RSA public key as the HMAC secret, allowing token forgery
- C. They only affect expired tokens
- D. They require access to the private key

Answer: B

Q1358. How does decentralized identity (DID) change the traditional identity management paradigm?

- A. By centralizing all identity data in one database
- B. By giving individuals control over their own identity credentials through self-sovereign identity, eliminating dependence on centralized identity providers
- C. By removing the need for authentication entirely
- D. By using only username and password

Answer: B

Q1359. What is a relay attack on NFC-based authentication and how does it bypass physical proximity requirements?

- A. It blocks all NFC signals within an area
- B. An attacker uses two devices to relay the NFC communication between a legitimate token and reader over a distance, making the reader believe the token is nearby when it is not
- C. It speeds up NFC communication
- D. It only works against Bluetooth devices

Answer: B

Q1360. What is the principle behind passwordless authentication using FIDO2 and why is it considered more secure than traditional passwords?

- A. It uses simpler passwords that are easier to remember
- B. FIDO2 replaces passwords with public-key cryptography where the private key never leaves the device, eliminating password databases, phishing, replay attacks, and credential stuffing
- C. It stores passwords in the cloud instead of locally
- D. It only works on specific operating systems

Answer: B

Q1361. What is a supply chain attack through a compromised build pipeline, and how does code signing mitigate it?

- A. An attack on physical supply logistics
- B. An attacker compromises the CI/CD pipeline to inject malicious code into builds; code signing creates a cryptographic proof of build integrity, allowing consumers to verify the software was not tampered with
- C. Code signing prevents all supply chain attacks completely
- D. Build pipelines cannot be compromised

Answer: B

Q1362. How does taint tracking analysis work in identifying security vulnerabilities?

- A. It tracks paint colors in the UI
- B. It marks user-controlled data as 'tainted' and traces its flow through the application to detect if it reaches security-sensitive operations (sinks) without proper sanitization
- C. It monitors CPU temperature
- D. It tracks changes in version control

Answer: B

Q1363. What is the SLSA (Supply-chain Levels for Software Artifacts) framework and what problem does it address?

- A. A programming language specification
- B. A framework defining increasing levels of supply chain security for software artifacts, addressing integrity and provenance from source to build to distribution
- C. A type of encryption standard
- D. A software testing methodology

Answer: B

Q1364. A development team discovers a deserialization vulnerability in their Java application. What makes Java deserialization attacks particularly dangerous?

- A. Java deserialization is slower than other languages
- B. Java's classpath often contains libraries with exploitable gadget chains that allow arbitrary code execution when crafted objects are deserialized
- C. Java does not support serialization
- D. Deserialization only affects database operations

Answer: B

Q1365. What is the security significance of reproducible builds and how do they protect the software supply chain?

- A. Reproducible builds make software faster
- B. Reproducible builds ensure that compiling the same source code always produces identical binary output, allowing independent verification that distributed binaries match the source and have not been tampered with
- C. Reproducible builds only work for open-source software
- D. They are identical to version control

Answer: B

Q1366. How does mutation testing evaluate the effectiveness of a security test suite?

- A. By testing the application with random inputs
- B. By introducing small changes (mutations) to the source code and checking whether the test suite detects them; surviving mutants indicate gaps in test coverage
- C. By mutating the database schema
- D. By changing the programming language

Answer: B

Q1367. What is a confused deputy vulnerability in application development and how can capability-based security prevent it?

- A. When a developer is confused about requirements
- B. A privilege escalation where a trusted program (deputy) is tricked into misusing its authority; capability-based security prevents it by requiring explicit unforgeable tokens for each resource access
- C. A type of race condition
- D. A denial-of-service attack on the development server

Answer: B

Q1368. What is the security impact of improper certificate validation in mobile and desktop applications?

- A. It only affects loading speed
- B. Improper certificate validation can allow man-in-the-middle attacks by accepting invalid, expired, or self-signed certificates, enabling interception of encrypted communications
- C. It improves security by accepting more certificates
- D. It only affects web browsers

Answer: B

Q1369. What are the security implications of using WebAssembly (WASM) in web applications and what unique threats does it introduce?

- A. WASM has no security implications
- B. WASM can be used to obfuscate malicious code, perform cryptomining, bypass traditional JavaScript security analysis, and introduce memory safety vulnerabilities from languages like C/C++
- C. WASM is inherently more secure than JavaScript
- D. WASM cannot interact with web APIs

Answer: B

Q1370. How does a security-focused chaos engineering approach differ from traditional chaos engineering?

- A. They are identical practices
- B. Security chaos engineering deliberately introduces security-relevant failures (certificate expiration, credential leaks, firewall rule removal) to verify that security controls respond correctly under adverse conditions
- C. Security chaos engineering only tests network outages
- D. It replaces the need for penetration testing

Answer: B

Q1371. How does the KRACK (Key Reinstallation Attack) exploit the WPA2 four-way handshake, and what specifically is compromised?

- A. It cracks the WiFi password directly
- B. It forces reinstallation of an already-in-use key by manipulating handshake messages, causing nonce reuse that allows decryption of packets and potential injection in TKIP and GCMP modes
- C. It disables the access point's encryption hardware
- D. It only works against WEP encryption

Answer: B

Q1372. What is the FragAttacks vulnerability class in WiFi security and why does it affect virtually all WiFi devices?

- A. It only affects devices manufactured before 2010
- B. FragAttacks comprises design flaws in WiFi's frame aggregation and fragmentation features present in the IEEE 802.11 standard since 1997, along with widespread implementation flaws, affecting nearly all WiFi devices
- C. It is specific to one router manufacturer
- D. It only works when WiFi encryption is disabled

Answer: B

Q1373. How do Stingray/IMSI catcher devices operate, and what defense mechanisms exist against them?

- A. They simply block cell signals
- B. They impersonate legitimate cell towers to force phones to connect, intercepting calls, texts, and tracking location; 5G standalone networks with SUPI concealment help mitigate identification attacks
- C. They only work within 1 meter range
- D. They are only used for WiFi attacks

Answer: B

Q1374. What is the security risk of Bluetooth Low Energy (BLE) tracking and how have recent attacks like BLESAs exploited BLE reconnection?

- A. BLE is too short-range to pose security risks
- B. BLESAs (BLE Spoofing Attacks) exploits the reconnection process where authentication is optional, allowing an attacker to impersonate a previously paired device and send spoofed data
- C. BLE attacks require physical contact with the device
- D. BLE tracking only works indoors

Answer: B

Q1375. What are the unique security challenges of eSIM compared to traditional physical SIM cards?

- A. eSIMs are identical to physical SIMs in security
- B. eSIMs introduce risks of remote provisioning attacks, profile manipulation, and remove the physical possession requirement, but also eliminate SIM swapping at carrier stores
- C. eSIMs cannot be used for authentication
- D. eSIMs are less secure in every aspect

Answer: B

Q1376. How does the Dragonblood attack affect WPA3-SAE (Simultaneous Authentication of Equals) security?

- A. WPA3 is completely immune to all attacks
- B. Dragonblood reveals side-channel vulnerabilities in WPA3-SAE's dragonfly handshake including timing-based and cache-based attacks that can recover the WiFi password, plus downgrade attacks to WPA2
- C. Dragonblood only affects WPA2 networks
- D. Dragonblood is a physical attack on routers

Answer: B

Q1377. What is a man-in-the-disk attack on Android and why is it effective despite Android's sandboxing?

- A. An attack that fills up the device storage
- B. An attack exploiting Android apps that use external storage (shared by all apps) for receiving data, allowing a malicious app to modify files before the target app processes them
- C. It bypasses device encryption
- D. It only works on rooted devices

Answer: B

Q1378. What security mechanisms does 5G introduce to address the vulnerabilities found in 4G LTE networks?

- A. 5G has no security improvements over 4G
- B. 5G introduces subscriber identity encryption (SUCI), enhanced key hierarchy, network slicing isolation, and edge computing security, addressing IMSI catching, false base stations, and subscriber tracking
- C. 5G only improves speed without security changes
- D. 5G uses the same security as WiFi

Answer: B

Q1379. What is a baseband processor attack and why is it considered one of the most severe mobile security threats?

- A. It is a type of app-level malware that can be removed easily
- B. Baseband attacks target the separate processor handling cellular communications, which runs its own RTOS with high privileges, potentially allowing call interception, SMS theft, and persistent access that survives factory resets
- C. It only affects WiFi connectivity
- D. It requires the attacker to have physical access to the device

Answer: B

Q1380. How does a WiFi direct connection present security risks different from traditional WiFi, and what attack scenarios are unique to WiFi Direct?

- A. WiFi Direct is more secure than traditional WiFi in all cases
- B. WiFi Direct creates peer-to-peer connections that bypass network security controls; attacks include rogue group owner impersonation, unauthorized device discovery, and exploiting WPS vulnerabilities in the setup process
- C. WiFi Direct cannot transfer data
- D. WiFi Direct uses wired connections

Answer: B

Q1381. What is a cloud instance metadata service (IMDS) attack and how did it contribute to the Capital One breach?

- A. IMDS attacks target cloud provider's headquarters
- B. An attacker exploited an SSRF vulnerability to query the instance metadata service at 169.254.169.254, obtaining temporary IAM credentials that gave access to S3 buckets containing customer data
- C. IMDS only contains non-sensitive information
- D. The Capital One breach was caused by a phishing attack

Answer: B

Q1382. How does a cross-account confused deputy attack work in cloud environments?

- A. It confuses cloud administrators about their account credentials
- B. A malicious customer tricks a cloud service (deputy) into using the service's cross-account permissions to access resources in a victim's account by providing the victim's account ID as the target
- C. It only affects personal cloud accounts
- D. It is a type of DDoS attack

Answer: B

Q1383. What is the security challenge of Kubernetes RBAC in multi-tenant cloud environments?

- A. Kubernetes does not support RBAC
- B. Kubernetes RBAC can be complex to configure correctly for multi-tenancy, with risks of overly permissive ClusterRoles, insecure default service accounts, and namespace escape through cluster-wide resources
- C. Kubernetes RBAC is identical to OS-level access control
- D. Multi-tenancy is not possible in Kubernetes

Answer: B

Q1384. What is the security purpose of confidential computing in cloud environments and how does it differ from traditional encryption?

- A. It is the same as encrypting data at rest
- B. Confidential computing protects data during processing (in use) using hardware-based trusted execution environments, ensuring not even the cloud provider can access data during computation
- C. It only encrypts network traffic
- D. It provides encryption for backup data only

Answer: B

Q1385. How does cloud infrastructure entitlements management (CIEM) address the permissions gap problem?

- A. CIEM manages cloud infrastructure hardware
- B. CIEM continuously analyzes actual permission usage versus granted permissions, identifying overly permissive access and recommending least-privilege policies based on real behavior patterns
- C. CIEM replaces IAM entirely
- D. CIEM only manages storage permissions

Answer: B

Q1386. What are the security risks of serverless function event injection and how does it differ from traditional injection attacks?

- A. Serverless functions cannot be attacked
- B. Serverless event injection exploits the various event sources (API Gateway, S3, SNS, DynamoDB) that trigger functions; each source can carry malicious payloads in different formats, expanding the attack surface beyond traditional HTTP input
- C. Serverless injection is identical to web injection
- D. Only API Gateway events can be exploited

Answer: B

Q1387. What is the security significance of cloud provider control plane versus data plane, and how should monitoring differ for each?

- A. Control plane and data plane are the same in cloud environments
- B. The control plane manages cloud resources (API calls, configuration) while the data plane handles actual data traffic; monitoring must cover both: control plane for unauthorized changes and data plane for exfiltration and anomalies
- C. Only the data plane needs monitoring
- D. The control plane is automatically secure

Answer: B

Q1388. How can an attacker exploit insecure cloud function dependencies to achieve persistent access in a serverless environment?

- A. Serverless environments prevent all dependency attacks
- B. An attacker can compromise a dependency in the function's package or inject a malicious layer, gaining code execution each time the function is invoked, achieving persistence without maintaining infrastructure
- C. Dependencies do not affect function security
- D. Only first-party code can be compromised

Answer: B

Q1389. What is a cloud-native application protection platform (CNAPP) and how does it unify previously separate security tools?

- A. CNAPP is a new cloud provider service
- B. CNAPP combines CSPM, CWPP, CIEM, and IaC scanning into a unified platform, providing end-to-end visibility across the application lifecycle from code to cloud runtime, reducing tool sprawl and alert correlation gaps
- C. CNAPP only provides antivirus for cloud
- D. CNAPP replaces the need for IAM

Answer: B

Q1390. What security challenges arise from cloud provider managed keys versus customer managed keys (CMK) for encryption?

- A. There is no difference between managed and customer keys
- B. Provider-managed keys simplify operations but give the provider access to key material; CMKs give customers control but require managing key rotation, access policies, and disaster recovery, with the risk of permanent data loss if keys are lost
- C. Customer keys are always less secure
- D. Provider keys cannot be used for compliance

Answer: B

Q1391. How does SSD wear leveling and TRIM complicate traditional forensic data recovery?

- A. SSDs are easier to forensically analyze than HDDs
- B. TRIM instructs the SSD to erase deleted data blocks for performance, while wear leveling moves data across cells, making traditional recovery of deleted files unreliable as data may be erased or relocated without notice
- C. SSDs store data identically to traditional hard drives
- D. TRIM and wear leveling only affect SSD performance, not forensics

Answer: B

Q1392. What are the forensic challenges of investigating incidents in containerized environments?

- A. Containers are identical to virtual machines for forensics
- B. Containers are ephemeral with short lifespans, share the host kernel, use layered filesystems, and may be automatically destroyed and replaced, making traditional disk imaging impractical and requiring real-time log collection and orchestrator-level evidence
- C. Container forensics uses the same tools as disk forensics
- D. Containers always preserve all evidence

Answer: B

Q1393. How does memory forensics using tools like Volatility detect rootkits that hide from traditional analysis?

- A. Memory forensics cannot detect rootkits
- B. Volatility analyzes RAM dumps to find discrepancies between OS-reported process lists and actual memory structures, detect hidden processes, injected code, and hooks that rootkits use to hide from live system tools
- C. Memory forensics only finds cached passwords
- D. Volatility is a network analysis tool

Answer: B

Q1394. What is the forensic significance of Windows Prefetch files and how do they aid in malware analysis?

- A. Prefetch files only speed up application loading
- B. Prefetch files record which executables were run, when they were last executed, run count, and which DLLs and files were loaded, providing evidence of malware execution even after the malware binary is deleted
- C. Prefetch files are encrypted and cannot be analyzed
- D. Prefetch files exist only on Linux systems

Answer: B

Q1395. What are the legal and technical challenges of performing forensics on encrypted devices with full disk encryption?

- A. Encryption has no impact on forensic investigation
- B. Full disk encryption prevents traditional dead-box forensic imaging of readable data, requiring either live acquisition while the device is running and unlocked, key recovery from memory or key escrow, or legal compulsion to provide the decryption key
- C. Encrypted devices can always be easily decrypted by forensic tools
- D. Encryption only protects deleted files

Answer: B

Q1396. How does NTFS journal forensics (\$UsnJrnl and \$LogFile) provide evidence that regular file analysis cannot?

- A. NTFS journals contain no useful forensic data
- B. The USN Journal records all file system changes (creation, modification, deletion, rename) with timestamps, and \$LogFile records transactional metadata, providing evidence of file operations even after files are deleted and overwritten
- C. NTFS journals only exist on Linux systems
- D. Journal analysis requires access to the original user account

Answer: B

Q1397. What is the role of digital forensics in investigating Advanced Persistent Threat (APT) campaigns?

- A. Digital forensics cannot help with APT investigations
- B. Forensics must trace lateral movement across multiple systems, identify initial access vectors, recover C2 communications, analyze custom malware through reverse engineering, and build a comprehensive timeline spanning months of activity
- C. APT investigations only require network monitoring
- D. APTs leave no forensic evidence

Answer: B

Q1398. What is the forensic approach to analyzing fileless malware that operates entirely in memory?

- A. Fileless malware cannot be detected or analyzed
- B. Analysis requires memory acquisition from the live system, examining PowerShell logs, WMI event subscriptions, registry-resident payloads, and system event logs since traditional disk-based forensics finds no malware files
- C. Fileless malware always leaves files on disk
- D. Simply scanning the hard drive is sufficient

Answer: B

Q1399. How does anti-forensic timestamp manipulation (timestomping) work, and what techniques can detect it?

- A. Timestamps cannot be manipulated
- B. Timestomping modifies file timestamps to blend in with legitimate files; detection involves comparing \$STANDARD_INFORMATION timestamps with \$FILE_NAME timestamps in NTFS MFT, analyzing USN Journal entries, and checking for timestamp inconsistencies
- C. Only law enforcement can detect timestamp manipulation
- D. Timestomping permanently destroys all timestamp evidence

Answer: B

Q1400. What are the unique challenges of cloud forensics compared to traditional on-premises forensics?

- A. Cloud forensics is simpler than traditional forensics
- B. Cloud forensics faces challenges including limited physical access, multi-tenant data isolation, jurisdiction across regions, volatile/ephemeral resources, dependency on provider cooperation, and ensuring forensic soundness without hardware control
- C. Cloud environments provide better forensic capabilities
- D. There are no differences between cloud and traditional forensics

Answer: B

Q1401. During a major incident, the IR team suspects the attacker is monitoring their Slack and email. What should the team do?

- A. Continue using Slack and email to avoid tipping off the attacker
- B. Switch to pre-established out-of-band communication channels such as a separate system, encrypted phone calls, or in-person meetings that the attacker has no access to
- C. Post misleading information on Slack to confuse the attacker
- D. Shut down all communication and work independently

Answer: B

Q1402. How should an IR team handle the discovery that a supply chain partner's software update was the initial attack vector?

- A. Immediately remove all partner software from the network
- B. Coordinate with the partner for joint investigation, isolate affected systems without breaking critical dependencies, analyze the compromised update for IoCs, and notify relevant stakeholders and potentially CISA or sector ISACs
- C. Ignore the supply chain aspect and focus only on internal systems
- D. Publicly blame the supply chain partner

Answer: B

Q1403. An organization detects ransomware but the attacker also exfiltrated data before encryption. How does this dual-threat change the incident response approach?

- A. Focus only on decrypting the ransomware
- B. The response must address both the ransomware (restoration from backups, containment) and the data breach (regulatory notification, determining what data was stolen, monitoring for data publication), treating it as a data breach with ransomware
- C. Data exfiltration is not a concern if data is encrypted on the attacker's end
- D. Only law enforcement can handle this type of incident

Answer: B

Q1404. What is the 'dwell time' metric in incident response and what does a high dwell time indicate about an organization's detection capabilities?

- A. Dwell time measures how long it takes to deploy patches
- B. Dwell time is the duration between initial compromise and detection; high dwell time indicates poor detection capabilities, allowing attackers to deeply entrench, move laterally, and accomplish objectives before being discovered
- C. Dwell time measures the time between incidents
- D. Dwell time is only relevant for insider threats

Answer: B

Q1405. How should an IR team determine whether to rebuild compromised systems from scratch versus cleaning and restoring them?

- A. Always clean and restore to save time
- B. Rebuilding is preferred for high-severity compromises where the attacker had deep access (admin/root), persistence mechanisms may be hidden, or the full extent of compromise is uncertain; cleaning is acceptable for low-severity, well-understood incidents
- C. Always rebuild every system regardless of the incident
- D. The decision should be made by the legal department only

Answer: B

Q1406. What is the role of deception technology during active incident response?

- A. Deception has no place in incident response
- B. Deploying decoys and honeypots during active response can detect attacker lateral movement, misdirect the attacker, gather intelligence on TTPs, and confirm when the attacker has been fully removed from the environment
- C. Deception technology only works before an incident occurs
- D. Deception technology replaces the need for containment

Answer: B

Q1407. What are the legal considerations when an IR team discovers evidence of criminal activity by an insider during a routine security investigation?

- A. Legal considerations do not apply during incident response
- B. The team must immediately involve legal counsel, ensure evidence is collected in a legally defensible manner, consider employee privacy rights, determine whether to involve law enforcement, and separate the HR process from the technical investigation
- C. The IR team should confront the employee directly
- D. The team should delete the evidence to avoid complications

Answer: B

Q1408. How does the MITRE ATT&CK framework enhance incident response activities?

- A. MITRE ATT&CK is only useful for threat intelligence, not incident response
- B. ATT&CK provides a common language for describing attacker techniques, helps map observed activity to known threat groups, identifies gaps in detection coverage, guides investigation by predicting likely next steps, and structures post-incident reporting
- C. ATT&CK replaces the need for an incident response plan
- D. ATT&CK only works for nation-state attacks

Answer: B

Q1409. An IR team has contained a breach but the attacker had access for 6 months. What specific challenges does this extended dwell time create for the response?

- A. Extended dwell time does not create additional challenges
- B. Extended access means the attacker likely established multiple persistence mechanisms, moved laterally across many systems, exfiltrated significant data, potentially tampered with logs and backups, and created credentials that must all be identified and remediated
- C. After 6 months the threat is no longer active
- D. Only the initially compromised system needs attention

Answer: B

Q1410. What is the strategic difference between tactical incident response and strategic incident response during a major breach?

- A. There is no difference between tactical and strategic response
- B. Tactical response focuses on immediate technical actions (containment, eradication, recovery) while strategic response addresses business continuity, stakeholder communication, regulatory compliance, reputation management, and long-term security improvements
- C. Tactical response is done by management and strategic by engineers
- D. Strategic response only happens after the incident is resolved

Answer: B

Q1411. How can an attacker evade security monitoring through living-off-the-land techniques, and what detection strategies are effective?

- A. Living-off-the-land techniques are easily detected by antivirus
- B. Attackers use legitimate system tools (PowerShell, WMI, certutil) for malicious purposes, evading signature-based detection; effective detection requires behavioral analysis, command-line logging, and baselining normal administrative tool usage
- C. These techniques only work on Linux systems
- D. Standard SIEM rules detect all living-off-the-land activity

Answer: B

Q1412. What is the detection challenge of encrypted C2 (command and control) traffic, and what network-level indicators can still reveal it?

- A. Encrypted C2 traffic cannot be detected at all
- B. While content is hidden, encrypted C2 traffic can be detected through JA3/JA3S fingerprinting, certificate analysis, beacon interval patterns, traffic volume anomalies, SNI field inspection, and unusual destination characteristics
- C. Simply decrypting all traffic is the only solution
- D. C2 traffic always uses unencrypted protocols

Answer: B

Q1413. How should security monitoring architecture be designed for a hybrid cloud environment?

- A. Use only on-premises monitoring tools for all environments
- B. Implement unified monitoring that aggregates logs from on-premises, cloud provider native logs, and SaaS audit logs into a centralized SIEM with normalized data formats, cloud-specific detection rules, and cross-environment correlation
- C. Cloud environments do not need monitoring
- D. Use separate, unconnected monitoring for each environment

Answer: B

Q1414. What is the OODA loop (Observe, Orient, Decide, Act) and how does it apply to SOC operations?

- A. OODA is a software development methodology
- B. The OODA loop provides a decision-making framework for SOC analysts: Observe (collect data), Orient (analyze context and threat intelligence), Decide (determine response), Act (execute response); faster OODA loops lead to better security outcomes
- C. OODA only applies to military operations
- D. OODA replaces SIEM technology

Answer: B

Q1415. What are the key metrics for measuring SOC effectiveness, and what do they indicate?

- A. Only the number of alerts matters
- B. Key metrics include MTTD (Mean Time To Detect), MTTR (Mean Time To Respond), false positive rate, alert-to-incident ratio, coverage against ATT&CK techniques, and analyst workload; together they measure detection capability, response efficiency, and operational health
- C. SOC effectiveness cannot be measured
- D. Only compliance audit results matter

Answer: B

Q1416. How does security orchestration, automation, and response (SOAR) reduce mean time to respond?

- A. SOAR replaces all human analysts
- B. SOAR automates repetitive investigation steps (enrichment, correlation), orchestrates actions across security tools, and executes predefined playbooks for common alert types, freeing analysts for complex decisions while reducing response time for routine incidents
- C. SOAR only generates reports
- D. SOAR increases response time due to complexity

Answer: B

Q1417. What is the challenge of monitoring east-west traffic in modern data center and cloud environments?

- A. East-west traffic does not exist in modern networks
- B. East-west (lateral) traffic between servers often bypasses traditional perimeter monitoring; detecting threats requires micro-segmentation with inline monitoring, agent-based endpoint telemetry, or network detection and response (NDR) solutions within the data center
- C. East-west traffic is automatically monitored by firewalls
- D. Only north-south traffic matters for security

Answer: B

Q1418. What is the role of machine learning anomaly detection in security monitoring, and what are its limitations?

- A. ML anomaly detection perfectly detects all threats with no false positives
- B. ML anomaly detection identifies deviations from learned baseline behavior, useful for detecting novel threats without signatures; limitations include high false positive rates during baseline changes, susceptibility to adversarial evasion, and need for quality training data
- C. ML makes all other detection methods obsolete
- D. ML anomaly detection only works for network traffic

Answer: B

Q1419. How should a SOC handle monitoring during a zero-day vulnerability disclosure before patches are available?

- A. Zero-day monitoring is impossible
- B. The SOC should implement compensating detection rules based on known exploitation indicators, increase monitoring of likely target systems, deploy virtual patches through WAF/IPS, monitor for proof-of-concept exploit code releases, and coordinate with threat intelligence for IoCs
- C. Simply wait for the vendor patch
- D. Disconnect all vulnerable systems from the network

Answer: B

Q1420. What is the concept of detection-as-code and how does it improve security monitoring operations?

- A. Detection-as-code means writing detection rules in any programming language
- B. Detection-as-code applies software engineering practices (version control, testing, peer review, CI/CD) to detection rule development, enabling systematic rule management, automated testing for false positives, and collaborative detection engineering
- C. Detection-as-code replaces SIEM platforms
- D. It only applies to cloud-native environments

Answer: B

Q1421. How does the CLOUD Act affect international data access for law enforcement, and what tensions does it create with GDPR?

- A. The CLOUD Act has no impact on international data access
- B. The CLOUD Act allows US authorities to compel US-based technology companies to provide data regardless of where it is stored; this creates conflicts with GDPR's data transfer restrictions and other countries' sovereignty concerns over their citizens' data
- C. The CLOUD Act only applies to cloud storage companies
- D. GDPR and the CLOUD Act are fully compatible

Answer: B

Q1422. What are the legal and ethical considerations of 'hack back' or active cyber defense measures by private organizations?

- A. Hack back is legal and encouraged for all organizations
- B. Active cyber defense by private entities raises complex legal issues: most jurisdictions prohibit unauthorized access regardless of motive, there are attribution challenges, risks of escalation, potential collateral damage, and limited legal frameworks distinguishing defensive from offensive actions
- C. Hack back is universally illegal with no exceptions
- D. Private organizations have unlimited rights to defend their networks through offensive measures

Answer: B

Q1423. How does the Budapest Convention on Cybercrime facilitate international cooperation, and what are its limitations?

- A. The Budapest Convention is no longer relevant
- B. The Convention provides a framework for mutual legal assistance, harmonizing cybercrime definitions and procedures; limitations include non-participation by major cyber powers (Russia, China), slow MLAT processes, and challenges adapting to emerging technologies
- C. The Convention automatically resolves all jurisdictional disputes
- D. All countries are members of the Budapest Convention

Answer: B

Q1424. What legal framework governs the use of artificial intelligence in cybersecurity decision-making, and what liability issues arise?

- A. AI in cybersecurity has no legal implications
- B. The legal framework is evolving: AI-powered security decisions raise questions of liability when automated systems cause false positives blocking legitimate users, algorithmic bias in threat detection, accountability for AI errors, and regulatory requirements for explainable AI
- C. AI decisions are always legally defensible
- D. Only developers of AI are liable, not the organizations using it

Answer: B

Q1425. What are the legal challenges of prosecuting state-sponsored cyber attacks under international law?

- A. International law clearly addresses all state-sponsored cyber attacks
- B. State-sponsored attacks face challenges including attribution difficulty, sovereign immunity, lack of binding international cyber norms, the Tallinn Manual's non-binding status, and debates about whether cyber attacks constitute 'armed attacks' triggering self-defense rights
- C. All state-sponsored attacks are considered acts of war
- D. International courts have jurisdiction over all cyber attacks

Answer: B

Q1426. How does the right to encryption conflict with government demands for lawful access, and what are the implications of encryption backdoors?

- A. There is no conflict between encryption and lawful access
- B. The tension lies between individuals' right to privacy through encryption and governments' need for lawful access to investigate crimes; mandated backdoors weaken security for all users and cannot be limited to authorized access only
- C. Encryption backdoors are perfectly secure
- D. Governments do not seek access to encrypted communications

Answer: B

Q1427. What is the legal significance of Pakistan's Prevention of Electronic Crimes Act (PECA) 2016 Section 10 regarding cyber terrorism?

- A. Section 10 only addresses spam emails
- B. Section 10 criminalizes cyber terrorism including using information systems to create fear, panic, or insecurity, interfering with critical infrastructure, or threatening national security, with severe penalties including imprisonment up to fourteen years
- C. PECA 2016 does not address terrorism
- D. Section 10 is about copyright protection

Answer: B

Q1428. What are the legal implications of cross-border data transfers following the Schrems II ruling, and how do organizations ensure compliance?

- A. Schrems II has no practical impact on data transfers
- B. Schrems II invalidated the EU-US Privacy Shield and requires organizations to conduct transfer impact assessments when using Standard Contractual Clauses, implement supplementary measures, and ensure the destination country's surveillance laws do not undermine EU-level data protection
- C. Organizations can freely transfer data between any countries
- D. Only EU organizations are affected by Schrems II

Answer: B

Q1429. How do cybersecurity regulations for critical infrastructure differ from general data protection laws, and what additional obligations do they impose?

- A. Critical infrastructure has fewer regulations than regular businesses
- B. Critical infrastructure regulations impose additional obligations including mandatory incident reporting with shorter deadlines, minimum security standards, regular security assessments, supply chain security requirements, and potential government oversight or certification
- C. Critical infrastructure only needs to follow GDPR
- D. There are no specific regulations for critical infrastructure

Answer: B

Q1430. What is the legal and ethical framework around vulnerability disclosure, and how do coordinated vulnerability disclosure policies reduce legal risk for researchers?

- A. Vulnerability disclosure has no legal framework
- B. Coordinated vulnerability disclosure (CVD) policies provide a legal safe harbor by defining how researchers should report vulnerabilities, establishing timelines for patches, and protecting researchers from prosecution under computer crime laws when they act in good faith within the policy's scope
- C. All vulnerability disclosure is illegal
- D. Only government researchers can disclose vulnerabilities

Answer: B

Q1431. How does the convergence of AI and cybersecurity create an arms race between attackers and defenders?

- A. AI only benefits defenders, not attackers
- B. Both attackers and defenders use AI: defenders for threat detection, anomaly analysis, and automated response; attackers for evading detection, generating polymorphic malware, automating social engineering, and discovering vulnerabilities, creating a continuous escalation cycle
- C. AI has no impact on the attacker-defender dynamic
- D. The arms race is only theoretical and has not materialized

Answer: B

Q1432. What is the concept of security chaos engineering and how does it proactively improve security posture?

- A. Chaos engineering makes security systems more chaotic
- B. Security chaos engineering deliberately introduces controlled security failures (expired certificates, disabled controls, simulated breaches) to verify that detection, alerting, and response mechanisms function correctly, identifying weaknesses before attackers exploit them
- C. It is identical to penetration testing
- D. Chaos engineering only tests system availability

Answer: B

Q1433. What are the unique security challenges of Web3 and decentralized applications (dApps)?

- A. Web3 applications are inherently more secure than Web2
- B. Web3 introduces unique challenges including smart contract vulnerabilities, irreversible transactions on blockchain, private key management, bridge protocol exploits, flash loan attacks, governance token manipulation, and the tension between immutability and the need to patch vulnerabilities
- C. Web3 has no security challenges
- D. Web3 uses the same security model as traditional web applications

Answer: B

Q1434. How does quantum key distribution (QKD) fundamentally differ from post-quantum cryptography (PQC), and what are the practical deployment challenges of each?

- A. QKD and PQC are the same technology
- B. QKD uses quantum physics to distribute keys with information-theoretic security but requires dedicated fiber/satellite links; PQC uses classical algorithms resistant to quantum attacks that work on existing infrastructure; QKD faces distance and cost limitations while PQC faces algorithm maturity and standardization challenges
- C. QKD is software-based while PQC requires hardware
- D. Neither technology addresses quantum threats

Answer: B

Q1435. What is the security significance of software-defined perimeter (SDP) and how does it implement zero trust principles?

- A. SDP is identical to a traditional VPN
- B. SDP creates dynamic, identity-based perimeters by making application infrastructure invisible to unauthorized users through single-packet authorization, mutual TLS, and need-to-know access, implementing zero trust by eliminating the concept of a trusted network
- C. SDP only works for physical security
- D. SDP replaces firewalls entirely

Answer: B

Q1436. What is the emerging threat of adversarial machine learning and how can it compromise AI-based security systems?

- A. Adversarial ML only affects image recognition
- B. Adversarial ML attacks manipulate AI models through techniques like evasion attacks (crafting inputs to bypass detection), poisoning attacks (corrupting training data), model stealing (extracting model parameters), and inversion attacks (extracting training data from model outputs)
- C. AI security systems cannot be manipulated
- D. Adversarial attacks require access to the model's source code

Answer: B

Q1437. How does the concept of cyber-physical systems security extend traditional cybersecurity to address safety-critical environments?

- A. Cyber-physical security is identical to IT security
- B. Cyber-physical security must address the intersection of digital and physical systems where cyber attacks can cause physical harm (e.g., industrial control systems, medical devices, autonomous vehicles), requiring safety engineering integration, real-time constraints, and consequence-based risk assessment
- C. Cyber-physical systems cannot be hacked
- D. Only military systems are cyber-physical

Answer: B

Q1438. What is the concept of digital sovereignty in cybersecurity and how does it influence technology and policy decisions?

- A. Digital sovereignty only means hosting websites domestically
- B. Digital sovereignty encompasses a nation's ability to control its digital infrastructure, data, and technology supply chains, influencing decisions on data localization, domestic technology development, trusted vendor requirements, and resistance to foreign surveillance
- C. Digital sovereignty has no impact on cybersecurity
- D. Only large countries can achieve digital sovereignty

Answer: B

Q1439. What is the security implication of neuromorphic computing and how might it change the cybersecurity landscape?

- A. Neuromorphic computing only affects battery life
- B. Neuromorphic computing mimics brain neural networks in hardware, potentially enabling real-time AI-powered threat detection with extremely low power consumption, but also poses risks of creating more sophisticated AI-driven attacks and may require new security paradigms for protecting brain-inspired architectures
- C. Neuromorphic computing is identical to quantum computing
- D. Neuromorphic computing has no security implications

Answer: B

Q1440. How does the concept of cyber resilience fundamentally differ from traditional cybersecurity, and why is it becoming more important?

- A. Cyber resilience and cybersecurity are identical concepts
- B. Cyber resilience accepts that breaches are inevitable and focuses on an organization's ability to anticipate, withstand, recover from, and adapt to adverse cyber events while maintaining critical operations, whereas traditional cybersecurity primarily focuses on prevention; resilience is critical as attack sophistication outpaces pure prevention
- C. Cyber resilience means giving up on security
- D. Traditional cybersecurity is always sufficient

Answer: B

SUBJECT

Databases

1,530 Multiple Choice Questions

Databases — Easy

510 questions

Q1. What is a database?

- A. A specialized type of programming language
- B. An organized collection of structured data
- C. A specific type of network protocol used
- D. A physical hardware component in a system

Answer: B

Q2. Which of the following is a popular Database Management System (DBMS)?

- A. CSS
- B. HTML
- C. MySQL
- D. FTP

Answer: C

Q3. What does DBMS stand for?

- A. Data Backup Management System
- B. Database Management System
- C. Database Modification Software
- D. Digital Base Management System

Answer: B

Q4. Which of these is an advantage of using a database system?

- A. Data cannot be shared between users
- B. Data redundancy is significantly reduced
- C. Overall storage cost increases greatly
- D. Programs become much harder to write

Answer: B

Q5. What is data redundancy?

- A. Algorithmic compression of data
- B. Unnecessary duplication of data
- C. Permanent loss of stored data
- D. Cryptographic encryption of data

Answer: B

Q6. Who manages and controls access to a database?

- A. Business Systems Analyst
- B. Database Administrator (DBA)
- C. Network Systems Engineer
- D. Web Interface Designer

Answer: B

Q7. Which of the following is NOT a type of database user?

- A. DBA administrator
- B. Database end user
- C. SQL programmer
- D. Compiler program

Answer: D

Q8. What is the primary goal of a DBMS?

- A. To manage and configure physical hardware components in a server rack
- B. To provide a convenient and efficient way to store and retrieve data
- C. To design and develop interactive websites and web applications online
- D. To replace the functionality of the underlying operating system entirely

Answer: B

Q9. In a file-based system, data is stored in:

- A. Random access memory storage only
- B. Separate files for each application
- C. Cloud-based storage systems only
- D. A single centralized data repository

Answer: B

Q10. Data independence means:

- A. Changes to data storage do not affect application programs
- B. Applications and data definitions are treated as the same
- C. Stored data values cannot be modified by any user at all
- D. Data items are not stored permanently on the storage disk

Answer: A

Q11. The two-tier architecture in databases consists of:

- A. Three layer tiers
- B. Client and Server
- C. Only Client tier
- D. Only Server tier

Answer: B

Q12. In a client-server architecture, the database resides on the:

- A. Client side
- B. Neither side
- C. Both equally
- D. Server side

Answer: D

Q13. What is a centralized database system?

- A. A system designed to operate without any DBMS software layer
- B. A system that runs exclusively on cloud computing platforms
- C. A system with data distributed across multiple remote locations
- D. A system where data is stored and managed at a single location

Answer: D

Q14. Which tier in three-tier architecture handles the user interface?

- A. Presentation tier
- B. Database data tier
- C. None of these tiers
- D. Business logic tier

Answer: A

Q15. What does a query processor do?

- A. Backs up data to external storage
- B. Interprets and executes database queries
- C. Stores data on physical disk drives
- D. Manages user accounts and profiles

Answer: B

Q16. The storage manager in a DBMS is responsible for:

- A. Creating graphical user interfaces
- B. Managing how data is stored on disk
- C. Writing and executing SQL queries
- D. Configuring network communication

Answer: B

Q17. Which component of DBMS translates high-level queries into low-level operations?

- A. Transaction manager
- B. Query compiler module
- C. Buffer manager module
- D. File manager module

Answer: B

Q18. In a three-tier architecture, the middle tier is called:

- A. Data warehouse store
- B. Application server
- C. Database server
- D. Web browser client

Answer: B

Q19. What is the role of the buffer manager?

- A. Creates and maintains database schemas and table structures
- B. Manages the transfer of data between disk and main memory
- C. Manages user authentication and role-based access control
- D. Processes and optimizes SQL queries for efficient execution

Answer: B

Q20. A database engine is also known as:

- A. Query language
- B. Storage engine
- C. Front-end application
- D. Report generator

Answer: B

Q21. Which data model organizes data in tables of rows and columns?

- A. Relational model
- B. Object model
- C. Hierarchical model
- D. Network model

Answer: A

Q22. In the hierarchical data model, data is organized as a:

- A. Graph structure
- B. Star structure
- C. Tree structure
- D. Table structure

Answer: C

Q23. An Entity-Relationship (ER) diagram is used to:

- A. Design network topologies for servers
- B. Create application interfaces for users
- C. Model the conceptual design of a database
- D. Write SQL queries against stored tables

Answer: C

Q24. In an ER diagram, a rectangle represents:

- A. An entity type
- B. A relationship
- C. An attribute
- D. A primary key

Answer: A

Q25. An attribute in a data model represents:

- A. A constraint on records
- B. A property of an entity
- C. A table in the database
- D. A relationship between entities

Answer: B

Q26. Which symbol represents a relationship in an ER diagram?

- A. Ellipse
- B. Rectangle
- C. Triangle
- D. Diamond

Answer: D

Q27. A primary key uniquely identifies:

- A. A relationship instance
- B. A single column value
- C. Each record in a table
- D. An entire database schema

Answer: C

Q28. In the network data model, the relationship between records is:

- A. Many-to-many using sets
- B. No relationships allowed
- C. Hierarchical only structure
- D. One-to-one relationships

Answer: A

Q29. The relational data model was proposed by:

- A. Edgar Dijkstra
- B. Charles Bachman
- C. E.F. Codd
- D. Peter Chen

Answer: C

Q30. Which of these is NOT a data model?

- A. Relational model
- B. Hierarchical model
- C. Compiler model
- D. Network model

Answer: C

Q31. In a relational database, a table is also called a:

- A. Tree
- B. Graph
- C. Document
- D. Relation

Answer: D

Q32. A row in a relational table is called a:

- A. Schema
- B. Attribute
- C. Domain
- D. Tuple

Answer: D

Q33. A column in a relational table is called:

- A. An attribute
- B. A relation
- C. A key value
- D. A tuple

Answer: A

Q34. A primary key must be:

- A. Unique and not null
- B. Duplicate in values
- C. Foreign key based
- D. Nullable and optional

Answer: A

Q35. A foreign key is:

- A. A key used only for sorting records in a particular order
- B. The first column of any table regardless of its data content
- C. An attribute that is always unique across all related tables
- D. An attribute that references the primary key of another table

Answer: D

Q36. The domain of an attribute specifies:

- A. The number of rows containing that attribute
- B. The name assigned to identify that attribute
- C. The set of allowed values for that attribute
- D. The table name where the attribute exists

Answer: C

Q37. The degree of a relation refers to:

- A. The number of tables in database
- B. The number of tuples (rows) stored
- C. The number of keys in the schema
- D. The number of attributes (columns)

Answer: D

Q38. The cardinality of a relation refers to:

- A. The number of keys in the table
- B. The number of foreign key links
- C. The number of tuples (rows)
- D. The number of attributes (columns)

Answer: C

Q39. Which of the following is a property of a relational table?

- A. Rows must be ordered
- B. Each row is unique
- C. Columns can be duplicated
- D. Attributes are ordered

Answer: B

Q40. NULL in a database represents:

- A. An empty string character
- B. A zero numeric value only
- C. A space character in data
- D. An unknown or missing value

Answer: D

Q41. The selection operation in relational algebra:

- A. Selects tuples (rows) that satisfy a condition
- B. Selects specific columns from a given relation
- C. Renames a relation or its attribute identifiers
- D. Combines two relations into a single relation

Answer: A

Q42. The projection operation in relational algebra:

- A. Deletes tuples from a stored relation
- B. Selects specific columns from a relation
- C. Joins two relations on common attributes
- D. Selects specific rows from a given relation

Answer: B

Q43. The union of two relations R and S contains:

- A. Only tuples that are common to both R and S
- B. All tuples from both R and S without duplicates
- C. The Cartesian product of relations R and S
- D. Tuples in R but not present in relation S

Answer: B

Q44. Which relational algebra operation renames a relation or its attributes?

- A. Rename (ρ)
- B. Projection (π)
- C. Division ($\div$)
- D. Selection (σ)

Answer: A

Q45. The Cartesian product of relations R and S is denoted as:

- A. $R \bowtie S$
- B. $R \times S$
- C. $R \cup S$
- D. $R \cap S$

Answer: B

Q46. Set difference ($R - S$) returns:

- A. Common tuples found in R and S
- B. Tuples in S that are not in R
- C. Tuples in R that are not in S
- D. All tuples from both R and S

Answer: C

Q47. For union compatibility, two relations must have:

- A. The same number of attributes with compatible domains
- B. The same name for both relations being combined
- C. The same number of tuples stored in both relations
- D. Identical primary keys defined on both data relations

Answer: A

Q48. The intersection of R and S ($R \cap S$) returns:

- A. Tuples that are only in relation R
- B. Tuples that are only in relation S
- C. All tuples from relations R and S
- D. Tuples that are in both R and S

Answer: D

Q49. Which operation is fundamental in relational algebra (cannot be derived from others)?

- A. Intersection
- B. Division
- C. Selection
- D. Natural join

Answer: C

Q50. The natural join operation:

- A. Renames attributes within a relation for query convenience
- B. Returns all tuples from both relations regardless of matching
- C. Combines tuples from two relations based on common attributes
- D. Removes duplicates from a single relation without conditions

Answer: C

Q51. SQL stands for:

- A. Standard Question Language
- B. Structured Query Language
- C. System Query Logic
- D. Simple Query Language

Answer: B

Q52. Which SQL statement is used to retrieve data from a database?

- A. DELETE
- B. INSERT
- C. UPDATE
- D. SELECT

Answer: D

Q53. Which SQL clause is used to filter rows?

- A. HAVING
- B. ORDER BY
- C. WHERE
- D. GROUP BY

Answer: C

Q54. Which SQL statement adds new rows to a table?

- A. UPDATE SET
- B. INSERT INTO
- C. ALTER TABLE
- D. CREATE INDEX

Answer: B

Q55. Which SQL statement modifies existing data?

- A. DROP
- B. INSERT
- C. UPDATE
- D. SELECT

Answer: C

Q56. Which SQL statement removes rows from a table?

- A. ALTER
- B. DELETE
- C. TRUNCATE
- D. DROP

Answer: B

Q57. Which SQL command creates a new table?

- A. CREATE TABLE
- B. NEW TABLE
- C. INSERT TABLE
- D. ADD TABLE

Answer: A

Q58. Which SQL command permanently removes a table?

- A. DESTROY TABLE
- B. REMOVE TABLE
- C. DELETE TABLE
- D. DROP TABLE

Answer: D

Q59. The ORDER BY clause is used to:

- A. Filter rows by value
- B. Join tables on keys
- C. Sort the result set
- D. Group rows together

Answer: C

Q60. Which keyword is used to remove duplicate rows from a result?

- A. FILTER
- B. UNIQUE
- C. REMOVE
- D. DISTINCT

Answer: D

Q61. A view in SQL is:

- A. A stored procedure in the database server
- B. A virtual table based on a SELECT query
- C. A physical copy of a table stored on disk
- D. A type of index on one or more columns

Answer: B

Q62. Which SQL command creates a view?

- A. INSERT VIEW
- B. MAKE VIEW
- C. BUILD VIEW
- D. CREATE VIEW

Answer: D

Q63. A stored procedure is:

- A. A precompiled set of SQL statements stored in the database
- B. An index structure built on one or more columns of a table
- C. A type of view that shows data from multiple source tables
- D. A constraint that enforces data integrity rules on a table

Answer: A

Q64. A trigger in SQL is:

- A. A constraint that restricts the values allowed in a specific column
- B. A type of view that displays filtered data from the underlying table
- C. A manual query written by the user and executed on demand each time
- D. A procedure that automatically executes when a specific event occurs

Answer: D

Q65. What is a cursor in SQL?

- A. A pointer to a table that references its location in data storage
- B. A database object used to retrieve and process rows one at a time
- C. A type of index structure created on one or more table columns
- D. A constraint on a column that restricts the allowed data values

Answer: B

Q66. Which SQL statement is used to grant privileges?

- A. PERMIT
- B. ALLOW
- C. ENABLE
- D. GRANT

Answer: D

Q67. Which SQL statement removes privileges?

- A. DENY
- B. DISABLE
- C. REVOKE
- D. REMOVE

Answer: C

Q68. An assertion in SQL is:

- A. A view that provides a virtual representation of the underlying data
- B. A stored procedure that runs on a scheduled basis within the server
- C. A constraint that specifies a condition the database must always satisfy
- D. A type of trigger that fires automatically when data changes occur

Answer: C

Q69. What is a transaction in SQL?

- A. A type of view that provides a virtual representation of table data
- B. A single SELECT query that retrieves data from the database tables
- C. An index structure that speeds up data retrieval from large tables
- D. A sequence of operations treated as a single logical unit of work

Answer: D

Q70. The COMMIT statement in SQL:

- A. Creates a savepoint within the current active transaction
- B. Starts a new transaction and initializes the session state
- C. Undoes all changes made in the current transaction entirely
- D. Saves all changes made in the current transaction permanently

Answer: D

Q71. Normalization in databases is the process of:

- A. Adding redundant data to speed up query processing
- B. Deleting all data from every table in the database
- C. Creating as many tables as possible in the schema
- D. Organizing data to reduce redundancy and dependency

Answer: D

Q72. First Normal Form (1NF) requires:

- A. All attributes are restricted to numeric
- B. No foreign keys exist within the tables
- C. All attributes contain atomic values only
- D. Tables have only one column of any data

Answer: C

Q73. A functional dependency $X \rightarrow Y$ means:

- A. The value of Y uniquely determines the value of X
- B. X and Y always contain the same identical values
- C. X and Y are completely unrelated to each other
- D. The value of X uniquely determines the value of Y

Answer: D

Q74. Redundancy in a database leads to:

- A. Insertion, deletion, and update anomalies
- B. Better data integrity and consistency
- C. Faster queries and improved performance
- D. Simplified database design structure

Answer: A

Q75. An update anomaly occurs when:

- A. A table is created for the first time in the schema
- B. A new row is inserted into an existing data table
- C. The same data must be changed in multiple places
- D. An index is dropped from a column in the database

Answer: C

Q76. Second Normal Form (2NF) requires:

- A. Only atomic values without any other constraints
- B. 1NF and no partial dependency on the primary key
- C. No functional dependencies of any kind at all
- D. All attributes must serve as keys in the table

Answer: B

Q77. Third Normal Form (3NF) requires:

- A. No attributes defined at all in it
- B. Only 1NF without other constraints
- C. 2NF and no transitive dependencies
- D. All attributes are primary key parts

Answer: C

Q78. A transitive dependency exists when:

- A. Two keys depend on each other in a circular dependency
- B. A key attribute depends on a non-key attribute directly
- C. A non-key attribute depends on another non-key attribute
- D. No dependencies exist between any attributes at all

Answer: C

Q79. A partial dependency exists when:

- A. A non-key attribute depends on the entire composite primary key
- B. A non-key attribute depends on part of a composite primary key
- C. No dependencies exist between any attributes in the data table
- D. All attributes depend on all keys defined in the relation schema

Answer: B

Q80. Denormalization is:

- A. Removing all tables and their data from the entire database
- B. Intentionally introducing redundancy to improve read performance
- C. Deleting all indexes to reduce overall storage requirements
- D. Normalizing the schema to a higher normal form than before

Answer: B

Q81. ACID properties of a transaction stand for:

- A. Atomicity, Concurrency, Isolation, Durability
- B. Addition, Consistency, Integrity, Durability
- C. Atomicity, Consistency, Isolation, Durability
- D. Atomicity, Consistency, Isolation, Dependency

Answer: C

Q82. Atomicity means that a transaction:

- A. Runs in isolation from all other transactions
- B. Is either fully completed or fully rolled back
- C. Is stored permanently on the disk after start
- D. Can be partially completed and then paused

Answer: B

Q83. Consistency ensures that a transaction:

- A. Never fails regardless of the operations within
- B. Is stored permanently on disk after the commit
- C. Runs concurrently with other active transactions
- D. Brings the database from one valid state to another

Answer: D

Q84. Isolation ensures that:

- A. Transactions are never allowed to execute concurrently
- B. All transactions see each other's changes immediately
- C. Only one transaction can exist in the system at a time
- D. Concurrent transactions do not interfere with each other

Answer: D

Q85. Durability ensures that:

- A. Data is stored only in volatile memory and not on stable disk
- B. Changes can be undone at any time even after transaction commit
- C. Committed transaction changes persist even after system failure
- D. Transactions are temporary and their changes are never saved

Answer: C

Q86. The COMMIT operation in a transaction:

- A. Pauses the active transaction
- B. Makes all changes permanent
- C. Undoes all current changes
- D. Starts a new transaction

Answer: B

Q87. The ROLLBACK operation in a transaction:

- A. Undoes all changes made by the transaction
- B. Starts a new transaction in the session
- C. Deletes the database and all stored data
- D. Saves all changes and makes them permanent

Answer: A

Q88. A transaction that has not yet been committed or rolled back is called:

- A. Committed
- B. Active
- C. Aborted
- D. Terminated

Answer: B

Q89. Which of the following is a transaction state?

- A. All of these: Active, Partially committed, Committed, Failed, Aborted
- B. Only Aborted is considered a valid state for a transaction process
- C. Only Active is considered a valid state for a transaction in a DBMS
- D. Only Committed is considered a valid state for a transaction to be

Answer: A

Q90. A schedule in transaction management is:

- A. A single SQL query executed against the database tables
- B. A backup plan for recovering from a system level failure
- C. A type of index structure for speeding up data lookups
- D. A sequence of operations from one or more transactions

Answer: D

Q91. Concurrency control ensures:

- A. Larger storage capacity on the disk drives
- B. Better network speed between client nodes
- C. Faster hardware performance for the system
- D. Correct execution of concurrent transactions

Answer: D

Q92. A lock in database concurrency control is:

- A. A mechanism to control access to a data item
- B. A backup method for protecting against loss
- C. A type of query for retrieving stored data
- D. A type of index for speeding up data search

Answer: A

Q93. A shared lock allows:

- A. Writing by multiple transactions to the same data item
- B. No access at all to the locked data item by any party
- C. Only one transaction to read the data item at any time
- D. Multiple transactions to read the data item simultaneously

Answer: D

Q94. An exclusive lock allows:

- A. Multiple transactions to write to the same data item
- B. Multiple transactions to read from the same data item
- C. Only one transaction to read and write the data item
- D. No operations at all on the locked data item by anyone

Answer: C

Q95. A deadlock in database systems occurs when:

- A. All transactions commit at the same time without any conflicts found
- B. A single transaction is very slow in completing its data operations
- C. Two or more transactions are waiting for each other to release locks
- D. No transactions are running in the database system at the moment

Answer: C

Q96. The Two-Phase Locking (2PL) protocol has two phases:

- A. Lock phase and Unlock phase only
- B. Growing phase and Shrinking phase
- C. Read phase and Write phase only
- D. Start phase and End phase only

Answer: B

Q97. Which of the following can break a deadlock?

- A. Adding more locks to the waiting transactions
- B. Creating more indexes on the locked data items
- C. Aborting one of the deadlocked transactions
- D. Increasing the buffer size for the data manager

Answer: C

Q98. Starvation in concurrency control occurs when:

- A. All transactions complete quickly without any delays or blocking
- B. A transaction waits indefinitely because others keep getting priority
- C. The database runs out of storage space on the physical disk
- D. No locks are used by any of the transactions in the database

Answer: B

Q99. A lock manager is responsible for:

- A. Designing schemas for new data models
- B. Creating tables in the database schema
- C. Writing SQL queries for data retrieval
- D. Granting and releasing locks on data items

Answer: D

Q100. The lock compatibility matrix shows:

- A. How to create new tables in the database schema now
- B. Which lock types can coexist on the same data item
- C. The execution plans for all queries in the database
- D. Index structures for optimizing data retrieval speed

Answer: B

Q101. Database recovery is the process of:

- A. Deleting all data from the tables in the entire database
- B. Restoring the database to a correct state after a failure
- C. Creating new tables and defining their column structures
- D. Optimizing queries by choosing better execution plans

Answer: B

Q102. A transaction log (write-ahead log) records:

- A. Table structures and their column definitions in the database schema
- B. Only SELECT queries that have been executed against the database tables
- C. User login information and authentication credentials stored securely
- D. All changes made by transactions before they are applied to the database

Answer: D

Q103. The redo operation:

- A. Creates a new database from scratch without using any data from the previous state
- B. Re-applies changes of committed transactions that may not have been written to disk
- C. Undoes all changes of committed transactions and reverts to the original data state
- D. Deletes the entire log file and removes all records of previous transaction actions

Answer: B

Q104. The undo operation:

- A. Reverses changes made by uncommitted transactions
- B. Creates a backup of the current database on disk
- C. Optimizes queries for faster execution performance
- D. Applies committed changes to the database on disk

Answer: A

Q105. A checkpoint in database recovery is:

- A. A type of lock used to prevent concurrent access to shared data items
- B. An SQL statement used to query data from one or more database tables
- C. A point at which all modified data is written to disk and recorded in the log
- D. A type of index structure built on columns for faster data retrieval

Answer: C

Q106. The Write-Ahead Log (WAL) protocol requires:

- A. Logs are only written to disk after the transaction has committed fully
- B. No log is needed for any database operations under this recovery protocol
- C. Data must be written to disk before the corresponding log records are made
- D. Log records must be written to disk before the corresponding data changes

Answer: D

Q107. A system crash typically causes:

- A. Loss of data in main memory but not on disk
- B. No data loss of any kind after the crash
- C. Loss of all data everywhere in the system
- D. Loss of data on disk but not in main memory

Answer: A

Q108. A media failure refers to:

- A. Application crash caused by a software defect
- B. Network slowness affecting query response times
- C. Disk or storage device failure causing data loss
- D. Memory overflow due to excessive data loading

Answer: C

Q109. Database backups are important for:

- A. Reducing table size by removing unnecessary data rows
- B. Recovering from media failures and catastrophic events
- C. Creating new databases from the backed up data copies
- D. Improving query speed and reducing execution latency

Answer: B

Q110. An incremental backup stores:

- A. The entire database every single time
- B. Only the database schema definitions
- C. Only the changes since the last backup
- D. Only the transaction log file entries

Answer: C

Q111. An index in a database is used to:

- A. Replace primary key usage
- B. Slow down query results
- C. Speed up data retrieval
- D. Increase storage redundancy

Answer: C

Q112. A primary index is built on:

- A. An unordered file without sorting
- B. A foreign key only in the relation
- C. Any non-key attribute in the table
- D. The primary key of an ordered file

Answer: D

Q113. A dense index has:

- A. An entry for every block in the data file
- B. Only one entry for the entire data file
- C. An entry for every record in the data file
- D. No entries at all in the index structure

Answer: C

Q114. A sparse index has:

- A. An entry for every individual record stored
- B. An entry for each block or group of records
- C. Entries only for deleted records in the file
- D. No entries at all in the entire index file

Answer: B

Q115. A B-tree is a:

- A. Linear list with sequential access
- B. Balanced search tree used for indexing
- C. Binary search tree with two children
- D. Unbalanced tree without constraints

Answer: B

Q116. In a B+ tree, all actual data pointers are stored in:

- A. All nodes equally
- B. Leaf nodes only
- C. Root node only
- D. Internal nodes only

Answer: B

Q117. Hashing is used for:

- A. Direct access to records using a hash function
- B. Sorting data into a specific order on columns
- C. Sequential access to all records in the file
- D. Creating views on top of the base table data

Answer: A

Q118. A secondary index is built on:

- A. The ordering field of the file
- B. The primary key field only
- C. A non-ordering field of a file
- D. A foreign key field only

Answer: C

Q119. A clustered index means:

- A. Data rows are stored randomly without any ordering
- B. Data rows are physically stored in the index order
- C. No physical ordering is implied by the index at all
- D. Multiple indexes exist on the same column of data

Answer: B

Q120. Which data structure is commonly used for implementing indexes?

- A. Linked list nodes
- B. Stack structure
- C. Queue structure
- D. B+ tree structure

Answer: D

Q121. Query processing involves:

- A. Only creating tables without any query functionality
- B. Only writing queries without any execution or output
- C. Only storing data without any retrieval functionality
- D. Parsing, optimizing, and executing database queries

Answer: D

Q122. A query execution plan describes:

- A. The user who wrote the query and their access privilege details
- B. The table creation date and the schema modification history
- C. The sequence of operations the DBMS will perform to execute a query
- D. The query syntax and grammatical structure in the SQL language

Answer: C

Q123. Query optimization aims to:

- A. Find the most efficient way to execute a query
- B. Make queries longer and more complex to write
- C. Increase the number of disk accesses required
- D. Slow down query processing for all operations

Answer: A

Q124. The EXPLAIN command in SQL shows:

- A. The database schema layout
- B. The query execution plan
- C. User access permissions
- D. The table data content

Answer: B

Q125. A full table scan reads:

- A. Only indexed rows stored
- B. Only the last row stored
- C. Every row in the table
- D. Only the first row found

Answer: C

Q126. Using an index for a query is generally:

- A. Always slower than performing a full table scan
- B. Faster than a full table scan for selective queries
- C. The same speed as a full table scan on all data
- D. Not recommended for any database query at all

Answer: B

Q127. Which join algorithm compares every tuple in one relation with every tuple in another?

- A. Nested Loop Join
- B. Sort-Merge Join
- C. Index Nested Join
- D. Hash Join method

Answer: A

Q128. The cost of a query is typically measured in:

- A. Number of SQL statements used
- B. Lines of code in the procedure
- C. Number of disk I/O operations
- D. Number of tables in the schema

Answer: C

Q129. Selectivity of a condition refers to:

- A. The size of the database measured in total bytes
- B. The number of columns selected in the projection
- C. The fraction of tuples that satisfy the condition
- D. The number of tables referenced in the SQL query

Answer: C

Q130. A query optimizer can be:

- A. Only cost-based approach
- B. Rule-based or cost-based
- C. Neither rule nor cost based
- D. Only rule-based approach

Answer: B

Q131. Database security aims to protect the database from:

- A. Faster queries and improved execution performance
- B. Unauthorized access, modification, and destruction
- C. Larger storage capacity on the available disk space
- D. Better indexing and optimized data retrieval speed

Answer: B

Q132. Authentication in database security verifies:

- A. The identity of a user
- B. The number of indexes
- C. The speed of queries
- D. The size of tables

Answer: A

Q133. Authorization in database security determines:

- A. The operating system and hardware details
- B. What actions a user is permitted to perform
- C. The database version and release number
- D. The user password and login credentials

Answer: B

Q134. The SQL GRANT statement is used to:

- A. Create tables in database
- B. Remove privileges from users
- C. Delete data from tables
- D. Give privileges to users

Answer: D

Q135. The SQL REVOKE statement is used to:

- A. Remove previously granted privileges
- B. Insert data into existing table records
- C. Grant new privileges to database users
- D. Create views on top of the base tables

Answer: A

Q136. A database role is:

- A. An index structure built on columns for faster data retrieval
- B. A type of table used to store data records within the database
- C. A named collection of privileges that can be assigned to users
- D. A query optimization technique to improve execution planning

Answer: C

Q137. Encryption in database security is used to:

- A. Compress data to reduce the amount of storage space it requires
- B. Create indexes on columns for faster retrieval of requested records
- C. Convert data into an unreadable format to prevent unauthorized access
- D. Speed up queries by creating cached copies of frequently used results

Answer: C

Q138. An audit trail in a database records:

- A. All operations performed on the database for security monitoring
- B. Only DDL operations like CREATE, ALTER, and DROP table commands
- C. Only user logins and their session authentication event details
- D. Only SELECT queries that have been executed against stored tables

Answer: A

Q139. SQL injection is a type of:

- A. Indexing strategy used for speeding up data retrieval from the tables
- B. Security attack that exploits vulnerabilities in SQL query construction
- C. Database optimization technique that improves overall query performance
- D. Backup method used for creating copies of the database for recovery

Answer: B

Q140. The principle of least privilege means:

- A. All users should have full access to every table in the database
- B. Users should have only the minimum privileges needed for their tasks
- C. No privileges should be granted to any user in the database
- D. Only administrators should be allowed to use the database system

Answer: B

Q141. A distributed database is:

- A. A database stored only in the cloud without any local presence
- B. A database stored on a single machine in one physical location
- C. A database spread across multiple sites connected by a network
- D. A backup copy of a database kept for disaster recovery purposes

Answer: C

Q142. Data fragmentation in distributed databases means:

- A. Duplicating the entire database at every site simultaneously
- B. Compressing data to reduce storage requirements at each site
- C. Losing data during transfer between sites on the network link
- D. Dividing a relation into smaller parts stored at different sites

Answer: D

Q143. Horizontal fragmentation divides a relation by:

- A. Rows and columns both
- B. Rows (tuples) only
- C. Neither rows nor cols
- D. Columns (attributes)

Answer: B

Q144. Vertical fragmentation divides a relation by:

- A. Rows (tuples) only
- B. Columns (attributes)
- C. Neither of the above
- D. Columns and rows both

Answer: B

Q145. Data replication in distributed databases means:

- A. Compressing data to reduce transfer size
- B. Deleting data from all distributed sites
- C. Encrypting data before sending it across
- D. Storing copies of data at multiple sites

Answer: D

Q146. The transparency goal in distributed databases means:

- A. Data cannot be distributed across multiple sites
- B. Users must know all data locations before querying
- C. Only administrators can query distributed data
- D. Users should not be aware that data is distributed

Answer: D

Q147. Location transparency means:

- A. Data is always stored locally on the user's own machine
- B. Users must specify the exact data location in every query
- C. Users do not need to know where data is physically stored
- D. No remote access is possible from any site in the system

Answer: C

Q148. A distributed DBMS (DDBMS) manages:

- A. Only local databases without any distribution
- B. A database distributed across multiple sites
- C. Only a centralized database on one machine
- D. Only cloud databases hosted by third parties

Answer: B

Q149. Which of the following is an advantage of distributed databases?

- A. Slower queries being preferred by users
- B. Higher costs being beneficial overall
- C. Improved reliability and availability
- D. Increased complexity as an advantage

Answer: C

Q150. Fragmentation transparency means:

- A. Users are unaware that data is fragmented
- B. Data cannot be fragmented at any site
- C. Only fragments can be queried directly
- D. Users must reassemble fragments manually

Answer: A

Q151. NoSQL stands for:

- A. Not Only SQL format
- B. Newer SQL approach
- C. Non-Standard Queries
- D. No Structured Queries

Answer: A

Q152. Which of the following is a NoSQL database?

- A. MySQL
- B. PostgreSQL
- C. Oracle DB
- D. MongoDB

Answer: D

Q153. NoSQL databases are designed primarily for:

- A. Replacing all SQL databases entirely in every use case now
- B. Only relational data organized in normalized table schemas
- C. Small structured datasets only stored in relational tables
- D. Scalability and handling large volumes of unstructured data

Answer: D

Q154. A document-oriented database stores data as:

- A. Graphs with nodes and edge links
- B. Fixed-size blocks on the disk drive
- C. Tables with rows and columns only
- D. Documents (typically JSON or BSON)

Answer: D

Q155. A key-value store maps:

- A. Tables to their schemas
- B. Rows to table columns
- C. Queries to result sets
- D. A unique key to a value

Answer: D

Q156. Redis is an example of a:

- A. Key-value store
- B. Column-family store
- C. Graph database
- D. Relational database

Answer: A

Q157. A column-family store organizes data into:

- A. Documents in JSON format
- B. Traditional rows and tables
- C. Columns and column families
- D. Graphs with node and edges

Answer: C

Q158. Apache Cassandra is an example of a:

- A. Relational database
- B. Document database
- C. Graph database
- D. Column-family store

Answer: D

Q159. A graph database stores data as:

- A. Documents in JSON formats
- B. Key-value pairs only stored
- C. Nodes, edges, and properties
- D. Tables and rows of records

Answer: C

Q160. Neo4j is an example of a:

- A. Document database
- B. Key-value store
- C. Relational database
- D. Graph database

Answer: D

Q161. A data warehouse is:

- A. A transactional database designed for processing day-to-day operations in real-time mode
- B. A subject-oriented, integrated, time-variant, non-volatile collection of data for decisions
- C. A backup storage mechanism that periodically copies data for disaster recovery plans
- D. A type of NoSQL database that supports flexible schemas and horizontal scaling systems

Answer: B

Q162. OLAP stands for:

- A. Offline Analytical Processing
- B. Online Application Programming
- C. Online Automated Processing
- D. Online Analytical Processing

Answer: D

Q163. OLTP stands for:

- A. Online Text Processing
- B. Online Transaction Processing
- C. Online Table Processing
- D. Offline Transaction Processing

Answer: B

Q164. The ETL process stands for:

- A. Export, Translate, Link
- B. Enter, Transfer, List
- C. Extract, Transfer, Log
- D. Extract, Transform, Load

Answer: D

Q165. A fact table in a data warehouse contains:

- A. Quantitative measures and foreign keys to dimension tables
- B. Only dimension attributes used for filtering and grouping
- C. Only text descriptions without any numeric measure values
- D. Only primary keys without any quantitative measure data

Answer: A

Q166. A dimension table in a data warehouse contains:

- A. Descriptive attributes used for filtering and grouping
- B. Log entries recording all data warehouse load operations
- C. Transaction records from the operational source systems
- D. Quantitative measures like sales amounts and quantities

Answer: A

Q167. The star schema consists of:

- A. Multiple fact tables connected to each other in it
- B. A central fact table connected to dimension tables
- C. Only dimension tables without any fact table data
- D. Only fact tables without any dimension table data

Answer: B

Q168. Data mining is:

- A. Writing SQL queries for retrieving records from relational tables
- B. Creating database backups for disaster recovery and data safety
- C. The process of discovering patterns and insights from large datasets
- D. Storing data in a warehouse for long-term historical analysis use

Answer: C

Q169. A data mart is:

- A. A type of OLTP system designed for transactional data processing
- B. A subset of a data warehouse focused on a specific business area
- C. A complete data warehouse containing all enterprise data sources
- D. A NoSQL database designed for handling unstructured data at scale

Answer: B

Q170. Which of the following is an OLAP operation?

- A. INSERT
- B. Drill-down
- C. UPDATE
- D. DELETE

Answer: B

Q171. What is a schema in a database context?

- A. A query used to retrieve specific data
- B. A backup copy of the entire database
- C. The overall design or structure of data
- D. A security policy for user permissions

Answer: C

Q172. Which component stores metadata about a database?

- A. Query processor
- B. Storage engine
- C. Data dictionary
- D. Buffer manager

Answer: C

Q173. What does data integrity refer to in databases?

- A. Amount of storage space data occupies
- B. Number of users accessing data at once
- C. Accuracy and consistency of stored data
- D. Speed of data retrieval operations

Answer: C

Q174. Which language is used to define database structure?

- A. DCL
- B. DML
- C. TCL
- D. DDL

Answer: D

Q175. What is a database instance?

- A. The design blueprint of the database schema
- B. The software used to manage the database
- C. The snapshot of data at a given moment
- D. The physical disk where data is stored

Answer: C

Q176. Which of these is a function of a DBMS?

- A. Rendering graphical user interface views
- B. Compiling high-level source code files
- C. Routing packets across network devices
- D. Managing concurrent data access safely

Answer: D

Q177. What is a query in database terminology?

- A. A method to compress stored records
- B. A protocol for network communication
- C. A type of database backup procedure
- D. A request to retrieve or modify data

Answer: D

Q178. Which of these describes a flat-file database?

- A. Data distributed across multiple server nodes
- B. Data stored in a single two-dimensional table
- C. Data organized in a hierarchical tree format
- D. Data linked through complex network pointers

Answer: B

Q179. What does ACID stand for in databases?

- A. Allocation, Computation, Indexing, Deletion
- B. Access, Control, Integrity, Design
- C. Atomicity, Consistency, Isolation, Durability
- D. Authentication, Concurrency, Integration, Data

Answer: C

Q180. What is the role of a query processor?

- A. It encrypts data before storage use
- B. It parses and executes user queries
- C. It backs up data to external drives
- D. It manages physical disk allocation

Answer: B

Q181. What is a client-server database architecture?

- A. A system where all processing happens on one machine
- B. A system that does not use any network connections
- C. A system where data is stored only on client machines
- D. A system where clients request services from a server

Answer: D

Q182. What is the function of the storage manager in a DBMS?

- A. It handles network routing between nodes
- B. It compiles application source code files
- C. It creates user interface forms and reports
- D. It manages data storage on physical media

Answer: D

Q183. Which tier handles the user interface in a three-tier architecture?

- A. Data tier
- B. Logic tier
- C. Storage tier
- D. Presentation tier

Answer: D

Q184. What is a database buffer in the system architecture?

- A. A backup copy of the entire database files
- B. A network connection between two servers
- C. A temporary memory area for data transfer
- D. A permanent storage location on the disk

Answer: C

Q185. What does the query compiler do in a DBMS?

- A. It handles backup and recovery processes
- B. It stores data permanently on disk drives
- C. It translates queries into executable plans
- D. It manages user authentication credentials

Answer: C

Q186. In a two-tier architecture, which components communicate directly?

- A. Two separate database servers communicate
- B. The middleware and storage tier communicate
- C. The client and database server communicate
- D. Two client applications communicate together

Answer: C

Q187. What is the role of the transaction manager?

- A. Ensuring transactions execute correctly and safely
- B. Designing the user interface for applications
- C. Compressing data files for efficient disk storage
- D. Routing network requests between server clusters

Answer: A

Q188. Which memory component holds recently accessed disk pages?

- A. Permanent storage
- B. Cache buffer pool
- C. Network registers
- D. Virtual memory

Answer: B

Q189. What is a centralized database system?

- A. A system spread across many geographic locations
- B. A system with no persistent data storage at all
- C. A system using only cloud-based storage services
- D. A system running on a single computer at one site

Answer: D

Q190. What is the purpose of the data communication component?

- A. To enable communication between DBMS and users
- B. To perform mathematical calculations on data
- C. To define the structure of database tables
- D. To compress data before writing to disk drives

Answer: A

Q191. What is a data model in database design?

- A. A physical storage device for database files
- B. A conceptual framework for organizing data
- C. A network protocol for data transmission
- D. A programming language for writing queries

Answer: B

Q192. Which data model organizes data into tables of rows and columns?

- A. Network model
- B. Hierarchical model
- C. Relational model
- D. Object model

Answer: C

Q193. In the hierarchical data model, data is organized as:

- A. A graph with many-to-many connections
- B. An unstructured collection of documents
- C. A tree with parent-child relationships
- D. A flat two-dimensional table structure

Answer: C

Q194. What is an entity in the ER model?

- A. A constraint applied to a column in a table
- B. A real-world object represented in a database
- C. A relationship between two database tables
- D. A query used to retrieve records from data

Answer: B

Q195. What does an attribute represent in a data model?

- A. A connection between two separate entities
- B. A property or characteristic of an entity
- C. A method for sorting records in a table
- D. A rule that constrains data entry values

Answer: B

Q196. What is a relationship in the ER model?

- A. A method for indexing table records fast
- B. An association between two or more entities
- C. A column in a database table structure
- D. A constraint on a single attribute value

Answer: B

Q197. Which symbol represents an entity in an ER diagram?

- A. Triangle shape
- B. Rectangle shape
- C. Oval shape
- D. Diamond shape

Answer: B

Q198. What does cardinality specify in a relationship?

- A. The number of entity instances in a link
- B. The data type of attributes in an entity
- C. The access permission level for database users
- D. The storage format for records on a disk

Answer: A

Q199. What is a composite attribute in the ER model?

- A. An attribute that can be divided into subparts
- B. An attribute that has multiple values at once
- C. An attribute derived from other stored values
- D. An attribute that cannot be subdivided further

Answer: A

Q200. Which data model uses nodes and edges to represent data?

- A. Graph data model
- B. Columnar model
- C. Relational model
- D. Flat file model

Answer: A

Q201. What is a tuple in a relational database?

- A. A column in a relational database table
- B. A key in a relational database design
- C. A table in a relational database schema
- D. A row in a relational database table

Answer: D

Q202. What is a primary key in a relational table?

- A. A column that always contains null values
- B. A column that uniquely identifies each row
- C. A column that links to an external file
- D. Any column that contains text data values

Answer: B

Q203. What is a foreign key used for?

- A. Calculating aggregate functions on data sets
- B. Encrypting data in a database column field
- C. Linking one table to another related table
- D. Sorting records in ascending order by value

Answer: C

Q204. What does the term relation refer to in relational databases?

- A. A connection between two different databases
- B. A table with rows and columns of data
- C. A constraint applied to a single column
- D. A query that joins multiple data sources

Answer: B

Q205. What is a domain in a relational database?

- A. A type of relationship between two tables
- B. A network address for the database server
- C. A set of allowable values for an attribute
- D. A backup strategy for database recovery use

Answer: C

Q206. What does a candidate key represent?

- A. A key that is always the foreign key value
- B. A key used only for sorting table records
- C. A key that allows duplicate values in rows
- D. A key that might be selected as primary key

Answer: D

Q207. What is the degree of a relation?

- A. The number of constraints on it
- B. The number of rows in the table
- C. The number of keys in the table
- D. The number of columns in the table

Answer: D

Q208. What are null values used to represent?

- A. The empty string in a text data column
- B. Missing or unknown information in a field
- C. The number zero in a numeric column field
- D. A default value assigned to every record

Answer: B

Q209. What is a superkey in relational databases?

- A. A set of attributes that uniquely identifies rows
- B. A key used only in object-oriented databases
- C. A key with exactly one attribute column only
- D. A key that cannot contain any null value at all

Answer: A

Q210. What is an attribute in a relational table?

- A. A column within the relational table structure
- B. A row within the relational table structure
- C. A constraint applied to the entire table
- D. A relationship between two different tables

Answer: A

Q211. What is relational algebra?

- A. A data storage format for flat files
- B. A programming language for web development
- C. A procedural query language for relations
- D. A network protocol for data transfer

Answer: C

Q212. What does the selection operation do?

- A. It combines two relations into one table
- B. It picks specific rows matching a condition
- C. It picks specific columns from a relation
- D. It removes duplicate rows from a relation

Answer: B

Q213. What does the projection operation do?

- A. It selects specific rows based on conditions
- B. It calculates aggregate values for a group
- C. It joins two relations on a common column
- D. It selects specific columns from a relation

Answer: D

Q214. What is the Cartesian product of two relations?

- A. The difference of rows between both tables
- B. All combinations of rows from both tables
- C. Only matching rows from both of the tables
- D. The intersection of rows from both tables

Answer: B

Q215. What does the union operation require?

- A. Relations must be union-compatible to combine
- B. Relations must share a common primary key
- C. Relations must be stored in the same file
- D. Relations must have different attribute counts

Answer: A

Q216. What does the set difference operation produce?

- A. All rows appearing in either of two relations
- B. Only rows common to both of the two relations
- C. A sorted version of the first input relation
- D. Rows in the first relation but not the second

Answer: D

Q217. What is a natural join operation?

- A. A join that only works on single-column tables
- B. A join that matches rows on common attributes
- C. A join that removes all duplicate column values
- D. A join that produces the Cartesian product only

Answer: B

Q218. What does the rename operation do in relational algebra?

- A. It sorts the tuples in a relation by key order
- B. It deletes a relation from the database schema
- C. It creates a backup copy of the existing table
- D. It changes the name of a relation or attribute

Answer: D

Q219. What is the intersection of two relations?

- A. Tuples present in both relations simultaneously
- B. Tuples in the first but not in the second one
- C. All tuples from both relations combined together
- D. Tuples in the second but not in the first one

Answer: A

Q220. Which operation combines selection and join in one step?

- A. Rename operation
- B. Projection operation
- C. Division operation
- D. Theta join operation

Answer: D

Q221. What does SQL stand for?

- A. Structured Query Language
- B. Sequential Query Logic
- C. Standard Query Library
- D. System Query Lookup

Answer: A

Q222. Which SQL command retrieves data from a table?

- A. UPDATE
- B. DELETE
- C. INSERT
- D. SELECT

Answer: D

Q223. Which clause filters rows in a SELECT statement?

- A. ORDER BY
- B. WHERE
- C. GROUP BY
- D. HAVING

Answer: B

Q224. What does the INSERT command do in SQL?

- A. Modifies existing rows in a table
- B. Adds new rows into a table
- C. Deletes rows from a table
- D. Creates a new database table

Answer: B

Q225. Which SQL keyword removes duplicate rows from results?

- A. FILTER
- B. PRIMARY
- C. DISTINCT
- D. UNIQUE

Answer: C

Q226. What does the UPDATE command do in SQL?

- A. Removes rows from the table
- B. Retrieves rows from a table
- C. Modifies existing rows in table
- D. Creates a new table in database

Answer: C

Q227. Which SQL command deletes rows from a table?

- A. CLEAR
- B. DELETE
- C. DROP
- D. REMOVE

Answer: B

Q228. What does the ORDER BY clause do?

- A. Sorts the result set by columns
- B. Groups rows by a specified column
- C. Limits the number of output rows
- D. Filters rows based on a condition

Answer: A

Q229. Which SQL command creates a new table?

- A. CREATE TABLE
- B. BUILD TABLE
- C. MAKE TABLE
- D. NEW TABLE

Answer: A

Q230. What is the wildcard character in SQL SELECT?

- A. Hash symbol
- B. Asterisk symbol
- C. Ampersand symbol
- D. Dollar symbol

Answer: B

Q231. What is a stored procedure in SQL?

- A. A single SQL query saved as a bookmark
- B. A temporary table created during a query
- C. A precompiled set of SQL statements stored
- D. A backup copy of the database schema file

Answer: C

Q232. What is a view in SQL?

- A. A physical table stored on the disk drive
- B. A log file recording all query activity
- C. A virtual table based on a query result
- D. A backup of the original database table

Answer: C

Q233. What is a trigger in SQL databases?

- A. A type of index for faster data retrieval
- B. Code that executes automatically on events
- C. A manual command executed by the user only
- D. A constraint that limits column data types

Answer: B

Q234. What is an index used for in SQL?

- A. Creating backup copies of table records
- B. Defining relationships between two tables
- C. Encrypting data stored in database tables
- D. Speeding up data retrieval from tables

Answer: D

Q235. What does the GRANT command do in SQL?

- A. Gives users specific access permissions
- B. Creates new columns in existing tables
- C. Backs up data to an external location
- D. Removes existing tables from a database

Answer: A

Q236. What is a cursor in SQL?

- A. A method for creating temporary table data
- B. A type of database constraint on columns
- C. A graphical pointer on the user interface
- D. A mechanism to traverse query result rows

Answer: D

Q237. What does the REVOKE command do?

- A. It deletes data from a specified table
- B. It creates new user accounts in database
- C. It removes previously granted permissions
- D. It modifies the structure of a table

Answer: C

Q238. What is a transaction in SQL?

- A. A unit of work with multiple operations
- B. A single SELECT query against one table
- C. A method for defining table constraints
- D. A type of database index on a column

Answer: A

Q239. What does COMMIT do in SQL?

- A. Deletes all data from the current table
- B. Creates a new savepoint within transaction
- C. Saves all changes made in a transaction
- D. Undoes all changes made in a transaction

Answer: C

Q240. What does ROLLBACK do in SQL?

- A. Saves all changes made in the transaction
- B. Grants permissions to a specified database user
- C. Undoes all changes made in the transaction
- D. Creates a new table in the active database

Answer: C

Q241. What is database normalization?

- A. Organizing data to reduce redundancy and dependency
- B. Adding redundant data to improve query speed
- C. Encrypting data for security and privacy protection
- D. Compressing data to save physical disk storage space

Answer: A

Q242. What is the first normal form (1NF)?

- A. All candidate keys are properly identified and used
- B. Each column contains only atomic indivisible values
- C. All non-key attributes depend on the primary key
- D. No transitive dependencies exist in the relation

Answer: B

Q243. What is a functional dependency?

- A. A relationship between two separate database tables
- B. A method for sorting records in ascending order
- C. A constraint where one attribute determines another
- D. A technique for encrypting stored data values

Answer: C

Q244. What is data redundancy in databases?

- A. Data that is encrypted for security purposes
- B. Data that is properly normalized in tables
- C. Unnecessary repetition of data across tables
- D. Data stored in compressed file formats only

Answer: C

Q245. What problem does normalization primarily solve?

- A. Data anomalies from redundancy
- B. Slow network connection speeds
- C. Lack of user interface design
- D. Insufficient hardware capacity

Answer: A

Q246. What is an insertion anomaly?

- A. Inability to add data without other unrelated data
- B. Difficulty deleting unwanted records from tables
- C. Errors when updating records across multiple tables
- D. Problems with reading data from large database files

Answer: A

Q247. What is a deletion anomaly?

- A. Creating circular references between related tables now
- B. Failing to update all copies of redundant data values
- C. Losing unrelated data when deleting a specific record
- D. Adding duplicate records accidentally to a table field

Answer: C

Q248. What is an update anomaly?

- A. Inconsistency from failing to update all data copies
- B. Inability to insert new records into a database table
- C. Failure to create proper indexes on table columns here
- D. Accidentally deleting records from a database table now

Answer: A

Q249. What is denormalization?

- A. Intentionally adding redundancy for performance gain
- B. Converting a relational database to a flat file type
- C. The process of achieving first normal form status
- D. Removing all indexes from database table columns

Answer: A

Q250. What does 2NF require beyond 1NF?

- A. No transitive dependencies on the primary key
- B. Every column must have a unique non-null value
- C. No partial dependencies on the primary key set
- D. All attributes must be of the same data type

Answer: C

Q251. What is a database transaction?

- A. A report generated from database queries
- B. A backup copy of the database schema
- C. A connection between two database servers
- D. A logical unit of work on a database

Answer: D

Q252. What does the Atomicity property ensure?

- A. All or none of the operations are completed
- B. Changes persist even after system failures
- C. Database remains consistent after transaction
- D. Transactions execute in complete isolation always

Answer: A

Q253. What does the Consistency property ensure?

- A. All operations in a transaction execute together
- B. Database moves from one valid state to another
- C. Transactions run without any interference at all
- D. Transaction results are permanently stored safely

Answer: B

Q254. What does the Isolation property ensure?

- A. All operations complete or none complete at all
- B. Changes are saved permanently after a commit
- C. Concurrent transactions do not interfere with others
- D. The database schema remains unchanged after commits

Answer: C

Q255. What does the Durability property ensure?

- A. Transactions can be rolled back at any later time
- B. Multiple transactions can run at the same time now
- C. Data types remain consistent across all table rows
- D. Committed changes persist even after system failure

Answer: D

Q256. What does COMMIT do in transaction processing?

- A. It creates a new transaction from the current state
- B. It saves all changes made during the transaction
- C. It undoes all changes made during the transaction
- D. It temporarily pauses the current active transaction

Answer: B

Q257. What does ROLLBACK do in transaction processing?

- A. Pauses the transaction until the user resumes it later
- B. Saves all pending changes to the database permanently
- C. Undoes all changes since the last commit or savepoint
- D. Creates a backup of the database before rolling back

Answer: C

Q258. What is a schedule in transaction processing?

- A. An ordered sequence of operations from transactions
- B. A configuration file for database server parameters
- C. A backup plan for the database recovery process
- D. A list of all users currently connected to database

Answer: A

Q259. What is a serial schedule?

- A. Transactions execute one after another without overlap
- B. Transactions execute simultaneously on different processors
- C. Transactions execute their operations in interleaved order
- D. Transactions execute in reverse order of their submission

Answer: A

Q260. What is a transaction log used for?

- A. Storing user passwords and authentication credentials
- B. Managing network connections between client and server
- C. Recording all changes for recovery and audit purposes
- D. Displaying query results to the end user interface

Answer: C

Q261. What is concurrency control in databases?

- A. Backing up data to prevent data loss scenarios
- B. Managing simultaneous access by multiple users
- C. Encrypting data for secure transmission purposes
- D. Compressing data to save disk storage space used

Answer: B

Q262. What is a lock in database concurrency control?

- A. A method for compressing database table records
- B. A technique for encrypting sensitive data fields
- C. A mechanism to restrict access to data items
- D. A backup mechanism for database recovery tasks

Answer: C

Q263. What is a shared lock used for?

- A. Preventing all access to the data item entirely
- B. Allowing only one transaction to access the data
- C. Allowing multiple transactions to read the data
- D. Allowing only write access to the data item

Answer: C

Q264. What is an exclusive lock used for?

- A. Giving one transaction sole access for writing
- B. Sharing write access among multiple transactions
- C. Allowing multiple users to read data together
- D. Preventing all transactions from accessing data

Answer: A

Q265. What is a deadlock in database systems?

- A. A backup process that runs during peak usage hours
- B. A transaction that completes faster than expected
- C. Two transactions waiting for each other indefinitely
- D. A query that returns more results than anticipated

Answer: C

Q266. What is starvation in concurrency control?

- A. A transaction completes too quickly for proper logging
- B. A transaction produces incorrect results due to bad data
- C. A transaction waits indefinitely for a resource access
- D. A transaction uses too much memory during its execution

Answer: C

Q267. What does the lock manager do in a DBMS?

- A. It compiles SQL queries into executable code plans
- B. It creates user accounts and manages permissions
- C. It manages physical storage allocation on disk drives
- D. It grants and releases locks on data items safely

Answer: D

Q268. What is a lock table used for?

- A. Maintaining backup copies of all locked data items
- B. Storing the actual data values of locked records
- C. Tracking which locks are held by which transactions
- D. Recording all SQL queries executed by each user

Answer: C

Q269. What is lock compatibility?

- A. Whether two lock types can coexist on same item
- B. Whether a lock persists after system restart event
- C. Whether a lock can be transferred between users
- D. Whether a lock applies to one or multiple tables

Answer: A

Q270. What is the purpose of a timeout in deadlock handling?

- A. To extend the duration of held locks indefinitely
- B. To increase the priority of waiting transactions
- C. To abort a transaction after waiting too long
- D. To speed up slow-running queries automatically

Answer: C

Q271. What is database recovery?

- A. Adding new data records to database tables
- B. Optimizing queries for faster execution speed
- C. Restoring a database after a failure event
- D. Creating user accounts for database access

Answer: C

Q272. What is a system crash in database context?

- A. A routine update of the database software used
- B. A planned maintenance shutdown of the server
- C. An unexpected failure that disrupts operations
- D. A scheduled backup of the database to disk

Answer: C

Q273. What is a transaction log?

- A. A record of all changes made by transactions
- B. A backup copy of the database schema only
- C. A list of all database users and permissions
- D. A configuration file for server parameters

Answer: A

Q274. What is the purpose of a database backup?

- A. To create a copy of data for recovery purposes
- B. To speed up query processing performance times
- C. To encrypt sensitive data for security compliance
- D. To normalize database tables for better design

Answer: A

Q275. What does the REDO operation do in recovery?

- A. Deletes all log records from the transaction log file
- B. Creates a new backup of the database on the disk
- C. Reapplies changes from committed transactions in log
- D. Undoes changes from committed transactions in log

Answer: C

Q276. What does the UNDO operation do in recovery?

- A. Applies changes from committed transactions to data
- B. Compresses the transaction log for storage savings
- C. Reverses changes from uncommitted transactions safely
- D. Creates new checkpoints in the transaction log file

Answer: C

Q277. What is a checkpoint in database recovery?

- A. A lock that prevents concurrent access to data
- B. A point where the database state is synchronized
- C. A user account with limited database permissions
- D. A query that checks for data integrity violations

Answer: B

Q278. What is the difference between volatile and non-volatile storage?

- A. Non-volatile storage is faster but loses data on power loss
- B. Neither type of storage can lose data under any conditions
- C. Volatile storage is faster but loses data on power loss
- D. Both types of storage retain data after power is lost

Answer: C

Q279. What is a disk failure in database context?

- A. A routine defragmentation of the disk drive unit
- B. A malfunction that causes loss of stored disk data
- C. A scheduled cleaning of the disk read-write heads
- D. A planned upgrade of the disk storage hardware

Answer: B

Q280. What is the purpose of a log buffer?

- A. Temporarily holding log records before writing to disk
- B. Encrypting data before it is stored on the disk drive
- C. Backing up the entire database to an external device
- D. Storing user queries before they are executed later

Answer: A

Q281. What is an index in a database?

- A. A backup method for database recovery tasks
- B. A security mechanism for user authentication
- C. A data structure for fast data retrieval access
- D. A complete copy of the database table data

Answer: C

Q282. What is a primary index in a database?

- A. An index that only supports range-based queries
- B. An index built on the primary key of the table
- C. An index built on a non-key column of a table
- D. An index that stores all table data within itself

Answer: B

Q283. What is a secondary index?

- A. An index that is only used for backup purposes
- B. An index that replaces the primary key entirely
- C. An index on the ordering key of the data file
- D. An index on a non-ordering field of a data file

Answer: D

Q284. What is a dense index?

- A. An index that compresses data for storage efficiency
- B. An index that stores data without any key structure
- C. An index with an entry for every data record stored
- D. An index with an entry for some data records only

Answer: C

Q285. What is a sparse index?

- A. An index with entries for only some data records
- B. An index with an entry for every single data record
- C. An index stored entirely in main memory at all times
- D. An index that does not use any key values at all

Answer: A

Q286. What is a B-tree in database indexing?

- A. A linear list of pointers to database records
- B. A balanced tree structure for disk-based indexing
- C. A binary search tree for in-memory data only
- D. A hash-based structure for exact match queries

Answer: B

Q287. What is a hash index used for?

- A. Efficient pattern matching on text data values
- B. Efficient exact match queries on key values
- C. Efficient range queries on sorted data values
- D. Efficient sequential scanning of all records

Answer: B

Q288. What is a clustered index?

- A. An index where data order differs from index order
- B. An index where data order matches the index order
- C. An index created automatically on every new column
- D. An index that works only on temporary table data

Answer: B

Q289. What is sequential file organization?

- A. Records stored in a tree structure on disk blocks
- B. Records stored in a hash table on the disk blocks
- C. Records stored in random order on the disk blocks
- D. Records stored in sorted order on the disk blocks

Answer: D

Q290. What is a heap file organization?

- A. Records are stored in the order they are inserted
- B. Records are stored in sorted order by primary key
- C. Records are stored using a B-tree index structure
- D. Records are stored in a hash table data structure

Answer: A

Q291. What is query processing in a database?

- A. Managing user accounts and access permissions sets
- B. Designing the physical layout of storage on disk
- C. Translating and executing queries against the data
- D. Creating backup copies of database tables regularly

Answer: C

Q292. What is a query execution plan?

- A. A list of all users who can run the query
- B. A log of all previously executed database queries
- C. A backup schedule for the database operations
- D. The strategy used to execute a database query

Answer: D

Q293. What does a query optimizer do?

- A. It creates indexes on all columns automatically now
- B. It translates SQL into a different programming language
- C. It selects the most efficient query execution plan
- D. It encrypts queries before sending to the server

Answer: C

Q294. What is a full table scan?

- A. Reading only indexed rows from the data table
- B. Reading only the first row of the database table
- C. Reading rows from multiple tables at the same time
- D. Reading every row in the table sequentially stored

Answer: D

Q295. What is the purpose of query parsing?

- A. Sorting the query results in alphabetical order
- B. Checking the syntax and validity of SQL queries
- C. Executing the query against the stored database
- D. Backing up the query text for future reference

Answer: B

Q296. What is a cost-based query optimizer?

- A. An optimizer that selects the plan with lowest cost
- B. An optimizer that ignores indexes during planning
- C. An optimizer that always chooses the first valid plan
- D. An optimizer that only works with simple queries

Answer: A

Q297. What are statistics used for in query optimization?

- A. Estimating the cost of different execution plans
- B. Encrypting data before storage on disk drives
- C. Displaying query results to end users on screen
- D. Creating user accounts and password management

Answer: A

Q298. What is an index scan in query processing?

- A. Scanning all rows in a table without using any index
- B. Using an index to locate specific rows efficiently
- C. Scanning multiple tables simultaneously for matches
- D. Scanning only the first page of the data table

Answer: B

Q299. What is query decomposition?

- A. Encrypting query text to prevent unauthorized access
- B. Combining multiple queries into a single large query
- C. Breaking a complex query into simpler sub-operations
- D. Removing queries from the execution queue permanently

Answer: C

Q300. What is the role of the query evaluation engine?

- A. It manages physical storage allocation on the disk
- B. It executes the plan generated by the optimizer
- C. It creates user interfaces for database applications
- D. It designs the database schema and table layouts

Answer: B

Q301. What is database security?

- A. Protecting data from unauthorized access or damage
- B. Compressing data to save storage space on disk
- C. Optimizing queries for faster execution speeds
- D. Sorting data in alphabetical order in all tables

Answer: A

Q302. What is authentication in database security?

- A. Compressing database files for efficient storage
- B. Verifying the identity of a user accessing data
- C. Encrypting data stored in the database tables
- D. Backing up data to prevent loss from failures

Answer: B

Q303. What is authorization in database security?

- A. Determining what actions a user is allowed to do
- B. Verifying user identity before granting access
- C. Encrypting data before storing it in the database
- D. Creating backup copies of the database regularly

Answer: A

Q304. What does the GRANT command do?

- A. Creates a new database on the server system
- B. Removes user access to database objects entirely
- C. Gives specific permissions to users or roles
- D. Deletes data from a specified database table

Answer: C

Q305. What does the REVOKE command do?

- A. Adds new permissions to a user or role account
- B. Encrypts all data in the specified database table
- C. Creates new user accounts in the database system
- D. Removes previously granted permissions from users

Answer: D

Q306. What is data encryption in database security?

- A. Duplicating data across multiple storage devices
- B. Converting data into an unreadable coded format
- C. Sorting data in a specific predetermined order
- D. Compressing data to reduce its storage size need

Answer: B

Q307. What is a database role?

- A. A named collection of related database privileges
- B. A physical server that hosts the database system
- C. A backup strategy for disaster recovery planning
- D. A type of query used for data retrieval purposes

Answer: A

Q308. What is an audit trail in database security?

- A. A method for optimizing database query performance
- B. A record of all access and changes to the database
- C. A technique for compressing data stored on disk drives
- D. A strategy for distributing data across multiple servers

Answer: B

Q309. What is SQL injection?

- A. A method for optimizing SQL query performance time
- B. An attack that inserts malicious SQL code in input
- C. A process for encrypting SQL queries before running
- D. A technique for backing up SQL database regularly

Answer: B

Q310. What is access control in database security?

- A. Compressing database tables to save storage space
- B. Optimizing the speed of data retrieval operations
- C. Regulating who can access what data and operations
- D. Creating indexes for faster query execution speeds

Answer: C

Q311. What is a distributed database?

- A. A database accessible only through a local area network
- B. A database spread across multiple connected computers
- C. A database that only stores metadata and no actual data
- D. A database stored entirely on a single server machine

Answer: B

Q312. What is data fragmentation in distributed databases?

- A. Compressing data to reduce network transfer overhead
- B. Encrypting data before distributing to remote servers
- C. Breaking a relation into smaller parts across sites
- D. Combining data from multiple sources into one table

Answer: C

Q313. What is horizontal fragmentation?

- A. Replicating the entire table across all network sites
- B. Combining multiple tables into a single unified table
- C. Dividing a table by selecting specific rows from it
- D. Dividing a table by selecting specific columns from it

Answer: C

Q314. What is vertical fragmentation?

- A. Dividing a table by selecting specific rows based on value
- B. Dividing a table by selecting specific columns from table
- C. Combining rows from different tables into a unified view
- D. Storing complete copies of a table at every network site

Answer: B

Q315. What is data replication in distributed databases?

- A. Encrypting data before transmission between all sites
- B. Dividing data into fragments across different sites
- C. Compressing data to reduce the overall storage needed
- D. Storing copies of data at multiple sites for access

Answer: D

Q316. What is a distributed DBMS?

- A. Software that manages data across multiple network sites
- B. Software that only handles backup and recovery operations
- C. Software that manages files on a single computer only
- D. Software that designs user interfaces for database access

Answer: A

Q317. What is location transparency?

- A. Users must establish connections to each site manually
- B. Users can only access data stored on their local site
- C. Users access data without knowing its physical location
- D. Users must specify which site stores the requested data

Answer: C

Q318. What is a site in a distributed database?

- A. A computer or node that hosts part of the database
- B. A column in a distributed database table structure
- C. A type of query used in distributed data processing
- D. A backup copy of the distributed database for safety

Answer: A

Q319. What is fragmentation transparency?

- A. Users access data without knowing how it is fragmented
- B. Users must specify fragment names in all their queries
- C. Users can only query one fragment at a time per query
- D. Users must manually join fragments when querying data

Answer: A

Q320. What is a distributed query?

- A. A query that is scheduled to run at a future time date
- B. A query that runs on a single database server only
- C. A query that only retrieves metadata from the catalog
- D. A query that accesses data from multiple network sites

Answer: D

Q321. What does NoSQL stand for?

- A. Not Only SQL databases
- B. Networked Open SQL system
- C. No Structured Query Language
- D. Non-Sequential Query Logic

Answer: A

Q322. Which is an example of a document-based NoSQL database?

- A. MongoDB
- B. MySQL
- C. Redis
- D. Neo4j

Answer: A

Q323. What is a key-value store?

- A. A database that maps unique keys to their values
- B. A database that uses SQL for all data operations
- C. A database that stores data in relational tables
- D. A database that only stores numeric data values

Answer: A

Q324. Which is an example of a graph database?

- A. MongoDB
- B. Neo4j
- C. Cassandra
- D. Redis

Answer: B

Q325. What type of NoSQL database is Redis?

- A. Document store
- B. Column-family store
- C. Graph database store
- D. Key-value store

Answer: D

Q326. What type of NoSQL database is Cassandra?

- A. Key-value store type
- B. Column-family store
- C. Graph database type
- D. Document store type

Answer: B

Q327. What is a document database?

- A. A database storing data in graph node structures
- B. A database storing data in fixed relational tables
- C. A database storing only text document file contents
- D. A database storing data in flexible document formats

Answer: D

Q328. What is horizontal scaling in NoSQL databases?

- A. Adding more resources to a single existing server
- B. Adding more servers to distribute the workload
- C. Upgrading the software on the existing servers
- D. Reducing the number of servers in the cluster

Answer: B

Q329. What is schema flexibility in NoSQL databases?

- A. Schema changes require rebuilding the entire database
- B. Schema must be defined before any data can be inserted
- C. Records in the same collection can have different fields
- D. All records must follow the exact same fixed schema

Answer: C

Q330. What is the main advantage of NoSQL over relational databases?

- A. More mature and established query language support
- B. Better support for complex multi-table join queries
- C. Better scalability for large unstructured data sets
- D. Stronger ACID transaction support across tables

Answer: C

Q331. What is a data warehouse?

- A. A central repository for integrated historical data
- B. A physical building where servers are maintained
- C. A system for real-time transaction processing only
- D. A temporary storage for data during transmission

Answer: A

Q332. What does ETL stand for in data warehousing?

- A. Evaluate, Test, Launch processing
- B. Encrypt, Transfer, Load processing
- C. Extract, Transform, Load processing
- D. Edit, Track, Log processing steps

Answer: C

Q333. What is a fact table in a data warehouse?

- A. A table containing descriptive text about entities
- B. A table containing measurable business event data
- C. A table containing database configuration settings
- D. A table storing user credentials and permissions

Answer: B

Q334. What is a dimension table?

- A. A table storing system configuration parameters
- B. A table providing descriptive context for facts
- C. A table storing numeric measurement values only
- D. A table containing temporary processing results

Answer: B

Q335. What is OLAP in data warehousing?

- A. Online Application Logging and Processing
- B. Online Analytical Processing of stored data
- C. Optimized Linear Analysis of Procedures
- D. Offline Logical Access and Programming

Answer: B

Q336. What is a star schema?

- A. A schema without any fact or dimension tables used
- B. A schema with many fact tables and one dimension
- C. A schema where all tables are fully normalized form
- D. A schema with one fact table and many dimensions

Answer: D

Q337. What is data mining?

- A. Deleting old data from the database storage files
- B. Backing up data to external storage media drives
- C. Manually entering data into database tables one row
- D. Discovering patterns and knowledge from large data

Answer: D

Q338. What is the purpose of data integration?

- A. Splitting data into smaller separate fragments only
- B. Encrypting data before storing in the data warehouse
- C. Combining data from multiple sources into unified view
- D. Deleting duplicate records from all source databases

Answer: C

Q339. What is a data mart?

- A. A complete enterprise-wide data warehouse system
- B. A tool for mining patterns from large data volumes
- C. A method for encrypting warehouse data at rest now
- D. A subset of a warehouse for a specific department

Answer: D

Q340. What is the difference between OLTP and OLAP?

- A. OLTP and OLAP serve the exact same purpose in databases
- B. OLTP is newer technology while OLAP is the older version
- C. OLTP is for analytics while OLAP is for transactions only
- D. OLTP handles transactions while OLAP handles analytics

Answer: D

Q341. Which type of database stores data in key-value pairs?

- A. Relational database
- B. Key-value store
- C. Hierarchical database
- D. Network database

Answer: B

Q342. What is the main purpose of a database management system?

- A. To compile programming code
- B. To manage and organize data efficiently
- C. To design user interfaces
- D. To configure network settings

Answer: B

Q343. Which of the following is an example of a relational DBMS?

- A. MongoDB
- B. Redis
- C. MySQL
- D. Cassandra

Answer: C

Q344. What does DDL stand for in database systems?

- A. Data Description Logic
- B. Data Definition Language
- C. Database Design Layer
- D. Dynamic Data Linking

Answer: B

Q345. Which language is most commonly used to interact with relational databases?

- A. Python
- B. Java
- C. SQL
- D. C++

Answer: C

Q346. What is a record in a database table?

- A. A column header
- B. A single row of data
- C. The table name
- D. A database file

Answer: B

Q347. Which of the following best describes data consistency?

- A. Data is stored in multiple formats
- B. Data follows defined rules and remains accurate
- C. Data is always encrypted
- D. Data is compressed for storage

Answer: B

Q348. What is a field in a database?

- A. An entire table
- B. A single piece of data within a record
- C. A database backup
- D. A type of query

Answer: B

Q349. Which of the following is NOT a benefit of using a DBMS?

- A. Reduced data redundancy
- B. Improved data security
- C. Increased hardware speed
- D. Data backup and recovery

Answer: C

Q350. What does DML stand for in database terminology?

- A. Data Manipulation Language
- B. Data Modeling Logic
- C. Database Management Layer
- D. Dynamic Memory Loading

Answer: A

Q351. What is the simplest form of database architecture?

- A. Three-tier architecture
- B. Distributed architecture
- C. Single-tier architecture
- D. Cloud architecture

Answer: C

Q352. In database architecture, what does the term 'tier' refer to?

- A. A type of database table
- B. A logical or physical layer in the system
- C. A security protocol
- D. A backup mechanism

Answer: B

Q353. Which component interprets and executes database queries?

- A. Storage engine
- B. Query processor
- C. Network adapter
- D. Display driver

Answer: B

Q354. What is the purpose of the disk manager in a DBMS?

- A. To display query results
- B. To manage the allocation of space on disk
- C. To handle user authentication
- D. To optimize network traffic

Answer: B

Q355. In a two-tier architecture, which component sends requests to the server?

- A. Database engine
- B. Client application
- C. Storage manager
- D. Buffer pool

Answer: B

Q356. What does the term 'back-end' refer to in database architecture?

- A. The user interface
- B. The server side that manages the database
- C. The network cable
- D. The display monitor

Answer: B

Q357. Which architecture separates presentation, logic, and data layers?

- A. Single-tier architecture
- B. Two-tier architecture
- C. Three-tier architecture
- D. Peer-to-peer architecture

Answer: C

Q358. What is the role of the authorization manager in a DBMS?

- A. To optimize queries
- B. To verify user permissions before allowing operations
- C. To manage disk space
- D. To handle data backup

Answer: B

Q359. What does a database server primarily do?

- A. Renders web pages
- B. Processes and responds to database requests
- C. Manages email services
- D. Compiles application code

Answer: B

Q360. Which DBMS component temporarily holds data pages in memory?

- A. Query parser
- B. Buffer pool
- C. Log manager
- D. Schema manager

Answer: B

Q361. What is a simple attribute in the ER model?

- A. An attribute that can be divided into sub-parts
- B. An attribute that cannot be divided further
- C. An attribute with multiple values
- D. An attribute derived from other attributes

Answer: B

Q362. What does a diamond shape represent in an ER diagram?

- A. An entity
- B. An attribute
- C. A relationship
- D. A primary key

Answer: C

Q363. What is a key attribute in an ER diagram?

- A. Any attribute of an entity
- B. An attribute that uniquely identifies each entity instance
- C. An attribute that stores encrypted data
- D. An attribute that links to another table

Answer: B

Q364. In the ER model, what is a one-to-many relationship?

- A. One entity instance relates to at most one instance of another entity
- B. One entity instance can relate to many instances of another entity
- C. Many entity instances relate to many instances of another entity
- D. No entity instances are related

Answer: B

Q365. What is the purpose of an ER diagram?

- A. To write SQL queries
- B. To visually represent the database structure and relationships
- C. To configure network settings
- D. To define programming functions

Answer: B

Q366. Which data model represents data as a collection of objects?

- A. Relational model
- B. Hierarchical model
- C. Object-oriented data model
- D. Flat file model

Answer: C

Q367. In the ER model, what is a many-to-many relationship?

- A. Each entity instance relates to exactly one other
- B. Multiple instances of both entities can relate to each other
- C. Only one entity participates in the relationship
- D. The relationship has no cardinality

Answer: B

Q368. What does an oval shape represent in an ER diagram?

- A. An entity
- B. A relationship
- C. An attribute
- D. A constraint

Answer: C

Q369. What is a strong entity in the ER model?

- A. An entity that has a primary key and can exist independently
- B. An entity that depends on another entity for identification
- C. An entity with the most attributes
- D. An entity connected to all other entities

Answer: A

Q370. In the network data model, what type of relationship structure is used?

- A. Tree structure
- B. Graph structure allowing many-to-many relationships
- C. Simple flat tables
- D. Star schema

Answer: B

Q371. What is an alternate key in a relational database?

- A. A key that is always numeric
- B. A candidate key that is not selected as the primary key
- C. A key used only for backup purposes
- D. A key that allows duplicate values

Answer: B

Q372. What is referential integrity in a relational database?

- A. All tables must have the same number of rows
- B. Foreign key values must match existing primary key values or be null
- C. All attributes must have default values
- D. Tables must be stored on the same disk

Answer: B

Q373. What does the term 'relation' mean in the relational model?

- A. A connection between two databases
- B. A two-dimensional table of data
- C. A physical storage device
- D. A type of programming function

Answer: B

Q374. What is entity integrity in a relational database?

- A. Every table must have at least one row
- B. The primary key of a relation cannot contain null values
- C. All attributes must be of the same data type
- D. Each table must have exactly one foreign key

Answer: B

Q375. How many candidate keys can a relation have?

- A. Exactly one
- B. At most two
- C. One or more
- D. None

Answer: C

Q376. What is the purpose of a composite key?

- A. To encrypt data in a column
- B. To use two or more attributes together to uniquely identify a tuple
- C. To link two databases
- D. To store multiple values in one field

Answer: B

Q377. What is a relation schema?

- A. The data stored in a table at a given time
- B. The definition of a relation including its name and attributes
- C. A backup copy of a relation
- D. A query that retrieves data from a relation

Answer: B

Q378. In a relational table, can two rows be identical?

- A. Yes, any number of duplicate rows are allowed
- B. No, each row must be unique
- C. Only if the table has no primary key defined
- D. Only in temporary tables

Answer: B

Q379. What is the role of a foreign key?

- A. To uniquely identify rows in its own table
- B. To establish a link between data in two tables
- C. To encrypt sensitive data
- D. To automatically generate unique IDs

Answer: B

Q380. What does the term 'arity' of a relation refer to?

- A. The number of rows in the relation
- B. The number of columns (attributes) in the relation
- C. The size of the relation in bytes
- D. The number of constraints on the relation

Answer: B

Q381. Which relational algebra operation removes duplicate rows from the result?

- A. Projection
- B. Selection
- C. Cartesian product
- D. Rename

Answer: A

Q382. What does the selection operation filter?

- A. Columns from a relation
- B. Rows from a relation based on a condition
- C. Duplicate tables
- D. Database users

Answer: B

Q383. What does the projection operation do in relational algebra?

- A. Selects specific rows from a table
- B. Selects specific columns from a relation
- C. Joins two tables together
- D. Renames a relation

Answer: B

Q384. What is the result of a Cartesian product of two relations?

- A. Only matching rows from both relations
- B. All possible combinations of rows from both relations
- C. The intersection of both relations
- D. An empty relation

Answer: B

Q385. For the union operation, what must be true about the two relations?

- A. They must have the same name
- B. They must be union compatible with the same number and types of attributes
- C. They must be stored in the same database
- D. They must have the same number of rows

Answer: B

Q386. What does the set difference operation $R - S$ return?

- A. All tuples in both R and S
- B. Tuples in R that are not in S
- C. Tuples in S that are not in R
- D. The union of R and S

Answer: B

Q387. Which operation combines two union-compatible relations and removes duplicates?

- A. Cartesian product
- B. Natural join
- C. Union
- D. Set difference

Answer: C

Q388. What is the rename operation used for in relational algebra?

- A. To delete a relation
- B. To change the name of a relation or its attributes
- C. To create a copy of a relation
- D. To merge two relations

Answer: B

Q389. How many fundamental operations exist in relational algebra?

- A. Three
- B. Five
- C. Six
- D. Eight

Answer: C

Q390. What is the intersection of two relations R and S?

- A. All tuples in R or S
- B. Tuples that appear in both R and S
- C. Tuples that appear in R but not S
- D. An empty set

Answer: B

Q391. Which SQL clause is used to filter rows based on a condition?

- A. ORDER BY
- B. GROUP BY
- C. WHERE
- D. HAVING

Answer: C

Q392. Which SQL statement is used to add new rows to a table?

- A. UPDATE
- B. INSERT INTO
- C. ALTER TABLE
- D. CREATE TABLE

Answer: B

Q393. What does the SELECT DISTINCT keyword do?

- A. Selects all rows including duplicates
- B. Selects only unique rows, removing duplicates
- C. Selects the first row only
- D. Selects rows in a random order

Answer: B

Q394. Which SQL keyword is used to sort the result set?

- A. SORT BY
- B. ARRANGE BY
- C. ORDER BY
- D. FILTER BY

Answer: C

Q395. What does the SQL COUNT() function do?

- A. Counts the number of tables in a database
- B. Counts the number of rows that match a criteria
- C. Counts the number of databases on the server
- D. Counts the number of characters in a column

Answer: B

Q396. Which SQL command is used to remove a table from the database?

- A. DELETE TABLE
- B. REMOVE TABLE
- C. DROP TABLE
- D. DESTROY TABLE

Answer: C

Q397. What does the SQL UPDATE statement do?

- A. Adds new rows to a table
- B. Modifies existing data in a table
- C. Deletes rows from a table
- D. Creates a new table

Answer: B

Q398. Which SQL operator is used to search for a pattern in a column?

- A. MATCH
- B. LIKE
- C. FIND
- D. SEARCH

Answer: B

Q399. What does the SQL DELETE statement do?

- A. Removes a table structure
- B. Removes specific rows from a table
- C. Removes a database
- D. Removes a column from a table

Answer: B

Q400. Which keyword is used to combine results from two SELECT statements?

- A. MERGE
- B. COMBINE
- C. UNION
- D. APPEND

Answer: C

Q401. What is a trigger in SQL?

- A. A button in the database interface
- B. A special stored procedure that automatically executes when a specified event occurs
- C. A type of database index
- D. A command to start the database server

Answer: B

Q402. What is an SQL view?

- A. A graphical display of the database
- B. A virtual table based on the result of a SELECT query
- C. A physical copy of a table
- D. A type of report

Answer: B

Q403. What is the purpose of the GRANT command in SQL?

- A. To create a new table
- B. To give users specific access privileges on database objects
- C. To delete user accounts
- D. To optimize queries

Answer: B

Q404. What does the REVOKE command do in SQL?

- A. Reverses a transaction
- B. Removes access privileges previously granted to users
- C. Restores deleted data
- D. Reverts schema changes

Answer: B

Q405. What is an assertion in SQL?

- A. A statement that prints debug information
- B. A constraint that specifies a condition the database must always satisfy
- C. A type of stored procedure
- D. A SQL comment

Answer: B

Q406. What is the purpose of the COMMIT command?

- A. To start a new transaction
- B. To save all changes made during the current transaction permanently
- C. To undo changes
- D. To lock the database

Answer: B

Q407. What does the ROLLBACK command do?

- A. Moves the database to a new server
- B. Undoes all changes made during the current transaction
- C. Deletes the entire database
- D. Creates a backup of the database

Answer: B

Q408. What is a CHECK constraint in SQL?

- A. A constraint that checks disk space
- B. A constraint that ensures values in a column satisfy a specified condition
- C. A constraint that checks user passwords
- D. A constraint that validates SQL syntax

Answer: B

Q409. What is the main goal of database normalization?

- A. To increase data redundancy
- B. To organize data to reduce redundancy and improve data integrity
- C. To make queries run faster
- D. To add more tables to the database

Answer: B

Q410. What is First Normal Form (1NF)?

- A. A table with no foreign keys
- B. A table where each column contains only atomic (indivisible) values
- C. A table with at least three columns
- D. A table stored in the first file

Answer: B

Q411. What is a repeating group in database design?

- A. A group of users who access the database repeatedly
- B. Multiple values stored in a single column violating 1NF
- C. A frequently executed query
- D. A backup that runs on a schedule

Answer: B

Q412. What does Second Normal Form (2NF) require?

- A. The table must be in 1NF and have no partial dependencies on a composite key
- B. The table must have at least two columns
- C. All columns must be numeric
- D. The table must have exactly two candidate keys

Answer: A

Q413. What is a partial dependency?

- A. A dependency on the entire primary key
- B. A non-key attribute that depends on only part of a composite primary key
- C. A dependency between two foreign keys
- D. A dependency that only sometimes holds

Answer: B

Q414. What does Third Normal Form (3NF) eliminate?

- A. All foreign keys
- B. Transitive dependencies of non-key attributes on the primary key
- C. All null values
- D. All composite keys

Answer: B

Q415. What type of anomaly occurs when deleting a row causes loss of unrelated data?

- A. Insertion anomaly
- B. Update anomaly
- C. Deletion anomaly
- D. Selection anomaly

Answer: C

Q416. Which normal form addresses the issue of repeating groups?

- A. Second Normal Form
- B. Third Normal Form
- C. First Normal Form
- D. Boyce-Codd Normal Form

Answer: C

Q417. What does the Atomicity property of a transaction ensure?

- A. The transaction is very small
- B. Either all operations in the transaction are completed or none are
- C. The transaction uses atomic data types
- D. The transaction runs on a single processor

Answer: B

Q418. What does the Consistency property of a transaction ensure?

- A. All transactions run at the same speed
- B. A transaction brings the database from one valid state to another valid state
- C. All columns have consistent data types
- D. The database is consistent in size

Answer: B

Q419. What does the Isolation property of a transaction ensure?

- A. Transactions are stored in isolated tables
- B. Concurrent transactions do not interfere with each other
- C. The database is isolated from the network
- D. Each transaction runs on a separate server

Answer: B

Q420. What does the Durability property of a transaction ensure?

- A. The transaction runs for a long duration
- B. Once a transaction is committed, its changes persist even after system failures
- C. The database hardware is durable
- D. The transaction cannot be undone

Answer: B

Q421. What are the possible states of a transaction?

- A. Start, Run, Stop
- B. Active, Partially Committed, Committed, Failed, Aborted
- C. Open, Closed, Locked
- D. Read, Write, Delete

Answer: B

Q422. What happens when a transaction is aborted?

- A. Its changes are permanently saved
- B. All changes made by the transaction are undone
- C. The database is shut down
- D. Other transactions are paused

Answer: B

Q423. What is a schedule in the context of transactions?

- A. A time table for database backups
- B. The chronological order in which operations from concurrent transactions are executed
- C. A list of database users
- D. A plan for database design

Answer: B

Q424. What is a read operation in a transaction?

- A. Reading the database schema
- B. Retrieving a data item value from the database
- C. Reading the transaction log
- D. Reading user input

Answer: B

Q425. What is concurrency control in database systems?

- A. A method to control the number of database tables
- B. A mechanism to manage simultaneous access to the database by multiple transactions
- C. A technique to control query speed
- D. A tool to manage database backups

Answer: B

Q426. What is a lock in the context of concurrency control?

- A. A physical security device for the server
- B. A mechanism that restricts access to a data item by other transactions
- C. A type of database table
- D. A method for encrypting data

Answer: B

Q427. What is a shared lock (S-lock)?

- A. A lock shared across multiple databases
- B. A lock that allows multiple transactions to read a data item simultaneously
- C. A lock that allows both reading and writing
- D. A lock that prevents all access

Answer: B

Q428. What is an exclusive lock (X-lock)?

- A. A lock available only to the DBA
- B. A lock that allows only one transaction to both read and write a data item
- C. A lock that blocks all database operations
- D. A lock used during database installation

Answer: B

Q429. What is the purpose of the two-phase locking (2PL) protocol?

- A. To lock data in two different databases
- B. To ensure serializability by dividing a transaction into a growing phase and a shrinking phase
- C. To perform two types of locks on each data item
- D. To execute transactions in two steps

Answer: B

Q430. In the two-phase locking protocol, what is the growing phase?

- A. The phase where the database grows in size
- B. The phase where a transaction acquires locks but cannot release any
- C. The phase where new tables are created
- D. The phase where transactions are added to the schedule

Answer: B

Q431. In the two-phase locking protocol, what is the shrinking phase?

- A. The phase where the database shrinks in size
- B. The phase where a transaction releases locks but cannot acquire new ones
- C. The phase where tables are deleted
- D. The phase where the transaction log is trimmed

Answer: B

Q432. What is starvation in the context of concurrency control?

- A. When a database runs out of storage
- B. When a transaction waits indefinitely because other transactions keep getting priority
- C. When the server runs out of memory
- D. When the network connection is lost

Answer: B

Q433. What is a lock manager in a DBMS?

- A. A person who manages physical locks on the server room
- B. A DBMS component that handles lock requests, grants, and releases
- C. A software for managing encryption keys
- D. A tool for managing database user accounts

Answer: B

Q434. What is a transaction log (journal)?

- A. A list of all database users
- B. A file that records all changes made to the database for recovery purposes
- C. A log of network traffic
- D. A list of all SQL queries ever written

Answer: B

Q435. What is a database backup?

- A. A secondary database server
- B. A copy of the database stored separately for recovery purposes
- C. A redundant index on a table
- D. An extra user account

Answer: B

Q436. What does the redo operation do during recovery?

- A. Re-executes all queries from the beginning
- B. Reapplies committed transactions whose changes may not have been written to disk
- C. Restarts the database server
- D. Recreates all database tables

Answer: B

Q437. What does the undo operation do during recovery?

- A. Removes the database entirely
- B. Reverses the changes of uncommitted transactions to restore consistency
- C. Undoes the last backup
- D. Removes the recovery log

Answer: B

Q438. What is the purpose of the write-ahead log rule?

- A. To ensure writes happen before reads
- B. To ensure log records are written before the corresponding data changes are flushed to disk
- C. To write data ahead of the schedule
- D. To log all user activities before database access

Answer: B

Q439. What is a system failure in database terminology?

- A. A failure in the database design process
- B. A failure that loses the contents of main memory but not disk storage
- C. A failure that destroys all data permanently
- D. A failure in the user interface

Answer: B

Q440. What is a media failure in database terminology?

- A. A failure in multimedia content
- B. A failure that damages the physical storage medium, potentially losing disk data
- C. A failure in the display monitor
- D. A failure in the network media

Answer: B

Q441. What is an incremental backup?

- A. A backup of the entire database
- B. A backup that captures only the changes made since the last backup
- C. A backup performed incrementally faster each time
- D. A backup that increments the database version

Answer: B

Q442. What is a primary index?

- A. The first index created on a table
- B. An index built on the primary key of an ordered file
- C. An index that can only store integers
- D. The most important index in the database

Answer: B

Q443. What is a B-tree?

- A. A binary tree used for sorting
- B. A balanced search tree where all leaf nodes are at the same level, used for indexing
- C. A tree that only stores binary data
- D. A tree with exactly two branches

Answer: B

Q444. What is the advantage of using indexes?

- A. They reduce storage space
- B. They speed up data retrieval operations
- C. They make all queries faster without any trade-off
- D. They eliminate the need for primary keys

Answer: B

Q445. What is the disadvantage of having too many indexes?

- A. Queries become slower to read
- B. Insert, update, and delete operations become slower as indexes must be maintained
- C. The database becomes read-only
- D. Indexes use no additional storage

Answer: B

Q446. How many clustered indexes can a table have?

- A. As many as needed
- B. Exactly one
- C. Exactly two
- D. None

Answer: B

Q447. What is query optimization?

- A. Writing queries in the shortest way possible
- B. The process of selecting the most efficient execution plan for a query
- C. Removing unnecessary queries from the database
- D. Optimizing the database for more queries

Answer: B

Q448. What is the role of the query parser?

- A. To execute the query
- B. To check the syntax and validate the SQL query before optimization
- C. To store query results
- D. To create database tables

Answer: B

Q449. What is a table scan (full table scan)?

- A. Scanning the table structure for errors
- B. Reading every row in a table to find matching records
- C. Scanning only the index
- D. A security scan of the table

Answer: B

Q450. Why is using an index generally faster than a full table scan?

- A. Indexes are stored on faster disks
- B. Indexes narrow down the search to specific records without scanning every row
- C. Indexes compress the data for faster reading
- D. Indexes always return fewer results

Answer: B

Q451. What does the EXPLAIN command show in SQL?

- A. An explanation of SQL syntax
- B. The execution plan the DBMS will use for a query
- C. The database schema
- D. A list of all indexes

Answer: B

Q452. What is a join operation in the context of query optimization?

- A. Joining two databases together
- B. Combining rows from two or more tables based on related columns
- C. Joining user sessions
- D. Adding columns to a table

Answer: B

Q453. What is cost-based optimization?

- A. Optimizing the monetary cost of database licenses
- B. Selecting the execution plan with the lowest estimated resource cost
- C. Minimizing the cost of database hardware
- D. Optimizing query writing costs

Answer: B

Q454. What is a query tree (query plan tree)?

- A. A tree-shaped database
- B. A tree structure representing the relational algebra operations of a query
- C. A decision tree for choosing queries
- D. A directory structure for storing queries

Answer: B

Q455. What are database statistics used for in query optimization?

- A. Generating reports about database usage
- B. Providing the optimizer with data distribution information to estimate operation costs
- C. Tracking user login statistics
- D. Measuring network performance

Answer: B

Q456. What is data encryption?

- A. Compressing data to save space
- B. Converting data into an unreadable format that can only be decoded with a key
- C. Backing up data to a remote location
- D. Indexing data for faster access

Answer: B

Q457. What is an access control list (ACL) in database security?

- A. A checklist for database design
- B. A list specifying which users have access to which database objects and what operations they can perform
- C. A list of all database connections
- D. A list of recently accessed tables

Answer: B

Q458. What is a database audit trail?

- A. A hiking trail near the data center
- B. A record of all activities performed on the database for monitoring and accountability
- C. A trail of deleted data
- D. A path for data migration

Answer: B

Q459. What is a database firewall?

- A. A physical wall around the server room
- B. A security layer that monitors and filters database traffic to prevent unauthorized access
- C. A backup power supply
- D. A type of database index

Answer: B

Q460. What is data masking?

- A. Hiding the database from the network
- B. Replacing sensitive data with fictitious but realistic data to protect privacy
- C. Compressing data to reduce size
- D. Encrypting data at rest

Answer: B

Q461. What is the advantage of data replication?

- A. It saves storage space
- B. It improves data availability and local read performance
- C. It eliminates the need for backups entirely
- D. It speeds up write operations

Answer: B

Q462. What is a homogeneous distributed database?

- A. A database with the same data at all sites
- B. A distributed database where all sites use the same DBMS software
- C. A database that stores only one type of data
- D. A database with uniform table sizes

Answer: B

Q463. What is a heterogeneous distributed database?

- A. A database with mixed data types
- B. A distributed database where different sites may use different DBMS software
- C. A database with unequal table sizes
- D. A database that stores data in different formats

Answer: B

Q464. What is location transparency in distributed databases?

- A. The database hides where data is physically stored from users
- B. The database reveals the location of all data to users
- C. Transparency about the data center location
- D. Showing users the physical address of each server

Answer: A

Q465. What is replication transparency?

- A. Making replication visible to all users
- B. Users are unaware that data is replicated; the system manages copies automatically
- C. Transparent replication logs
- D. Showing users all copies of data

Answer: B

Q466. Which of the following is a document-based NoSQL database?

- A. MySQL
- B. PostgreSQL
- C. MongoDB
- D. Oracle

Answer: C

Q467. Which of the following is an example of a key-value store?

- A. MongoDB
- B. Redis
- C. Neo4j
- D. Cassandra

Answer: B

Q468. What is a column-family database?

- A. A database organized by families of users
- B. A NoSQL database that stores data in columns grouped into column families
- C. A database with family-related data only
- D. A relational database feature

Answer: B

Q469. Which of the following is a graph database?

- A. Redis
- B. Cassandra
- C. Neo4j
- D. HBase

Answer: C

Q470. What is the main advantage of NoSQL databases over relational databases?

- A. They always provide ACID guarantees
- B. They offer better scalability and flexibility for unstructured or semi-structured data
- C. They always have better query capabilities
- D. They require less storage

Answer: B

Q471. What is a document in a document-based NoSQL database?

- A. A text file on disk
- B. A self-contained data record often in JSON or BSON format with flexible schema
- C. A PDF stored in the database
- D. A database manual

Answer: B

Q472. What does horizontal scaling mean in the context of NoSQL?

- A. Adding more columns to tables
- B. Adding more servers to handle increased load
- C. Making the server hardware more powerful
- D. Increasing disk space on one server

Answer: B

Q473. What is vertical scaling?

- A. Adding more servers to the cluster
- B. Increasing the capacity of a single server by adding more CPU, RAM, or storage
- C. Adding more rows to a table
- D. Stacking databases vertically

Answer: B

Q474. What is ETL in data warehousing?

- A. Electronic Transfer Link
- B. Extract, Transform, Load - the process of moving data from sources into the data warehouse
- C. Extended Table Logic
- D. Enterprise Technology Layer

Answer: B

Q475. What is a dimension table in a data warehouse?

- A. A table that stores database dimensions (size)
- B. A table containing descriptive attributes used to filter, group, and label fact data
- C. A table with three-dimensional data
- D. A temporary table

Answer: B

Q476. What is a star schema in data warehousing?

- A. A schema shaped like a star on the database diagram
- B. A schema with a central fact table connected to multiple dimension tables, forming a star pattern
- C. A schema used in astronomy databases
- D. A schema with star-rated data

Answer: B

Q477. What is OLAP?

- A. Online Automatic Processing
- B. Online Analytical Processing - technology for complex analytical queries on multidimensional data
- C. Open Link Access Protocol
- D. Offline Loading and Processing

Answer: B

Q478. What is a measure in a data warehouse fact table?

- A. The physical size of the table
- B. A numeric value that can be aggregated, such as sales amount or quantity
- C. A unit of measurement for storage
- D. A count of dimension tables

Answer: B

Q479. What is a data cube in OLAP?

- A. A cubic-shaped storage device
- B. A multidimensional representation of data allowing analysis across multiple dimensions
- C. A backup cube for data protection
- D. A rubik's cube made of data drives

Answer: B

Q480. What is a DEFAULT constraint in SQL?

- A. The default database setting
- B. A constraint that assigns a default value to a column when no value is specified during insertion
- C. A constraint that defaults to NULL
- D. The default table in a database

Answer: B

Q481. What is the purpose of the UNIQUE constraint in SQL?

- A. To make all rows unique across all columns
- B. To ensure that all values in a column or combination of columns are distinct
- C. To create a unique database
- D. To uniquely identify the database

Answer: B

Q482. What is an unnormalized table?

- A. A table without a name
- B. A table that contains repeating groups or non-atomic values violating 1NF
- C. A table with too many columns
- D. A table that is not indexed

Answer: B

Q483. What is the relationship between normalization and data redundancy?

- A. Normalization increases data redundancy
- B. Normalization reduces data redundancy by organizing data into separate related tables
- C. Normalization has no effect on redundancy
- D. Normalization eliminates all data from the database

Answer: B

Q484. What is a write operation in a transaction?

- A. Writing documentation about the database
- B. Modifying the value of a data item in the database
- C. Writing a query to the console
- D. Creating a new table

Answer: B

Q485. What does it mean when a transaction is in the 'committed' state?

- A. The transaction is waiting to start
- B. The transaction has completed successfully and its changes are permanently recorded
- C. The transaction has been cancelled
- D. The transaction is still running

Answer: B

Q486. Why is concurrency control necessary in database systems?

- A. To make the database run faster
- B. To ensure data consistency and isolation when multiple transactions access data simultaneously
- C. To control the number of database users
- D. To manage disk space

Answer: B

Q487. What is a full database backup?

- A. A backup that only stores schema information
- B. A complete copy of the entire database at a specific point in time
- C. A backup of the backup system
- D. A partial backup of frequently accessed data

Answer: B

Q488. What is the purpose of a log file in database recovery?

- A. To log user login attempts
- B. To record all database modifications so transactions can be redone or undone during recovery
- C. To store query execution plans
- D. To track disk space usage

Answer: B

Q489. What is the search key of an index?

- A. A physical key to unlock the database
- B. The attribute or set of attributes used to look up records in the index
- C. A password for accessing indexed data
- D. The primary key of the indexed table

Answer: B

Q490. Can a table have multiple non-clustered indexes?

- A. No, only one index per table
- B. Yes, a table can have multiple non-clustered indexes on different columns
- C. Only if the table has no primary key
- D. Only two non-clustered indexes are allowed

Answer: B

Q491. What is an index entry composed of?

- A. Only the table name
- B. A search key value and a pointer to the corresponding data record or block
- C. Only the row number
- D. A copy of the entire row

Answer: B

Q492. What happens to indexes when a row is inserted into a table?

- A. Indexes are unaffected by insertions
- B. All relevant indexes must be updated to include entries for the new row
- C. Indexes are automatically deleted
- D. Only the primary index is updated

Answer: B

Q493. Why might a database optimizer choose not to use an available index?

- A. Indexes can never be ignored
- B. When the optimizer estimates a full table scan would be faster, such as when most rows match the query
- C. The optimizer always uses indexes
- D. Indexes are only used for SELECT queries

Answer: B

Q494. What is a query rewrite in the optimization process?

- A. Rewriting the query in a different programming language
- B. Transforming a query into an equivalent but more efficient form before generating execution plans
- C. Manually rewriting queries for better readability
- D. Rewriting queries to fix syntax errors

Answer: B

Q495. What is the purpose of a password policy in database security?

- A. To make passwords decorative
- B. To enforce rules about password strength, expiration, and reuse to prevent unauthorized access
- C. To store passwords in plain text
- D. To share passwords among users

Answer: B

Q496. What is a privilege in database security?

- A. A type of database table
- B. A right or permission granted to a user to perform specific operations on database objects
- C. A special type of data
- D. A database backup method

Answer: B

Q497. What is the difference between system privileges and object privileges?

- A. There is no difference
- B. System privileges allow operations on the system level while object privileges allow operations on specific database objects
- C. System privileges are for hardware while object privileges are for software
- D. Object privileges are more powerful

Answer: B

Q498. Why is it important to regularly update database software?

- A. To change the database color theme
- B. To patch security vulnerabilities and protect against newly discovered threats
- C. To increase storage space
- D. To delete old data

Answer: B

Q499. What is a distributed database management system (DDBMS)?

- A. A DBMS installed on multiple monitors
- B. Software that manages a distributed database, making distribution transparent to users
- C. A mobile database application
- D. A database stored on a USB drive

Answer: B

Q500. What is a site (node) in a distributed database?

- A. A website that hosts the database
- B. A physical or logical location that has its own local database and processing capability
- C. A web page with database information
- D. A user workstation

Answer: B

Q501. What is the benefit of distributing a database across multiple sites?

- A. It makes the database harder to use
- B. It improves reliability, availability, and performance by placing data closer to where it is used
- C. It reduces the total amount of data stored
- D. It eliminates the need for security

Answer: B

Q502. What is a communication network in a distributed database system?

- A. A social network for database users
- B. The network infrastructure that connects different database sites and enables data transfer between them
- C. A chat system within the database
- D. An internal database messaging system

Answer: B

Q503. What is a collection in MongoDB?

- A. A group of database servers
- B. A grouping of documents, similar to a table in relational databases
- C. A collection of SQL queries
- D. A backup set

Answer: B

Q504. What is a node in a graph database?

- A. A network server
- B. An entity or data point represented as a vertex in the graph, such as a person or product
- C. A connection between two databases
- D. A cluster of documents

Answer: B

Q505. What are the four key characteristics of a data warehouse according to Bill Inmon?

- A. Fast, Reliable, Secure, Scalable
- B. Subject-oriented, Integrated, Time-variant, and Non-volatile
- C. Structured, Indexed, Normalized, and Backed-up
- D. Large, Distributed, Real-time, and Encrypted

Answer: B

Q506. What is a data source in the context of data warehousing?

- A. The power source for the data center
- B. An operational system, external file, or other origin from which data is extracted for the warehouse
- C. The database administrator
- D. A query result

Answer: B

Q507. What is a dashboard in business intelligence?

- A. The front panel of a database server
- B. A visual display of key performance indicators and metrics from the data warehouse for decision making
- C. A database configuration page
- D. A network monitoring tool

Answer: B

Q508. What is the staging area in a data warehouse architecture?

A. A theater stage for database presentations

B. An intermediate storage area where extracted data is cleaned and transformed before loading into the warehouse

- C. The main warehouse storage
- D. A backup location

Answer: B

Q509. What does it mean to revoke a privilege from a database user?

- A. To grant additional privileges
- B. To remove a previously granted permission from the user
- C. To delete the user account
- D. To reset the user password

Answer: B

Q510. What is network latency in the context of distributed databases?

- A. The speed of the database processor
- B. The time delay for data to travel between sites across the network
- C. The size of the database
- D. The number of concurrent users

Answer: B

Databases — Medium

510 questions

Q511. Which level of data abstraction describes how data is actually stored?

- A. View level
- B. Logical level
- C. External level
- D. Physical level

Answer: D

Q512. The three-schema architecture was proposed by:

- A. IEEE standards body
- B. ISO organization
- C. W3C consortium
- D. ANSI/SPARC committee

Answer: D

Q513. Which of the following is a disadvantage of DBMS?

- A. Increased data redundancy across tables
- B. Program-data dependence across modules
- C. High initial cost of hardware and software
- D. Data inconsistency between applications

Answer: C

Q514. What is metadata in a database context?

- A. Temporary data
- B. Data about data
- C. Deleted data
- D. Encrypted data

Answer: B

Q515. Which component of DBMS is responsible for ensuring data consistency?

- A. Integrity manager
- B. Authorization manager
- C. Buffer pool manager
- D. File system manager

Answer: A

Q516. A data dictionary stores:

- A. Application programs and their code
- B. Actual user data stored in tables
- C. Metadata about the database structure
- D. Backup files created periodically

Answer: C

Q517. Which of the following describes logical data independence?

- A. Ability to change applications without affecting the underlying data
- B. Ability to change the logical schema without affecting external schemas
- C. None of these options correctly describes logical data independence
- D. Ability to change physical storage without affecting the logical schema

Answer: B

Q518. What is a database instance?

- A. The database management software application
- B. The overall architectural design of the database
- C. A backup copy of the database stored on disk
- D. The collection of data stored at a particular moment

Answer: D

Q519. A database schema is:

- A. A data structure used for indexing records
- B. A language used for querying the database
- C. The overall design or structure of the database
- D. The actual data values stored in the tables

Answer: C

Q520. Which of the following is NOT a function of a DBMS?

- A. Generating source code for applications
- B. Manipulating and querying stored data
- C. Managing concurrent transaction access
- D. Defining and managing data structures

Answer: A

Q521. In the three-schema architecture, which schema defines the user's view?

- A. External schema
- B. Internal schema
- C. Conceptual schema
- D. Physical schema

Answer: A

Q522. Which DBMS component ensures that the database remains in a consistent state after a failure?

- A. Authorization manager
- B. Buffer manager
- C. Recovery manager
- D. Query optimizer

Answer: C

Q523. The data definition language (DDL) compiler processes:

- A. Application programs written in the host language
- B. Schema definitions and stores metadata in the catalog
- C. User-submitted queries for data retrieval operations
- D. Data insertion commands for populating new tables

Answer: B

Q524. In a two-tier architecture, the application logic resides:

- A. Exclusively on the client tier
- B. Exclusively on the server tier
- C. On a separate dedicated middle tier
- D. On the client side or server side

Answer: D

Q525. What is a database catalog?

- A. A system database containing metadata about the database structure
- B. A comprehensive list of all users who have database access rights
- C. An index structure built on primary keys of all related tables
- D. A sequential log file that records all committed transactions

Answer: A

Q526. Which architecture is most suitable for web-based database applications?

- A. Peer-to-peer architecture
- B. Two-tier architecture
- C. Single-tier architecture
- D. Three-tier architecture

Answer: D

Q527. The runtime database processor executes:

- A. Backup and recovery operations only
- B. Data definition language statements only
- C. Schema compilation processes only
- D. Privileged commands and query plans at runtime

Answer: D

Q528. What is the purpose of the DML precompiler?

- A. To compile DDL commands and update the system catalog
- B. To extract DML commands embedded in application programs
- C. To manage concurrency control among active transactions
- D. To optimize queries by selecting the best execution plan

Answer: B

Q529. In a parallel database system, the main goal is:

- A. Reduced overall storage cost on disk
- B. Simplified query writing for users
- C. Eliminating the need for any backups
- D. Improved performance through parallelism

Answer: D

Q530. Shared-nothing architecture means:

- A. All processors share the memory and disk
- B. Only disk is shared among all processors
- C. Each processor has its own memory and disk
- D. Only memory is shared among processors

Answer: C

Q531. In an Enhanced ER (EER) model, specialization is:

- A. Adding new relationships between existing entity types
- B. Combining multiple entity types into a single entity
- C. The process of defining subclasses of an entity type
- D. Removing attributes from entities during refinement

Answer: C

Q532. A weak entity in an ER diagram:

- A. Cannot be uniquely identified by its own attributes alone
- B. Is always fully independent of any other entity type
- C. Cannot have any attributes or properties defined on it
- D. Has a complete primary key defined on its own attributes

Answer: A

Q533. Total participation in an ER diagram means:

- A. The relationship is optional for all entities
- B. No entity participates in the defined relationship
- C. Only some entities participate in the relationship
- D. Every entity must participate in the relationship

Answer: D

Q534. A composite attribute is:

- A. An attribute that holds multiple values for one entity
- B. An attribute that serves as the key for identification
- C. An attribute whose value is derived from other attributes
- D. An attribute that can be divided into smaller sub-attributes

Answer: D

Q535. A multivalued attribute is represented in an ER diagram by:

- A. A single ellipse
- B. A rectangle shape
- C. A dashed ellipse
- D. A double ellipse

Answer: D

Q536. In an ER diagram, a double rectangle represents:

- A. A weak entity
- B. An attribute
- C. A relationship
- D. A strong entity

Answer: A

Q537. Generalization in EER modeling is:

- A. Adding new attributes to an existing entity class
- B. Removing a class entirely from the ER model
- C. Splitting a single class into multiple subclasses
- D. Combining subclasses into a generalized superclass

Answer: D

Q538. A derived attribute is one whose value:

- A. Must be entered manually by users
- B. Cannot change once it is set initially
- C. Is always NULL in every record stored
- D. Can be computed from other attributes

Answer: D

Q539. The cardinality ratio in an ER model specifies:

- A. The overall size of the database measured in stored records
- B. The number of attributes defined on a single entity type
- C. The total number of entities present in the entire ER model
- D. The number of relationship instances an entity can participate in

Answer: D

Q540. An object-oriented data model supports:

- A. Only tree structures and parent-child links
- B. Only tables, rows, and column structures
- C. Only flat files and sequential access paths
- D. Encapsulation, inheritance, and polymorphism

Answer: D

Q541. A candidate key is:

- A. Any arbitrary attribute present in the table
- B. The same concept as a foreign key reference
- C. A minimal superkey that uniquely identifies tuples
- D. Always the first column defined in the schema

Answer: C

Q542. A superkey is:

- A. Any set of attributes that uniquely identifies tuples
- B. A key that is permitted to contain NULL values
- C. Always limited to a single attribute in the table
- D. The same concept as a foreign key in a relation

Answer: A

Q543. Referential integrity constraint ensures that:

- A. A foreign key value must match a primary key value in the referenced table or be NULL
- B. All columns across every table in the database must have the same compatible data type
- C. All tables in the database schema must have exactly the same total number of data rows
- D. Primary key values can be duplicated across different rows within the same data table

Answer: A

Q544. Entity integrity constraint states that:

- A. Foreign keys must always be unique in tables
- B. Tables must have at least one row of data
- C. All attributes in every row must have values
- D. No primary key attribute can have a NULL value

Answer: D

Q545. An alternate key is:

- A. A composite key made up of two or more attributes
- B. A candidate key that is not chosen as the primary key
- C. A key that is permitted to contain NULL value entries
- D. The same concept as a foreign key in another table

Answer: B

Q546. A composite key is:

- A. A key with only one single attribute value
- B. A foreign key referencing another table
- C. A key that allows NULL values in rows
- D. A key consisting of two or more attributes

Answer: D

Q547. Which of the following is NOT a relational integrity constraint?

- A. Entity integrity
- B. Sequential constraint
- C. Referential integrity
- D. Domain constraint

Answer: B

Q548. A relation schema defines:

- A. Only the primary key definition of the relation in question
- B. The structure of a relation including attribute names and domains
- C. The actual data values currently stored within the relation
- D. Only the foreign keys that reference other related tables

Answer: B

Q549. In relational algebra, the Cartesian product of two relations R and S produces:

- A. All possible combinations of tuples from R and S
- B. The intersection of tuples in both R and S
- C. Only tuples that match on common attributes
- D. The union of all tuples from both R and S

Answer: A

Q550. A relation in 1NF requires that:

- A. The table has only one column of values
- B. There are no foreign keys in the relation
- C. All values are strictly numeric in type
- D. All attribute values are atomic (indivisible)

Answer: D

Q551. The theta join of relations R and S is:

- A. A rename operation applied to change the relation name
- B. A Cartesian product followed by selection with a condition
- C. A set union combining all tuples from two given relations
- D. A simple projection on selected attributes from the relation

Answer: B

Q552. An equi-join is a special case of theta join where:

- A. No condition is applied to the join result
- B. The result of the join is always an empty set
- C. The condition uses only inequality comparisons
- D. The condition uses only equality comparisons

Answer: D

Q553. The division operation $R \div S$ returns:

- A. The Cartesian product of both relations R and S fully
- B. Tuples in R that are associated with every tuple in S
- C. All tuples from relation S regardless of the condition
- D. All tuples from relation R regardless of the condition

Answer: B

Q554. Left outer join includes:

- A. All tuples from the right relation and matching from the left side
- B. Only tuples that have matching values in both of the joined tables
- C. No tuples at all if there is no matching condition between tables
- D. All tuples from the left relation and matching tuples from the right

Answer: D

Q555. In relational algebra, which operation can be derived from the fundamental operations?

- A. Projection
- B. Intersection
- C. Division
- D. Selection

Answer: B

Q556. The semi-join of R and S returns:

- A. All tuples from both relations R and S combined
- B. The complete Cartesian product of R and S result
- C. Only the tuples from relation S not in relation R
- D. Tuples from R that have matching tuples in S

Answer: D

Q557. Anti-join of R and S returns:

- A. All tuples from R regardless of matching in S
- B. The complete Cartesian product of R and S both
- C. Tuples from R that have no matching tuples in S
- D. All tuples that match between relations R and S

Answer: C

Q558. Relational calculus is:

- A. A procedural query language that specifies how to retrieve data
- B. A data definition language for creating tables and constraints
- C. A physical storage language for defining data file structures
- D. A non-procedural query language that describes what to retrieve

Answer: D

Q559. Tuple relational calculus uses:

- A. Tuple variables that range over relations
- B. Domain variables that range over values
- C. Only table names without any variables
- D. No variables of any kind are required

Answer: A

Q560. Domain relational calculus uses:

- A. SQL queries written in standard syntax format
- B. No variables of any kind within the expression
- C. Domain variables that range over attribute domains
- D. Tuple variables that range over entire relations

Answer: C

Q561. Which SQL clause is used to filter groups in a GROUP BY query?

- A. WHERE
- B. HAVING
- C. ORDER BY
- D. LIMIT

Answer: B

Q562. An INNER JOIN returns:

- A. All rows from the left table with NULLs for right
- B. Only rows that have matching values in both tables
- C. All rows from the right table with NULLs for left
- D. All rows from both the left and the right tables

Answer: B

Q563. Which aggregate function returns the number of rows?

- A. COUNT()
- B. SUM()
- C. AVG()
- D. MAX()

Answer: A

Q564. A LEFT JOIN returns:

- A. The Cartesian product of both tables without any condition
- B. All rows from the right table and matching from the left
- C. Only rows that have matching values in both joined tables
- D. All rows from the left table and matching rows from the right

Answer: D

Q565. Which SQL constraint ensures a column cannot have NULL values?

- A. CHECK
- B. UNIQUE
- C. NOT NULL
- D. DEFAULT

Answer: C

Q566. The LIKE operator is used with which wildcard characters?

- A. # and @
- B. % and _
- C. * and ?
- D. & and ^

Answer: B

Q567. What does the IN operator do in SQL?

- A. Checks if a value matches any value in a list
- B. Performs an inner join between two given tables
- C. Inserts data into a specified target table row
- D. Indexes a column for faster search performance

Answer: A

Q568. Which SQL clause limits the number of rows returned?

- A. LIMIT (or TOP in SQL Server)
- B. GROUP BY (aggregation clause)
- C. HAVING (group filter clause)
- D. WHERE (filter condition clause)

Answer: A

Q569. A subquery is:

- A. A query that modifies existing data
- B. A query that creates new table objects
- C. A stored procedure in the database
- D. A query nested inside another query

Answer: D

Q570. The BETWEEN operator selects values:

- A. Within a given inclusive range
- B. Outside a specified range only
- C. That are NULL valued entries
- D. Equal to a single specific value

Answer: A

Q571. A materialized view differs from a regular view in that it:

- A. Cannot be refreshed or updated at all
- B. Physically stores the result set on disk
- C. Is always virtual and never materialized
- D. Does not use SELECT queries for data

Answer: B

Q572. Window functions in SQL are used to:

- A. Delete rows from tables based on specified filtering conditions
- B. Create new tables by defining their schema and column structures
- C. Perform calculations across a set of rows related to the current row
- D. Modify table structure by adding or removing column definitions

Answer: C

Q573. The ROW_NUMBER() function in SQL:

- A. Deletes duplicate rows from the result set of the current query
- B. Returns the primary key value from the underlying data table
- C. Assigns a unique sequential number to each row within a partition
- D. Counts the total number of rows stored in the entire data table

Answer: C

Q574. A Common Table Expression (CTE) is:

- A. A trigger that fires automatically in response to a data change
- B. A stored procedure that encapsulates reusable database SQL logic
- C. A permanent table that persists after the query has been executed
- D. A temporary named result set used within a single SQL statement

Answer: D

Q575. The RANK() function differs from ROW_NUMBER() in that:

- A. RANK() never produces ties in the ranking of any result set rows
- B. RANK() assigns the same rank to ties and skips subsequent ranks
- C. ROW_NUMBER() handles ties by assigning them the same rank value
- D. They are identical and produce exactly the same results always

Answer: B

Q576. A recursive CTE is used for:

- A. Querying hierarchical or recursive data structures
- B. Creating indexes on one or more table columns
- C. Optimizing joins between tables in the query
- D. Dropping tables from the database permanently

Answer: A

Q577. The SAVEPOINT statement in SQL:

- A. Commits the transaction and makes all changes fully permanent
- B. Starts a new transaction and initializes all session variables
- C. Creates a point within a transaction to which you can roll back
- D. Drops a table and removes it permanently from the data schema

Answer: C

Q578. An INSTEAD OF trigger:

- A. Executes after the triggering action ends
- B. Never executes regardless of the trigger
- C. Executes before the triggering action runs
- D. Executes in place of the triggering action

Answer: D

Q579. The MERGE statement in SQL combines:

- A. Only DDL operations such as CREATE, ALTER, and DROP tables
- B. Only INSERT and DELETE operations without any UPDATE logic
- C. Only SELECT operations for querying data from source tables
- D. INSERT, UPDATE, and DELETE operations based on a condition

Answer: D

Q580. What is a sequence in SQL?

- A. A type of trigger that fires on data modification
- B. An object that generates sequential numeric values
- C. An ordered view of data filtered by a set condition
- D. A sorted table arranged by a specific column value

Answer: B

Q581. Boyce-Codd Normal Form (BCNF) is stricter than 3NF because:

- A. Every determinant must be a candidate key
- B. It allows partial dependencies on some keys
- C. It requires no functional dependencies at all
- D. It requires only atomic values in each field

Answer: A

Q582. A relation in BCNF is always in:

- A. 4NF
- B. 1NF
- C. 5NF
- D. 3NF

Answer: D

Q583. A multivalued dependency X '!' Y exists when:

- A. Y is a primary key attribute that uniquely identifies every tuple
- B. A set of values of Y is determined by X, independent of other attributes
- C. X functionally determines Y through a standard functional dependency
- D. No dependency exists between the attributes X and Y in the relation

Answer: B

Q584. Fourth Normal Form (4NF) requires:

- A. No functional dependencies of any kind in the schema
- B. BCNF and no non-trivial multivalued dependencies
- C. All attributes serve as keys in the relation structure
- D. Only 1NF without any additional constraints applied

Answer: B

Q585. A lossless join decomposition ensures that:

- A. Some data is always permanently lost during the decomposition process
- B. Joining the decomposed relations reproduces the original relation exactly
- C. Extra spurious tuples are generated when joining decomposed relations
- D. Only key attributes are preserved in the decomposed relation fragments

Answer: B

Q586. Which normal form deals with join dependencies?

- A. Third Normal Form (3NF)
- B. First Normal Form (1NF)
- C. Second Normal Form (2NF)
- D. Fifth Normal Form (5NF)

Answer: D

Q587. Armstrong's axiom of reflexivity states:

- A. If X determines Y, then XZ determines YZ for any Z
- B. If Y is a subset of X, then X determines Y
- C. If X determines Y and Y determines Z, then X determines Z
- D. If X determines Y, then Y also determines X always

Answer: B

Q588. Armstrong's axiom of augmentation states:

- A. If X determines Y and Y determines Z, then X determines Z
- B. If X determines Y, then Y also determines X in reverse
- C. If X determines Y, then XZ determines YZ for any attribute Z
- D. If Y is a subset of X, then X functionally determines Y

Answer: C

Q589. The canonical (minimal) cover of a set of FDs:

- A. Is always empty regardless of the original dependency set
- B. Contains all possible FDs derivable from the original set
- C. Has maximum redundancy among all its functional dependencies
- D. Has no redundant dependencies and no extraneous attributes

Answer: D

Q590. A dependency-preserving decomposition ensures that:

- A. All original functional dependencies can be enforced without joining decomposed tables
- B. All tables in the decomposition must have exactly the same schema and attributes
- C. Joins are never needed between any of the resulting decomposed relation fragments
- D. Some functional dependencies are always lost during the process of decomposition

Answer: A

Q591. A serial schedule is one where:

- A. Only one transaction is allowed in the database system total
- B. Operations are randomly ordered across multiple transactions
- C. Transactions execute one after another without interleaving
- D. Transactions execute concurrently with operations interleaved

Answer: C

Q592. A serializable schedule is:

- A. A schedule whose result is equivalent to some serial schedule
- B. A schedule where all transactions run simultaneously at once
- C. A schedule that is always a serial schedule by definition
- D. A schedule with no transactions present within its timeline

Answer: A

Q593. Conflict serializability is tested using:

- A. Hash table (bucket-based structure)
- B. B-tree index (balanced tree structure)
- C. ER diagram (entity relationship model)
- D. Precedence graph (serialization graph)

Answer: D

Q594. Two operations conflict if:

- A. They belong to different transactions, access the same data item, and at least one is a write
- B. They are both read operations accessing the same data item from within different transactions
- C. They belong to the same transaction and access different data items within the transaction
- D. They access different data items from different transactions without any write operations

Answer: A

Q595. A dirty read occurs when:

- A. No read operation occurs between any concurrent transactions
- B. A transaction reads data that it has written by itself before
- C. A transaction reads data written by an uncommitted transaction
- D. A transaction reads data that has already been fully committed

Answer: C

Q596. A non-repeatable read occurs when:

- A. No read operation is performed during the entire transaction
- B. All reads from a transaction return the same consistent value
- C. A transaction reads a value once and never accesses it again
- D. A transaction reads the same item twice and gets different values

Answer: D

Q597. A phantom read occurs when:

- A. A transaction re-executes a query and finds new rows added by another transaction
- B. A transaction reads no rows at all from the table during its entire execution
- C. A transaction creates a table and populates it with data from another data source
- D. A transaction deletes rows from the table and those changes are then committed

Answer: A

Q598. The READ UNCOMMITTED isolation level allows:

- A. No anomalies of any kind during transaction processing
- B. Dirty reads, non-repeatable reads, and phantom reads
- C. Only phantom reads but prevents all other read anomalies
- D. Only non-repeatable reads but prevents all dirty reads

Answer: B

Q599. The SERIALIZABLE isolation level provides:

- A. Complete isolation from other transactions
- B. Only dirty read prevention mechanism
- C. Faster performance than other levels
- D. No isolation between any transactions

Answer: A

Q600. A cascading rollback occurs when:

- A. No rollback is needed because every transaction completes without any failures
- B. Only one transaction rolls back while all other transactions continue normally
- C. One transaction's rollback forces other dependent transactions to also roll back
- D. All transactions commit successfully without any errors during their execution

Answer: C

Q601. Strict Two-Phase Locking requires that:

- A. No locks are needed for any transaction under this locking protocol
- B. Only shared locks are used and exclusive locks are never acquired
- C. All exclusive locks are held until the transaction commits or aborts
- D. Locks can be released at any time during the transaction processing

Answer: C

Q602. Rigorous Two-Phase Locking requires:

- A. Locks are released immediately after each individual use
- B. All locks (shared and exclusive) are held until commit or abort
- C. Only exclusive locks are held until the transaction commits
- D. No growing phase exists in this locking protocol at all

Answer: B

Q603. A wait-die deadlock prevention scheme:

- A. Allows younger transactions to wait; older ones are rolled back
- B. Allows older transactions to wait; younger ones are rolled back
- C. Prevents all waiting by immediately aborting every transaction
- D. Kills all transactions to resolve and prevent deadlock situations

Answer: B

Q604. A wound-wait deadlock prevention scheme:

- A. All transactions wait without any preemption at all now
- B. No preemption occurs under any circumstances in the system
- C. Older transactions preempt younger ones; younger ones wait
- D. Younger transactions preempt older ones; older ones wait

Answer: C

Q605. A deadlock detection algorithm uses:

- A. A hash table index
- B. A wait-for graph
- C. An ER diagram model
- D. A B-tree structure

Answer: B

Q606. Timestamp-based concurrency control assigns:

- A. Random access to data items without any order
- B. Locks to all data items accessed by transactions
- C. A unique timestamp to each transaction for ordering
- D. Priority based on the size of each transaction

Answer: C

Q607. In timestamp ordering, if a transaction tries to write a data item with a later read timestamp:

- A. The data item gets deleted
- B. The transaction is rolled back
- C. The read timestamp is updated
- D. The write proceeds normally

Answer: B

Q608. Optimistic concurrency control assumes that:

- A. Conflicts are frequent and locks must always be acquired
- B. All transactions conflict and none can proceed at once
- C. No validation is needed at any point during processing
- D. Conflicts are rare, so validation is done at commit time

Answer: D

Q609. The three phases of optimistic concurrency control are:

- A. Start, Process, End
- B. Read, Validation, Write
- C. Read, Write, Commit
- D. Lock, Execute, Unlock

Answer: B

Q610. Lock granularity refers to:

- A. The number of transactions in the system
- B. The type of query being currently executed
- C. The size of the data item that is locked
- D. The speed of acquiring locks on the item

Answer: C

Q611. Deferred update (no-undo/redo) recovery technique:

- A. Requires neither undo nor redo operations during the recovery process
- B. Writes changes immediately and may need undo for uncommitted changes
- C. Does not write changes to disk until commit, so undo is never needed
- D. Does not use a log file for recording any of the transaction changes

Answer: C

Q612. Immediate update recovery technique:

- A. Does not use a log file for any of the transaction record entries
- B. Writes changes only after commit, requiring only redo operations
- C. Requires only redo operations during the crash recovery process
- D. Writes changes to disk before commit, requiring both undo and redo

Answer: D

Q613. Shadow paging recovery technique:

- A. Maintains two page tables: current and shadow
- B. Requires checkpoints at all times to function
- C. Uses only a log file for the recovery process
- D. Cannot handle any system crashes that may occur

Answer: A

Q614. After a crash, which transactions need to be redone?

- A. All transactions regardless of their commit state now
- B. Committed transactions whose changes may not be on disk
- C. Uncommitted transactions that were active during crash
- D. Only aborted transactions that failed before the crash

Answer: B

Q615. After a crash, which transactions need to be undone?

- A. All transactions regardless of their state at the time of the crash
- B. No transactions need to be undone during the recovery after a crash
- C. Transactions that were active (not committed) at the time of crash
- D. Committed transactions that completed successfully before the crash

Answer: C

Q616. The ARIES recovery algorithm stands for:

- A. Automated Recovery and Integrity Enforcement System
- B. Advanced Recovery and Index Enhancement System
- C. Algorithm for Redo and Integrity Evaluation System
- D. Algorithm for Recovery and Isolation Exploiting Semantics

Answer: D

Q617. ARIES uses which three phases during recovery?

- A. Scan, Parse, Execute
- B. Analysis, Redo, Undo
- C. Lock, Execute, Unlock
- D. Read, Write, Commit

Answer: B

Q618. A log sequence number (LSN) is:

- A. The total number of active transactions
- B. A type of lock used in concurrency control
- C. The size of the log file on stable storage
- D. A unique identifier for each log record

Answer: D

Q619. Fuzzy checkpointing differs from standard checkpointing in that:

- A. No log entry is written to record the occurrence of the checkpoint
- B. The database does not need to stop processing during the checkpoint
- C. All processing must stop completely during the checkpoint operation
- D. It occurs only once during the entire lifetime of the database

Answer: B

Q620. Physiological logging means:

- A. Log records describe changes at the page level with logical operations within the page
- B. Only logical operation names are logged without any reference to the physical pages
- C. Only physical byte-level changes are logged for each modification to the data pages
- D. No logging occurs at all for any modification made to the database during processing

Answer: A

Q621. In a B+ tree of order n , an internal node can have at most:

- A. $n+1$ keys in the node
- B. n keys and n children
- C. n children and $n-1$ keys
- D. $2n$ children in total

Answer: C

Q622. The height of a B+ tree with n records and order p is approximately:

- A. $p \cdot \log(n)$
- B. $n \cdot p$
- C. $\log_p(n)$
- D. n / p

Answer: C

Q623. Static hashing has which disadvantage?

- A. Fixed number of buckets may lead to overflow as data grows
- B. It requires B+ trees to function as the base structure
- C. It is too slow for any practical database use case at all
- D. It cannot handle any data stored in the database tables

Answer: A

Q624. Extendible hashing handles growth by:

- A. Deleting old records to make room for new data entries
- B. Using a B+ tree instead of hashing for the index data
- C. Increasing the number of hash functions used for keys
- D. Doubling the directory and splitting buckets as needed

Answer: D

Q625. Linear hashing handles growth by:

- A. Using a fixed number of buckets without any changes
- B. Splitting all buckets simultaneously at the same time
- C. Splitting buckets in a linear order, one at a time
- D. Never splitting any buckets regardless of the load

Answer: C

Q626. A composite index is an index on:

- A. A stored procedure reference
- B. Two or more columns combined
- C. A view of the base table data
- D. A single column of the table

Answer: B

Q627. A covering index is one that:

- A. Indexes all tables in the database regardless of whether they need indexing
- B. Has no columns included in it and serves no purpose for query optimization
- C. Covers only the primary key column and does not include any other attributes
- D. Contains all columns needed to satisfy a query without accessing the base table

Answer: D

Q628. A bitmap index is most efficient for:

- A. Primary key columns that uniquely identify each row
- B. Columns with unique values that never repeat at all
- C. Columns with high cardinality (many distinct values)
- D. Columns with low cardinality (few distinct values)

Answer: D

Q629. An index-organized table (IOT) stores:

- A. Data separately from all index structures created
- B. Data only in memory without disk-based persistence
- C. Data directly in the index structure (B+ tree)
- D. Data in flat files without any indexing structures

Answer: C

Q630. The term fan-out in a B+ tree refers to:

- A. The number of records stored in the entire data file
- B. The maximum number of pointers (children) in a node
- C. The number of leaf nodes at the bottom of the tree
- D. The total height of the tree from root to leaf level

Answer: B

Q631. Sort-Merge Join works by:

- A. Using a full table scan on both relations without any index use
- B. Sorting both relations on the join attribute and then merging them
- C. Creating a hash table on one relation and probing with the other
- D. Using nested loops to compare every tuple in both the relations

Answer: B

Q632. Hash Join works by:

- A. Nested iteration comparing every pair of tuples from relations
- B. Sorting both relations on the join attribute and merging results
- C. Using indexes on both tables to find matching join attributes
- D. Building a hash table on one relation and probing with the other

Answer: D

Q633. An index nested loop join uses:

- A. No index at all on either of the two relations being joined here
- B. An index on the inner relation to find matching tuples efficiently
- C. An index on the outer relation only for scanning its tuple values
- D. A full scan of both relations without using any index structures

Answer: B

Q634. Pushing selections down in a query tree:

- A. Increases the size of intermediate results
- B. Removes selections entirely from the plan
- C. Has no effect on the intermediate results
- D. Reduces the size of intermediate results

Answer: D

Q635. Materialization in query processing means:

- A. Not storing any intermediate results and processing everything in one single pass
- B. Using only indexes to process the query without accessing the base table data
- C. Computing and storing the result of each operation before passing it to the next
- D. Only computing the final result without evaluating any intermediate operations

Answer: C

Q636. Pipelining in query processing means:

- A. Processing operations one at a time in a strict sequential fashion
- B. Storing all intermediate results on disk before the next operation
- C. Passing tuples from one operation to the next as they are produced
- D. Using only a single CPU core for all database query computations

Answer: C

Q637. The catalog statistics used by a cost-based optimizer include:

- A. Only the table name without any other statistical information
- B. Only the primary key definition of each table in the catalog
- C. Number of tuples, number of distinct values, number of blocks
- D. Only column names without cardinality or distribution details

Answer: C

Q638. Heuristic optimization rules include:

- A. Perform joins before selections and projections always
- B. Always use Cartesian products first before other joins
- C. Perform selections and projections as early as possible
- D. Avoid using indexes for any data retrieval operations

Answer: C

Q639. The join ordering problem in query optimization refers to:

- A. Ordering rows within a single table by a specific column
- B. Ordering columns in a table based on their data type size
- C. Determining the most efficient order to join multiple tables
- D. Sorting query results in ascending or descending sequence

Answer: C

Q640. Dynamic programming is used in query optimization for:

- A. Creating tables and defining column data types
- B. Parsing SQL queries into abstract syntax trees
- C. Managing locks in the concurrency control layer
- D. Finding the optimal join order for multiple tables

Answer: D

Q641. Mandatory Access Control (MAC) is based on:

- A. Security labels and clearance levels assigned to subjects and objects
- B. User discretion in deciding who can access which database objects
- C. No access control at all with every user having full open access
- D. Role assignments only without any additional security label checks

Answer: A

Q642. Discretionary Access Control (DAC) allows:

- A. Data owners to grant and revoke access to other users
- B. No access control with all data open to every user
- C. Access based on security clearance only in the system
- D. Only the DBA to control access to all database objects

Answer: A

Q643. Role-Based Access Control (RBAC) assigns privileges to:

- A. Individual users only without grouping
- B. Queries only without role management
- C. Tables only without any user control
- D. Roles, which are then assigned to users

Answer: D

Q644. The Bell-LaPadula model enforces:

- A. Only read access controls without write restrictions
- B. No read-up and no write-down rules for confidentiality
- C. No rules at all for controlling information access
- D. Only write access controls without read restrictions

Answer: B

Q645. Data masking in database security:

- A. Encrypts entire databases for secure data storage
- B. Deletes all data from the tables in the database
- C. Replaces sensitive data with realistic but fake data
- D. Creates copies of data for backup and recovery use

Answer: C

Q646. A view can provide security by:

- A. Deleting sensitive records from the database tables
- B. Encrypting all data stored in the underlying tables
- C. Creating new tables with restricted column schemas
- D. Restricting which columns and rows a user can see

Answer: D

Q647. Virtual Private Database (VPD) provides:

- A. Only audit logging without any enforcement of access policies
- B. Column-level encryption only without any row-level restrictions
- C. No security features of any kind for the database application
- D. Row-level security by automatically adding conditions to queries

Answer: D

Q648. Transparent Data Encryption (TDE) encrypts:

- A. Query results only sent to clients
- B. Log files only on the disk storage
- C. Data in transit only on the network
- D. Data at rest on the storage media

Answer: D

Q649. Database activity monitoring (DAM) is used to:

- A. Optimize storage allocation across available disk partitions
- B. Speed up queries by caching frequently accessed data in memory
- C. Create backups of the database on a scheduled periodic basis
- D. Monitor and record database activity in real-time for security

Answer: D

Q650. The GRANT OPTION in SQL allows:

- A. Creating tables and views in the database schema at will
- B. Revoking all privileges from every user in the database
- C. Deleting databases and all their data from the server
- D. A grantee to further grant the same privilege to other users

Answer: D

Q651. The two-phase commit (2PC) protocol ensures:

- A. Only read operations complete
- B. No atomicity guarantees at all
- C. Only local transaction atomicity
- D. Atomicity of distributed transactions

Answer: D

Q652. In the 2PC protocol, the coordinator first sends:

- A. A prepare (vote) message to all participants
- B. A commit message directly to all the sites
- C. An abort message to cancel the transaction
- D. A query to all participants for data first

Answer: A

Q653. If any participant votes No in 2PC, the coordinator:

- A. Ignores the vote and proceeds with commit
- B. Sends an abort message to all participants
- C. Retries the transaction automatically again
- D. Sends a commit message to all participants

Answer: B

Q654. A distributed query involves:

- A. No data access from any site at all
- B. Only local data access on one site
- C. Accessing data from a single table
- D. Accessing data from multiple sites

Answer: D

Q655. The CAP theorem states that a distributed system can guarantee at most:

- A. Two of three: Consistency, Availability, Partition Tolerance
- B. None of these properties can be guaranteed in any system
- C. Only one property out of the three possible in the theorem
- D. All three properties at the same time without any trade-offs

Answer: A

Q656. Semi-join optimization in distributed queries:

- A. Increases data transfer by sending all records across the link
- B. Uses full Cartesian products between all fragments in the join
- C. Reduces data transfer by sending only relevant join attributes
- D. Eliminates all joins from the distributed query execution plan

Answer: C

Q657. Mixed fragmentation combines:

- A. No fragmentation is used at all
- B. Only vertical fragmentation types
- C. Horizontal and vertical fragmentation
- D. Only horizontal fragmentation types

Answer: C

Q658. Full replication means:

- A. Every site has a complete copy of the entire database
- B. No replication exists at any site in the system at all
- C. Only one site has the data and others have no copies
- D. Data is partially replicated at only a few of sites

Answer: A

Q659. The blocking problem in 2PC occurs when:

- A. No failures occur during the execution of the two-phase commit protocol
- B. The coordinator fails after sending prepare but before sending the decision
- C. All participants commit successfully without any failures in the protocol
- D. The network is fast and reliable with no message delays or lost packets

Answer: B

Q660. Distributed deadlock detection is more complex because:

- A. All transactions are local and never span multiple sites
- B. Deadlocks can involve transactions at multiple sites
- C. Deadlocks never occur in distributed database systems
- D. Only one site has transactions running at any time

Answer: B

Q661. The BASE properties in NoSQL stand for:

- A. Batch Analysis, Stable Environment for data processing
- B. Binary Access, Sequential Evaluation of stored records
- C. Basic Access, Secure Entry with authentication support
- D. Basically Available, Soft state, Eventually consistent

Answer: D

Q662. NoSQL databases typically favor:

- A. Strong consistency over availability in all distributed environments
- B. Availability and partition tolerance over strong consistency (AP in CAP)
- C. Neither availability nor consistency for distributed data systems
- D. Only consistency without any consideration for availability at all

Answer: B

Q663. Sharding in NoSQL databases refers to:

- A. Compressing data to reduce storage on each server node
- B. Horizontally partitioning data across multiple servers
- C. Vertically splitting a table into separate column groups
- D. Encrypting data before storing it on distributed servers

Answer: B

Q664. MongoDB stores data in which format?

- A. CSV (Comma Separated)
- B. Plain text (Flat file)
- C. XML (Markup Language)
- D. BSON (Binary JSON)

Answer: D

Q665. In MongoDB, a collection is analogous to:

- A. A column in a relational database
- B. A database in a relational system
- C. A table in a relational database
- D. A row in a relational database

Answer: C

Q666. MapReduce in NoSQL is used for:

- A. Managing transactions and ensuring ACID properties on the data
- B. Creating indexes on columns for improving data retrieval speed
- C. Single-record queries for retrieving individual data items fast
- D. Processing large datasets in parallel across distributed systems

Answer: D

Q667. Which NoSQL database type is best for social network relationship queries?

- A. Key-value store
- B. Document database
- C. Column-family store
- D. Graph database

Answer: D

Q668. Denormalization in NoSQL is common because:

- A. It reduces storage requirements on each server in cluster
- B. It enforces referential integrity between related records
- C. It avoids expensive joins and improves read performance
- D. It simplifies updates by reducing the number of writes

Answer: C

Q669. Apache HBase is built on top of:

- A. MongoDB
- B. Redis
- C. Hadoop HDFS
- D. MySQL

Answer: C

Q670. Eventual consistency in NoSQL means:

- A. No consistency is guaranteed between replicas at any point in time whatsoever
- B. Data is never consistent across replicas regardless of the time that passes
- C. All reads always return the latest written value from any replica in the cluster
- D. All replicas will converge to the same state given enough time without new updates

Answer: D

Q671. The snowflake schema extends the star schema by:

- A. Removing dimension tables from the schema completely
- B. Adding more fact tables to handle additional measures
- C. Normalizing dimension tables into sub-dimension tables
- D. Denormalizing all tables into one single flat structure

Answer: C

Q672. Roll-up in OLAP means:

- A. Drilling down to see more detailed level of data
- B. Selecting a specific dimension value for filtering
- C. Aggregating data to a higher level of summarization
- D. Rotating the data cube axes for a different view

Answer: C

Q673. Drill-down in OLAP means:

- A. Rotating the data cube to view a different perspective
- B. Navigating from summarized data to more detailed data
- C. Aggregating data to higher levels of summarization
- D. Removing dimensions from the cube for simplification

Answer: B

Q674. Slice operation in OLAP:

- A. Selects a single value for one dimension, creating a sub-cube
- B. Aggregates all dimensions into one single summary result
- C. Selects multiple values for multiple dimensions simultaneously
- D. Rotates the cube to provide an alternative data perspective

Answer: A

Q675. Dice operation in OLAP:

- A. Selects a single dimension value for data filtering
- B. Rotates the cube axes for an alternative data view
- C. Selects specific values for two or more dimensions
- D. Aggregates data across all available dimension types

Answer: C

Q676. Pivot (rotate) in OLAP:

- A. Deletes a dimension from the cube structure entirely
- B. Rotates the data axes to provide an alternative view
- C. Merges cubes from different source data warehouses
- D. Adds new data records into the existing data cube

Answer: B

Q677. MOLAP (Multidimensional OLAP) stores data in:

- A. A multidimensional array (cube) structure
- B. Key-value stores for fast data retrieval
- C. Flat files stored on the file system disk
- D. Relational tables with rows and columns

Answer: A

Q678. ROLAP (Relational OLAP) stores data in:

- A. Relational database tables
- B. Flat files on disk storage
- C. NoSQL database documents
- D. Multidimensional arrays

Answer: A

Q679. Association rule mining discovers:

- A. Database schemas and their normalization structure in the system
- B. Index structures and their configuration for faster data access
- C. Relationships between items (e.g., items frequently bought together)
- D. SQL queries and their execution plans for optimized performance

Answer: C

Q680. The Apriori algorithm is used in data mining for:

- A. Finding frequent itemsets and association rules
- B. Classification of records into known classes
- C. Regression analysis on continuous value data
- D. Clustering data into groups of similar items

Answer: A

Q681. What distinguishes logical data independence from physical data independence?

- A. Logical is used in NoSQL while physical is used in relational databases only
- B. Logical shields from schema changes while physical shields from storage changes
- C. Logical handles storage changes while physical handles schema modifications
- D. Logical applies to queries while physical applies to transactions exclusively

Answer: B

Q682. Which mapping exists between the external and conceptual schema levels?

- A. External-internal mapping
- B. External-conceptual mapping
- C. Schema-instance mapping
- D. Conceptual-internal mapping

Answer: B

Q683. In the three-schema architecture, the conceptual level describes:

- A. Individual user views of specific data subsets
- B. How data is physically stored on disk devices
- C. The overall logical structure of the database
- D. The network protocols used for data transfer

Answer: C

Q684. Which type of database language handles data access permissions?

- A. Data Control Language handles permissions
- B. Data Definition Language handles permissions
- C. Transaction Control Language handles them
- D. Data Manipulation Language handles them

Answer: A

Q685. What is the difference between a database schema and a database state?

- A. Schema is the data values while state is the structure definition
- B. Schema applies to queries while state applies to transactions only
- C. Schema is the structure definition while state is the current data
- D. Schema is temporary storage while state is permanent data storage

Answer: C

Q686. Which of the following best describes program-data independence?

- A. Program logic is separated from the data structure definitions
- B. Programs and data are stored on the same physical disk drives
- C. Data files are independent of the operating system platform used
- D. Programs automatically generate data without user intervention

Answer: A

Q687. What is the self-describing nature of a database system?

- A. The system generates documentation without any user involvement
- B. The system repairs itself when errors are automatically detected
- C. The system contains both data and its own metadata description
- D. The system creates backups at regular predetermined time intervals

Answer: C

Q688. Which database model was the first to be widely commercially adopted?

- A. Hierarchical data model
- B. Object-oriented model
- C. Network data model
- D. Relational data model

Answer: A

Q689. What is the purpose of a database catalog?

- A. To compress data for efficient disk storage
- B. To maintain metadata about database objects
- C. To store actual user data records in tables
- D. To provide backup copies of all user data

Answer: B

Q690. Which characteristic differentiates a DBMS from a traditional file system?

- A. DBMS cannot handle concurrent access but file systems can do it
- B. DBMS supports data abstraction while file systems do not offer it
- C. DBMS uses flat files while file systems use structured tables
- D. DBMS requires less memory than file systems for similar data sets

Answer: B

Q691. In a three-tier architecture, what role does the application server play?

- A. It serves as intermediary between client and database
- B. It only handles user interface rendering on screen
- C. It manages the operating system kernel processes
- D. It directly stores data in physical database files

Answer: A

Q692. What advantage does a parallel database architecture provide?

- A. Simplified system administration with fewer components
- B. Improved query performance through concurrent processing
- C. Reduced hardware costs compared to single server systems
- D. Elimination of the need for any backup or recovery plan

Answer: B

Q693. Which component of DBMS architecture handles authorization checks?

- A. File manager component
- B. Buffer manager component
- C. Disk space manager component
- D. Authorization manager component

Answer: D

Q694. What is the shared-nothing architecture in parallel databases?

- A. All processors share a common memory and disk pool
- B. Each processor has its own private memory and disk
- C. All processors share memory but have private disk units
- D. Each processor has private memory but shares all disks

Answer: B

Q695. How does connection pooling improve database performance?

- A. By encrypting all data connections between nodes
- B. By compressing data packets sent over the network link
- C. By duplicating queries across multiple server instances
- D. By reusing existing connections instead of creating new

Answer: D

Q696. What distinguishes embedded database systems from server-based ones?

- A. Embedded systems only work with object-oriented languages
- B. Embedded systems require dedicated server hardware always
- C. Embedded systems support more concurrent users overall
- D. Embedded systems run within the application process itself

Answer: D

Q697. In DBMS architecture, what does the disk manager handle?

- A. Allocating and managing space on storage devices
- B. Rendering graphical interfaces for database users
- C. Parsing and optimizing SQL queries for execution
- D. Managing user sessions and authentication tokens

Answer: A

Q698. What is the benefit of a shared-disk architecture in clusters?

- A. Data is automatically replicated to every single node
- B. Any node can access any data on the shared storage
- C. Each node operates with completely independent data
- D. No network communication is needed between the nodes

Answer: B

Q699. Which architectural approach best supports database scalability?

- A. Single monolithic server with maximum hardware resources
- B. Standalone desktop database with local file storage only
- C. Distributed architecture with horizontal partitioning used
- D. Centralized file-based system with sequential data access

Answer: C

Q700. What is the purpose of the catalog manager in DBMS?

- A. To maintain and provide access to system metadata
- B. To manage physical disk read and write operations
- C. To encrypt data before transmission over networks
- D. To handle user interface rendering for the client

Answer: A

Q701. What is a weak entity in the ER model?

- A. An entity that cannot participate in any relationships
- B. An entity that depends on another entity for identity
- C. An entity that contains only a single attribute value
- D. An entity that has its own unique primary key defined

Answer: B

Q702. How does the network data model differ from the hierarchical model?

- A. Network model has no relationships while hierarchical has them
- B. Network model only supports one-to-one cardinality mappings
- C. Network model allows many-to-many while hierarchical does not
- D. Network model uses tables while hierarchical uses trees only

Answer: C

Q703. What is generalization in the Enhanced ER model?

- A. Removing attributes from entities to simplify the schema
- B. Combining entities into a higher-level general entity type
- C. Breaking a general entity into specific subtype entities
- D. Creating relationships between two unrelated entity types

Answer: B

Q704. What is the difference between total and partial participation?

- A. Total is for strong entities while partial is for weak ones
- B. Total applies to attributes while partial applies to entities
- C. Total means some entities participate while partial means all
- D. Total means all entities participate while partial means some

Answer: D

Q705. In the ER model, what is a multivalued attribute?

- A. An attribute that is shared between multiple entities
- B. An attribute that cannot store any null values at all
- C. An attribute with exactly one value for each entity
- D. An attribute with multiple values for a single entity

Answer: D

Q706. What is specialization in the Enhanced ER model?

- A. Removing relationships between entities to reduce complexity
- B. Merging multiple entities into one general supertype entity
- C. Converting attributes into separate independent entity types
- D. Defining subtypes of an entity based on distinguishing traits

Answer: D

Q707. What does a ternary relationship involve in the ER model?

- A. A relationship connecting exactly two entity types together
- B. A relationship with three attributes and no entity types
- C. A relationship connecting an entity type to itself only
- D. A relationship connecting exactly three entity types at once

Answer: D

Q708. What is the object-relational data model?

- A. A model designed exclusively for unstructured text data
- B. A model using only hierarchical tree data structures
- C. A model combining relational and object-oriented features
- D. A model that eliminates the concept of tables entirely

Answer: C

Q709. What is a derived attribute in the ER model?

- A. An attribute that uniquely identifies each entity instance
- B. An attribute whose value is entered manually by users
- C. An attribute that connects two entities in a relationship
- D. An attribute whose value is computed from other attributes

Answer: D

Q710. What does the concept of aggregation address in ER modeling?

- A. Combining multiple attributes into a single composite one
- B. Treating a relationship set as a higher-level entity set
- C. Splitting an entity into multiple independent sub-entities
- D. Removing redundant relationships from the ER diagram view

Answer: B

Q711. What is the difference between a superkey and a candidate key?

- A. A candidate key is a minimal superkey without extra attributes
- B. A superkey cannot contain null values but candidate keys can
- C. A candidate key allows duplicate values but superkeys do not
- D. A superkey is always a single attribute unlike candidate key

Answer: A

Q712. What does entity integrity constraint specifically require?

- A. Primary key attributes cannot contain any null values
- B. Every table must have at least one foreign key defined
- C. All attributes in a table must have default values set
- D. Foreign keys must reference existing primary key values

Answer: A

Q713. What is referential integrity in relational databases?

- A. Each table must have at least two candidate key options
- B. Foreign key values must match existing primary key values
- C. All attributes must have the same domain type definition
- D. Each row must have a unique value in every single column

Answer: B

Q714. What is the cardinality of a relation?

- A. The number of candidate keys defined in the table
- B. The number of tuples or rows currently in the table
- C. The number of attributes or columns in the table
- D. The number of foreign key constraints on the table

Answer: B

Q715. What is a composite key in relational databases?

- A. A key consisting of two or more attributes
- B. A key consisting of a single attribute only
- C. A key that allows null values in all parts
- D. A key that is automatically generated by DBMS

Answer: A

Q716. What is the difference between natural and surrogate keys?

- A. Natural keys are system-generated while surrogate keys are not
- B. Natural keys come from data while surrogate keys are generated
- C. Natural keys are always composite while surrogate ones are not
- D. Natural keys must be numeric while surrogate keys are textual

Answer: B

Q717. What does the closure of a set of functional dependencies represent?

- A. The complete set of all functional dependencies that hold
- B. The total count of candidate keys in a given relation set
- C. The minimal number of attributes needed for a primary key
- D. The maximum number of tuples a relation can store safely

Answer: A

Q718. What is an alternate key in relational databases?

- A. Any attribute that is part of the primary key itself
- B. A foreign key that references a composite primary key
- C. A candidate key that is not chosen as primary key
- D. A key that only exists in temporary database tables

Answer: C

Q719. What does the relational model information principle state?

- A. All information is represented as values in relations
- B. Some data must be stored outside of relation tables
- C. Data can be stored in hierarchical tree structures
- D. Relations can contain duplicate tuples when necessary

Answer: A

Q720. What is a relation schema compared to a relation instance?

- A. Schema defines queries while instance defines storage format
- B. Schema is the data while instance is the structure definition
- C. Schema and instance are always identical in all situations
- D. Schema is the structure while instance is the actual data set

Answer: D

Q721. How does a left outer join differ from a natural join?

- A. Left outer join requires explicit join conditions unlike natural
- B. Left outer join only works on tables with identical schemas
- C. Left outer join excludes all unmatched tuples entirely
- D. Left outer join preserves all tuples from the left relation

Answer: D

Q722. What is the division operation used for in relational algebra?

- A. Splitting a relation into two halves by row count
- B. Calculating arithmetic division on numeric column values
- C. Removing duplicate tuples from a single relation quickly
- D. Finding tuples associated with all values in another set

Answer: D

Q723. What is the equivalence rule for pushing selection through a join?

- A. Selections on attributes of one relation can precede the join
- B. Selections can never be applied before join operations
- C. Selections must always follow projection operations in order
- D. Selections and projections are interchangeable in all cases

Answer: A

Q724. How does semijoin differ from natural join?

- A. Semijoin returns only attributes from one input relation
- B. Semijoin returns attributes from both input relations used
- C. Semijoin does not require any common attributes to operate
- D. Semijoin always produces more tuples than natural join does

Answer: A

Q725. What does the extended projection operation allow?

- A. Arithmetic expressions and renaming in the output columns
- B. Filtering rows based on aggregate function result values
- C. Joining multiple relations without specifying join conditions
- D. Only selecting existing columns from the base relation

Answer: A

Q726. In relational algebra, which operation is NOT a fundamental operation?

- A. Union operation
- B. Selection operation
- C. Intersection operation
- D. Cartesian product

Answer: C

Q727. What is the antijoin operation in relational algebra?

- A. Tuples from left relation that have no match in right
- B. Tuples from right relation that have no match in left
- C. Tuples from both relations that match on join condition
- D. All possible combinations of tuples from both relations

Answer: A

Q728. How is the generalized projection different from standard projection?

- A. It can only select a single column from the relation
- B. It removes the requirement for union compatibility checks
- C. It allows arithmetic operations on attributes in output
- D. It automatically eliminates null values from the results

Answer: C

Q729. What does the grouping operation (gamma) do in extended relational algebra?

- A. It renames the relation and all of its attribute names used
- B. It sorts tuples by a specified attribute in ascending order
- C. It groups tuples and applies aggregate functions to groups
- D. It removes all duplicate tuples from the relation entirely

Answer: C

Q730. What is a full outer join in relational algebra?

- A. A join that only returns tuples from the right side table
- B. A join preserving unmatched tuples from both left and right
- C. A join that produces the Cartesian product without any filter
- D. A join preserving only matching tuples from both relations

Answer: B

Q731. What is the difference between WHERE and HAVING clauses?

- A. WHERE works only with joins while HAVING works with all queries
- B. WHERE is used in DDL while HAVING is used in DML statements
- C. WHERE filters individual rows while HAVING filters groups
- D. WHERE filters after grouping while HAVING filters before it

Answer: C

Q732. Which type of join returns rows only when there is a match in both tables?

- A. Inner join
- B. Right outer join
- C. Left outer join
- D. Full outer join

Answer: A

Q733. What does the GROUP BY clause do in SQL?

- A. Sorts results in descending order by default
- B. Removes duplicate values from a single column only
- C. Limits the number of rows in the result output
- D. Groups rows sharing common values for aggregation

Answer: D

Q734. What is a subquery in SQL?

- A. A query nested inside another SQL query statement
- B. A query that creates a temporary table permanently
- C. A query that runs automatically on a fixed schedule
- D. A query that only works with a single table at once

Answer: A

Q735. What is the purpose of the LIKE operator in SQL?

- A. To perform exact matching on numeric columns only
- B. To perform pattern matching on string column values
- C. To compare two tables for identical structure setup
- D. To join tables based on a common column attribute

Answer: B

Q736. What does the BETWEEN operator do in SQL?

- A. Joins two tables on a specified column attribute
- B. Checks if a value exists in a list of values
- C. Filters values within a specified inclusive range
- D. Sorts results between ascending and descending order

Answer: C

Q737. What is the difference between DELETE and TRUNCATE?

- A. DELETE can use WHERE clause while TRUNCATE removes all rows
- B. DELETE is DDL while TRUNCATE is DML in SQL classification
- C. DELETE is faster than TRUNCATE for large table operations
- D. DELETE removes the table while TRUNCATE only removes rows

Answer: A

Q738. Which aggregate function counts non-null values in a column?

- A. MAX function
- B. AVG function
- C. COUNT function
- D. SUM function

Answer: C

Q739. What does the IN operator do in SQL?

- A. Checks if a value falls within a numeric range
- B. Verifies if a column has null values present
- C. Performs pattern matching on string data values
- D. Checks if a value matches any value in a list

Answer: D

Q740. What is a self-join in SQL?

- A. A join between two completely different database tables
- B. A join that requires no ON clause or condition specified
- C. A join where a table is joined with itself using aliases
- D. A join that automatically matches all columns in tables

Answer: C

Q741. What is the difference between a stored procedure and a function in SQL?

- A. Functions can modify data while procedures cannot modify it
- B. Procedures cannot take parameters while functions always can
- C. Procedures can return values while functions cannot do so
- D. Functions must return a value while procedures need not do

Answer: D

Q742. What is a materialized view and how does it differ from a regular view?

- A. Materialized views store data physically while regular do not
- B. Materialized views cannot be refreshed while regular ones can
- C. Materialized views use less storage than regular views always
- D. Materialized views are always up to date while regular are not

Answer: A

Q743. What are the different types of triggers based on timing?

- A. FAST, MEDIUM, and SLOW trigger performance speed types
- B. BEFORE, AFTER, and INSTEAD OF trigger execution types
- C. START, MIDDLE, and END trigger position location types
- D. FIRST, SECOND, and THIRD trigger priority level types

Answer: B

Q744. What is dynamic SQL and when is it used?

- A. SQL that only works with temporary tables created at runtime
- B. SQL statements constructed and executed at runtime dynamically
- C. SQL that automatically optimizes queries without any user input
- D. SQL embedded directly in application source code at compile

Answer: B

Q745. What is the purpose of a savepoint in SQL transactions?

- A. To lock all tables preventing concurrent access by others
- B. To create a backup of the entire database at that moment
- C. To permanently commit all changes up to that specific point
- D. To mark a point within a transaction for partial rollback

Answer: D

Q746. What is the difference between clustered and non-clustered indexes?

- A. Clustered indexes use more disk space than non-clustered type
- B. Clustered indexes sort table data while non-clustered do not
- C. Clustered indexes are slower than non-clustered for all uses
- D. Clustered indexes cannot be created on primary key columns

Answer: B

Q747. What is a Common Table Expression (CTE) used for?

- A. Creating database users with specific permission levels set
- B. Encrypting sensitive data before storing it in the database
- C. Permanently storing query results in a physical table file
- D. Defining temporary named result sets within a single query

Answer: D

Q748. What does the EXPLAIN command do in SQL?

- A. It describes the structure of a database table in detail
- B. It shows the execution plan for a given SQL query statement
- C. It documents the purpose of stored procedures and functions
- D. It provides help text for all available SQL commands listed

Answer: B

Q749. What is a window function in SQL?

- A. A function that manages database connection windows open
- B. A function that creates graphical windows in applications
- C. A function that performs calculations across row sets
- D. A function that displays query results in separate panels

Answer: C

Q750. What is the purpose of the CASCADE option in DROP TABLE?

- A. It drops the table and all dependent objects together
- B. It only drops the table if it contains no data rows
- C. It converts the table to a view before deletion occurs
- D. It creates a backup before dropping the specified table

Answer: A

Q751. What is a partial dependency in database normalization?

- A. A key attribute depends on a non-key attribute in table
- B. A non-key attribute depends on another non-key attribute
- C. A non-key attribute depends on the entire composite key
- D. A non-key attribute depends on part of a composite key

Answer: D

Q752. What additional requirement does 3NF impose over 2NF?

- A. No transitive dependencies on the primary key column
- B. All tables must have at least two candidate key options
- C. Every attribute must be part of some candidate key set
- D. All attributes must be of the same domain type value

Answer: A

Q753. What is a transitive dependency?

- A. Attribute A depends on a foreign key in another table
- B. Attribute A depends on B which depends on primary key
- C. Attribute A and B both depend on the same primary key
- D. Attribute A depends directly on the primary key only

Answer: B

Q754. How does BCNF differ from 3NF?

- A. BCNF allows transitive dependencies that 3NF does not
- B. BCNF is less restrictive than 3NF for all relations
- C. BCNF requires every determinant to be a candidate key
- D. BCNF only applies to tables with a single candidate key

Answer: C

Q755. What is a multivalued dependency?

- A. An attribute depends on the concatenation of all other ones
- B. One attribute value determines a set of independent values
- C. Two attributes are always equal in every tuple of table
- D. One attribute value determines exactly one other value

Answer: B

Q756. What does the fourth normal form (4NF) address?

- A. Transitive dependencies among non-key attributes used
- B. Join dependencies that cannot be reduced any further
- C. Partial dependencies on the composite primary key
- D. Multivalued dependencies that cause data redundancy

Answer: D

Q757. What is lossless join decomposition?

- A. A decomposition that always results in fewer tables total
- B. A decomposition where some data may be lost permanently
- C. A decomposition where original data can be fully recovered
- D. A decomposition that eliminates all foreign keys from tables

Answer: C

Q758. What is dependency preservation in normalization?

- A. All functional dependencies can be checked within tables
- B. Dependencies are only preserved in the original table form
- C. Dependencies are stored in a separate metadata table file
- D. Some functional dependencies may be lost during the split

Answer: A

Q759. When is denormalization justified in database design?

- A. When read performance is prioritized over write efficiency
- B. When all tables are already in first normal form status
- C. When the database has too few tables for organization
- D. When the database has no functional dependencies at all

Answer: A

Q760. What is the difference between lossless and lossy decomposition?

- A. Lossless recovers original data while lossy creates spurious tuples
- B. Lossless is always faster while lossy requires more processing
- C. Lossless uses more storage while lossy uses compression methods
- D. Lossless adds extra data while lossy preserves original data

Answer: A

Q761. What is a serializable schedule?

- A. A schedule that does not require any concurrency control
- B. A schedule equivalent in result to some serial schedule
- C. A schedule where transactions run in strict serial order
- D. A schedule that allows all types of data conflicts always

Answer: B

Q762. What is the difference between conflict serializability and view serializability?

- A. View serializability allows more schedules than conflict type
- B. Conflict serializability is less restrictive than view type
- C. View serializability requires all transactions to be serial
- D. Conflict serializability only applies to read operations here

Answer: A

Q763. What is a dirty read in transaction processing?

- A. Reading data from a backup file instead of the live database
- B. Reading data written by an uncommitted transaction directly
- C. Reading data from a table that has no index defined on it
- D. Reading data that has been committed by another transaction

Answer: B

Q764. What is a non-repeatable read anomaly?

- A. A transaction reads the same row twice and gets same results
- B. A transaction cannot read any rows because they are all locked
- C. A transaction reads the same row twice and gets different results
- D. A transaction reads rows from a table that does not exist yet

Answer: C

Q765. What is a cascading rollback in transaction management?

- A. Automatically committing all pending transactions at the same time
- B. Rolling back a single transaction without affecting any others
- C. Restarting the database server to clear all active transactions
- D. One transaction rollback causing other transactions to rollback

Answer: D

Q766. What is the write-ahead logging (WAL) protocol?

- A. Neither log records nor data pages need to be written to disk
- B. Log records are written to disk before data pages are flushed
- C. Both log records and data pages are written simultaneously
- D. Data pages are written to disk before log records are made

Answer: B

Q767. What is a recoverable schedule?

- A. A schedule that automatically recovers from all hardware failures
- B. A schedule where no transaction ever needs to be rolled back
- C. A schedule where transactions commit only after dependencies commit
- D. A schedule where all transactions execute in strict serial order

Answer: C

Q768. What are the different transaction isolation levels in SQL?

- A. Read Uncommitted, Read Committed, Repeatable Read, Serializable
- B. Private, Shared, Protected, and Public access levels for data
- C. Fast, Normal, Slow, and Batch processing modes for transactions
- D. Low, Medium, High, and Maximum security levels for transactions

Answer: A

Q769. What is a checkpoint in database recovery?

- A. A point where all current data is deleted from the database
- B. A point where the database schema is backed up to a file
- C. A point where database state is synchronized with the log
- D. A point where new transactions are prevented from starting

Answer: C

Q770. What is a cascadeless schedule?

- A. A schedule allowing transactions to read uncommitted data freely
- B. A schedule where transactions only read data from committed ones
- C. A schedule where all transactions execute without any commits
- D. A schedule that permits cascading rollbacks to occur frequently

Answer: B

Q771. What is the two-phase locking protocol?

- A. Transactions use only shared locks in the first phase entirely
- B. Transactions acquire all locks first then release all at end
- C. Transactions can acquire and release locks in any order freely
- D. Transactions have a growing phase and a shrinking phase

Answer: D

Q772. How does the wait-die scheme handle deadlock prevention?

- A. Younger transactions wait while older ones are rolled back
- B. Older transactions wait while younger ones are rolled back
- C. Transactions are randomly selected for rollback on each conflict
- D. All transactions are rolled back when a conflict is detected

Answer: B

Q773. How does the wound-wait scheme handle deadlock prevention?

- A. Older transactions are rolled back while younger ones wait
- B. Older transactions preempt younger ones while younger wait
- C. Both transactions are always rolled back on any conflict
- D. Transactions are processed strictly in first-come first-served

Answer: B

Q774. What is timestamp-based concurrency control?

- A. Scheduling transactions alphabetically by their name values
- B. Using random numbers to determine transaction execution order
- C. Assigning locks based on the size of each transaction query
- D. Ordering transactions by timestamps to ensure serializability

Answer: D

Q775. What is optimistic concurrency control?

- A. Transactions acquire locks before accessing any data items
- B. Transactions are executed one at a time in serial order only
- C. Transactions always use exclusive locks on all data items used
- D. Transactions proceed without locks and validate before commit

Answer: D

Q776. What is a lock escalation?

- A. Converting an exclusive lock to a shared lock type
- B. Releasing all locks held by a transaction at once
- C. Converting fine-grained locks to coarser-grained locks
- D. Transferring locks from one transaction to another one

Answer: C

Q777. What is the difference between pessimistic and optimistic concurrency control?

- A. Pessimistic uses timestamps while optimistic uses lock-based
- B. Pessimistic locks data preemptively while optimistic validates at commit
- C. Pessimistic allows dirty reads while optimistic prevents all of them
- D. Pessimistic is always faster than optimistic concurrency approaches

Answer: B

Q778. What is intention locking in a multigranularity system?

- A. Locking individual rows before accessing a full table record
- B. Preventing any transaction from acquiring exclusive lock types
- C. Locking the entire database before any transaction can start
- D. Signaling intent to lock at a finer granularity level below

Answer: D

Q779. What is the phantom problem in concurrency control?

- A. A transaction reads data that was never written to database
- B. New rows appear in repeated queries due to concurrent inserts
- C. Data becomes corrupted due to simultaneous write operations
- D. A transaction loses its locks after a network disconnection

Answer: B

Q780. What is multiversion concurrency control (MVCC)?

- A. Maintaining a single version of data with exclusive locking
- B. Maintaining multiple versions of data for concurrent access
- C. Deleting old versions of data immediately after each update
- D. Compressing multiple data versions into a single stored copy

Answer: B

Q781. What is the difference between immediate and deferred database modification?

- A. Immediate writes to log first while deferred writes to disk first
- B. Immediate uses checkpoints while deferred uses log records for data
- C. Immediate only works for read operations while deferred handles writes
- D. Immediate writes changes to disk before commit while deferred waits

Answer: D

Q782. What is shadow paging in database recovery?

- A. Creating shadows of all user queries for later replay at anytime
- B. Maintaining two page tables: current and shadow for safe recovery
- C. Encrypting page data to prevent unauthorized access to records
- D. Duplicating the entire database to a secondary server for backup

Answer: B

Q783. What is the steal/no-steal policy in buffer management?

- A. Steal and no-steal both prevent uncommitted pages from being flushed
- B. No-steal allows uncommitted pages while steal prevents their flushing
- C. Steal allows uncommitted pages to be flushed while no-steal prevents
- D. Steal refers to memory allocation while no-steal refers to disk usage

Answer: C

Q784. What is the force/no-force policy in buffer management?

- A. Force uses redo logging while no-force uses undo logging exclusively
- B. Force writes all pages at checkpoint while no-force writes at commit
- C. Force prevents dirty pages from being flushed while no-force allows
- D. Force requires all pages written at commit while no-force does not

Answer: D

Q785. What is media recovery versus crash recovery?

- A. Media recovery restores from disk failure while crash handles system crash
- B. Media recovery handles software bugs while crash recovery handles disk
- C. Media recovery is faster than crash recovery in all failure situations
- D. Media recovery uses logs while crash recovery uses backups exclusively

Answer: A

Q786. What information does a log record typically contain?

- A. Only the transaction ID and the timestamp of each operation
- B. Only the names of tables that were accessed during the transaction
- C. Only the SQL query text that was executed by the user application
- D. Transaction ID, data item, old value, new value, and operation type

Answer: D

Q787. What is fuzzy checkpointing?

- A. A checkpoint that runs automatically without any administrator control
- B. A checkpoint that allows transactions to continue during the process
- C. A checkpoint that only saves metadata without any actual data pages
- D. A checkpoint that stops all transactions until it completes fully

Answer: B

Q788. What is the purpose of the log sequence number (LSN)?

- A. To assign priority levels to different transactions for scheduling
- B. To uniquely identify and order log records in the transaction log
- C. To measure the physical size of each log record stored on disk
- D. To count the total number of transactions in the database system

Answer: B

Q789. What is a warm backup versus a cold backup?

- A. Cold backup is taken while database is online while warm is offline
- B. Warm backup is taken while database is online while cold is offline
- C. Warm backup only copies logs while cold backup copies entire database
- D. Cold backup is faster than warm backup in all operational scenarios

Answer: B

Q790. What is point-in-time recovery?

- A. Recovering only the tables that were modified since last backup
- B. Recovering the database schema without any of the actual data
- C. Recovering the database to a specific moment before the failure
- D. Recovering the database to its most recent committed state only

Answer: C

Q791. What is the difference between a B-tree and a B+ tree?

- A. B+ tree requires more levels than B-tree for the same data volume
- B. B-tree supports range queries while B+ tree only supports exact match
- C. B+ tree stores data only in leaves while B-tree stores in all nodes
- D. B-tree stores data in leaves only while B+ tree stores in all nodes

Answer: C

Q792. What is a composite index?

- A. An index on a single column of a database table
- B. An index built on two or more columns together
- C. An index that is shared between multiple tables
- D. An index that uses both hash and tree structures

Answer: B

Q793. What is index selectivity and why does it matter?

- A. The time required to create the index on a large data table
- B. The size of the index file compared to the original data file
- C. The ratio of distinct values to total records affecting efficiency
- D. The number of tables that reference a particular index entry

Answer: C

Q794. What is extendible hashing?

- A. A static hash function that never changes bucket count
- B. A hashing technique that eliminates all collision handling
- C. A hash function that only works with string data values
- D. A dynamic hashing scheme that grows and shrinks as needed

Answer: D

Q795. What is a bitmap index best suited for?

- A. Columns with very high cardinality like unique identifiers
- B. Tables that are frequently updated with new data records
- C. Columns with low cardinality like gender or status fields
- D. Queries that require exact match lookups on primary keys

Answer: C

Q796. What is the advantage of a covering index?

- A. It works only with aggregate queries on numeric data types
- B. It automatically updates when the table schema is changed
- C. It satisfies a query entirely without accessing table data
- D. It requires more storage space than a regular index type

Answer: C

Q797. What is linear hashing?

- A. A dynamic hashing scheme that splits buckets incrementally
- B. A hashing scheme that uses a fixed number of buckets always
- C. A hash function that only produces sequential hash values
- D. A hashing technique that stores data in a linear linked list

Answer: A

Q798. What is the difference between static and dynamic hashing?

- A. Static is always faster than dynamic for all query types used
- B. Static uses trees while dynamic uses linear search methods
- C. Static supports range queries while dynamic only supports exact
- D. Static has fixed buckets while dynamic adjusts bucket count

Answer: D

Q799. What is a multi-level index?

- A. An index structure with multiple levels like a tree hierarchy
- B. An index on multiple columns of the same table structure
- C. An index shared across multiple databases on the network
- D. An index that indexes other indexes for circular referencing

Answer: A

Q800. What is the difference between ordered and unordered file organization?

- A. Ordered files use hashing while unordered files use tree indexes
- B. Ordered files cannot be indexed while unordered files always can
- C. Ordered files are stored in RAM while unordered are stored on disk
- D. Ordered files maintain sort order while unordered files do not

Answer: D

Q801. What is the difference between a nested loop join and a hash join?

- A. Hash join only works with equality conditions while nested loop not
- B. Hash join builds a hash table while nested loop iterates through rows
- C. Nested loop is always faster than hash join for all data sizes
- D. Nested loop requires sorted input while hash join does not need it

Answer: B

Q802. What is a merge join and when is it most efficient?

- A. Merge join sorts and merges inputs and is efficient when pre-sorted
- B. Merge join uses nested loops and is efficient for indexed columns
- C. Merge join hashes both inputs and is efficient for small tables
- D. Merge join uses random access and is efficient for all query types

Answer: A

Q803. What is query rewriting in optimization?

- A. Changing the query results to match expected output format
- B. Adding additional columns to the query output automatically
- C. Transforming a query into an equivalent but more efficient form
- D. Replacing all queries with stored procedure calls instead

Answer: C

Q804. What is selectivity estimation in query optimization?

- A. The process of selecting the best join algorithm for queries
- B. The process of selecting which indexes to create on tables
- C. Estimating the total storage required for query result output
- D. Estimating the fraction of rows that satisfy a given condition

Answer: D

Q805. What is the purpose of a histogram in query optimization?

- A. Tracking the number of queries executed over time periods
- B. Displaying query performance metrics to database operators
- C. Providing data distribution information for cost estimation
- D. Graphically showing the structure of the execution plan tree

Answer: C

Q806. What is pipelining in query execution?

- A. Passing results from one operation to the next immediately
- B. Executing all operations in parallel on separate processors
- C. Storing intermediate results to disk before continuing
- D. Repeating operations until the correct result is obtained

Answer: A

Q807. What is materialization in query execution?

- A. Executing all operations in a single pass without stopping
- B. Storing intermediate results temporarily before next step
- C. Deleting temporary tables after query execution completes
- D. Converting query results into a permanent database table

Answer: B

Q808. What is predicate pushdown in query optimization?

- A. Removing all filter conditions to speed up processing time
- B. Duplicating filter conditions across multiple plan operators
- C. Moving filter conditions closer to the data source in plan
- D. Moving filter conditions to the end of the execution plan

Answer: C

Q809. What does the catalog store that helps query optimization?

- A. The source code of all stored procedures and functions used
- B. The network configuration for distributed query processing
- C. Table sizes, column statistics, and index information data
- D. The actual data rows from all database tables and views

Answer: C

Q810. What is a left-deep join tree in query optimization?

- A. A tree where both inputs of each join are intermediate results
- B. A tree where the left input of each join is a base table
- C. A tree where the right input of each join is a base table
- D. A tree where all joins are performed simultaneously in parallel

Answer: C

Q811. What is the difference between discretionary and mandatory access control?

- A. Discretionary allows owner control while mandatory uses labels
- B. Discretionary is managed by system while mandatory by data owner
- C. Discretionary applies to tables while mandatory applies to rows
- D. Discretionary uses encryption while mandatory uses authentication

Answer: A

Q812. What is role-based access control (RBAC)?

- A. Encrypting data based on the role of the user accessing data
- B. Assigning permissions to roles that are then granted to users
- C. Auditing user actions based on their assigned role in system
- D. Assigning permissions directly to each individual user account

Answer: B

Q813. How does parameterized querying prevent SQL injection attacks?

- A. It blocks all user input from being used in SQL queries
- B. It validates user input using regular expressions only here
- C. It encrypts the entire SQL query before sending to server
- D. It separates SQL code from user input preventing injection

Answer: D

Q814. What is transparent data encryption (TDE)?

- A. Encrypting data using user-provided keys for each session
- B. Encrypting data at rest without requiring application changes
- C. Encrypting data only when it is transmitted over a network
- D. Encrypting only the database schema and not the actual data

Answer: B

Q815. What is the principle of least privilege in database security?

- A. Users should share a single account to simplify access control
- B. Users should have only minimum access needed for their tasks
- C. Users should have maximum access to complete tasks efficiently
- D. Users should have temporary access that expires after each day

Answer: B

Q816. What is database masking?

- A. Replacing sensitive data with realistic but fake values shown
- B. Removing all data from a database for security purposes only
- C. Encrypting all database files using symmetric key algorithms
- D. Compressing database tables to obscure the stored data values

Answer: A

Q817. What is a security label in mandatory access control?

- A. A classification assigned to data and users for access rules
- B. A type of encryption key used to protect data at rest only
- C. A log entry recording when data was last accessed by users
- D. A physical tag attached to the database server hardware

Answer: A

Q818. What is the purpose of database activity monitoring?

- A. Managing storage allocation across multiple database disk drives
- B. Optimizing query performance by tracking slow-running queries
- C. Tracking and analyzing database activities for security threats
- D. Scheduling automated backups during off-peak operational hours

Answer: C

Q819. What is column-level security in databases?

- A. Restricting access to specific columns within a table view
- B. Encrypting individual columns using different key algorithms
- C. Restricting access to entire database tables for all users
- D. Compressing specific columns to reduce storage size needed

Answer: A

Q820. What is a virtual private database (VPD)?

- A. A database that is only accessible through a VPN connection
- B. A feature that adds predicates to queries based on user policy
- C. A temporary database created for each user session separately
- D. A database running on a private physical server exclusively

Answer: B

Q821. What is the CAP theorem in distributed databases?

- A. Compression, Authentication, Privacy are the three key goals
- B. Concurrency, Atomicity, Persistence must all be maintained
- C. Consistency, Availability, Performance can all be guaranteed
- D. Consistency, Availability, Partition tolerance: pick two of three

Answer: D

Q822. What is the two-phase commit protocol used for?

- A. Replicating data between primary and secondary server sites
- B. Fragmenting tables into horizontal and vertical data parts
- C. Ensuring atomicity of transactions across distributed sites
- D. Optimizing queries across multiple distributed database sites

Answer: C

Q823. What is the difference between homogeneous and heterogeneous distributed databases?

- A. Homogeneous uses same DBMS at all sites while heterogeneous not
- B. Heterogeneous uses same DBMS at all sites while homogeneous not
- C. Heterogeneous has more data than homogeneous distributed database
- D. Homogeneous stores data at one site while heterogeneous multiple

Answer: A

Q824. What is eventual consistency in distributed systems?

- A. All nodes always have identical data at every single moment
- B. All nodes will converge to the same data state over time
- C. Only the primary node maintains the consistent data state
- D. Data is never consistent across any nodes in the system

Answer: B

Q825. What is a federated database system?

- A. A database system that only supports read-only query operations
- B. An integration of multiple autonomous database systems together
- C. A single database distributed across multiple data centers
- D. A backup system that replicates data to geographically distant

Answer: B

Q826. What is distributed deadlock and how is it detected?

- A. Deadlock involving transactions across multiple sites via graph
- B. Deadlock that only affects read-only transactions across sites
- C. Deadlock that automatically resolves without any intervention
- D. Deadlock that occurs only on a single site in the system

Answer: A

Q827. What is the difference between synchronous and asynchronous replication?

- A. Synchronous only works with two nodes while asynchronous many
- B. Synchronous replicates to all nodes before commit while async not
- C. Asynchronous replicates to all nodes before commit while sync not
- D. Both methods replicate at exactly the same speed and timing

Answer: B

Q828. What is a global schema in a distributed database?

- A. A schema that only exists at the primary coordinator node
- B. A temporary schema created for each distributed query session
- C. A physical schema that defines storage at each individual site
- D. A unified logical view of the entire distributed database

Answer: D

Q829. What is the semi-join operation used for in distributed databases?

- A. Joining all columns from two tables at different remote sites
- B. Splitting a table into horizontal fragments for distribution
- C. Replicating the result of a join across all available sites
- D. Reducing data transfer by sending only relevant join columns

Answer: D

Q830. What is sharding in distributed databases?

- A. Replicating the entire database to every node in the cluster
- B. Encrypting data during transmission between distributed nodes
- C. Compressing data before storing it on distributed server nodes
- D. Partitioning data across nodes where each holds a data subset

Answer: D

Q831. What is the BASE model in NoSQL databases?

- A. Batch Access, Sequential Execution, Cached data approach
- B. Binary Allocation, Sorted Entries, Encrypted data approach
- C. Basically Available, Soft state, Eventually consistent approach
- D. Buffered Access, Static Entries, Compressed data approach

Answer: C

Q832. How does a column-family store differ from a relational table?

- A. Column-family requires a fixed schema like relational tables do
- B. Column-family does not support any form of data querying at all
- C. Column-family groups columns into families with dynamic columns
- D. Column-family stores data in rows like relational tables exactly

Answer: C

Q833. What is the advantage of document databases for hierarchical data?

- A. They require multiple collections for each hierarchy level
- B. They require joins to represent nested data structures
- C. They store nested data naturally within a single document
- D. They flatten all hierarchical data into a single flat table

Answer: C

Q834. What is a graph database best suited for?

- A. Storing large volumes of unstructured text documents only
- B. Storing time-series data from Internet of Things sensors
- C. Processing simple key-value lookups at maximum speed
- D. Modeling and querying highly connected relationship data

Answer: D

Q835. What is eventual consistency in NoSQL systems?

- A. All replicas are always perfectly synchronized at every moment
- B. Consistency is only guaranteed during maintenance windows only
- C. Replicas may temporarily diverge but will converge over time
- D. Data is never consistent across any of the database replicas

Answer: C

Q836. What is data denormalization in NoSQL and why is it used?

- A. Compressing data to reduce storage requirements on disk drives
- B. Removing all redundancy from the data model for efficiency
- C. Encrypting data for security before storing in the database
- D. Duplicating data to avoid expensive join operations at query

Answer: D

Q837. What is the difference between embedded and referenced documents in MongoDB?

- A. Referenced stores related data together while embedded links by ID
- B. Embedded is for read operations while referenced is for write only
- C. Both approaches store data identically with no practical difference
- D. Embedded stores related data together while referenced links by ID

Answer: D

Q838. What is MapReduce in the context of NoSQL databases?

- A. A strategy for backing up NoSQL databases to external storage
- B. A programming model for processing large data sets in parallel
- C. A method for encrypting data stored in NoSQL database systems
- D. A technique for replicating data across multiple server nodes

Answer: B

Q839. What is a wide-column store?

- A. A database that only supports columns with wide text data types
- B. A database that stores each row with exactly the same columns
- C. A database where each row can have different sets of columns
- D. A database where column width is fixed at creation time always

Answer: C

Q840. What is the role of a partition key in NoSQL databases?

- A. It manages user authentication and access control rights
- B. It defines the schema structure for each document record
- C. It determines how data is distributed across cluster nodes
- D. It encrypts data before storing it in the database system

Answer: C

Q841. What is a snowflake schema and how does it differ from a star schema?

- A. Snowflake has no dimension tables while star schema has many
- B. Snowflake normalizes dimension tables while star keeps denormalized
- C. Snowflake has multiple fact tables while star schema has one only
- D. Snowflake is faster for queries while star schema is slower ones

Answer: B

Q842. What is the difference between Extract and Transform phases in ETL?

- A. Extract cleans data while Transform retrieves data from sources
- B. Extract and Transform perform the exact same operations on data
- C. Extract loads data into warehouse while Transform retrieves it
- D. Extract retrieves source data while Transform cleans and converts

Answer: D

Q843. What is a slowly changing dimension (SCD)?

- A. A dimension whose attributes change infrequently over time
- B. A dimension that is updated in real-time with every change
- C. A dimension that never changes after initial data loading
- D. A dimension that is deleted and recreated each data load

Answer: A

Q844. What is the drill-down operation in OLAP?

- A. Moving from detailed data to summarized aggregate level
- B. Sorting data by a specified column in descending order only
- C. Moving from summary data to more detailed granular level
- D. Filtering data to show only records from a specific time

Answer: C

Q845. What is the roll-up operation in OLAP?

- A. Moving from aggregated summary to detailed granular data
- B. Adding new dimension tables to the existing schema design
- C. Deleting old data from the data warehouse storage tables
- D. Moving from detailed data to higher-level aggregated summary

Answer: D

Q846. What is a surrogate key in a data warehouse dimension table?

- A. A natural business key from the source operational system
- B. A composite key made from multiple business attribute columns
- C. A foreign key referencing the primary fact table records
- D. An artificial system-generated key independent of source data

Answer: D

Q847. What is data granularity in a data warehouse?

- A. The frequency at which the data warehouse backup is performed
- B. The level of detail at which data is stored in the warehouse
- C. The total number of dimension tables in the warehouse schema
- D. The level of encryption applied to stored warehouse data

Answer: B

Q848. What is the slice operation in OLAP?

- A. Selecting a single value on one dimension to view data
- B. Aggregating data across all available dimensions at once
- C. Filtering data based on a range of values in a dimension
- D. Rotating the data cube axes to change the perspective view

Answer: A

Q849. What is the dice operation in OLAP?

- A. Rotating the axes of the data cube for different views
- B. Selecting data by filtering on a single dimension value
- C. Aggregating data from the lowest to highest detail level
- D. Selecting a sub-cube by filtering on multiple dimensions

Answer: D

Q850. What is the pivot operation in OLAP?

- A. Filtering data to show only specific dimension values only
- B. Merging two dimension tables into a single combined table
- C. Rotating the data cube axes to get a different perspective
- D. Adding new measures to the existing fact table in warehouse

Answer: C

Q851. Which type of data independence allows changes to the storage structure without affecting the conceptual schema?

- A. Logical data independence
- B. Physical data independence
- C. Schema independence
- D. View independence

Answer: B

Q852. In the three-schema architecture, which schema represents individual user views?

- A. Internal schema
- B. Conceptual schema
- C. External schema
- D. Physical schema

Answer: C

Q853. What is the primary difference between a database and a data warehouse?

- A. A database is for operational data while a data warehouse is for analytical data
- B. A database is larger than a data warehouse
- C. A data warehouse only stores text data
- D. There is no difference between them

Answer: A

Q854. Which DBMS component is responsible for enforcing integrity constraints?

- A. Query optimizer
- B. Integrity constraint manager
- C. Buffer manager
- D. File manager

Answer: B

Q855. What is the purpose of a view in a database system?

- A. To store physical data on disk
- B. To provide a virtual table derived from base tables
- C. To manage network connections
- D. To compile SQL statements

Answer: B

Q856. Which of the following is a characteristic of the relational model?

- A. Data is stored in tree structures
- B. Data is represented as tables with rows and columns
- C. Data must be stored sequentially
- D. Each record must have a parent record

Answer: B

Q857. What role does the data dictionary play in a DBMS?

- A. It stores actual user data
- B. It stores metadata about the database structure
- C. It performs data encryption
- D. It manages user sessions

Answer: B

Q858. Which of the following describes a multi-user DBMS?

- A. A DBMS that runs on a single processor only
- B. A DBMS that allows multiple users to access the database concurrently
- C. A DBMS that stores data in multiple formats
- D. A DBMS limited to read-only access

Answer: B

Q859. What is the difference between intension and extension of a database?

- A. Intension is the schema while extension is the current data
- B. Intension is the data while extension is the schema
- C. Both refer to the same concept
- D. Intension refers to queries while extension refers to indexes

Answer: A

Q860. Which of the following is an example of a DCL command?

- A. CREATE TABLE
- B. SELECT
- C. GRANT
- D. UPDATE

Answer: C

Q861. What is the primary benefit of connection pooling in database architecture?

- A. It encrypts all database connections
- B. It reuses existing connections to reduce overhead of creating new ones
- C. It automatically backs up data
- D. It compresses query results

Answer: B

Q862. In a shared-memory parallel architecture, what is the main bottleneck?

- A. Network bandwidth between nodes
- B. Memory bus contention when many processors access shared memory
- C. Disk storage capacity
- D. Application code complexity

Answer: B

Q863. What is the function of the log manager in DBMS architecture?

- A. It manages user login sessions
- B. It records all database modifications for recovery purposes
- C. It formats query output
- D. It manages network connections

Answer: B

Q864. Which architecture is most suitable for large-scale internet applications?

- A. Single-tier architecture
- B. Two-tier architecture
- C. N-tier or multi-tier architecture
- D. Standalone architecture

Answer: C

Q865. What distinguishes a fat client from a thin client in database architecture?

- A. Fat clients have larger monitors
- B. Fat clients process more application logic locally while thin clients rely on the server
- C. Fat clients use more network bandwidth
- D. There is no real difference

Answer: B

Q866. In DBMS architecture, what does the term 'middleware' refer to?

- A. Hardware between the client and server
- B. Software that connects different applications or system components
- C. The middle table in a database
- D. A type of storage device

Answer: B

Q867. What is the role of the query optimizer in DBMS architecture?

- A. To check SQL syntax
- B. To determine the most efficient execution plan for a query
- C. To store query results
- D. To manage user connections

Answer: B

Q868. What is an embedded database system?

- A. A database that runs within an application process without a separate server
- B. A database stored on embedded hardware only
- C. A database that cannot be queried
- D. A database used only for IoT devices

Answer: A

Q869. In database architecture, what is a stored procedure?

- A. A procedure for physically storing disks
- B. A precompiled collection of SQL statements stored in the database
- C. A method for backing up data
- D. A procedure for installing the DBMS

Answer: B

Q870. What advantage does the three-tier architecture offer over two-tier for security?

- A. It uses stronger encryption algorithms
- B. It adds an intermediate layer that prevents direct client access to the database
- C. It requires fewer passwords
- D. It eliminates the need for firewalls

Answer: B

Q871. What is partial participation in an ER diagram?

- A. All entity instances must participate in the relationship
- B. Some entity instances may not participate in the relationship
- C. The relationship only involves one entity
- D. The entity has no attributes

Answer: B

Q872. How is a weak entity identified in an ER diagram?

- A. By a single rectangle
- B. By a double-bordered rectangle
- C. By a dashed rectangle
- D. By a bold rectangle

Answer: B

Q873. What is a partial key (discriminator) of a weak entity?

- A. A key that uniquely identifies the weak entity globally
- B. An attribute that partially identifies weak entity instances within their owner
- C. A foreign key reference
- D. A candidate key of a strong entity

Answer: B

Q874. In the EER model, what does disjoint specialization mean?

- A. An entity can belong to multiple subclasses simultaneously
- B. An entity can belong to only one subclass at a time
- C. All entities must belong to a subclass
- D. No entity belongs to any subclass

Answer: B

Q875. What is the difference between specialization and generalization in EER?

- A. They are the same process
- B. Specialization is top-down while generalization is bottom-up
- C. Specialization is bottom-up while generalization is top-down
- D. Neither relates to entity hierarchies

Answer: B

Q876. How is a derived attribute represented in an ER diagram?

- A. With a solid oval
- B. With a dashed oval
- C. With a double oval
- D. With an underlined oval

Answer: B

Q877. What is an identifying relationship for a weak entity?

- A. Any relationship the weak entity participates in
- B. The relationship that provides the weak entity with part of its identification
- C. A self-referencing relationship
- D. A many-to-many relationship

Answer: B

Q878. In the ER model, what is a binary relationship?

- A. A relationship involving exactly two entity types
- B. A relationship stored in binary format
- C. A relationship with two attributes
- D. A relationship between an entity and itself

Answer: A

Q879. What does the participation constraint specify in an ER relationship?

- A. The data types of related entities
- B. Whether existence of an entity depends on being related to another entity
- C. The maximum number of entities in a table
- D. The storage format of relationships

Answer: B

Q880. What is an associative entity in ER modeling?

- A. A strong entity with multiple keys
- B. An entity created to resolve a many-to-many relationship
- C. An entity with only derived attributes
- D. An entity without any relationships

Answer: B

Q881. What is a functional dependency in relational databases?

- A. A dependency between two database servers
- B. A constraint where one attribute set determines another
- C. A physical storage dependency
- D. A relationship between database users

Answer: B

Q882. What is the update anomaly in relational databases?

- A. An error that occurs during database installation
- B. Inconsistency caused when the same data must be updated in multiple rows
- C. A problem with database backup procedures
- D. An error in the query optimizer

Answer: B

Q883. What is the insertion anomaly in a relational table?

- A. Inability to insert a new row because required data for another entity is missing
- B. An error in the INSERT SQL statement syntax
- C. A performance issue during batch inserts
- D. A conflict between two simultaneous insertions

Answer: A

Q884. What is the deletion anomaly in relational databases?

- A. A failure to delete data from disk
- B. Unintended loss of data when deleting a row that contains other useful information
- C. A conflict during concurrent deletions
- D. An error in the DELETE SQL syntax

Answer: B

Q885. What is a natural join in the relational model?

- A. A join that only uses primary keys
- B. A join that combines tuples from two relations based on common attributes with equal values
- C. A join that preserves all rows from both tables
- D. A join that creates a Cartesian product

Answer: B

Q886. What constraint does the ON DELETE CASCADE option enforce?

- A. Prevents deletion of any row with a primary key
- B. Automatically deletes referencing rows when the referenced row is deleted
- C. Logs all deletion operations
- D. Requires manual confirmation before deletion

Answer: B

Q887. What is a self-referencing foreign key?

- A. A foreign key that references a column in the same table
- B. A foreign key that references itself recursively with no limit
- C. A key that auto-increments
- D. A key used for database replication

Answer: A

Q888. What is the closed world assumption in the relational model?

- A. The database is closed for modifications after deployment
- B. Only the data present in the database is considered true; absent data is considered false
- C. All tables must be fully populated before queries
- D. The database cannot communicate with external systems

Answer: B

Q889. What is the difference between ON DELETE SET NULL and ON DELETE RESTRICT?

- A. SET NULL deletes the child row while RESTRICT sets it to null
- B. SET NULL sets the foreign key to null while RESTRICT prevents the deletion
- C. Both options behave identically
- D. SET NULL removes the constraint while RESTRICT adds one

Answer: B

Q890. What is a theta join in relational algebra?

- A. A join using only the equality condition
- B. A join that combines relations based on any comparison condition
- C. A join that produces a Cartesian product
- D. A join exclusive to temporal databases

Answer: B

Q891. How does a left outer join differ from an inner join?

- A. Left outer join only returns rows from the left table
- B. Left outer join includes all rows from the left table, padding with nulls where there is no match
- C. Left outer join is faster than inner join
- D. There is no difference

Answer: B

Q892. In relational algebra, can the intersection operation be expressed using other fundamental operations?

- A. No, intersection is a fundamental operation
- B. Yes, $R \cap S = R - (R - S)$
- C. Yes, $R \cap S = R \times S$
- D. Yes, $R \cap S = R \div S$

Answer: B

Q893. What is the result of a full outer join?

- A. Only matching rows from both tables
- B. All rows from both tables with nulls where no match exists
- C. Only the Cartesian product
- D. An empty relation

Answer: B

Q894. What does the grouping (gamma) operation do in extended relational algebra?

- A. Groups tuples by specified attributes and applies aggregate functions
- B. Groups tables into schemas
- C. Groups users by access level
- D. Groups queries for batch processing

Answer: A

Q895. What is a semijoin in relational algebra?

- A. Half of a natural join result
- B. A join that returns tuples from the first relation that have matching tuples in the second
- C. A join that uses only half the attributes
- D. A partial Cartesian product

Answer: B

Q896. Why is relational algebra considered procedural?

- A. Because it uses procedures stored in the database
- B. Because it specifies the sequence of operations to obtain the result
- C. Because it requires procedural programming languages
- D. Because it processes data in procedure calls

Answer: B

Q897. What is relational completeness?

- A. A database that stores all possible data
- B. A query language that can express any query expressible in relational algebra
- C. A relation that has no null values
- D. A database with all constraints defined

Answer: B

Q898. What is the difference between WHERE and HAVING clauses in SQL?

- A. There is no difference
- B. WHERE filters rows before grouping while HAVING filters groups after grouping
- C. HAVING is used before WHERE in query execution
- D. WHERE only works with numeric columns

Answer: B

Q899. What is a correlated subquery in SQL?

- A. A subquery that runs independently of the outer query
- B. A subquery that references columns from the outer query
- C. A query that uses the CORRELATE keyword
- D. A query that joins two subqueries

Answer: B

Q900. What does the COALESCE function do in SQL?

- A. Combines two tables
- B. Returns the first non-null value from a list of expressions
- C. Counts all null values
- D. Converts null to zero

Answer: B

Q901. What is the purpose of the GROUP BY clause in SQL?

- A. To sort the result set
- B. To group rows with the same values in specified columns for aggregate functions
- C. To filter individual rows
- D. To join tables together

Answer: B

Q902. What does the EXISTS keyword do in SQL?

- A. Checks if a table exists in the database
- B. Returns TRUE if the subquery returns one or more rows
- C. Checks if a column exists in a table
- D. Verifies database connection

Answer: B

Q903. What is the purpose of the CASE expression in SQL?

- A. To define a database case study
- B. To provide conditional logic within a SQL query
- C. To change the case of text values
- D. To handle exception cases

Answer: B

Q904. What is an alias in SQL?

- A. A permanent rename of a table
- B. A temporary name given to a table or column for the duration of a query
- C. A backup name for a database
- D. A type of database index

Answer: B

Q905. What is the difference between BEFORE and AFTER triggers?

- A. BEFORE triggers execute before the triggering event while AFTER triggers execute after
- B. BEFORE triggers are faster than AFTER triggers
- C. AFTER triggers cannot modify data
- D. There is no practical difference

Answer: A

Q906. What is a Common Table Expression (CTE) in SQL?

- A. A table shared across multiple databases
- B. A temporary named result set defined within a query using the WITH clause
- C. A permanent table created with CREATE TABLE
- D. A type of materialized view

Answer: B

Q907. What is the difference between a function and a stored procedure in SQL?

- A. Functions must return a value and can be used in expressions while procedures may not return a value
- B. Functions cannot take parameters
- C. Procedures always return a value
- D. There is no difference

Answer: A

Q908. What is dynamic SQL?

- A. SQL that adjusts to different time zones
- B. SQL statements constructed and executed at runtime as strings
- C. SQL that automatically optimizes itself
- D. SQL used only in dynamic websites

Answer: B

Q909. What is the WITH GRANT OPTION used for in SQL privileges?

- A. To grant access for a limited time
- B. To allow the grantee to further grant the same privileges to other users
- C. To grant read-only access
- D. To grant access to system tables

Answer: B

Q910. What is an updatable view in SQL?

- A. Any view that has been recently modified
- B. A view through which INSERT, UPDATE, and DELETE operations can be performed on the base tables
- C. A view that refreshes automatically
- D. A view with an auto-increment column

Answer: B

Q911. What is the purpose of the INSTEAD OF trigger?

- A. To execute instead of a SELECT query
- B. To replace the default DML action on a view with custom logic
- C. To run instead of other triggers
- D. To execute when an error occurs instead of raising the error

Answer: B

Q912. What is a row-level trigger versus a statement-level trigger?

- A. Row-level triggers fire once per affected row while statement-level triggers fire once per SQL statement
- B. Row-level triggers are faster
- C. Statement-level triggers process each row individually
- D. They execute at the same frequency

Answer: A

Q913. What is embedded SQL?

- A. SQL stored inside HTML pages
- B. SQL statements written within a host programming language like C or Java
- C. SQL embedded in PDF documents
- D. SQL that runs only on embedded systems

Answer: B

Q914. What is Boyce-Codd Normal Form (BCNF) and how does it differ from 3NF?

- A. BCNF is the same as 3NF
- B. BCNF is stricter than 3NF, requiring every determinant to be a candidate key
- C. BCNF is weaker than 3NF
- D. BCNF only applies to tables with composite keys

Answer: B

Q915. Can a relation be in 3NF but not in BCNF?

- A. No, 3NF always implies BCNF
- B. Yes, when a non-candidate key attribute determines part of a candidate key
- C. No, BCNF is a weaker form than 3NF
- D. Yes, but only in tables with no candidate keys

Answer: B

Q916. What is Fourth Normal Form (4NF)?

- A. A table in BCNF with no trivial multivalued dependencies
- B. A table with four or fewer columns
- C. A table with exactly four candidate keys
- D. A table that has been normalized four times

Answer: A

Q917. What is the purpose of decomposition in normalization?

- A. To delete unnecessary data
- B. To split a relation into smaller relations to eliminate anomalies while preserving data
- C. To combine multiple tables into one
- D. To encrypt data across multiple tables

Answer: B

Q918. What is a canonical cover (minimal cover) of functional dependencies?

- A. The largest possible set of functional dependencies
- B. A minimal set of functional dependencies equivalent to the original set with no redundancy
- C. A set of dependencies that covers all tables
- D. The first set of dependencies defined during design

Answer: B

Q919. When is denormalization appropriate in database design?

- A. Always, as it improves all aspects of performance
- B. When read performance is critical and the overhead of maintaining redundancy is acceptable
- C. Never, as it violates database theory
- D. Only when the database has fewer than 10 tables

Answer: B

Q920. What is the synthesis approach to normalization?

- A. Combining all tables into one
- B. Building relations from a given set of functional dependencies using a bottom-up approach
- C. Creating tables randomly and then checking normal forms
- D. Synthesizing data from external sources

Answer: B

Q921. What is a prime attribute?

- A. The most important attribute in a table
- B. An attribute that is part of any candidate key
- C. An attribute that stores primary data
- D. The first attribute defined in a table

Answer: B

Q922. What does the decomposition algorithm for BCNF guarantee?

- A. Both lossless join and dependency preservation
- B. Lossless join but not necessarily dependency preservation
- C. Dependency preservation but not lossless join
- D. Neither lossless join nor dependency preservation

Answer: B

Q923. What is a conflict in transaction schedules?

- A. A disagreement between database administrators
- B. When two operations from different transactions access the same data item and at least one is a write
- C. When two transactions have the same name
- D. When the database runs out of storage

Answer: B

Q924. What is conflict serializability?

- A. A schedule where all conflicts are resolved
- B. A schedule that is equivalent to a serial schedule by swapping non-conflicting operations
- C. A schedule with no conflicts
- D. A schedule where conflicts are ignored

Answer: B

Q925. How is conflict serializability tested using a precedence graph?

- A. By counting the number of nodes
- B. A schedule is conflict serializable if and only if its precedence graph has no cycles
- C. By checking if the graph is fully connected
- D. By verifying all nodes have equal edges

Answer: B

Q926. What is a cascading rollback?

- A. Rolling back only the last operation of a transaction
- B. When the rollback of one transaction forces rollbacks of other dependent transactions
- C. Rolling back changes in alphabetical order
- D. A rollback that happens automatically at midnight

Answer: B

Q927. What is the difference between a strict and a cascadeless schedule?

- A. They are the same thing
- B. Cascadeless prevents cascading rollbacks; strict additionally prevents reading uncommitted data items until the writing transaction commits or aborts
- C. Strict schedules allow more concurrency
- D. Cascadeless is stricter than strict schedules

Answer: B

Q928. What is view serializability?

- A. A schedule based on database views
- B. A schedule where each transaction sees the same data values as in some serial schedule
- C. A schedule that only involves view operations
- D. A schedule verified by viewing the database

Answer: B

Q929. What is a blind write in transactions?

- A. A write performed by an unauthorized user
- B. A write operation performed without first reading the data item
- C. A write that produces no output
- D. A write to a hidden column

Answer: B

Q930. What is strict two-phase locking (Strict 2PL)?

- A. A 2PL variant where locks are acquired in strict order
- B. A 2PL variant where all exclusive locks are held until the transaction commits or aborts
- C. A 2PL variant that uses only shared locks
- D. A 2PL variant with no growing phase

Answer: B

Q931. What is rigorous two-phase locking?

- A. A 2PL variant that is more flexible
- B. A 2PL variant where all locks (both shared and exclusive) are held until commit or abort
- C. A 2PL variant that uses no locks
- D. A 2PL variant for read-only transactions

Answer: B

Q932. What is the wait-die deadlock prevention scheme?

- A. Older transactions wait; younger ones are rolled back if they would need to wait
- B. Younger transactions always wait for older ones
- C. Both transactions are rolled back
- D. The database picks a random transaction to abort

Answer: A

Q933. What is the wound-wait deadlock prevention scheme?

- A. Older transactions roll back younger ones; younger transactions wait for older ones
- B. Younger transactions always get priority
- C. Both transactions always wait
- D. Deadlocks are detected after they occur

Answer: A

Q934. How is deadlock detection performed using a wait-for graph?

- A. By counting the number of edges
- B. A deadlock exists if and only if the wait-for graph contains a cycle
- C. By checking if the graph has more than 10 nodes
- D. By measuring the graph's depth

Answer: B

Q935. What is lock granularity in concurrency control?

- A. The size of the lock data structure
- B. The level at which locking is applied: database, table, page, or row level
- C. The number of transactions that can hold a lock
- D. The duration a lock is held

Answer: B

Q936. What is the trade-off between fine-grained and coarse-grained locking?

- A. Fine-grained locking is always better
- B. Fine-grained locking allows more concurrency but has higher lock management overhead
- C. Coarse-grained locking allows more concurrency
- D. There is no trade-off

Answer: B

Q937. What is an intention lock in multi-granularity locking?

- A. A lock that indicates the transaction intends to lock the database
- B. A lock placed on a higher-level node indicating that a finer-grained lock is held on a descendant
- C. A lock that is planned but not yet acquired
- D. A lock used during database design

Answer: B

Q938. What is a livelock in concurrency control?

- A. A lock that keeps the database alive
- B. A situation where a transaction repeatedly retries an operation but never succeeds
- C. A lock on live streaming data
- D. A lock that never expires

Answer: B

Q939. What is the ARIES recovery algorithm?

- A. A simple backup tool
- B. An advanced recovery algorithm using WAL with three phases: analysis, redo, and undo
- C. An encryption algorithm for log files
- D. A database compression algorithm

Answer: B

Q940. In ARIES, what does the analysis phase do?

- A. Analyzes query performance
- B. Scans the log from the last checkpoint to determine dirty pages and active transactions at crash time
- C. Analyzes the database schema
- D. Performs statistical analysis on data

Answer: B

Q941. What is the difference between steal and no-steal buffer management policies?

- A. Steal allows modified pages to be flushed before commit while no-steal does not
- B. Steal refers to taking data from other transactions
- C. No-steal prevents any buffer modifications
- D. They refer to how memory is allocated

Answer: A

Q942. What is the difference between force and no-force buffer management policies?

- A. Force requires all modified pages to be written to disk at commit time while no-force does not
- B. Force means using forced writes for better performance
- C. No-force prevents any writes to disk
- D. They refer to the physical force required to insert disks

Answer: A

Q943. What combination of buffer management policies does ARIES use?

- A. Force, No-steal
- B. No-force, Steal
- C. Force, Steal
- D. No-force, No-steal

Answer: B

Q944. What is a log sequence number (LSN)?

- A. A serial number for database licenses
- B. A unique identifier assigned to each log record to maintain ordering
- C. A number identifying the database sequence
- D. A network sequence number

Answer: B

Q945. What is physiological logging?

- A. Logging based on physical health metrics
- B. A logging approach that identifies pages physically but logs changes logically within each page
- C. A form of logging used only for physical databases
- D. Logging the physical location of data on disk

Answer: B

Q946. What is a compensation log record (CLR) in ARIES?

- A. A log record for financial compensation
- B. A log record written during undo to describe the reversal of an action
- C. A log record that compensates for lost data
- D. A log record for replication

Answer: B

Q947. What is the purpose of a fuzzy checkpoint?

- A. A checkpoint with imprecise data
- B. A checkpoint that does not halt transaction processing while recording the checkpoint information
- C. A checkpoint performed at random intervals
- D. A checkpoint that only saves partial data

Answer: B

Q948. What is a B+ tree and how does it differ from a B-tree?

- A. They are identical structures
- B. In a B+ tree, all data pointers are at the leaf level and leaves are linked, unlike B-trees where data pointers exist at all levels
- C. A B+ tree is always smaller than a B-tree
- D. B+ trees do not support range queries

Answer: B

Q949. What is a hash index?

- A. An index that uses a hash function to map keys directly to their storage location
- B. An index that stores data in alphabetical order
- C. An index used only for text fields
- D. An index that requires no storage space

Answer: A

Q950. What is a covering index?

- A. An index that covers the entire disk
- B. An index that contains all columns needed by a query, eliminating the need to access the base table
- C. An index that covers all tables in the database
- D. An index with a protective encryption layer

Answer: B

Q951. When would a hash index be preferred over a B+ tree index?

- A. For range queries
- B. For exact match (equality) lookups where range queries are not needed
- C. For pattern matching queries
- D. Hash indexes are always preferred

Answer: B

Q952. What is a bitmap index?

- A. An index stored as an image file
- B. An index that uses bit arrays to represent the presence or absence of values for each indexed column
- C. An index on binary data columns
- D. An index that maps bits to bytes

Answer: B

Q953. What is the order (or degree) of a B-tree?

- A. The number of levels in the tree
- B. The maximum number of children a node can have
- C. The number of records in the tree
- D. The total number of nodes

Answer: B

Q954. What is index selectivity?

- A. The ability to select which index to use
- B. The ratio of distinct indexed values to total number of records, indicating how well an index discriminates
- C. How selective the DBA is when creating indexes
- D. The speed of index selection

Answer: B

Q955. What is a non-clustered index?

- A. An unorganized index
- B. An index whose logical order differs from the physical order of the data rows
- C. An index without a B-tree structure
- D. An index that cannot be used for searching

Answer: B

Q956. What is the nested loop join algorithm?

- A. A join that creates nested tables
- B. For each row in the outer table, it scans the entire inner table to find matches
- C. A join that only works with nested queries
- D. A loop that nests multiple joins together

Answer: B

Q957. What is the sort-merge join algorithm?

- A. A join that sorts results after merging
- B. Both tables are sorted on the join attribute and then merged together in a single pass
- C. A join that only works on sorted tables
- D. A combination of sorting and hashing

Answer: B

Q958. What is the hash join algorithm?

- A. A join that uses hash codes for security
- B. One table is hashed into buckets on the join key, then the other table is probed against these buckets
- C. A join that produces hashed output
- D. A join between hash tables

Answer: B

Q959. What is the difference between a rule-based and cost-based query optimizer?

- A. They produce identical plans
- B. Rule-based uses predefined heuristic rules while cost-based uses statistical cost estimates to choose plans
- C. Rule-based is always better
- D. Cost-based does not use any rules

Answer: B

Q960. Why is pushing selections down in a query tree an important optimization?

- A. It makes the query tree shorter
- B. It reduces the size of intermediate results early, decreasing processing costs for subsequent operations
- C. It removes the need for joins
- D. It changes the query semantics for better results

Answer: B

Q961. What is the difference between materialization and pipelining in query execution?

- A. They are the same technique
- B. Materialization stores intermediate results on disk while pipelining passes results directly between operations
- C. Pipelining is always slower
- D. Materialization uses less memory

Answer: B

Q962. What are histograms used for in query optimization?

- A. Displaying query results graphically
- B. Providing detailed data distribution information to improve cardinality estimation accuracy
- C. Showing database usage patterns
- D. Graphing query execution times

Answer: B

Q963. What is cardinality estimation in query optimization?

- A. Estimating the number of tables needed
- B. Predicting the number of rows produced by each operation in the query plan
- C. Estimating the number of users
- D. Calculating the number of indexes required

Answer: B

Q964. What is an index-only scan?

- A. A scan that creates an index
- B. A query execution method that retrieves all needed data from the index without accessing the base table
- C. A scan that only checks if an index exists
- D. A scan of the index metadata

Answer: B

Q965. What is SQL injection and how can it be prevented?

- A. A method to inject data faster; prevented by faster hardware
- B. An attack inserting malicious SQL through user input; prevented by parameterized queries and input validation
- C. An SQL optimization technique; prevented by using indexes
- D. A database backup method; prevented by RAID

Answer: B

Q966. What is mandatory access control (MAC)?

- A. Access control that all users must follow voluntarily
- B. Access control enforced by the system based on security labels and clearance levels, not user discretion
- C. Optional access restrictions
- D. Access control managed by users themselves

Answer: B

Q967. What is discretionary access control (DAC)?

- A. Access control based on time of day
- B. Access control where data owners grant or revoke permissions to other users at their discretion
- C. Access control enforced by the operating system only
- D. Access control that cannot be changed

Answer: B

Q968. What is the Bell-LaPadula model in database security?

- A. A model for database performance tuning
- B. A multilevel security model that enforces no read up and no write down policies
- C. A model for database backup
- D. A relational data model

Answer: B

Q969. What is the difference between encryption at rest and encryption in transit?

- A. They are the same type of encryption
- B. At rest protects stored data on disk while in transit protects data moving across networks
- C. At rest encrypts network data while in transit encrypts stored data
- D. At rest is stronger than in transit

Answer: B

Q970. What is a privilege cascade in database security?

- A. A waterfall display of privileges
- B. When revoking a privilege from a user also revokes it from users who received it through that user
- C. Cascading permissions to all database objects
- D. A list of privileges sorted by priority

Answer: B

Q971. What is column-level security?

- A. Security that applies to all columns equally
- B. Restricting user access to specific columns within a table rather than the entire table
- C. Encryption of column headers
- D. A security column added to every table

Answer: B

Q972. What is row-level security (RLS)?

- A. Security applied to each row of the audit log
- B. Filtering rows based on user attributes so users can only see rows they are authorized to access
- C. Encrypting individual rows
- D. Adding a security row to each table

Answer: B

Q973. What is the two-phase commit (2PC) protocol?

- A. A commitment to finish in two phases of development
- B. A protocol that coordinates distributed transactions by having a prepare phase and a commit/abort phase
- C. A two-step backup process
- D. A protocol for connecting two database servers

Answer: B

Q974. What is the role of the coordinator in the two-phase commit protocol?

- A. To optimize queries across sites
- B. To initiate the commit protocol, collect votes from participants, and make the final commit or abort decision
- C. To balance load across database sites
- D. To manage user authentication

Answer: B

Q975. What is the difference between full replication and partial replication?

- A. Full replication stores more data per site
- B. Full replication copies the entire database to every site while partial replication copies only selected fragments
- C. Full replication is always faster
- D. Partial replication is not possible in distributed databases

Answer: B

Q976. What is a distributed catalog in a distributed database?

- A. A catalog distributed to all users
- B. Metadata about the location, fragmentation, and replication of data across sites
- C. A printed catalog of database features
- D. A central list of all distributed databases

Answer: B

Q977. What is the global deadlock problem in distributed databases?

- A. A deadlock affecting the entire internet
- B. A deadlock involving transactions at multiple sites that cannot be detected by any single site's local deadlock detector
- C. A deadlock in the global catalog
- D. A worldwide database outage

Answer: B

Q978. What is mixed fragmentation in distributed databases?

- A. A mix of correct and corrupted data
- B. A combination of horizontal and vertical fragmentation applied to a relation
- C. Mixing data from different databases
- D. Fragmenting data in a random order

Answer: B

Q979. What is the principle of local autonomy in distributed databases?

- A. Each site must be autonomous from the network
- B. Each site maintains control over its local data and can operate independently
- C. Users can autonomously create databases
- D. Local sites do not need backup

Answer: B

Q980. How does MongoDB store data internally?

- A. In relational tables
- B. In BSON (Binary JSON) documents organized into collections
- C. In key-value pairs only
- D. In column families

Answer: B

Q981. What is sharding in NoSQL databases?

- A. Breaking data into pieces and discarding some
- B. Distributing data across multiple servers by partitioning it based on a shard key
- C. Creating backup copies of data
- D. Encrypting data into shards

Answer: B

Q982. What is the difference between embedded documents and references in MongoDB?

- A. They are the same concept
- B. Embedded documents nest related data within a document while references store relationships using document IDs
- C. Embedded documents are faster to delete
- D. References are used only for primary keys

Answer: B

Q983. What is the Cassandra data model?

- A. A relational model with SQL support
- B. A partitioned row store using partition keys for distribution and clustering keys for sorting within partitions
- C. A pure key-value model
- D. A document-based model

Answer: B

Q984. What is the CAP theorem's significance for NoSQL database design?

- A. It has no relevance to NoSQL databases
- B. It forces NoSQL designers to choose between consistency, availability, and partition tolerance trade-offs
- C. It guarantees all three properties for NoSQL databases
- D. It only applies to SQL databases

Answer: B

Q985. What is a time-series database?

- A. A database that tracks the time of each query
- B. A specialized database optimized for storing and querying time-stamped data points
- C. A database that only works during certain times
- D. A temporary database

Answer: B

Q986. What is the aggregation framework in MongoDB?

- A. A framework for adding data
- B. A pipeline-based data processing framework that transforms and analyzes documents through stages
- C. A framework for managing database clusters
- D. A tool for database administration

Answer: B

Q987. What is the difference between SCD Type 1 and SCD Type 2?

- A. They handle dimension changes identically
- B. Type 1 overwrites old values while Type 2 creates new rows to preserve history
- C. Type 1 preserves history while Type 2 does not
- D. Type 1 is for fact tables while Type 2 is for dimension tables

Answer: B

Q988. What is a surrogate key in a data warehouse?

- A. A natural business key
- B. A system-generated artificial key used as the primary key in dimension tables instead of natural keys
- C. A temporary key used during ETL
- D. A backup of the primary key

Answer: B

Q989. What is the difference between MOLAP, ROLAP, and HOLAP?

- A. They are different programming languages
- B. MOLAP uses multidimensional storage, ROLAP uses relational storage, and HOLAP combines both approaches
- C. They are different database vendors
- D. MOLAP is the fastest and ROLAP is the slowest

Answer: B

Q990. What is a conformed dimension in data warehousing?

- A. A dimension that conforms to naming conventions
- B. A dimension that has the same meaning and content when referenced across multiple fact tables or data marts
- C. A dimension that has been validated
- D. A dimension with confirmed data

Answer: B

Q991. What is a surrogate key and when is it used in relational design?

- A. A key borrowed from another table
- B. A system-generated artificial key used when no natural candidate key is suitable
- C. A temporary key used during testing
- D. A key that replaces foreign keys

Answer: B

Q992. What is the extended projection operation in relational algebra?

- A. A projection that includes all columns
- B. A projection that allows arithmetic expressions and string operations on attributes in the result
- C. A projection that extends the table with new rows
- D. A projection applied to multiple tables

Answer: B

Q993. What is the assignment operation used for in relational algebra?

- A. Assigning users to database roles
- B. Storing the result of a relational algebra expression in a temporary relation variable
- C. Assigning data types to attributes
- D. Assigning primary keys to tables

Answer: B

Q994. What is the purpose of the IN operator in SQL?

- A. To insert new rows
- B. To check if a value matches any value in a specified list or subquery
- C. To index a column
- D. To include all columns in the result

Answer: B

Q995. What is the difference between INNER JOIN and CROSS JOIN in SQL?

- A. They are identical
- B. INNER JOIN matches rows based on a condition while CROSS JOIN produces all combinations of rows from both tables
- C. CROSS JOIN requires a join condition
- D. INNER JOIN produces more rows

Answer: B

Q996. What is the NULL-safe equality operator in SQL?

- A. The = operator handles NULL automatically
- B. The IS NOT DISTINCT FROM operator that treats two NULLs as equal
- C. There is no such operator
- D. The <=> operator that ignores NULL values

Answer: B

Q997. What is a materialized view refresh strategy?

- A. Refreshing the browser to view database changes
- B. The method used to update a materialized view's stored data, either completely (full) or with only changes (incremental)
- C. Clearing the view cache
- D. Restarting the database to refresh views

Answer: B

Q998. What is an extraneous attribute in a functional dependency?

- A. An attribute that is extra in the table
- B. An attribute that can be removed from the left or right side of a dependency without changing the closure
- C. An attribute added by mistake
- D. An attribute from an external database

Answer: B

Q999. What is the non-repeatable read problem?

- A. A read operation that takes too long
- B. When a transaction reads the same data item twice and gets different values because another transaction modified it
- C. A read that cannot be repeated due to errors
- D. A read of non-existent data

Answer: B

Q1000. What is the READ UNCOMMITTED isolation level?

- A. A level where no reads are allowed
- B. The lowest isolation level that allows dirty reads, non-repeatable reads, and phantom reads
- C. A level that prevents all anomalies
- D. A level that only allows uncommitted writes

Answer: B

Q1001. What is the difference between an aborted transaction and a failed transaction?

- A. They are the same state
- B. A failed transaction has encountered an error and cannot proceed, while aborted means it has been rolled back
- C. Aborted transactions can resume while failed ones cannot
- D. Failed transactions are committed while aborted ones are not

Answer: B

Q1002. What is lock compatibility in concurrency control?

- A. Whether locks are compatible with the hardware
- B. The rules determining which lock types can coexist on the same data item, such as shared locks being compatible with each other
- C. Whether locks can be used across databases
- D. Compatibility of lock software versions

Answer: B

Q1003. What is a differential backup and how does it differ from an incremental backup?

- A. They are identical
- B. A differential backup captures all changes since the last full backup while an incremental captures changes since the last backup of any type
- C. Differential is smaller than incremental
- D. Incremental captures more data

Answer: B

Q1004. What is a unique index?

- A. An index on a unique table
- B. An index that enforces uniqueness on the indexed columns, preventing duplicate values
- C. The only index in the database
- D. An index with a unique name

Answer: B

Q1005. What is index fragmentation and how does it affect performance?

- A. Physical breaking of the index file
- B. When index pages become disordered or have excessive free space due to insertions and deletions, degrading scan performance
- C. Splitting an index across databases
- D. Creating too many index levels

Answer: B

Q1006. What is the selectivity of a predicate in query optimization?

- A. How selective the DBA is about indexing
- B. The fraction of rows in a table that satisfy the predicate condition, used to estimate result sizes
- C. The order in which predicates are evaluated
- D. The number of predicates in a query

Answer: B

Q1007. What is a database honeypot?

- A. A storage container for database files
- B. A decoy database system designed to attract and detect unauthorized access attempts
- C. A type of database optimization
- D. A backup database server

Answer: B

Q1008. What is the principle of separation of duties in database security?

- A. Separating the database into different files
- B. Dividing critical security functions among different individuals so no single person has complete control
- C. Separating development and production databases
- D. Keeping security logs separate from data

Answer: B

Q1009. What is a distributed join operation?

- A. Joining multiple distributed systems
- B. A join operation that requires data from multiple sites, involving data transfer across the network
- C. Joining two local tables
- D. A social gathering of database administrators

Answer: B

Q1010. What is the difference between tight coupling and loose coupling in distributed databases?

- A. They refer to how tightly cables connect servers
- B. Tight coupling shares resources like memory and is more integrated, while loose coupling connects independent systems via messages
- C. Tight coupling is always faster
- D. There is no practical difference

Answer: B

Q1011. What is the catalog management challenge in distributed databases?

- A. Managing physical catalogs of database products
- B. Deciding where to store the distributed catalog (centralized, replicated, or partitioned) while balancing lookup speed and update cost
- C. Organizing database documentation
- D. Managing vendor catalogs

Answer: B

Q1012. What is an edge in a graph database?

- A. The boundary of the database
- B. A connection between two nodes representing a relationship, which can have its own properties
- C. The last record in a collection
- D. A database boundary condition

Answer: B

Q1013. What is the replica set in MongoDB?

- A. A set of replicated queries
- B. A group of MongoDB instances that maintain the same data set, providing redundancy and high availability
- C. A collection of duplicate documents
- D. A set of backup scripts

Answer: B

Q1014. What is the MapReduce programming model used in NoSQL?

- A. A model for mapping database locations
- B. A data processing paradigm where Map transforms data into key-value pairs and Reduce aggregates values by key
- C. A model for reducing database size
- D. A navigation model for data maps

Answer: B

Q1015. What is a pivot operation in OLAP?

- A. Rotating the OLAP server hardware
- B. Rotating the data cube to view data from a different perspective by swapping dimensions on axes
- C. Pivoting from one database to another
- D. Changing the database server

Answer: B

Q1016. What is the difference between additive, semi-additive, and non-additive measures?

- A. They refer to the number of measures in a fact table
- B. Additive measures can be summed across all dimensions, semi-additive across some, and non-additive cannot be meaningfully summed
- C. Additive measures add rows while non-additive do not
- D. They are different data types for measures

Answer: B

Q1017. What is a role-playing dimension?

- A. A dimension used in role-based access control
- B. A single physical dimension table referenced multiple times in a fact table with different meanings, like date used as order date and ship date
- C. A dimension for storing user roles
- D. A dimension that changes behavior

Answer: B

Q1018. What is a galaxy schema (fact constellation)?

- A. A schema based on astronomical data
- B. A data warehouse schema containing multiple fact tables that share common dimension tables
- C. A schema with star-shaped dimensions
- D. A schema used only in space databases

Answer: B

Q1019. What is ELT and how does it differ from ETL?

- A. They are the same process
- B. ELT loads raw data into the target first then transforms it there, while ETL transforms data before loading
- C. ELT is faster because it skips extraction
- D. ETL loads data while ELT extracts it

Answer: B

Q1020. What is a dimension hierarchy in a data warehouse?

- A. The importance ranking of dimensions
- B. A logical structure within a dimension that defines levels of aggregation, such as day to month to quarter to year
- C. A hierarchy of dimension tables
- D. The order in which dimensions are created

Answer: B

Databases — Hard

510 questions

Q1021. In the ANSI/SPARC three-schema architecture, which mapping exists between the conceptual and internal schemas?

- A. Application/Internal mapping
- B. External/Conceptual mapping
- C. Conceptual/Internal mapping
- D. External/Internal mapping

Answer: C

Q1022. Which of the following best describes the impedance mismatch problem?

- A. Differences between database model and programming language data types
- B. Mismatch between primary key constraints and foreign key references
- C. Slow network connectivity between the client and the database server
- D. Hardware incompatibility between different types of storage devices

Answer: A

Q1023. Self-describing nature of a database system means:

- A. The system contains metadata along with the data itself
- B. Users do not need to interact with it in any way
- C. The database automatically generates its own queries
- D. Data stored in the system is automatically encrypted

Answer: A

Q1024. Program-data independence is primarily achieved through:

- A. Avoiding the use of all index structures
- B. Using only one single programming language
- C. Data abstraction and catalog separation
- D. Upgrading to faster processing hardware

Answer: C

Q1025. Which of the following is a consequence of violating data independence?

- A. Concurrent transaction handling is improved across the system
- B. Data security and access controls are substantially improved
- C. The system achieves significantly faster query processing speed
- D. Application programs must be modified when data storage changes

Answer: D

Q1026. The database approach provides controlled redundancy by:

- A. Encrypting all data stored in the system
- B. Avoiding the use of keys or constraints
- C. Integrating data and applying normalization
- D. Storing data in multiple separate files

Answer: C

Q1027. Which type of DBMS supports complex data types like spatial and multimedia data?

- A. Flat file based DBMS
- B. Network model DBMS
- C. Hierarchical tree DBMS
- D. Object-Relational DBMS

Answer: D

Q1028. In a multi-user DBMS environment, the concurrency control subsystem is essential to:

- A. Perform scheduled database backup operations to external storage
- B. Ensure correct results when multiple users access data simultaneously
- C. Speed up the processing of single-user queries on a local database
- D. Manage the allocation of available disk space across the system

Answer: B

Q1029. Which of the following database utilities is used to reorganize data for better performance?

- A. Statistical analysis utility
- B. Backup restore utility
- C. Reorganization utility
- D. Data loading utility

Answer: C

Q1030. Data abstraction in DBMS hides complexity at different levels. Which sequence is correct from lowest to highest?

- A. External !' Conceptual !' Internal
- B. Conceptual !' Internal !' External
- C. External !' Internal !' Conceptual
- D. Internal !' Conceptual !' External

Answer: D

Q1031. In a shared-disk parallel architecture, the potential bottleneck is:

- A. The interconnection network to the shared disk
- B. The CPU processing speed of each processor
- C. Query parsing and syntax validation steps
- D. Memory allocation among running transactions

Answer: A

Q1032. The query optimizer in a DBMS uses which approach to find the best execution plan?

- A. Cost-based optimization
- B. Random selection method
- C. User preference settings
- D. Alphabetical table ordering

Answer: A

Q1033. Which type of parallelism involves executing different operations of a query simultaneously?

- A. Inter-query parallelism
- B. None of these types
- C. Intra-query parallelism
- D. Pipeline parallelism

Answer: A

Q1034. In a DBMS architecture, the catalog manager is responsible for:

- A. Managing user connections and authentication sessions
- B. Handling network protocols and data transmission tasks
- C. Processing application logic and business rule validation
- D. Storing and retrieving schema information and statistics

Answer: D

Q1035. The concept of data independence is directly supported by:

- A. Using only a single schema without any additional views
- B. Storing all data exclusively in flat file format on disk
- C. Avoiding the use of views or external schema definitions
- D. The three-level architecture with mappings between levels

Answer: D

Q1036. In a DBMS, the lock manager is part of which subsystem?

- A. Storage management subsystem
- B. Communication layer subsystem
- C. Concurrency control subsystem
- D. Query processing subsystem

Answer: C

Q1037. What is the main advantage of shared-memory parallel architecture?

- A. Lower hardware costs compared to other parallel architectures
- B. Fast communication between processors through shared memory
- C. No synchronization needed between the concurrent processors
- D. No need for an operating system to coordinate the processes

Answer: B

Q1038. The DBMS buffer replacement strategy LRU stands for:

- A. Least Recently Used
- B. Last Record Updated
- C. Latest Read Utility
- D. Least Required Update

Answer: A

Q1039. Which DBMS component is responsible for enforcing authorization and integrity constraints?

- A. Network manager and router module
- B. Query parser and syntax analyzer
- C. Storage manager and file handler
- D. Authorization and integrity manager

Answer: D

Q1040. In a multi-tier architecture, which tier contains the business rules?

- A. Data tier (bottom tier)
- B. Application tier (middle tier)
- C. Client tier (front tier)
- D. Presentation tier (top tier)

Answer: B

Q1041. In the EER model, an overlapping specialization means:

- A. An entity can belong to multiple subclasses
- B. No entity can be specialized at all
- C. An entity belongs to exactly one subclass
- D. Subclasses have no common superclass type

Answer: A

Q1042. A category (union type) in the EER model represents:

- A. A superclass entity that has no subclasses
- B. An entity defined without any attributes
- C. A relationship with no participants at all
- D. A subclass with multiple possible superclasses

Answer: D

Q1043. The concept of aggregation in the ER model is used to:

- A. Treat a relationship set as a higher-level entity
- B. Create weak entities that depend on other types
- C. Delete entities from the conceptual data model
- D. Merge two databases into a single schema model

Answer: A

Q1044. In a ternary relationship among three entities A, B, and C, the cardinality constraint is specified:

- A. Only for the strongest entity participating here
- B. Only for one entity in the ternary relationship
- C. Cardinality does not apply to ternary relationships
- D. For each pair of entities with respect to the third

Answer: D

Q1045. Disjoint constraint (d) on specialization means:

- A. An entity can be a member of at most one subclass
- B. Subclasses can overlap with shared memberships
- C. There is no constraint on subclass membership
- D. An entity must belong to all subclasses at once

Answer: A

Q1046. Attribute inheritance in EER means:

- A. Attributes are shared across all entities uniformly
- B. Subclass entities inherit all attributes of the superclass
- C. Attributes cannot be inherited between entity types
- D. Superclass inherits all attributes from the subclass

Answer: B

Q1047. A lattice in the EER model occurs when:

- A. An entity has no attributes or properties defined on it
- B. A superclass has no subclasses defined in the model at all
- C. A subclass has more than one superclass (multiple inheritance)
- D. All entities in the model are weak entity types entirely

Answer: C

Q1048. The Object-Relational model extends the relational model by adding:

- A. Hierarchical parent-child relationships between records
- B. Network-style pointers linking records across the model
- C. Only more tables and relations without other extensions
- D. Support for complex data types, methods, and inheritance

Answer: D

Q1049. In the Entity-Relationship model, the participation constraint and cardinality ratio together define:

- A. Query optimization parameters used
- B. Physical storage structure of tables
- C. Only the key constraints of entities
- D. Structural constraints of a relationship

Answer: D

Q1050. A recursive relationship is one where:

- A. No entity type participates in the relationship that is defined
- B. The same entity type participates more than once in different roles
- C. Only weak entity types participate in the relationship instance
- D. Two different entity types participate together in one relationship

Answer: B

Q1051. Codd's Rule 0 (Foundation Rule) states:

- A. SQL is the only query language allowed for use within the database system
- B. Indexes are mandatory for every attribute present in all database tables
- C. All data must be stored exclusively in flat files without any table structure
- D. A relational DBMS must manage data entirely through its relational capabilities

Answer: D

Q1052. The information rule (Codd's Rule 1) states that:

- A. Pointers can be used to represent data relationships
- B. All information must be represented as values in tables
- C. Metadata need not be stored in tables or relations
- D. Data can be stored in external files outside the system

Answer: B

Q1053. A relation is in BCNF if:

- A. For every non-trivial functional dependency $X \rightarrow Y$, X is a superkey
- B. All attributes in the relation are prime (part of some key)
- C. It has no multivalued dependencies among any of its attributes
- D. It satisfies only the requirements of first normal form (1NF)

Answer: A

Q1054. The closure of a set of attributes X (X^+) under a set of functional dependencies is:

- A. The set of all foreign keys that reference attribute X
- B. The set of all attributes functionally determined by X
- C. The total number of individual attributes within X
- D. The set of all tables in the database containing X

Answer: B

Q1055. Armstrong's axioms include all EXCEPT:

- A. Augmentation
- B. Reflexivity
- C. Distribution
- D. Transitivity

Answer: C

Q1056. A lossless-join decomposition guarantees that:

- A. The original relation can be reconstructed by joining the decomposed relations
- B. No foreign keys are ever needed between the resulting decomposed relations
- C. Join operations are always faster when applied to the decomposed relations
- D. Some data will always be permanently lost during the decomposition process

Answer: A

Q1057. The dependency preservation property ensures that:

- A. Only primary key dependencies are preserved during the decomposition of tables
- B. All functional dependencies can be checked within individual decomposed relations
- C. No dependencies are maintained after decomposition of the original relation
- D. Dependencies are stored separately from the decomposed relation structures

Answer: B

Q1058. A surrogate key is:

- A. A system-generated unique identifier with no business meaning
- B. A natural key derived directly from the business domain
- C. A composite key made up of multiple business attributes
- D. A foreign key referencing a primary key in another table

Answer: A

Q1059. Codd defined how many rules for a fully relational database?

- A. 12 rules (numbered 0-12, so 13 total)
- B. 10 rules (numbered 1 through 10 only)
- C. 5 rules (covering the basic properties)
- D. 20 rules (for comprehensive coverage)

Answer: A

Q1060. The Closed World Assumption in relational databases means:

- A. Facts not present in the database are considered false
- B. Nothing stored in the database is considered to be true
- C. All possible facts about the domain are stored in it
- D. The database cannot be modified once it has been created

Answer: A

Q1061. A query language is relationally complete if it can express:

- A. All queries expressible in relational calculus
- B. Only join operations between related tables
- C. Only aggregate functions on grouped data
- D. Only selection and projection operations used

Answer: A

Q1062. The aggregate operation in extended relational algebra:

- A. Performs Cartesian products between two unrelated relations
- B. Renames relations and their associated attributes in queries
- C. Selects individual tuples based on a simple filter condition
- D. Computes functions like SUM, AVG, COUNT on groups of tuples

Answer: D

Q1063. Which of the following cannot be expressed in basic relational algebra?

- A. Projection of attributes from relations
- B. Selection with various filter conditions
- C. Recursive queries like transitive closure
- D. Natural join of two compatible relations

Answer: C

Q1064. The concept of safe expressions in relational calculus ensures:

- A. Queries always run faster than other approaches
- B. No NULL values appear in the query results
- C. All tuples in the relation are always selected
- D. The result of a query is a finite set of tuples

Answer: D

Q1065. In tuple relational calculus, the expression $\{t \mid P(t)\}$ means:

- A. Update tuples in the relation where P is a false value
- B. Delete all tuples from the relation where P is true value
- C. The set of all tuples t such that predicate P(t) is true
- D. Insert tuples into the relation that satisfy predicate P

Answer: C

Q1066. The outer union operation:

- A. Only works with relations that have identical schemas and matching attributes
- B. Is the same as regular union and produces exactly identical results every time
- C. Takes the union of relations that are not union-compatible by padding with NULLs
- D. Removes all NULL values from the result set after combining both relations

Answer: C

Q1067. Full outer join preserves:

- A. Only tuples from the left relation with NULL for non-matching rows
- B. Only tuples from the right relation with NULL for non-matching rows
- C. All tuples from both relations, padding with NULLs where necessary
- D. Only tuples that have matching values in both of the joined tables

Answer: C

Q1068. The multiset (bag) version of relational algebra differs from set-based algebra in that:

- A. It removes all duplicates
- B. It allows duplicate tuples
- C. It does not support joins
- D. It only supports selection

Answer: B

Q1069. Which algebraic equivalence rule is used for query optimization?

- A. Removing all joins from the query plan
- B. Pushing selections down the query tree
- C. Eliminating projections from the query
- D. Reversing the order of query operations

Answer: B

Q1070. The assignment operation in relational algebra is used to:

- A. Delete relations permanently from the database schema and storage system
- B. Assign the result of a relational algebra expression to a temporary variable
- C. Modify existing tuples by updating their attribute values in the table
- D. Create new databases and define their schema structure from scratch

Answer: B

Q1071. A correlated subquery is different from a regular subquery because it:

- A. References columns from the outer query and executes once per outer row
- B. Does not reference the outer query and runs completely independently
- C. Is always faster than any other type of subquery in all situations
- D. Executes only once regardless of how many rows the outer query returns

Answer: A

Q1072. The COALESCE function in SQL:

- A. Calculates the average of numeric values
- B. Returns the last value in a specified list
- C. Concatenates strings from multiple columns
- D. Returns the first non-NULL value in a list

Answer: D

Q1073. What is the difference between DELETE and TRUNCATE?

- A. TRUNCATE can have a WHERE clause to filter which specific rows should be removed from tables
- B. DELETE is faster than TRUNCATE because it removes all rows without any logging of the changes
- C. They are identical in function and there is no difference between them in any database system
- D. DELETE can have a WHERE clause and is logged; TRUNCATE removes all rows and is minimally logged

Answer: D

Q1074. The CASE expression in SQL is used for:

- A. Managing concurrent transactions
- B. Dropping indexes from a table
- C. Creating tables in the database
- D. Conditional logic within a query

Answer: D

Q1075. A CROSS JOIN produces:

- A. An empty result set with no rows
- B. The intersection of two data tables
- C. Only rows matching between tables
- D. The Cartesian product of two tables

Answer: D

Q1076. Which SQL statement is used to create an index?

- A. CREATE INDEX
- B. ADD INDEX
- C. INSERT INDEX
- D. MAKE INDEX

Answer: A

Q1077. The EXISTS operator in SQL:

- A. Returns TRUE if the subquery returns at least one row
- B. Checks for NULL values in a specified column only
- C. Returns the count of rows matching in the subquery
- D. Creates a new table based on the subquery results

Answer: A

Q1078. A self-join is:

- A. A cross join of two tables
- B. An outer join between tables
- C. A join of a table with itself
- D. A join without any conditions

Answer: C

Q1079. UNION vs UNION ALL in SQL:

- A. They are identical in behavior and produce exactly the same result set
- B. UNION ALL removes duplicates while UNION keeps all including duplicates
- C. UNION removes duplicates; UNION ALL keeps all rows including duplicates
- D. UNION is faster because it skips the deduplication processing entirely

Answer: C

Q1080. What does the NVL/IFNULL/ISNULL function do?

- A. Replaces NULL with a specified value
- B. Creates NULL constraints on columns
- C. Deletes all rows containing NULLs
- D. Counts NULL values in the column

Answer: A

Q1081. The DENSE_RANK() function differs from RANK() in that:

- A. They are identical in their ranking behavior
- B. DENSE_RANK() only works with string values
- C. DENSE_RANK() skips ranks after ties occur
- D. DENSE_RANK() does not skip ranks after ties

Answer: D

Q1082. Lateral joins (LATERAL keyword) allow:

- A. The right side of the join to reference columns from the left side
- B. Only cross joins to be performed without any join filter condition
- C. Joining tables without specifying any condition between the rows
- D. Only inner joins to be used between the two tables in the query

Answer: A

Q1083. The PARTITION BY clause in window functions:

- A. Creates new tables from partitioned subsets of the original data
- B. Divides the result set into partitions for function calculation
- C. Deletes rows from specific partitions based on filter conditions
- D. Physically partitions a table into separate storage file segments

Answer: B

Q1084. Dynamic SQL refers to:

- A. SQL without variables or parameters of any kind
- B. SQL statements constructed and executed at runtime
- C. SQL that runs only during the compilation phase
- D. Static predefined queries that never change at all

Answer: B

Q1085. The PIVOT operation in SQL:

- A. Joins two tables together
- B. Transforms rows into columns
- C. Transforms columns into rows
- D. Creates an index on data

Answer: B

Q1086. SQL injection can be prevented by:

- A. Using parameterized queries and prepared statements
- B. Storing user passwords in plain text in database
- C. Disabling authentication on the database server
- D. Using dynamic SQL without any input validation

Answer: A

Q1087. A user-defined function (UDF) in SQL differs from a stored procedure in that:

- A. A UDF must return a value and can be used in SELECT statements
- B. A stored procedure can be used directly within SELECT queries
- C. A UDF cannot return any values to the calling SQL statement
- D. They are identical in every way with no functional difference

Answer: A

Q1088. The GROUPING SETS clause in SQL:

- A. Groups all rows into one single group regardless of the criteria
- B. Removes grouping and returns individual rows from the result set
- C. Allows specifying multiple grouping combinations in a single query
- D. Sorts the result set based on the specified column or expression

Answer: C

Q1089. ROLLUP and CUBE in SQL GROUP BY are used for:

- A. Generating subtotals and grand totals across multiple dimensions
- B. Sorting data within each group by a specified column expression
- C. Creating indexes on columns that are used in GROUP BY clauses
- D. Deleting grouped data from the tables based on aggregate values

Answer: A

Q1090. Temporal tables in SQL track:

- A. Network latency and response metrics
- B. Only the current state of stored data
- C. Deleted tables and their old schemas
- D. Historical changes to data over time

Answer: D

Q1091. Fifth Normal Form (5NF) eliminates:

- A. Join dependencies that are not implied by candidate keys
- B. Multivalued dependencies among the stored data attributes
- C. Functional dependencies between attributes in the table
- D. All types of dependencies regardless of their categories

Answer: A

Q1092. A relation is in Domain-Key Normal Form (DKNF) if:

- A. Every constraint is a logical consequence of domain constraints and key constraints
- B. It satisfies only the requirements of first normal form and nothing beyond that
- C. All attributes in the relation must serve as keys for unique identification
- D. It has no constraints of any type defined on its attributes or relationships

Answer: A

Q1093. The synthesis algorithm for 3NF decomposition:

- A. Always produces a BCNF decomposition that preserves all functional dependencies
- B. Uses the canonical cover to create a dependency-preserving, lossless decomposition
- C. Only works for binary relations with exactly two attributes in the schema
- D. Removes all dependencies from the relation during the decomposition procedure

Answer: B

Q1094. It is possible to have a decomposition that is lossless but NOT dependency-preserving in:

- A. BCNF decomposition
- B. 1NF decomposition
- C. Any decomposition
- D. No decomposition

Answer: A

Q1095. The chase algorithm is used to:

- A. Create indexes on frequently queried columns
- B. Optimize storage allocation across disk pages
- C. Test whether a decomposition is lossless
- D. Test whether a query is syntactically correct

Answer: C

Q1096. A trivial functional dependency is one where:

- A. The right side is a subset of the left side
- B. The left side is empty with no attributes
- C. No attributes are involved in the FD
- D. Both sides are identical key attributes

Answer: A

Q1097. An extraneous attribute in an FD $X \twoheadrightarrow Y$ is an attribute that:

- A. Can be removed from X or Y without changing the closure
- B. Cannot be removed under any circumstance from the FD
- C. Must always be present in the functional dependency rule
- D. Is a primary key attribute that cannot ever be removed

Answer: A

Q1098. Normalization theory is based on which mathematical concept?

- A. Functional dependencies and their properties
- B. Probability theory and statistical methods
- C. Set theory only without other foundations
- D. Graph theory only without other foundations

Answer: A

Q1099. When BCNF decomposition is not dependency-preserving, the alternative is:

- A. Go to 4NF which eliminates all multivalued dependencies from the relation
- B. Accept 3NF which guarantees both lossless join and dependency preservation
- C. Denormalize completely to avoid any decomposition of the original table
- D. Use 1NF only which requires just atomic values in every attribute field

Answer: B

Q1100. A fully functionally dependent attribute means:

- A. Removing any attribute from the left side of the FD destroys the dependency
- B. The attribute has no dependencies of any kind on other attributes at all
- C. The attribute is part of the key and contributes to unique identification
- D. The attribute depends on a single column only in the current relation schema

Answer: A

Q1101. View serializability is:

- A. Not related to serializability in any way
- B. Less restrictive than conflict serializability
- C. The same as conflict serializability criteria
- D. More restrictive than conflict serializability

Answer: B

Q1102. A recoverable schedule ensures that:

- A. A transaction commits only after all transactions whose data it read have committed
- B. All transactions must run serially with no concurrent execution allowed at all
- C. Transactions can commit in any order regardless of their data reading dependencies
- D. Rollbacks are never needed because all transactions always complete successfully

Answer: A

Q1103. A cascadeless schedule is one where:

- A. All transactions must abort immediately
- B. Transactions only read committed data
- C. Transactions can read uncommitted data
- D. No reads are allowed in any transaction

Answer: B

Q1104. A strict schedule requires that:

- A. No transaction reads or writes data written by an uncommitted transaction
- B. Transactions can freely read uncommitted data from other transactions
- C. Commits are not required for transactions to be considered complete
- D. Only serial schedules are allowed for all transactions in the system

Answer: A

Q1105. The precedence graph for testing conflict serializability has:

- A. Nodes for SQL statements and edges for their execution ordering
- B. Nodes for transactions and edges for conflicting operation pairs
- C. Nodes for data items and edges for transactions accessing them
- D. No nodes or edges are used in this graph representation at all

Answer: B

Q1106. Testing view serializability is:

- A. NP-complete
- B. Linear time
- C. Logarithmic time
- D. Constant time

Answer: A

Q1107. The READ COMMITTED isolation level prevents:

- A. No anomalies of any kind
- B. All anomalies including phantoms
- C. Only dirty reads alone
- D. Dirty and non-repeatable reads

Answer: C

Q1108. The REPEATABLE READ isolation level prevents:

- A. All anomalies including phantom reads
- B. Dirty reads and non-repeatable reads
- C. Only dirty reads from transactions
- D. No anomalies of any kind at all

Answer: B

Q1109. In a multi-version concurrency control (MVCC) system:

- A. Transactions must be serial with no concurrent execution allowed at all
- B. Multiple versions of data items are maintained for concurrent access
- C. Only one version of each data item exists at any given point in time
- D. Locks are always required for every read and write operation performed

Answer: B

Q1110. A blind write is:

- A. A committed transaction that has been successfully applied
- B. A query optimization technique that reduces disk access
- C. A read operation that is not followed by any write at all
- D. A write operation without reading the current value first

Answer: D

Q1111. Multiple Granularity Locking uses intention locks. An Intention Shared (IS) lock means:

- A. No lower-level locks exist on any of the descendant nodes in the tree
- B. The item cannot be locked by any transaction under any circumstances
- C. A transaction intends to acquire shared locks on finer-granularity items
- D. A transaction has exclusively locked the entire item and all subitems

Answer: C

Q1112. An Intention Exclusive (IX) lock means:

- A. A transaction currently has a shared lock on the item and its subitems
- B. No locks are needed for any data items under this locking protocol
- C. A transaction intends to acquire exclusive locks on finer-granularity items
- D. The transaction is aborted because it cannot acquire the needed lock

Answer: C

Q1113. A Shared Intention Exclusive (SIX) lock means:

- A. No intention locks exist on any node in the hierarchy and all nodes are freely open
- B. The node is shared-locked and the transaction intends to exclusively lock finer items
- C. The node is exclusively locked by the transaction and no other can access it at all
- D. The transaction is complete and all locks have been released from every node here

Answer: B

Q1114. In the Thomas Write Rule (modification to timestamp ordering):

- A. Obsolete writes are ignored instead of causing rollback
- B. All writes cause rollback regardless of timestamp order
- C. Reads are ignored and only writes are processed by it
- D. Timestamps are not used in this modified protocol

Answer: A

Q1115. The phantom problem in locking can be solved by:

- A. Allowing dirty reads between queries
- B. Using only row-level locks in tables
- C. Index locking or predicate locking
- D. Removing all indexes from the tables

Answer: C

Q1116. In multi-version timestamp ordering (MVTO):

- A. Only one version of each data item is maintained
- B. Reads always block writes until they are completed
- C. No timestamps are used for ordering transactions
- D. Each write creates a new version of the data item

Answer: D

Q1117. The wound-wait scheme is a preemptive protocol because:

- A. Younger transactions always preempt older ones holding locks on data items
- B. No rollback ever occurs because all transactions complete without conflict
- C. An older transaction can force a younger one holding a needed lock to roll back
- D. Only reads are preempted while writes always proceed without interruption

Answer: C

Q1118. In tree locking protocol (for B+ tree indexes), a transaction must:

- A. Use no locks at all when accessing data through the index structure
- B. Lock children before parents when traversing the index tree structure
- C. Lock a node before locking its children, and unlock parent before child
- D. Lock all nodes simultaneously before accessing any data in the tree

Answer: C

Q1119. Lock escalation is the process of:

- A. Converting coarse-grained locks into many more fine-grained locks
- B. Converting many fine-grained locks into fewer coarse-grained locks
- C. Adding locks continuously without ever releasing any of them
- D. Removing all locks from the data items in the locked collection

Answer: B

Q1120. Snapshot isolation provides each transaction with:

- A. Only read access to the data without any ability to write modifications
- B. No isolation at all between concurrently executing database transactions
- C. Access to the latest uncommitted data written by other active transactions
- D. A consistent snapshot of the database as of the transaction's start time

Answer: D

Q1121. In ARIES, the analysis phase determines:

- A. The set of dirty pages and active transactions at crash time
- B. Only committed transactions that completed before the crash
- C. The hardware failure cause and the affected disk components
- D. Only the last checkpoint that was recorded in the log file

Answer: A

Q1122. In ARIES, the redo phase:

- A. Replays all logged changes from the earliest dirty page LSN forward
- B. Starts from the end of the log and processes records in reverse
- C. Only replays committed transactions and ignores uncommitted ones
- D. Undoes all transactions that were active at the time of the crash

Answer: A

Q1123. In ARIES, Compensation Log Records (CLRs) are:

- A. Checkpoint records that mark points of database consistency
- B. Log records for committed transactions only in the system
- C. Log records written during undo to record the undo actions
- D. Index maintenance records for B-tree structure updates

Answer: C

Q1124. The steal/no-force buffer management policy means:

- A. Uncommitted pages can be written to disk (steal); committed need not be forced immediately (no-force)
- B. Committed pages are always forced to disk immediately; uncommitted pages are never written to disk
- C. Only committed pages are present on disk; uncommitted data remains exclusively in the memory buffer
- D. All pages are always kept in memory; nothing is written to disk until the entire database shuts down

Answer: A

Q1125. No-steal/force policy would mean:

- A. Uncommitted pages are never written to disk, and committed pages are always forced to disk
- B. Neither undo nor redo is needed with this policy since both cases are eliminated
- C. Uncommitted pages can be written to disk at any time before the transaction commits
- D. Committed pages may not be on disk immediately and can remain only in memory buffer

Answer: A

Q1126. The redoLSN in ARIES is:

- A. The checkpoint LSN that marks the most recent consistency checkpoint
- B. The last LSN that was recorded in the transaction log before the crash
- C. The LSN from which redo must start (earliest recLSN among dirty pages)
- D. The LSN of the last commit record written to the stable storage log

Answer: C

Q1127. Write-ahead logging requires that log records be written to stable storage before:

- A. The transaction starts its initial read operation
- B. Any query is executed against the database tables
- C. The corresponding data page is flushed to disk
- D. The user submits the query to the database system

Answer: C

Q1128. In ARIES, when a transaction is undone, the undo follows:

- A. The commit order of other transactions in the same schedule
- B. The table creation order defined in the database schema file
- C. The lastLSN chain backward through that transaction's log records
- D. A random order without any specific sequence or priority rules

Answer: C

Q1129. Remote backup systems for disaster recovery provide:

- A. A copy of the database at a geographically separate site
- B. Better index structures for improving search performance
- C. Improved normalization of tables to reduce data redundancy
- D. Faster query processing through parallel execution plans

Answer: A

Q1130. The concept of idempotent redo means:

- A. Applying redo multiple times produces the same result as applying it once
- B. Redo can only be applied once and cannot be repeated after that point
- C. Redo changes the result each time it is applied to the database state
- D. Redo is never repeated because recovery always succeeds on first try

Answer: A

Q1131. In a B+ tree, the minimum occupancy of internal nodes (non-root) is:

- A. All pointers must be full
- B. One pointer (child) as minimum
- C. Exactly n pointers at all times
- D. Ceiling of $n/2$ pointers (children)

Answer: D

Q1132. The global depth in extendible hashing indicates:

- A. The total number of records stored across all the buckets
- B. The number of buckets currently allocated in the structure
- C. The number of bits used to determine the directory entry
- D. The number of hash functions used for the key computation

Answer: C

Q1133. Local depth in extendible hashing indicates:

- A. The depth of the B+ tree from the root node to the leaf node level
- B. The total number of collisions that have occurred in the hash table
- C. The number of bits used to determine which bucket a record belongs to
- D. The size of the directory that maps hash values to bucket addresses

Answer: C

Q1134. A hash join in query processing works by:

- A. Partitioning both relations using the same hash function then joining matching partitions
- B. Using an index on the join attribute to look up matching tuples from the inner relation
- C. Sorting both relations on the join attribute first and then merging the sorted result sets
- D. Using nested loops where each tuple of one relation is compared with every tuple of other

Answer: A

Q1135. R-trees are used to index:

- A. Text data and documents only
- B. Temporal data and timestamps
- C. One-dimensional key values only
- D. Spatial (multidimensional) data

Answer: D

Q1136. A function-based index is created on:

- A. A user role that defines access permissions and grants
- B. A database name used to identify the schema information
- C. A table name stored in the database system catalog data
- D. The result of a function applied to one or more columns

Answer: D

Q1137. An inverted index is commonly used in:

- A. Foreign key enforcement
- B. Numerical computations only
- C. Primary key lookups only
- D. Full-text search engines

Answer: D

Q1138. The order of a B+ tree affects performance because:

- A. A higher order means more keys per node, reducing tree height and disk I/O
- B. A higher order always increases the tree height and requires more disk access
- C. Lower order is always better because smaller nodes fit in memory more easily
- D. Order has no effect on performance and does not change disk I/O requirements

Answer: A

Q1139. Bulk loading a B+ tree is more efficient than individual insertions because:

- A. It creates an unbalanced tree that must be rebalanced later
- B. It sorts data first and builds the tree bottom-up, minimizing splits
- C. It skips creating the tree entirely and uses a flat file instead
- D. It uses no sorting and inserts records in their original order

Answer: B

Q1140. A skip list can be used as an alternative to B+ trees for indexing because:

- A. It provides $O(\log n)$ average search, insert, and delete with simpler implementation
- B. It uses less memory than any other data structure used for indexing purposes
- C. It is always faster than B+ trees for every type of database query and operation
- D. It requires no randomization and is fully deterministic in its performance

Answer: A

Q1141. The Selinger optimizer (System R) uses:

- A. Only heuristic rules without any cost estimation being performed
- B. Random plan selection from all possible execution plan choices
- C. Dynamic programming with interesting orders to find optimal plans
- D. No optimization at all with queries running as they are written

Answer: C

Q1142. An interesting sort order in query optimization is:

- A. Any random sort order applied to tuples without considering the query operations
- B. A sort order used only for displaying the final result to the end user query
- C. A sort order that increases cost by requiring additional sorting in later steps
- D. A sort order produced by one operation that is useful for a subsequent operation

Answer: D

Q1143. The number of possible join orders for n relations is:

- A. Grows exponentially (Catalan number)
- B. Always n^2 for n relations
- C. Always n for n given relations total
- D. Exactly $n!$ for n relations total

Answer: A

Q1144. In cost-based optimization, the estimated cost of a nested loop join $R \bowtie S$ is approximately:

- A. Always 1 block access regardless of the sizes of relations R and S used
- B. b_R plus b_S (sum of blocks from both R and S relations) in simple analysis
- C. n_R plus n_S (sum of tuples from both R and S relations) in simple analysis
- D. n_R times b_S plus b_R (b is blocks, n_R is tuples in R) in simple analysis

Answer: D

Q1145. Histogram statistics improve query optimization by:

- A. Increasing query complexity by adding more steps to the optimization process
- B. Providing more accurate selectivity estimates for non-uniform data distributions
- C. Removing the need for indexes by providing direct access to all stored records
- D. Making all estimates uniform regardless of the actual data value distribution

Answer: B

Q1146. A left-deep join tree is preferred by many optimizers because:

- A. It is the only valid tree shape for all joins
- B. It avoids all disk I/O during the join process
- C. It minimizes the number of tables in joins
- D. It allows pipelining of intermediate results

Answer: D

Q1147. Adaptive query processing differs from traditional optimization by:

- A. Only optimizing before execution begins and then running without changes
- B. Adjusting the execution plan during query execution based on runtime statistics
- C. Never changing the plan once it has been selected by the query optimizer
- D. Ignoring all statistics and using a fixed plan for every query submitted

Answer: B

Q1148. The concept of equivalent query expressions means:

- A. Identical query text that is written exactly the same way in SQL
- B. Different relational algebra expressions that produce the same result
- C. Queries that produce different results from the same input relations
- D. Queries executed on different databases with different table schemas

Answer: B

Q1149. Predicate pushdown in distributed queries:

- A. Ignores remote data sources completely and only queries local tables
- B. Sends all data to a central location first before any filtering occurs
- C. Sends filter conditions to remote data sources to reduce data transfer
- D. Removes all predicates from the query and returns all unfiltered data

Answer: C

Q1150. Columnar storage benefits analytical queries because:

- A. No indexes are needed for any query on columnar data store
- B. Row storage is used instead of column-oriented data format
- C. All columns are always read regardless of the query needs
- D. Only the needed columns are read from disk, reducing I/O

Answer: D

Q1151. Statistical database security addresses the problem of:

- A. Managing user roles and their assigned privileges set
- B. Creating backup copies of the database for recovery
- C. Inferring individual data from aggregate query results
- D. Encrypting data at rest on the physical storage media

Answer: C

Q1152. The inference problem in database security occurs when:

- A. No queries are allowed to be executed against the tables
- B. Users deduce restricted information from permitted queries
- C. Users have direct database access without any restrictions
- D. All data is encrypted and cannot be read without the key

Answer: B

Q1153. Label-based security in databases assigns:

- A. Sensitivity labels to data rows and clearance levels to users
- B. Labels only to tables without any row-level classification
- C. No labels to any data regardless of its sensitivity or nature
- D. Random access permissions to all users without any restrictions

Answer: A

Q1154. Homomorphic encryption allows:

- A. Faster decryption of data using optimized algorithms
- B. Only reading encrypted data without any modifications
- C. Computations on encrypted data without decrypting it
- D. Only writing encrypted data without reading it first

Answer: C

Q1155. Database firewall works by:

- A. Encrypting all data stored in the database tables and log files
- B. Only blocking network traffic without inspecting SQL statements
- C. Creating physical firewalls around the database server hardware
- D. Monitoring SQL traffic and blocking unauthorized or suspicious queries

Answer: D

Q1156. The k-anonymity privacy model ensures:

- A. Only k users can access the database at any given time during concurrent operations
- B. Data is stored in k copies across different sites for redundancy and availability
- C. All data is encrypted using a key of length k bits for secure storage and retrieval
- D. Each record is indistinguishable from at least k-1 other records on quasi-identifiers

Answer: D

Q1157. Differential privacy provides:

- A. Full access to all data without any restrictions or privacy controls
- B. Only physical security measures without any mathematical foundations
- C. No privacy guarantees of any kind for the data stored in the database
- D. Mathematical guarantees that query results do not reveal individual data

Answer: D

Q1158. A privilege graph is used to:

- A. Track the flow of granted privileges among users
- B. Design ER diagrams for conceptual data modeling
- C. Optimize query execution plans for better speed
- D. Create indexes on columns for fast data retrieval

Answer: A

Q1159. Cascading revocation in SQL means:

- A. Revoking a privilege also revokes it from all users who received it through the original grant
- B. No revocation occurs and the privilege remains active for all users who currently have it
- C. Only the specified user loses the privilege and no other users are affected by the revocation
- D. All database privileges for every user are revoked regardless of the specific grant involved

Answer: A

Q1160. Column-level encryption differs from TDE in that:

- A. It encrypts specific columns rather than entire database files
- B. It encrypts only at the network level rather than at storage level
- C. It encrypts only table names rather than the actual column data
- D. It is less secure than TDE because it covers fewer data elements

Answer: A

Q1161. The three-phase commit (3PC) protocol improves on 2PC by:

- A. Using only one phase for the commit decision
- B. Removing the prepare phase from the protocol
- C. Adding a pre-commit phase to avoid blocking
- D. Ignoring all failures that occur at any site

Answer: C

Q1162. In distributed databases, the global query optimization must consider:

- A. Only CPU time without considering disk or network access costs
- B. Only disk I/O costs without considering network or CPU overhead
- C. Only local processing costs without considering network overhead
- D. Network communication costs in addition to local processing costs

Answer: D

Q1163. Paxos is a protocol used for:

- A. Achieving consensus in distributed systems
- B. Indexing data for faster retrieval queries
- C. Query optimization in database management
- D. Schema design for database normalization

Answer: A

Q1164. The RAFT consensus algorithm is designed to be:

- A. Faster than all other protocols in every distributed environment
- B. A replacement for SQL in distributed relational database systems
- C. More understandable than Paxos while providing the same guarantees
- D. A type of index for organizing data in distributed hash tables

Answer: C

Q1165. In a federated database system:

- A. No integration is possible between any databases at all
- B. Autonomous databases cooperate to provide integrated access
- C. Only one database exists in the entire distributed system
- D. All databases are identical copies of the same data schema

Answer: B

Q1166. The eventual consistency model guarantees that:

- A. No consistency is provided between any of the replicas in the system
- B. Immediate consistency at all times for every read at every site node
- C. All reads always return the latest written value at every site instantly
- D. All replicas will converge to the same value if no new updates are made

Answer: D

Q1167. The quorum-based protocol requires:

- A. $Q_r = Q_w = 1$ for consistency meaning only one replica needs to respond
- B. Read quorum (Q_r) + Write quorum (Q_w) > total replicas (N) for consistency
- C. No quorum is needed and any single replica can respond to operations
- D. $Q_r + Q_w$ less than N for consistency between read and write quorums

Answer: B

Q1168. Vector clocks in distributed systems are used to:

- A. Capture causal relationships between events at different sites
- B. Measure CPU speed and processing capacity at each network node
- C. Optimize queries by selecting the best execution plan for joins
- D. Tell wall-clock time accurately across all distributed node sites

Answer: A

Q1169. Distributed hash tables (DHTs) are used in:

- A. Peer-to-peer distributed storage systems
- B. Centralized databases on a single machine
- C. Single-machine databases without networks
- D. Only for indexing within one database node

Answer: A

Q1170. The coordinator selection problem in distributed databases can be solved by:

- A. Manual intervention always requiring a human administrator
- B. No algorithm exists for solving the coordinator selection
- C. Random selection only without any formal algorithmic approach
- D. Election algorithms like the Bully algorithm or Ring algorithm

Answer: D

Q1171. The concept of tunable consistency in Cassandra means:

- A. Consistency cannot be changed once the Cassandra cluster has been configured
- B. Only strong consistency is available for all queries in the entire cluster
- C. The consistency level can be configured per query (ONE, QUORUM, ALL, etc.)
- D. Only eventual consistency is possible and no other level can be selected

Answer: C

Q1172. A wide-column store differs from a traditional columnar database in that:

- A. It is identical to a relational database model
- B. All rows must have the same columns defined
- C. Each row can have a different set of columns
- D. It uses only fixed schemas without flexibility

Answer: C

Q1173. CRDTs (Conflict-free Replicated Data Types) are used in distributed NoSQL to:

- A. Automatically resolve conflicts in replicated data without coordination
- B. Compress data to reduce the network transfer size between replica sites
- C. Encrypt data before replicating it across the distributed cluster nodes
- D. Create indexes on replicated data for faster query retrieval operations

Answer: A

Q1174. The gossip protocol in distributed NoSQL systems is used for:

- A. Transaction management for multi-site commit control
- B. Index creation on distributed data across all nodes
- C. Query optimization for distributed join operations
- D. Spreading information about cluster state across nodes

Answer: D

Q1175. NewSQL databases aim to provide:

- A. Only NoSQL features without any ACID guarantee support
- B. No guarantees at all for either consistency or scaling
- C. SQL-like guarantees (ACID) with NoSQL-like scalability
- D. Only traditional SQL features without scalability gains

Answer: C

Q1176. Examples of NewSQL databases include:

- A. Google Spanner, CockroachDB, VoltDB
- B. All of the above are NewSQL types
- C. MongoDB, Redis, Apache Cassandra
- D. MySQL, PostgreSQL, Oracle Database

Answer: A

Q1177. The LSM (Log-Structured Merge) tree used in many NoSQL databases provides:

- A. Only sequential reads without support for random access query patterns
- B. High read throughput only without any optimization for write operations
- C. High write throughput by buffering writes in memory and merging to disk
- D. No performance benefits over traditional B-tree index structures at all

Answer: C

Q1178. Google's Bigtable is:

- A. A traditional relational database with SQL support
- B. A key-value store only without column family data
- C. A distributed, sparse, multi-dimensional sorted map
- D. A graph database using nodes and edge connections

Answer: C

Q1179. Amazon DynamoDB uses:

- A. B+ trees for all data storage and access
- B. Consistent hashing for data partitioning
- C. Only single-node storage without sharding
- D. Relational tables internally for all data

Answer: B

Q1180. Multi-model databases support:

- A. Only relational data organized in standard normalized table format on disk
- B. Only flat files stored sequentially without any structured data model in use
- C. Multiple data models (document, graph, key-value) in a single database engine
- D. Only one data model such as relational without any support for other models

Answer: C

Q1181. A slowly changing dimension (SCD) Type 2 handles changes by:

- A. Overwriting the old value directly in place without keeping any history of changes
- B. Adding a new row with the new value and preserving the old row with history tracking
- C. Deleting the old row entirely and inserting a brand new row with the changed value
- D. Adding a new column to store the updated value alongside the previous column value

Answer: B

Q1182. A degenerate dimension is:

- A. A dimension key in the fact table that has no corresponding dimension table
- B. A dimension that is always empty and contains no rows of data whatsoever
- C. A dimension table with many attributes and a large number of data records
- D. A normalized dimension table that has been split into multiple sub-tables

Answer: A

Q1183. The galaxy schema (fact constellation) contains:

- A. No dimension tables in the schema at all
- B. Only dimension tables without fact tables
- C. Only one fact table with no shared dimensions
- D. Multiple fact tables sharing dimension tables

Answer: D

Q1184. Clustering in data mining groups:

- A. Data by primary key values in ascending sort order
- B. Data based on known categories and predefined classes
- C. Similar data points together without predefined labels
- D. Data randomly without any similarity considerations

Answer: C

Q1185. Decision tree classification in data mining:

- A. Builds a tree structure to classify data based on attribute values
- B. Creates random groupings of data without any logical partitioning
- C. Performs regression only for predicting continuous numeric values
- D. Finds association rules between items in transactional data sets

Answer: A

Q1186. The K-means algorithm is a:

- A. Classification algorithm using labeled training data sets
- B. Association rule algorithm for finding item relationships
- C. Regression algorithm for predicting continuous value data
- D. Clustering algorithm that partitions data into K groups

Answer: D

Q1187. A materialized view in a data warehouse is refreshed:

- A. Only when the database restarts after a scheduled shutdown
- B. Periodically or on demand to reflect source data changes
- C. In real-time always with zero latency from source updates
- D. Never after creation regardless of any source data changes

Answer: B

Q1188. Data lake differs from a data warehouse in that it:

- A. Is always smaller in size than a data warehouse
- B. Requires data transformation before storage occurs
- C. Stores raw, unstructured data in its native format
- D. Only stores structured data in normalized table form

Answer: C

Q1189. The concept of data lineage in data warehousing refers to:

- A. The size of tables measured in rows and storage bytes
- B. Tracking the origin and transformation history of data
- C. The number of queries executed against the data store
- D. The age of the database since its initial creation date

Answer: B

Q1190. Real-time data warehousing aims to:

- A. Minimize the latency between source data changes and warehouse availability
- B. Store data offline in cold storage without any access for active queries
- C. Avoid using ETL processes entirely and load data without transformation
- D. Only process batch data on a periodic schedule without real-time updates

Answer: A

Q1191. In a scenario where multiple applications need different views of employee data, which architecture feature best addresses this?

- A. External schema views tailored to each application need
- B. Conceptual schema duplication across each separate application
- C. Internal schema customization for each application program
- D. Physical storage partitioning for each individual application

Answer: A

Q1192. A university database must track students, courses, and enrollments. Which data independence level is impacted when changing the index structure on the student table?

- A. Physical data independence is impacted directly
- B. Neither level of independence is affected here
- C. Logical data independence is impacted directly
- D. Both logical and physical independence equally

Answer: A

Q1193. When a DBMS enforces referential integrity, what specific problem is being prevented?

- A. Excessive storage consumption from duplicate entries
- B. Unauthorized users gaining access to sensitive records
- C. Slow query performance due to missing index structures
- D. Dangling references to non-existent related records

Answer: D

Q1194. An enterprise migrates from file-based to DBMS. Which challenge is most critical during this transition?

- A. Selecting a new operating system for all server machines
- B. Reducing the total number of end user workstations
- C. Converting existing data and ensuring schema consistency
- D. Upgrading monitor displays for the database administrators

Answer: C

Q1195. A company needs to change the conceptual schema by adding a new attribute to a table without affecting existing applications. This exemplifies:

- A. View-level independence from external schema changes
- B. Instance-level independence from data value updates
- C. Logical data independence from schema modifications
- D. Physical data independence from storage changes

Answer: C

Q1196. In the ANSI/SPARC architecture, which component is responsible for transforming requests between schema levels?

- A. The transaction coordinator
- B. The schema mapping engine
- C. The query optimizer module
- D. The concurrency controller

Answer: B

Q1197. A hospital database requires that patient records cannot be deleted if they have associated billing entries. Which DBMS feature enforces this?

- A. Triggers that log all deletion attempts made
- B. Check constraints on the billing amount field
- C. Referential integrity with restrict delete
- D. Indexing on the patient identifier column

Answer: C

Q1198. When evaluating DBMS overhead versus file systems for a small single-user application, which factor most favors using a file system?

- A. The application must enforce complex integrity constraints
- B. The application needs minimal setup and lower overhead
- C. The application demands sophisticated query optimization
- D. The application requires complex multi-user concurrency

Answer: B

Q1199. A database system uses deferred modification during transaction execution. What does this mean regarding write operations?

- A. Writes are duplicated to two separate disk locations each
- B. Writes go directly to disk before the transaction commits
- C. Writes are encrypted before being stored on the disk drive
- D. Writes are held in buffer until transaction commits first

Answer: D

Q1200. An organization has separate databases for HR, Finance, and Inventory with overlapping employee data. Which integration approach best reduces redundancy?

- A. Creating a centralized database with shared employee records
- B. Allowing each department to independently define employee data
- C. Using flat files to export and import data between departments
- D. Maintaining separate databases with manual data synchronization

Answer: A

Q1201. A company experiences slow queries during peak hours with a two-tier architecture. Which architectural change would best address this?

- A. Increasing the network bandwidth between client and server
- B. Migrating to a three-tier architecture with application server
- C. Replacing the client hardware with more powerful machines
- D. Adding more storage disks to the existing database server

Answer: B

Q1202. In a shared-nothing parallel database, how is data redistribution handled during query joins across partitions?

- A. All data is consolidated to a single node before joining
- B. Joins across partitions are not supported in this setup
- C. Relevant data is shipped between nodes over the network
- D. Data is copied to a shared memory area for join processing

Answer: C

Q1203. A web application handles thousands of concurrent users. Which DBMS architectural feature is most critical for maintaining response times?

- A. Connection pooling and efficient buffer management
- B. Manual memory allocation by the database operator
- C. Verbose logging of every individual query executed
- D. Schema versioning for backward compatibility support

Answer: A

Q1204. When designing a fault-tolerant database architecture, which strategy best ensures continuous availability?

- A. Disabling transaction logging to improve performance speed
- B. Using active-passive replication with automatic failover
- C. Storing all data on a single high-performance server
- D. Relying solely on periodic backup tapes for recovery

Answer: B

Q1205. In a multi-tier architecture, which tier should implement data validation business rules for optimal security?

- A. In the application logic tier on the middle server
- B. Distributed equally across all three architectural tiers
- C. Exclusively in the presentation tier on the client side
- D. Only in the data tier within stored database procedures

Answer: A

Q1206. A distributed database system uses a two-phase commit protocol. What happens if the coordinator fails after sending prepare messages?

- A. The transaction is automatically rolled back at all sites
- B. Each participant independently decides to commit or abort
- C. All participants automatically commit their transactions
- D. Participants remain blocked until the coordinator recovers

Answer: D

Q1207. An organization needs to process analytical queries without affecting transactional performance. Which architectural pattern best achieves this?

- A. Using a single-tier architecture with query prioritization
- B. Implementing separate OLTP and OLAP systems with data feeds
- C. Disabling indexing on the transactional database for speed
- D. Running both workloads on the same database server instance

Answer: B

Q1208. In a cloud-based database architecture, what does the concept of elastic scaling specifically refer to?

- A. Permanently allocating maximum resources for peak loads
- B. Reducing database features to lower computational overhead
- C. Manually adding hardware when usage increases over time
- D. Automatically adjusting resources based on current demand

Answer: D

Q1209. When implementing a microservices architecture, what database pattern avoids tight coupling between services?

- A. Services communicate by directly reading each others data
- B. Each microservice owns its own private database instance
- C. A single transaction spans multiple microservice databases
- D. All microservices share a single centralized database

Answer: B

Q1210. A DBMS uses write-ahead logging in its architecture. What constraint does this impose on buffer management?

- A. Buffer management operates independently of log records
- B. Data pages must be written before any log records at all
- C. Buffer pages can be flushed to disk at any time freely
- D. Log records must be written to disk before data pages

Answer: D

Q1211. A university needs to model a scenario where a student can major in multiple departments, and each department offers multiple majors. Which relationship type best represents this?

- A. Many-to-many between student and department entities
- B. Unary relationship on the student entity type alone
- C. One-to-many from department entity to student entity
- D. One-to-one between student and department entities

Answer: A

Q1212. When converting an ER diagram with a ternary relationship to a relational schema, how many foreign keys does the resulting relation typically contain?

- A. No foreign keys since ternary cannot be directly mapped
- B. Two foreign keys referencing the two main entity types
- C. Three foreign keys referencing each participating entity
- D. One foreign key referencing the primary entity only

Answer: C

Q1213. In the Enhanced ER model, an overlapping specialization constraint means:

- A. Subtypes must collectively include all supertype entities
- B. An entity can belong to at most one subtype at a time
- C. No entity can belong to any of the defined subtype sets
- D. An entity can belong to multiple subtypes simultaneously

Answer: D

Q1214. A hospital system models doctors, patients, and treatments. A doctor treats a patient with a specific treatment. Which ER construct best models this scenario?

- A. An aggregation of doctor-patient with treatment entity
- B. Binary relationship between doctor and patient only
- C. Two separate binary relationships for each pair type
- D. A ternary relationship among all three entity types

Answer: D

Q1215. When modeling a recursive relationship where an employee manages other employees, what special consideration is needed?

- A. The relationship requires two separate entity types always
- B. A weak entity must be created for managed employees here
- C. Role names must distinguish the two participations clearly
- D. Recursive relationships cannot have any cardinality ratios

Answer: C

Q1216. In an EER diagram, the category (union type) construct is used when:

- A. An entity belongs to exactly one of multiple supertype sets
- B. An entity is always independent of all other entity types
- C. An entity has no relationship with any supertype entity set
- D. An entity must belong to all listed supertype entity sets

Answer: A

Q1217. A library system has Books, Authors, and Publishers. A book can have multiple authors, and each author may work with multiple publishers. If we need to track which publisher published which author-specific book, the best modeling approach is:

- A. Two binary relationships with an aggregation construct used
- B. Three binary relationships connecting each pair of entities
- C. A single ternary relationship among Book, Author, Publisher
- D. A single binary relationship between Book and Author only

Answer: C

Q1218. When mapping a total specialization with disjoint constraint to a relational schema, which approach uses the fewest tables?

- A. Create a single table with a type attribute discriminator
- B. Create tables for only the subtypes with inherited attributes
- C. Create tables for supertype and all subtypes separately
- D. Create one table per attribute of the supertype entity type

Answer: B

Q1219. In object-oriented data models, what does the concept of encapsulation specifically provide?

- A. Hiding internal state and exposing only defined methods
- B. Direct access to all internal data attributes of objects
- C. Conversion of objects into flat relational table records
- D. Automatic replication of objects across multiple servers

Answer: A

Q1220. A social network needs to model users who can be friends with each other and also belong to groups. Which combination of ER constructs most accurately captures this?

- A. A ternary relationship among user, friendship, and group
- B. Only binary relationships between user and group entities
- C. A recursive relationship on user plus binary with groups
- D. An aggregation of user entity with a group attribute added

Answer: C

Q1221. Given a relation $R(A, B, C, D)$ with functional dependencies $A \rightarrow B$, $B \rightarrow C$, and $C \rightarrow D$, what is the candidate key?

- A. The attribute set consisting of C only
- B. The attribute set consisting of D only
- C. The attribute set consisting of A only
- D. The attribute set consisting of B only

Answer: C

Q1222. In a relation with attributes $\{A, B, C, D, E\}$ and FDs $\{AB \rightarrow C, C \rightarrow D, D \rightarrow E\}$, what is the closure of $\{A, B\}$?

- A. The closure is the set $\{A, B, D, E\}$ only
- B. The closure is the set $\{A, B, C\}$ only
- C. The closure is the set $\{C, D, E\}$ without A B
- D. The closure is the set $\{A, B, C, D, E\}$

Answer: D

Q1223. A table has a composite primary key (StudentID, CourseID). Which statement about this design is correct?

- A. The combination must be unique but individual parts may repeat
- B. Each attribute alone must uniquely identify every record
- C. Only StudentID needs to be unique across all table records
- D. Neither StudentID nor CourseID can be null independently

Answer: A

Q1224. If a relation has five candidate keys each consisting of two attributes from a set of six, how many superkeys exist at minimum?

- A. Only one superkey exists in this relation total
- B. Exactly five superkeys exist in this relation
- C. At least five but potentially many more superkeys
- D. Exactly ten superkeys exist in this relation

Answer: C

Q1225. A database designer must choose between a natural key (SSN) and a surrogate key (auto-increment ID) for a Person table. Which consideration most favors the surrogate key?

- A. Surrogate keys carry inherent meaning about the entity
- B. Surrogate keys are stable and unaffected by real-world changes
- C. Natural keys provide better query performance in all cases
- D. Natural keys are always shorter than surrogate key values

Answer: B

Q1226. In a relation $R(A, B, C)$ with the functional dependency $AB \rightarrow C$ and no other non-trivial FDs, which normal form is R in?

- A. Second normal form but not third due to transitivity
- B. Third normal form since no transitive dependency exists
- C. Boyce-Codd normal form since AB is a superkey of R
- D. First normal form only since it has partial dependency

Answer: C

Q1227. When designing a relational schema for a many-to-many relationship between Students and Courses with an enrollment date attribute, which approach is correct?

- A. Add enrollment date to the Students table as a new column
- B. Store enrollment date in a separate unrelated lookup table
- C. Create a junction table with enrollment date as attribute
- D. Add enrollment date to the Courses table as a new column

Answer: C

Q1228. If Armstrong axioms are applied to derive $A \rightarrow C$ from $A \rightarrow B$ and $B \rightarrow C$, which specific axiom is used?

- A. Transitivity axiom of functional dependencies
- B. Decomposition axiom of functional dependencies
- C. Reflexivity axiom of functional dependencies
- D. Augmentation axiom of functional dependencies

Answer: A

Q1229. A relation has attributes $\{W, X, Y, Z\}$ with FDs $\{W \rightarrow X, X \rightarrow Y, WY \rightarrow Z\}$. What are all the candidate keys?

- A. The candidate keys are both $\{W\}$ and $\{X\}$ individually
- B. The only candidate key is the single attribute $\{W\}$
- C. The only candidate key is the attribute set $\{W, Y\}$
- D. The only candidate key is the attribute set $\{W, X\}$

Answer: B

Q1230. In a relational database, what specific problem does the phantom read anomaly cause in concurrent transactions?

- A. A transaction reads data that was already committed earlier
- B. A transaction sees new rows that match its previous query range
- C. A transaction cannot read any rows due to an exclusive lock
- D. A transaction overwrites changes made by another transaction

Answer: B

Q1231. Given relations $R(A,B)$ and $S(B,C)$, which expression finds A values associated with all C values in S?

- A. Divide the projection of AB from R by projection of B from S
- B. Divide the projection of AC from R join S by projection of C from S
- C. Divide the natural join of R and S by relation R on A only
- D. Project A from the natural join of R and S directly

Answer: B

Q1232. When optimizing a relational algebra expression, which transformation typically yields the greatest performance improvement?

- A. Replacing all natural joins with Cartesian products instead
- B. Pushing selections down to be applied as early as possible
- C. Performing projections after all joins are completed fully
- D. Delaying all selections until the final result is computed

Answer: B

Q1233. In relational algebra, how can the intersection operation be expressed using fundamental operations?

- A. A minus the result of A minus B gives the intersection
- B. A union B minus the Cartesian product of A and B together
- C. A union B minus A minus B gives the intersection result
- D. The Cartesian product of A and B filtered by equality check

Answer: A

Q1234. A query requires finding employees who work in every department. Which relational algebra operation is most appropriate?

- A. Division of employee-department pairs by all departments
- B. Natural join of employee and department relations directly
- C. Projection of employee names from the department relation
- D. Selection on the Cartesian product with a count condition

Answer: A

Q1235. When converting SELECT DISTINCT A FROM R WHERE B > 5 to relational algebra, the correct expression is:

- A. $R \text{ join } \sigma_{\{B>5\}}(R)$ using natural join with selection first
- B. $\pi_A(\sigma_{\{B>5\}}(R))$ applying selection before projection
- C. $\sigma_{\{B>5\}}(\pi_A(R))$ applying projection before selection
- D. $\pi_A(R) / \sigma_{\{B>5\}}(R)$ using division after projection

Answer: B

Q1236. In query tree optimization, why is it beneficial to perform projections early in the expression tree?

- A. Early projections increase the number of attributes processed
- B. Early projections automatically sort the intermediate results
- C. Early projections eliminate the need for any join operations
- D. Early projections reduce tuple width reducing memory overhead

Answer: D

Q1237. Given $R(A,B,C)$ and $S(C,D,E)$, which expression correctly computes R left outer join S on R.C = S.C?

- A. $(R \text{ join } S) \text{ union } ((R - \pi_{\{A,B,C\}}(R \text{ join } S)) \text{ times } \{(null, null)\})$
- B. $(R \text{ join } S) \text{ union } (\pi_{\{A,B,C\}}(R \text{ join } S) - R)$ with null padding
- C. $R \text{ times } S$ filtered by R.C equals S.C with duplicates removed
- D. $\pi_{\{A,B\}}(R) \text{ join } \sigma_{\{D>0\}}(S)$ with null values for unmatched

Answer: A

Q1238. When two selection conditions are conjunctive (AND), which algebraic equivalence holds?

- A. $\sigma_{\{p \text{ AND } q\}}(R) = \sigma_p(\sigma_q(R))$ using cascaded selections
- B. $\sigma_{\{p \text{ AND } q\}}(R) = \sigma_p(R) \text{ times } \sigma_q(R)$ using product
- C. $\sigma_{\{p \text{ AND } q\}}(R) = \sigma_p(R) \text{ union } \sigma_q(R)$ using union
- D. $\sigma_{\{p \text{ AND } q\}}(R) = \sigma_p(R) - \sigma_q(R)$ using set difference

Answer: A

Q1239. In the context of query optimization, what is the cost of a Cartesian product of relations with m and n tuples respectively?

- A. The cost is proportional to the sum of m plus n tuples
- B. The cost is proportional to the minimum of m or n tuples
- C. The cost is proportional to the maximum of m or n tuples
- D. The cost is proportional to the product of m times n tuples

Answer: D

Q1240. A relational algebra expression uses multiple joins. Which join ordering heuristic typically minimizes intermediate result sizes?

- A. Always join the two smallest intermediate results first
- B. Always join the two largest relations first in the query
- C. Join relations in the order they appear in the SQL query
- D. Join relations in alphabetical order of their table names

Answer: A

Q1241. A query needs to find the second highest salary from an Employee table. Which approach is correct?

- A. `SELECT MIN(salary) FROM Employee WHERE salary > (SELECT MIN(salary) FROM Employee)`
- B. `SELECT DISTINCT salary FROM Employee ORDER BY salary LIMIT 1`
- C. `SELECT MAX(salary) FROM Employee WHERE salary < (SELECT MAX(salary) FROM Employee)`
- D. `SELECT MAX(salary) FROM Employee` without any additional filter

Answer: C

Q1242. What is the difference between UNION and UNION ALL in SQL?

- A. UNION works with different columns while UNION ALL needs same
- B. UNION removes duplicates while UNION ALL keeps all duplicates
- C. UNION keeps duplicates while UNION ALL removes all duplicates
- D. UNION is for joins while UNION ALL is for subquery operations

Answer: B

Q1243. In a correlated subquery, when is the inner query executed?

- A. Once for each row processed by the outer query statement
- B. Only when the outer query returns an empty result set
- C. Once before the outer query begins its execution cycle
- D. Once after the outer query completes all its processing

Answer: A

Q1244. Which SQL construct is best for assigning a rank with gaps to rows based on a column value?

- A. NTILE window function
- B. RANK window function
- C. ROW_NUMBER window function
- D. DENSE_RANK window function

Answer: B

Q1245. A query uses multiple joins. In which order does the SQL engine typically process the clauses?

- A. SELECT, FROM, WHERE, GROUP BY, HAVING, ORDER BY sequence
- B. ORDER BY, SELECT, FROM, WHERE, GROUP BY, HAVING sequence
- C. WHERE, FROM, SELECT, GROUP BY, ORDER BY, HAVING sequence
- D. FROM, WHERE, GROUP BY, HAVING, SELECT, ORDER BY sequence

Answer: D

Q1246. What is the purpose of the COALESCE function in SQL?

- A. It returns the first non-null value from its arguments
- B. It concatenates multiple string values into one result
- C. It converts a value from one data type to another type
- D. It calculates the average of all provided numeric values

Answer: A

Q1247. When using a Common Table Expression (CTE), what advantage does it provide over a regular subquery?

- A. CTEs allow recursive queries that subqueries cannot handle
- B. CTEs bypass all security permissions on underlying base tables
- C. CTEs are always faster than equivalent subquery expressions
- D. CTEs automatically create permanent tables in the database

Answer: A

Q1248. A query needs to find departments where ALL employees earn more than 50000. Which approach is correct?

- A. SELECT dept FROM Employee GROUP BY dept HAVING MAX(salary) > 50000
- B. SELECT dept FROM Employee GROUP BY dept HAVING MIN(salary) > 50000
- C. SELECT dept FROM Employee GROUP BY dept HAVING AVG(salary) > 50000
- D. SELECT dept FROM Employee WHERE salary > 50000 without grouping

Answer: B

Q1249. What is the difference between EXISTS and IN when used with subqueries?

- A. EXISTS only works with correlated subqueries and IN never does
- B. EXISTS and IN always produce different results for same data
- C. EXISTS checks for value matches while IN checks row existence
- D. EXISTS returns true if subquery returns any rows at all

Answer: D

Q1250. In SQL, what does the PIVOT operation accomplish?

- A. It transforms row values into separate column headers
- B. It merges multiple tables into a single combined view
- C. It sorts data by multiple columns in alternating order
- D. It splits a single column into multiple separate tables

Answer: A

Q1251. A recursive CTE is used to traverse an employee hierarchy. What component prevents infinite recursion?

- A. A termination condition in the recursive member WHERE clause
- B. The LIMIT clause applied to the final outer SELECT query
- C. An index on the self-referencing foreign key column used
- D. The DISTINCT keyword in the recursive member query

Answer: A

Q1252. When should a materialized view be refreshed using ON COMMIT versus ON DEMAND?

- A. ON COMMIT for infrequently changed data and ON DEMAND for frequent
- B. ON COMMIT for read-heavy workloads and ON DEMAND for write-heavy
- C. ON COMMIT when data freshness is critical and ON DEMAND when not
- D. ON COMMIT for large tables and ON DEMAND for small table sizes

Answer: C

Q1253. A trigger needs to maintain an audit trail of all salary changes. Which trigger type and timing combination is most appropriate?

- A. BEFORE SELECT trigger on the employee table records
- B. INSTEAD OF DELETE trigger on the employee table only
- C. AFTER UPDATE trigger on the employee salary column
- D. BEFORE INSERT trigger on the employee table only

Answer: C

Q1254. In SQL, what is the difference between RANK(), DENSE_RANK(), and ROW_NUMBER() for tied values?

- A. All three produce identical results for tied values always
- B. ROW_NUMBER skips ranks while RANK and DENSE_RANK assign same to ties
- C. RANK and DENSE_RANK handle ties while ROW_NUMBER assigns unique numbers
- D. RANK skips numbers for ties while DENSE_RANK and ROW_NUMBER do not

Answer: C

Q1255. A stored procedure needs to handle errors gracefully. Which SQL mechanism is most appropriate?

- A. Implementing TRY-CATCH or EXCEPTION handling blocks within
- B. Using nested IF-ELSE statements for every possible error
- C. Wrapping every statement in a separate transaction context
- D. Checking return values of every SQL statement manually each

Answer: A

Q1256. When creating a covering index, what specific advantage does it provide for query performance?

- A. It compresses the data to reduce overall storage requirements
- B. It allows the query to be answered from the index alone
- C. It eliminates the need for primary keys on the covered table
- D. It automatically partitions the table across multiple disks

Answer: B

Q1257. A database has a view defined on a join of three tables. Under which condition is this view updatable?

- A. When all three tables have identical primary key definitions
- B. When the update affects columns from only one base table
- C. When the view includes aggregate functions on joined columns
- D. When the view includes a DISTINCT clause in its definition

Answer: B

Q1258. What is the difference between statement-level and row-level triggers?

- A. Statement-level only works with SELECT while row-level with all DML
- B. Statement-level is faster than row-level in every possible case
- C. Statement-level fires for each row while row-level fires once
- D. Statement-level fires once per statement while row-level per row

Answer: D

Q1259. When using the MERGE statement, what advantage does it provide over separate INSERT, UPDATE, DELETE statements?

- A. MERGE automatically creates indexes on the target table columns
- B. MERGE combines insert, update, and delete in a single atomic step
- C. MERGE is always faster than individual DML statements executed
- D. MERGE bypasses all constraint checking for improved performance

Answer: B

Q1260. A query uses LAG and LEAD window functions. What do these functions specifically provide?

- A. They access data from preceding and following rows respectively
- B. They count the number of rows before and after current row
- C. They calculate running totals across all rows in partition
- D. They determine the first and last values within each partition

Answer: A

Q1261. Given R(A, B, C, D) with FDs {A->B, B->C, C->D}, decompose into BCNF relations.

- A. R1(A,D), R2(B,C) splitting based on attribute positions
- B. R1(A,B,C,D) remains as a single table in BCNF form
- C. R1(A,C), R2(B,D) with cross-referencing foreign key links
- D. R1(A,B), R2(B,C), R3(C,D) each with proper determinants

Answer: D

Q1262. A relation R(Student, Course, Instructor) has FDs {Student,Course->Instructor, Instructor->Course}. What normal form is R in?

- A. R is only in 2NF because of a partial dependency present
- B. R is only in 1NF because of a transitive dependency issue
- C. R is in 3NF but not BCNF due to the second dependency
- D. R is in BCNF since all determinants are candidate keys

Answer: C

Q1263. When decomposing a relation into 3NF using the synthesis algorithm, what is the first step?

- A. Identify all candidate keys of the original relation first
- B. List all attributes and their domains in the relation schema
- C. Compute a minimal cover of the functional dependencies set
- D. Create a separate table for each attribute in the relation

Answer: C

Q1264. A relation has attributes {A, B, C, D, E} with FDs {AB→C, C→D, D→E, E→A}. How many candidate keys does this relation have?

- A. Exactly two candidate keys exist in this relation
- B. Exactly one candidate key exists in this relation
- C. Exactly three candidate keys exist in this relation
- D. Exactly four candidate keys exist in this relation

Answer: D

Q1265. What specific problem can arise when decomposing a relation into BCNF that does not occur with 3NF decomposition?

- A. BCNF decomposition may lose some functional dependencies
- B. BCNF decomposition cannot handle composite primary key sets
- C. BCNF decomposition always results in lossy join operations
- D. BCNF decomposition always creates more tables than needed

Answer: A

Q1266. A table stores Employee(EmpID, Name, DeptID, DeptName, DeptLocation). With FD DeptID→DeptName, DeptLocation, what anomalies exist?

- A. No anomalies exist because the table is fully normalized
- B. Update, insertion, and deletion anomalies all exist here
- C. Only deletion anomalies exist due to DeptID dependency
- D. Only insertion anomalies exist due to the composite key

Answer: B

Q1267. Fifth normal form (5NF) addresses which specific type of dependency?

- A. Join dependencies that cannot be expressed as simpler ones
- B. Inclusion dependencies between attributes of related tables
- C. Functional dependencies between key and non-key attributes
- D. Multivalued dependencies between independent attribute sets

Answer: A

Q1268. In the chase algorithm for testing lossless join, what does the algorithm verify?

- A. Whether the original relation has any candidate key defined
- B. Whether the resulting tables are all in BCNF normal form
- C. Whether the decomposition allows lossless reconstruction
- D. Whether all functional dependencies are preserved in split

Answer: C

Q1269. A relation R(A,B,C) has multivalued dependencies A→→B and A→→C. What is the correct 4NF decomposition?

- A. Keep R(A,B,C) as a single table since it is already in 4NF
- B. Decompose into R1(A,B) and R2(A,C) removing the dependency
- C. Decompose into R1(B,C) and R2(A) with a mapping table added
- D. Decompose into R1(A,B,C) and R2(A) with a foreign key link

Answer: B

Q1270. When is a relation in Domain-Key Normal Form (DKNF)?

- A. When all functional dependencies have superkeys as determinants
- B. When all constraints are consequences of domain and key constraints
- C. When no multivalued dependencies exist in the relation schema
- D. When all attributes are of the same domain type and key type

Answer: B

Q1271. A banking system processes concurrent transfers between accounts. If T1 transfers from A to B and T2 transfers from B to A simultaneously, what specific ACID property prevents incorrect total balances?

- A. Atomicity ensures each transfer fully completes or not at all
- B. All three properties above work together to prevent the issue
- C. Isolation ensures the transfers do not interfere with each
- D. Durability ensures the balances survive server failures

Answer: C

Q1272. In a schedule where T1 reads X, T2 writes X, T1 reads X again, which anomaly occurs and at which isolation level is it first prevented?

- A. Non-repeatable read prevented at Repeatable Read level first
- B. Dirty read anomaly prevented at Read Uncommitted level first
- C. Phantom read anomaly prevented at Serializable level first
- D. No anomaly occurs because both transactions read the data

Answer: A

Q1273. When testing conflict serializability, what does a cycle in the precedence graph indicate?

- A. The schedule needs more transactions to determine its result
- B. The schedule is not conflict serializable and has conflicts
- C. The schedule is conflict serializable and safe to execute
- D. The schedule has no conflicts between any transactions at all

Answer: B

Q1274. A long-running analytical transaction keeps getting aborted due to conflicts with short OLTP transactions. Which strategy best addresses this?

- A. Using snapshot isolation for the analytical transaction query
- B. Increasing the timeout period for the analytical transaction
- C. Converting the analytical query into multiple short transactions
- D. Disabling concurrency control for the analytical transaction

Answer: A

Q1275. In a distributed transaction using the two-phase commit protocol, what happens during the prepare phase?

- A. All participants send their data to the coordinator node
- B. The coordinator unilaterally decides to commit or abort all
- C. All participants commit their local transactions immediately
- D. The coordinator asks participants if they can commit safely

Answer: D

Q1276. A system uses strict two-phase locking. What additional guarantee does this provide over basic two-phase locking?

- A. It prevents deadlocks from occurring between transactions
- B. It holds all exclusive locks until the transaction commits
- C. It allows locks to be released during the growing phase
- D. It eliminates the need for any lock management overhead

Answer: B

Q1277. When using write-ahead logging with UNDO/REDO recovery, what must be true before a dirty page can be flushed to disk?

- A. The page must have been read by at least one other transaction
- B. The buffer pool must be completely full of dirty data pages
- C. The log record for the update must be on stable storage
- D. The transaction must have already committed successfully

Answer: C

Q1278. A system uses multiversion concurrency control (MVCC). What is the primary advantage over lock-based concurrency?

- A. Readers do not block writers and writers do not block readers
- B. MVCC eliminates the need for any transaction isolation level
- C. MVCC uses less memory than lock-based systems in all cases
- D. MVCC guarantees serializability without any additional effort

Answer: A

Q1279. In the ARIES recovery algorithm, what are the three phases of recovery?

- A. Prepare, Commit, and Acknowledge phases for transaction recovery
- B. Scan, Parse, and Execute phases for query recovery management
- C. Analysis, Redo, and Undo phases for crash recovery processing
- D. Backup, Restore, and Verify phases for data recovery operations

Answer: C

Q1280. A transaction T1 reads a set of rows matching a condition, then T2 inserts a new row matching that condition, then T1 re-reads. What anomaly is this and how is it prevented?

- A. Phantom read anomaly prevented by Serializable isolation level
- B. Dirty read anomaly prevented by Read Committed isolation level
- C. Non-repeatable read prevented by Repeatable Read isolation level
- D. Lost update anomaly prevented by Read Uncommitted isolation level

Answer: A

Q1281. In a system using strict two-phase locking, a transaction T1 holds an exclusive lock on item X and T2 requests a shared lock on X. What happens?

- A. T1 is forced to release its exclusive lock for T2 to proceed
- B. T2 is permanently aborted and must restart from the beginning
- C. T2 immediately gets the shared lock alongside the exclusive
- D. T2 must wait until T1 releases the exclusive lock on item X

Answer: D

Q1282. A database uses multigranularity locking with IS, IX, S, SIX, and X modes. Which lock mode allows reading an entire table while intending to write some rows?

- A. SIX (Shared with Intention Exclusive) lock on table
- B. IS (Intention Shared) lock mode on the entire table
- C. S (Shared) lock mode on the entire table resource
- D. IX (Intention Exclusive) lock mode on the table

Answer: A

Q1283. When using timestamp ordering, what happens when a transaction tries to write an item with a read timestamp greater than its own?

- A. The write proceeds normally without any restriction applied
- B. The transaction is rolled back and restarted with new timestamp
- C. The read timestamp is updated to match the write transaction
- D. The item is locked until both transactions complete their work

Answer: B

Q1284. In optimistic concurrency control, what are the three phases of transaction execution?

- A. Prepare, Commit, and Cleanup phases for transaction flow
- B. Read, Validation, and Write phases for each transaction
- C. Parse, Optimize, and Execute phases for query processing
- D. Lock, Execute, and Release phases for each transaction

Answer: B

Q1285. A system detects deadlocks using a wait-for graph. What does a cycle in this graph indicate?

- A. No conflicts exist between the transactions in the cycle
- B. A deadlock exists among the transactions in the cycle now
- C. The transactions in the cycle have all committed already
- D. All transactions in the cycle can proceed without issues

Answer: B

Q1286. When using predicate locking to prevent phantoms, what is the main practical limitation?

- A. Predicate locking requires all transactions to run serially
- B. Predicate locking is computationally expensive to implement
- C. Predicate locking cannot prevent any type of data anomaly
- D. Predicate locks only work with exclusive lock modes applied

Answer: B

Q1287. In snapshot isolation, what specific anomaly can still occur that true serializability prevents?

- A. Phantom reads from newly inserted rows matching conditions
- B. Dirty reads from uncommitted transaction data values
- C. Write skew where two transactions write based on stale reads
- D. Non-repeatable reads from concurrent update operations

Answer: C

Q1288. A database uses tree protocol locking. What constraint does this protocol impose on lock acquisition?

- A. All locks must be acquired simultaneously before any operation
- B. Locks must be acquired in alphabetical order of data items
- C. Locks can only be acquired on leaf nodes of the tree structure
- D. First lock can be on any item but subsequent locks follow tree

Answer: D

Q1289. When comparing wound-wait and wait-die for deadlock prevention, which scheme causes more unnecessary rollbacks and why?

- A. Wait-die causes more because younger transactions die on conflict
- B. Neither scheme causes any unnecessary rollbacks by their design
- C. Wound-wait causes more because it preempts younger transactions
- D. Both schemes cause exactly the same number of rollbacks always

Answer: A

Q1290. In a real-time database system, how should the concurrency control protocol be modified to meet timing constraints?

- A. Use standard two-phase locking with no modifications at all
- B. Disable concurrency control entirely to maximize throughput
- C. Use priority-based protocols that consider transaction deadlines
- D. Lock all data items at the start to prevent any waiting time

Answer: C

Q1291. In the ARIES recovery algorithm, what is the purpose of the analysis phase?

- A. To determine dirty pages and active transactions at crash time
- B. To redo all committed transactions found in the log records
- C. To create a new checkpoint after the recovery process completes
- D. To undo all uncommitted transactions found in the log records

Answer: A

Q1292. During ARIES redo phase, why does it repeat history by redoing all logged actions?

- A. To optimize the recovery process by skipping unnecessary operations
- B. To restore the database to its exact state at the moment of crash
- C. To ensure only committed transaction changes are applied to data
- D. To verify that all log records are correctly formatted and valid

Answer: B

Q1293. In a system using steal/no-force policy, which recovery operations are needed?

- A. Neither UNDO nor REDO operations are needed for the system
- B. Only REDO operations are needed for committed transactions
- C. Both UNDO and REDO operations are needed for full recovery
- D. Only UNDO operations are needed for uncommitted transactions

Answer: C

Q1294. A system crash occurs during a checkpoint. How does the recovery process handle this incomplete checkpoint?

- A. The incomplete checkpoint is treated as if it completed normally
- B. The recovery process ignores the incomplete checkpoint entirely
- C. The database is restored from the most recent full backup only
- D. Recovery uses the previous complete checkpoint as starting point

Answer: D

Q1295. In physiological logging used by ARIES, what does a log record describe?

- A. The logical operation applied to a specific physical page only
- B. The exact byte-level changes made to the physical disk blocks
- C. The complete SQL statement that was executed by the transaction
- D. The schema changes made to the table definition during update

Answer: A

Q1296. A database uses asynchronous replication for disaster recovery. What is the primary risk of this approach?

- A. Network bandwidth usage is higher than synchronous replication
- B. The primary server may experience increased write latency
- C. The replica server cannot handle any read query operations
- D. Some committed transactions may be lost if the primary fails

Answer: D

Q1297. How does the compensation log record (CLR) work in the ARIES algorithm?

- A. CLR creates a backup of the data before any changes are applied
- B. CLR records the original changes made by a committed transaction
- C. CLR logs the undo action and points to the next record to undo
- D. CLR prevents any further modifications to the recovered data items

Answer: C

Q1298. A system needs sub-second recovery time. Which technique best achieves this requirement?

- A. Shadow paging with deferred modification and periodic checkpoints
- B. In-memory database with synchronous replication to a standby
- C. Full database backup every hour with log replay for recovery
- D. Traditional checkpoint-based recovery with large log intervals

Answer: B

Q1299. In a distributed database, what additional complexity does recovery face compared to centralized systems?

- A. Distributed databases do not require any transaction log records
- B. All sites must use identical hardware and software configurations
- C. Recovery in distributed systems is always faster than centralized
- D. Coordinating recovery across multiple sites with network issues

Answer: D

Q1300. When using logical undo during recovery, why might a physical undo be insufficient?

- A. Physical undo is always sufficient for all recovery scenarios
- B. Concurrent transactions may have modified the same page since then
- C. Physical undo cannot read the log records written to stable storage
- D. Logical undo is faster than physical undo in every possible case

Answer: B

Q1301. A B+ tree with order 4 and 1000 records needs at minimum how many levels including the root?

- A. Two levels are needed for this tree configuration setup
- B. Four levels are needed for this tree configuration setup
- C. Five levels are needed for this tree configuration setup
- D. Three levels are needed for this tree configuration setup

Answer: D

Q1302. When should a database administrator choose a hash index over a B+ tree index?

- A. When the indexed column has very low cardinality values only
- B. When equality queries dominate and data size is predictable
- C. When the table is frequently updated with many insert operations
- D. When range queries are the predominant access pattern needed

Answer: B

Q1303. In a B+ tree, what happens during a leaf node split when inserting into a full node?

- A. The leaf splits into two and the middle key propagates upward
- B. The entire tree is rebuilt from scratch with new node sizes
- C. All records in the full node are redistributed to sibling nodes
- D. The insertion is rejected until space becomes available in node

Answer: A

Q1304. A query accesses 5% of records in a table with one million rows. Is using an index beneficial compared to a full table scan?

- A. Index is always beneficial regardless of the percentage accessed
- B. Index is never beneficial when accessing more than 1% of records
- C. Full table scan is better because 5% means too many random reads
- D. It depends on whether the access is sequential or random pattern

Answer: D

Q1305. What is the advantage of using a B+ tree over extendible hashing for concurrent access?

- A. B+ tree never requires any locking for concurrent operations
- B. B+ tree allows finer granularity locking on individual nodes
- C. Extendible hashing cannot support more than one concurrent user
- D. Extendible hashing always requires locking the entire directory

Answer: B

Q1306. In a database with write-heavy workload, what is the impact of having too many indexes on a table?

- A. Write performance degrades because each index must be updated too
- B. There is no impact because indexes only affect read query operations
- C. Write performance improves because indexes speed up all operations
- D. Read performance degrades because indexes conflict with each other

Answer: A

Q1307. What is a partial index and when is it most useful?

- A. An index that is partially stored in memory and partially on disk
- B. An index created during off-peak hours for performance reasons
- C. An index on all rows but only some columns of the data table
- D. An index on a subset of rows matching a predicate condition

Answer: D

Q1308. How does a log-structured merge tree (LSM tree) differ from a B+ tree in write performance?

- A. B+ trees are faster for writes due to their balanced tree structure
- B. Both structures have identical write performance characteristics
- C. LSM trees are faster for writes by using sequential append-only IO
- D. LSM trees are slower for writes due to frequent merge operations

Answer: C

Q1309. A table has a composite index on columns (A, B, C). Which queries can efficiently use this index?

- A. Queries filtering on A, or A and B, or A and B and C together
- B. Only queries filtering on all three columns A, B, and C at once
- C. Queries filtering on any single column A or B or C independently
- D. Only queries filtering on column C alone can use this index

Answer: A

Q1310. What is the write amplification problem in B+ tree indexes and how do LSM trees address it?

- A. LSM trees have worse write amplification than B+ trees in all cases
- B. B+ trees have no write amplification issue at all in practice
- C. Write amplification only occurs in hash-based indexes not in trees
- D. B+ trees cause multiple page writes per update while LSM trees batch

Answer: D

Q1311. When joining three tables R, S, and T, how does the optimizer determine the best join order?

- A. It always joins in the order specified in the SQL FROM clause
- B. It enumerates possible orders and estimates the cost of each
- C. It randomly selects a join order and uses that for execution
- D. It always joins the two smallest tables first without analysis

Answer: B

Q1312. A query has a selection condition with OR predicates on different indexed columns. How does the optimizer typically handle this?

- A. It creates a temporary composite index on both columns at once
- B. It uses index union (bitmap OR) to combine results from indexes
- C. It ignores all indexes and performs a full table scan always
- D. It only uses the index on the first column mentioned in query

Answer: B

Q1313. In a distributed database, what additional factor must the query optimizer consider compared to centralized systems?

- A. The color scheme of the user interface displaying query results
- B. Only the CPU cost of processing each query operation step
- C. Only the memory usage of temporary tables during query execution
- D. The network communication cost of transferring data between sites

Answer: D

Q1314. What is the difference between rule-based and cost-based optimization?

- A. Cost-based does not consider indexes while rule-based always does so
- B. Rule-based uses predefined rules while cost-based uses data statistics
- C. Rule-based is always more accurate than cost-based for complex plans
- D. Rule-based considers data statistics while cost-based uses fixed rules

Answer: B

Q1315. How does the optimizer handle correlated subqueries for performance?

- A. It ignores correlated subqueries and returns approximate results
- B. It always executes correlated subqueries exactly as they are written
- C. It may decorrelate them by transforming into joins when possible
- D. It converts all correlated subqueries into temporary table scans

Answer: C

Q1316. What is adaptive query processing?

- A. Modifying the execution plan during runtime based on actual data
- B. Processing queries without any optimization or planning phase
- C. Using a fixed plan regardless of the data distribution changes
- D. Processing queries only during off-peak hours for efficiency

Answer: A

Q1317. When estimating the cost of a join operation, what is the most critical factor?

- A. The estimated size of the intermediate join result produced
- B. The number of columns selected in the final output projection
- C. The order of columns listed in the SELECT clause of the query
- D. The names of the tables being joined in the SQL statement

Answer: A

Q1318. A query execution plan shows a sort-merge join between two large unsorted tables. Under what condition would a hash join be more efficient?

- A. When both tables have clustered indexes on the join attribute
- B. When the join condition involves a range-based comparison only
- C. When one table fits in memory and an equality join is needed
- D. When both tables are already sorted on the join attribute key

Answer: C

Q1319. What is the purpose of maintaining multiple access paths in the optimizer search space?

- A. To simplify the optimization process by reducing total choices
- B. To find the plan with the lowest cost among various alternatives
- C. To guarantee that indexes are never used for any query plans
- D. To ensure every query produces exactly the same result always

Answer: B

Q1320. How do parameterized queries affect query optimization?

- A. They force the optimizer to always perform a full table scan only
- B. They prevent the optimizer from generating any execution plan
- C. They allow plan caching and reuse across different parameter values
- D. They eliminate the need for any statistics collection on columns

Answer: C

Q1321. An application stores passwords in a database. Which approach provides the strongest security?

- A. Hashing passwords with salt using a slow algorithm like bcrypt
- B. Encrypting passwords with a reversible symmetric algorithm
- C. Encoding passwords with Base64 encoding for basic obfuscation
- D. Storing passwords in plaintext for easy comparison checks

Answer: A

Q1322. A database administrator needs to implement row-level security for a multi-tenant application. Which approach is most effective?

- A. Using views with security predicates based on tenant context
- B. Using application-level filtering without any database controls
- C. Creating separate tables for each tenant in the same database
- D. Giving each tenant a completely separate database instance here

Answer: A

Q1323. What is the risk of a second-order SQL injection compared to a first-order injection?

- A. Second-order only affects SELECT queries while first-order all
- B. Stored malicious input executes later when used in another query
- C. Second-order is less dangerous because the input is validated
- D. There is no practical difference between first and second order

Answer: B

Q1324. When implementing database encryption, what is the key management challenge?

- A. Encryption keys do not need any management after initial creation
- B. Securely storing, rotating, and distributing keys without exposure
- C. Key management only matters for symmetric encryption not asymmetric
- D. Encryption keys are automatically managed by the operating system

Answer: B

Q1325. A healthcare database must comply with HIPAA regulations. Which database security measures are most critical?

- A. Only password protection and regular backups are sufficient here
- B. Access control, encryption, audit trails, and data masking combined
- C. Only data encryption at rest without any other security measures
- D. Only network firewalls without any database-level security controls

Answer: B

Q1326. What is the difference between data-at-rest encryption and data-in-transit encryption?

- A. At-rest is optional while in-transit is always mandatory requirement
- B. At-rest protects network data while in-transit protects stored data
- C. Both protect data at the same stage of the data lifecycle process
- D. At-rest protects stored data while in-transit protects network data

Answer: D

Q1327. In a privilege escalation attack on a database, what specific vulnerability is exploited?

- A. The attacker gains higher privileges than originally authorized
- B. The attacker corrupts data by writing invalid values to tables
- C. The attacker creates excessive connections to overload the server
- D. The attacker exploits weak network protocols to intercept data

Answer: A

Q1328. A database uses fine-grained auditing. How does this differ from standard auditing?

- A. Fine-grained auditing captures specific conditions and column access
- B. Standard auditing provides more detail than fine-grained auditing
- C. Fine-grained auditing is performed only at the application level
- D. Fine-grained auditing only records failed access attempts made

Answer: A

Q1329. What security risk does dynamic SQL pose that static SQL does not?

- A. Dynamic SQL is more vulnerable to injection if input not sanitized
- B. Dynamic SQL is slower and uses more memory than static SQL code
- C. Dynamic SQL bypasses all authentication checks automatically always
- D. Static SQL cannot access any tables while dynamic SQL can access all

Answer: A

Q1330. When implementing database security for a cloud-hosted database, what additional concern must be addressed compared to on-premises?

- A. Cloud databases are inherently more secure than on-premises ones
- B. Shared responsibility model and data sovereignty across regions
- C. Only network security matters for cloud-hosted database instances
- D. Cloud databases do not require any encryption for stored data

Answer: B

Q1331. In a distributed database using two-phase commit, what is the blocking problem and how does three-phase commit address it?

- A. Participants block if coordinator fails; 3PC adds precommit phase
- B. Three-phase commit eliminates all network communication needed
- C. Blocking only occurs during the abort phase of commit protocol
- D. Blocking occurs when a participant crashes before prepare phase

Answer: A

Q1332. A distributed database must choose between strong consistency and high availability during a network partition. According to CAP, which trade-off must be made?

- A. The system must choose between consistency or availability only
- B. The system should shut down until the partition is resolved
- C. The system can maintain both consistency and availability fully
- D. The system must sacrifice both consistency and availability

Answer: A

Q1333. When optimizing a distributed query that joins tables at different sites, what is the primary cost to minimize?

- A. The CPU processing time at each individual site in network
- B. The memory consumption at the coordinator site during join
- C. The network data transfer cost between the distributed sites
- D. The disk storage used for temporary tables at each site node

Answer: C

Q1334. In a multi-master replication setup, how are write conflicts typically resolved?

- A. Using conflict resolution policies like last-writer-wins or merge
- B. By routing all writes to a single designated primary master node
- C. By preventing all writes until conflict is manually resolved
- D. By rejecting all conflicting writes and requiring resubmission

Answer: A

Q1335. What is the Paxos consensus algorithm used for in distributed databases?

- A. Replicating data between nodes using synchronous write operations
- B. Optimizing query execution plans across distributed network nodes
- C. Partitioning tables into fragments for distributed storage placement
- D. Achieving agreement on a value among distributed nodes despite failures

Answer: D

Q1336. In a geo-distributed database, what is the primary challenge of maintaining ACID transactions across data centers?

- A. Network latency between data centers increases transaction time
- B. Geo-distribution eliminates the need for any concurrency control
- C. Data centers always have identical hardware and network configs
- D. Each data center uses different database management software

Answer: A

Q1337. What is the difference between eager and lazy replication in terms of consistency guarantees?

- A. Eager provides eventual consistency while lazy provides strong
- B. Both provide identical consistency guarantees in all situations
- C. Eager has no consistency guarantee while lazy guarantees it all
- D. Eager provides strong consistency while lazy provides eventual

Answer: D

Q1338. A company uses a distributed database with read replicas. How does read-your-writes consistency differ from strong consistency?

- A. Read-your-writes ensures all users see the same data at all
- B. Read-your-writes and strong consistency are the same guarantee
- C. Read-your-writes ensures a user sees their own writes quickly
- D. Read-your-writes provides weaker guarantees than eventual one

Answer: C

Q1339. In a distributed database using vector clocks, what do they provide that physical timestamps cannot?

- A. Automatic conflict resolution without any additional logic now
- B. Higher precision timing than physical clock implementations can
- C. Exact wall-clock time ordering of all events across all nodes
- D. Causal ordering of events without requiring synchronized clocks

Answer: D

Q1340. When designing a distributed database schema, what is the key consideration for choosing between horizontal and vertical fragmentation?

- A. Choose based on query access patterns and data locality needs
- B. Vertical fragmentation always results in less network transfer
- C. The choice has no impact on query performance or utilization
- D. Horizontal fragmentation is always preferred over vertical form

Answer: A

Q1341. When should a system architect choose a document database over a relational database for a new application?

- A. When the application has a fixed well-defined relational schema
- B. When the application requires complex multi-table join operations
- C. When the data model is hierarchical and schema evolves frequently
- D. When strong ACID transactions across entities are the top priority

Answer: C

Q1342. In a distributed NoSQL database using consistent hashing, what happens when a new node is added to the cluster?

- A. All data is completely redistributed across all existing nodes
- B. All existing nodes must be taken offline during the process
- C. The new node starts empty and receives no data automatically
- D. Only a portion of data from adjacent nodes is redistributed

Answer: D

Q1343. What is the gossip protocol used for in distributed NoSQL databases?

- A. Propagating cluster state information between nodes efficiently
- B. Encrypting data during transmission between cluster nodes only
- C. Executing distributed queries across all nodes in the cluster
- D. Rebalancing data partitions when nodes join or leave cluster

Answer: A

Q1344. In a NoSQL database handling a social media feed, why might a fan-out-on-write approach be chosen over fan-out-on-read?

- A. Fan-out-on-write reduces write complexity and storage overhead
- B. Fan-out-on-write requires less storage than fan-out-on-read
- C. Fan-out-on-read eliminates the need for any caching mechanisms
- D. Fan-out-on-write provides faster read times at cost of writes

Answer: D

Q1345. What is the trade-off between strong consistency and partition tolerance in a distributed NoSQL system?

- A. Strong consistency improves availability during network partition
- B. Maintaining strong consistency during partitions requires blocking
- C. Partition tolerance is never needed in modern cloud environments
- D. Strong consistency and partition tolerance have no trade-off

Answer: B

Q1346. In Cassandra data model, what is the significance of the clustering key?

- A. It specifies the replication factor for the data across nodes
- B. It determines the consistency level for read-write operations
- C. It determines which node stores the data in the cluster ring
- D. It defines the sort order of data within a partition on disk

Answer: D

Q1347. When designing a NoSQL schema for a real-time analytics application, what is the primary modeling principle?

- A. Design schema based on entity relationships like relational models
- B. Design schema to maximize normalization for data integrity only
- C. Design schema to minimize data redundancy above all other goals
- D. Design schema based on the query patterns the application needs

Answer: D

Q1348. What is a vector clock conflict resolution limitation in eventually consistent NoSQL systems?

- A. Vector clocks grow in size with the number of participating nodes
- B. Vector clocks cannot detect any concurrent write conflicts at all
- C. Vector clocks only work with key-value stores and no other types
- D. Vector clocks require perfectly synchronized physical time clocks

Answer: A

Q1349. In a multi-model NoSQL database, what advantage does combining document and graph capabilities provide?

- A. It allows modeling both structured data and complex relationships
- B. It reduces storage requirements compared to single-model databases
- C. It guarantees ACID transactions across all data model types used
- D. It eliminates the need for any indexing on the stored data sets

Answer: A

Q1350. A NoSQL database uses quorum-based replication with $N=5$, $W=3$, $R=3$. What consistency guarantee does this provide?

- A. Strong consistency since $W+R$ exceeds N ensuring overlap exists
- B. Eventual consistency with no read-your-writes guarantee at all
- C. No consistency guarantee regardless of the quorum configuration
- D. Consistency only for write operations not for read operations

Answer: A

Q1351. When designing an enterprise data warehouse, what is the key difference between Inmon top-down and Kimball bottom-up approach?

- A. Inmon builds data marts first while Kimball builds warehouse
- B. Both approaches build the data warehouse in exactly same order
- C. Inmon uses star schemas while Kimball uses snowflake schemas
- D. Inmon builds normalized warehouse first while Kimball marts first

Answer: D

Q1352. In a Type 2 slowly changing dimension, how are historical changes tracked?

- A. Changes are not tracked and old values are permanently deleted
- B. The existing record is overwritten with the new attribute values
- C. A new record is added with effective dates preserving old ones
- D. A separate history table stores all previous versions of records

Answer: C

Q1353. What is a degenerate dimension in data warehouse design?

- A. A dimension containing only null values for all its attributes
- B. A dimension key in the fact table without a dimension table
- C. A dimension stored as a separate fully normalized table entity
- D. A dimension that has been deleted from the warehouse schema

Answer: B

Q1354. When designing a fact table, what is the difference between additive, semi-additive, and non-additive measures?

- A. Non-additive measures can be summed across time dimension only
- B. Semi-additive can be summed across all dimensions but additive cannot
- C. Additive measures can be summed across all dimensions while others not
- D. All three types of measures can be summed across any dimension

Answer: C

Q1355. A company implements a real-time data warehouse. What architectural change is needed compared to traditional batch ETL?

- A. Use only flat files instead of database tables for data storage
- B. Implement change data capture and micro-batch or stream processing
- C. Replace ETL with ELT and remove all transformation logic entirely
- D. Remove all indexes from the warehouse for faster write performance

Answer: B

Q1356. In data mining, what is the difference between classification and clustering?

- A. Both methods use identical approaches with labeled training data sets
- B. Clustering uses labeled data while classification uses unlabeled data
- C. Classification uses labeled data while clustering uses unlabeled data
- D. Classification is unsupervised while clustering is supervised learning

Answer: C

Q1357. What is a factless fact table and when is it used in data warehouse design?

- A. A fact table that stores future predictions instead of facts
- B. A fact table with no numeric measures recording only events
- C. A fact table with no dimension keys linking to other tables
- D. A fact table that is temporarily empty during initial loading

Answer: B

Q1358. When implementing ELT instead of ETL, what is the key architectural difference?

- A. ELT does not require any extraction from source systems at all
- B. Data is loaded first then transformed inside the target warehouse
- C. Data is transformed before loading into the target warehouse
- D. ELT skips the loading step entirely and queries sources directly

Answer: B

Q1359. What is a conformed dimension in Kimball dimensional modeling and why is it important?

- A. A dimension that has been fully normalized into sub-dimensions
- B. A dimension shared across multiple data marts for consistency
- C. A dimension containing only surrogate keys without attributes
- D. A dimension used in only one specific data mart exclusively here

Answer: B

Q1360. In association rule mining, what do the metrics support and confidence measure?

- A. Support measures rule accuracy while confidence measures frequency
- B. Support measures query performance while confidence measures quality
- C. Support measures item frequency while confidence measures strength
- D. Support measures data volume while confidence measures processing

Answer: C

Q1361. In a DBMS, what does the concept of impedance mismatch refer to?

- A. Mismatch between different hardware configurations
- B. Mismatch between the data model used by the application and the database
- C. Mismatch between primary and foreign key types
- D. Mismatch between storage media speeds

Answer: B

Q1362. Which of the following correctly describes the closed world assumption in databases?

- A. All data in the database is encrypted by default
- B. Facts not present in the database are considered false
- C. The database cannot accept new data after initial loading
- D. All queries must return results

Answer: B

Q1363. What is the significance of Codd's 12 rules in database systems?

- A. They define network protocol standards
- B. They establish criteria for a system to qualify as a relational DBMS
- C. They specify hardware requirements for databases
- D. They outline data encryption algorithms

Answer: B

Q1364. Which Codd rule states that all information in a relational database must be represented as values in tables?

- A. Rule 0: Foundation Rule
- B. Rule 1: Information Rule
- C. Rule 5: Comprehensive Data Sublanguage Rule
- D. Rule 8: Physical Data Independence

Answer: B

Q1365. In database systems, what does the principle of minimal redundancy aim to achieve?

- A. Maximum storage utilization by duplicating data
- B. Storing each fact in exactly one place to avoid update anomalies
- C. Removing all indexes to save space
- D. Eliminating all foreign key relationships

Answer: B

Q1366. What problem does the lost update anomaly cause in concurrent database access?

- A. Data is permanently deleted from the database
- B. One transaction overwrites changes made by another concurrent transaction
- C. Indexes become corrupted during updates
- D. The database schema is modified unintentionally

Answer: B

Q1367. Which of the following scenarios best illustrates the need for logical data independence?

- A. Changing disk storage from HDD to SSD
- B. Adding a new column to a table without modifying existing applications
- C. Moving the database to a different server
- D. Increasing the buffer pool size

Answer: B

Q1368. What is the phantom read problem in database concurrency?

- A. A transaction reads data that has been permanently deleted
- B. A transaction reads rows that were inserted by another uncommitted transaction
- C. A transaction cannot find previously existing records
- D. The database returns empty result sets randomly

Answer: B

Q1369. In the context of database evolution, what advantage did the relational model provide over the hierarchical model?

- A. Faster physical storage access
- B. Data independence and flexible querying through declarative languages
- C. Built-in support for multimedia data
- D. Automatic data replication

Answer: B

Q1370. What is the dirty read problem in database transactions?

- A. Reading data from a corrupted disk sector
- B. Reading uncommitted data written by another transaction that may roll back
- C. Reading outdated cached data from the buffer
- D. Reading data without proper authentication

Answer: B

Q1371. In a shared-nothing parallel database architecture, how is fault tolerance typically achieved?

- A. By sharing memory across all nodes
- B. Through data replication across multiple independent nodes
- C. By using a single centralized backup server
- D. Through shared disk access

Answer: B

Q1372. What is the primary challenge of implementing a shared-disk architecture?

- A. Limited network bandwidth
- B. Managing concurrent disk access and cache coherence across nodes
- C. Insufficient disk storage
- D. Slow query parsing

Answer: B

Q1373. In the context of DBMS architecture, what is the write-ahead log (WAL) protocol?

- A. All write operations are performed after user confirmation
- B. Log records must be written to stable storage before the corresponding data changes are written to disk
- C. Data is written ahead of any read operation
- D. Logs are written only after transaction completion

Answer: B

Q1374. What is the purpose of the ARIES recovery algorithm in DBMS architecture?

- A. To optimize query execution plans
- B. To provide efficient and correct crash recovery using WAL
- C. To manage user authentication
- D. To allocate memory buffers

Answer: B

Q1375. In a multi-tier architecture, what is the benefit of using an application server as a connection broker?

- A. It eliminates the need for a database entirely
- B. It multiplexes many client connections into fewer database connections, reducing server load
- C. It automatically generates SQL queries
- D. It compresses all data before storage

Answer: B

Q1376. What is the CAP theorem's relevance to distributed database architecture?

- A. It states that a database can achieve consistency, availability, and partition tolerance simultaneously
- B. It proves that a distributed system can guarantee at most two of consistency, availability, and partition tolerance
- C. It defines the maximum number of concurrent users
- D. It specifies the minimum hardware requirements

Answer: B

Q1377. What is the difference between inter-query and intra-query parallelism?

- A. Inter-query parallelism is faster than intra-query parallelism
- B. Inter-query runs different queries in parallel while intra-query parallelizes a single query
- C. Inter-query uses more memory while intra-query uses more disk
- D. They are the same concept with different names

Answer: B

Q1378. In DBMS architecture, what is the purpose of the checkpoint mechanism?

- A. To mark the completion of a user session
- B. To periodically flush modified buffers to disk and record a checkpoint in the log to limit recovery time
- C. To check database integrity constraints
- D. To verify user permissions

Answer: B

Q1379. What architectural pattern does database sharding implement?

- A. Vertical partitioning across different schemas
- B. Horizontal partitioning of data across multiple independent database instances
- C. Replication of entire databases to standby servers
- D. Compression of data into fewer storage nodes

Answer: B

Q1380. In a replicated database architecture, what is the split-brain problem?

- A. A query that is too complex for the optimizer
- B. When network partition causes two nodes to independently accept writes, leading to conflicting states
- C. When a database table is split across two different schemas
- D. When CPU usage is divided between query processing and logging

Answer: B

Q1381. When converting an ER diagram to a relational schema, how is a multivalued attribute handled?

- A. It is stored as a comma-separated list in the parent table
- B. A separate table is created with a foreign key referencing the parent entity
- C. It is ignored during conversion
- D. It becomes a primary key in the parent table

Answer: B

Q1382. In the EER model, what is a shared subclass (multiple inheritance)?

- A. A subclass that inherits attributes from only one superclass
- B. A subclass that is a subset of two or more superclasses
- C. A subclass with no attributes of its own
- D. A superclass with no subclasses

Answer: B

Q1383. When mapping a ternary relationship to a relational schema, how is the resulting table structured?

- A. It contains only the primary key of one entity
- B. It contains the primary keys of all three participating entities as foreign keys
- C. It creates three separate binary relationship tables
- D. It merges all three entities into a single table

Answer: B

Q1384. What is the temporal data model's primary extension to the relational model?

- A. Adding spatial coordinates to every record
- B. Incorporating time dimensions to track data changes over time
- C. Replacing tables with graphs
- D. Removing the need for primary keys

Answer: B

Q1385. In the context of ER modeling, what is the minimum cardinality constraint?

- A. The maximum number of relationships an entity can have
- B. The minimum number of relationship instances each entity must participate in
- C. The minimum number of attributes an entity must have
- D. The minimum number of tables in a database

Answer: B

Q1386. How does the attribute-defined specialization differ from user-defined specialization in EER?

- A. Attribute-defined uses a discriminating attribute while user-defined is determined manually
- B. Attribute-defined is faster to process
- C. User-defined cannot have disjoint constraints
- D. There is no difference between them

Answer: A

Q1387. What happens to a total specialization constraint when converting an EER diagram to a relational schema?

- A. It is automatically enforced by the schema
- B. It cannot be directly enforced in the relational model and requires application-level or trigger enforcement
- C. It is converted to a CHECK constraint
- D. It becomes a foreign key constraint

Answer: B

Q1388. In the object-relational data model, what are user-defined types (UDTs)?

- A. Types that only the database administrator can use
- B. Custom data types created by users that can encapsulate attributes and methods
- C. Temporary types used only during queries
- D. Types that replace all standard SQL types

Answer: B

Q1389. What is the concept of closure in the context of data model operations?

- A. The database cannot accept new connections
- B. The result of any operation on relations is also a relation
- C. All transactions must be closed before new ones begin
- D. The database is shut down properly

Answer: B

Q1390. When mapping overlapping specialization to a relational schema, which approach is most appropriate?

- A. Create a single table for all subclasses with a type column
- B. Create separate tables for each subclass with redundant superclass attributes
- C. Create separate tables for each subclass with foreign keys to the superclass table
- D. Merge all entities into the superclass table only

Answer: C

Q1391. What is Armstrong's axiom of reflexivity in functional dependencies?

- A. If Y is a subset of X, then X functionally determines Y
- B. If X determines Y, then Y determines X
- C. If X determines Y and Y determines Z, then X determines Z
- D. If X determines Y, then XZ determines YZ

Answer: A

Q1392. What is the transitive rule in Armstrong's axioms?

- A. If $X \rightarrow Y$, then $Y \rightarrow X$
- B. If $X \rightarrow Y$ and $Y \rightarrow Z$, then $X \rightarrow Z$
- C. If $X \rightarrow Y$, then $XZ \rightarrow YZ$
- D. If Y is a subset of X, then $X \rightarrow Y$

Answer: B

Q1393. What is the closure of a set of attributes under a set of functional dependencies?

- A. The set of all attributes that can be functionally determined from the given attributes
- B. The removal of all redundant attributes
- C. The set of all tables referencing the attributes
- D. The physical storage allocation for the attributes

Answer: A

Q1394. What is a lossless join decomposition?

- A. A decomposition where no data is physically deleted
- B. A decomposition where the original relation can be perfectly reconstructed by joining the decomposed relations
- C. A decomposition that reduces storage by 50%
- D. A decomposition that creates no foreign keys

Answer: B

Q1395. What is a dependency-preserving decomposition?

- A. A decomposition where all data dependencies are documented
- B. A decomposition where all original functional dependencies can be enforced using the decomposed relations
- C. A decomposition that preserves physical storage format
- D. A decomposition that maintains the same number of rows

Answer: B

Q1396. What is a multivalued dependency in relational theory?

- A. A dependency where an attribute has multiple data types
- B. A dependency where one attribute set determines a set of values independently of other attributes
- C. A dependency between multiple databases
- D. A dependency that only exists in NoSQL databases

Answer: B

Q1397. What is a join dependency in relational database theory?

- A. A constraint that two tables must always be joined in queries
- B. A constraint where a relation can be losslessly decomposed into multiple relations and reconstructed via natural join
- C. A dependency between join operations
- D. A physical storage constraint for joined tables

Answer: B

Q1398. What is a trivial functional dependency?

- A. A dependency that is obvious to the database designer
- B. A dependency $X \rightarrow Y$ where Y is a subset of X
- C. A dependency that involves only primary keys
- D. A dependency that can be derived from other dependencies

Answer: B

Q1399. In relational algebra, what is the difference between division and other operations?

- A. Division is faster than other operations
- B. Division finds tuples in one relation that are associated with all tuples in another relation
- C. Division removes duplicate tuples
- D. Division is used for aggregation

Answer: B

Q1400. What does the augmentation rule in Armstrong's axioms state?

- A. If $X \rightarrow Y$, then $X \rightarrow YZ$ for any Z
- B. If $X \rightarrow Y$, then $XZ \rightarrow YZ$ for any attribute set Z
- C. If $X \rightarrow Y$ and $Y \rightarrow Z$, then $X \rightarrow Z$
- D. If $XY \rightarrow Z$, then $X \rightarrow Z$ and $Y \rightarrow Z$

Answer: B

Q1401. How can the division operation $R \div S$ be expressed using fundamental relational algebra operations?

- A. $R \div S = R - S$
- B. $R \div S = \{ \langle x, y \rangle \in R \mid \forall \langle x, y' \rangle \in S, \langle x, y' \rangle \in R \}$
- C. $R \div S = R \cap S$
- D. $R \div S = \{ \langle x, y \rangle \in R \mid \langle x, y \rangle \in S \}$

Answer: B

Q1402. What is the algebraic equivalence rule for pushing selection through a join?

- A. Selections cannot be pushed through joins
- B. $\sigma_c(R \bowtie S) = \sigma_c(R) \bowtie S$ if condition c involves only attributes of R
- C. $\sigma_c(R \bowtie S) = R \bowtie \sigma_c(S)$ regardless of which relation c references
- D. Selections must always be applied after joins

Answer: B

Q1403. In query optimization, why is pushing projections down the query tree beneficial?

- A. It increases the number of columns processed
- B. It reduces the width of intermediate results, decreasing memory and processing costs
- C. It makes queries more readable
- D. It eliminates the need for selection operations

Answer: B

Q1404. What is the difference between tuple relational calculus and domain relational calculus?

- A. They are identical in expressive power and syntax
- B. Tuple calculus uses tuple variables ranging over relations while domain calculus uses variables ranging over attribute domains
- C. Tuple calculus is more powerful than domain calculus
- D. Domain calculus cannot express joins

Answer: B

Q1405. What does the concept of safe expressions mean in relational calculus?

- A. Expressions that do not cause runtime errors
- B. Expressions guaranteed to produce a finite result set
- C. Expressions that do not modify the database
- D. Expressions that use only primary keys

Answer: B

Q1406. How is the outer union operation different from the standard union?

- A. Outer union requires union compatibility
- B. Outer union can combine relations that are not union compatible by using nulls for missing attributes
- C. Outer union removes all duplicates while union does not
- D. There is no difference

Answer: B

Q1407. What is the commutative property of natural join in relational algebra?

- A. $R \bowtie S$ is not equal to $S \bowtie R$
- B. $R \bowtie S = S \bowtie R$, meaning the order of operands does not affect the result
- C. Natural join can only be applied in one direction
- D. Commutativity only holds for equi-joins

Answer: B

Q1408. In relational algebra, what is the associative property of join?

- A. Joins cannot be reordered
- B. $(R \bowtie S) \bowtie T = R \bowtie (S \bowtie T)$, allowing join reordering for optimization
- C. Only two relations can be joined at a time
- D. Associativity only applies to Cartesian products

Answer: B

Q1409. What is the expressive power relationship between relational algebra and safe relational calculus?

- A. Relational algebra is more powerful than relational calculus
- B. Relational calculus is more powerful than relational algebra
- C. They are equivalent in expressive power for safe expressions
- D. Neither can express joins

Answer: C

Q1410. What is the deferred operation approach in evaluating relational algebra expressions?

- A. All operations are executed immediately
- B. Operations are composed into a query tree and optimized before execution
- C. Operations are deferred until the database is idle
- D. Only selection operations are deferred

Answer: B

Q1411. What is the execution order of clauses in a SQL SELECT statement?

- A. SELECT, FROM, WHERE, GROUP BY, HAVING, ORDER BY
- B. FROM, WHERE, GROUP BY, HAVING, SELECT, ORDER BY
- C. FROM, SELECT, WHERE, GROUP BY, ORDER BY, HAVING
- D. SELECT, WHERE, FROM, HAVING, GROUP BY, ORDER BY

Answer: B

Q1412. What is a recursive Common Table Expression (CTE) used for in SQL?

- A. Creating temporary indexes
- B. Querying hierarchical or recursive data structures like organizational charts
- C. Improving query performance automatically
- D. Creating permanent views

Answer: B

Q1413. What is the difference between RANK() and DENSE_RANK() window functions?

- A. They always produce the same result
- B. RANK() leaves gaps after ties while DENSE_RANK() does not
- C. DENSE_RANK() leaves gaps after ties while RANK() does not
- D. RANK() is faster than DENSE_RANK()

Answer: B

Q1414. What is a lateral join in SQL?

- A. A join that connects tables horizontally
- B. A join where the right-hand subquery can reference columns from the left-hand table
- C. A standard cross join with an alias
- D. A join used exclusively in NoSQL databases

Answer: B

Q1415. What does the SQL MERGE statement do?

- A. Merges two databases into one
- B. Performs insert, update, or delete operations in a single statement based on match conditions
- C. Combines query results like UNION
- D. Merges table schemas

Answer: B

Q1416. What is the difference between a scalar subquery and a table subquery?

- A. They are the same thing
- B. A scalar subquery returns exactly one value while a table subquery returns a result set
- C. A scalar subquery is faster
- D. A table subquery cannot be used in WHERE clauses

Answer: B

Q1417. What is a window function's PARTITION BY clause used for?

- A. To partition a table into separate physical storage
- B. To divide the result set into partitions to which the window function is independently applied
- C. To create table partitions for archiving
- D. To split a query into parallel operations

Answer: B

Q1418. What is the purpose of the ROWS BETWEEN clause in window functions?

- A. To limit the total number of rows returned
- B. To define the window frame specifying which rows relative to the current row are included in the calculation
- C. To filter rows before the window function is applied
- D. To specify the number of rows per page

Answer: B

Q1419. What is the NTH_VALUE() window function used for?

- A. To find the nth database in a server
- B. To retrieve the value of an expression at the nth row within a window frame
- C. To calculate the nth percentile
- D. To insert values at the nth position

Answer: B

Q1420. What is SQL injection and how is it prevented?

- A. A method to inject performance optimizations; prevented by disabling indexes
- B. A security vulnerability where malicious SQL is inserted into queries; prevented using parameterized queries
- C. A technique to insert bulk data; prevented by limiting batch sizes
- D. A method to inject stored procedures; prevented by disabling triggers

Answer: B

Q1421. What is the purpose of EXPLAIN or EXPLAIN PLAN in SQL?

- A. To explain SQL syntax to beginners
- B. To display the execution plan showing how the DBMS will process a query
- C. To explain error messages in detail
- D. To document stored procedures

Answer: B

Q1422. What is a pivot operation in SQL?

- A. Rotating a table physically on screen
- B. Transforming row data into column data for cross-tabulation reporting
- C. Reversing the order of rows
- D. Swapping primary and foreign keys

Answer: B

Q1423. What is the difference between OLTP and OLAP in terms of SQL usage?

- A. OLTP uses SQL while OLAP does not
- B. OLTP uses simple short transactions while OLAP uses complex analytical queries
- C. OLTP is for analytics while OLAP is for transactions
- D. There is no difference

Answer: B

Q1424. What is a temporal table in SQL?

- A. A table that is deleted after each session
- B. A system-versioned table that automatically tracks data changes over time
- C. A table used only for temporary calculations
- D. A table with timestamp columns

Answer: B

Q1425. What are the ACID properties' implications for SQL transaction design?

- A. They require all queries to be written in uppercase
- B. They ensure that transactions are atomic, consistent, isolated, and durable for reliable processing
- C. They define the SQL syntax rules
- D. They specify hardware requirements for databases

Answer: B

Q1426. What is the purpose of the GROUPING SETS clause in SQL?

- A. To create multiple user groups
- B. To specify multiple grouping combinations in a single query instead of multiple UNION queries
- C. To set group permissions
- D. To group database connections

Answer: B

Q1427. What is a deferred constraint in SQL?

- A. A constraint that is never checked
- B. A constraint whose enforcement is postponed until the end of the transaction
- C. A constraint applied only to archived data
- D. A constraint that is always disabled

Answer: B

Q1428. What is the FETCH FIRST or LIMIT clause used for with OFFSET?

- A. To limit the database size
- B. To implement pagination by skipping a number of rows and returning a limited set
- C. To limit the number of database connections
- D. To restrict the number of columns returned

Answer: B

Q1429. What is the difference between CUBE and ROLLUP in SQL?

- A. They produce identical results
- B. ROLLUP generates hierarchical subtotals while CUBE generates subtotals for all combinations of grouping columns
- C. CUBE is faster than ROLLUP
- D. ROLLUP generates more rows than CUBE

Answer: B

Q1430. What is Fifth Normal Form (5NF) or Project-Join Normal Form?

- A. A relation with five or fewer attributes
- B. A relation in 4NF with no non-trivial join dependencies that are not implied by candidate keys
- C. A relation that requires five decompositions
- D. A theoretical form that cannot be achieved in practice

Answer: B

Q1431. What is Domain-Key Normal Form (DKNF)?

- A. A form where all constraints are based on domains and keys only
- B. A form that normalizes domain names
- C. A form that requires key encryption
- D. A form applicable only to key-value databases

Answer: A

Q1432. Why might a BCNF decomposition not preserve all functional dependencies?

- A. BCNF does not use functional dependencies
- B. Some dependencies may span across decomposed relations and cannot be checked without joining them
- C. BCNF only considers primary keys
- D. Dependencies are automatically removed during decomposition

Answer: B

Q1433. What is the minimal cover algorithm used for in normalization?

- A. To find the minimum number of tables
- B. To reduce a set of functional dependencies to an equivalent minimal set
- C. To cover all tables with indexes
- D. To minimize the number of rows in a table

Answer: B

Q1434. In the context of normalization, what is a spurious tuple?

- A. A tuple with all null values
- B. An invalid tuple generated by incorrectly joining decomposed relations
- C. A tuple that violates a domain constraint
- D. A duplicate tuple in a relation

Answer: B

Q1435. How does the 3NF synthesis algorithm ensure dependency preservation?

- A. By keeping all attributes in one table
- B. By creating a separate relation for each functional dependency in the minimal cover
- C. By ignoring dependencies during decomposition
- D. By enforcing all dependencies through triggers

Answer: B

Q1436. What is the relationship between multivalued dependencies and Fourth Normal Form?

- A. 4NF ignores multivalued dependencies
- B. 4NF requires that all non-trivial multivalued dependencies have a superkey on their left side
- C. Multivalued dependencies only exist in 1NF
- D. 4NF eliminates all functional dependencies

Answer: B

Q1437. What is over-normalization and what are its consequences?

- A. Having too many columns in a table
- B. Excessive decomposition that leads to too many joins, degrading query performance
- C. Having too many indexes
- D. Normalizing data that should be kept as text

Answer: B

Q1438. What is the Heath's theorem in normalization?

- A. Every relation can be decomposed into 1NF
- B. If $R(A,B,C)$ has $A \rightarrow B$, then R can be losslessly decomposed into $R_1(A,B)$ and $R_2(A,C)$
- C. All relations must have at least three attributes
- D. Normalization always preserves dependencies

Answer: B

Q1439. What is the difference between the decomposition and synthesis approaches to achieving 3NF?

- A. They always produce identical results
- B. Decomposition starts from a universal relation and decomposes, while synthesis builds relations from functional dependencies
- C. Synthesis is a top-down approach while decomposition is bottom-up
- D. Decomposition is always preferred over synthesis

Answer: B

Q1440. What is the Thomas Write Rule in transaction processing?

- A. All writes must be timestamped
- B. An outdated write can be ignored if a more recent transaction has already written to the same item
- C. Writes must always be performed before reads
- D. Thomas must approve all writes

Answer: B

Q1441. What is the write-ahead logging (WAL) protocol for transaction recovery?

- A. All writes are performed ahead of other operations
- B. Log records must be written to stable storage before the actual database modifications
- C. All log files must be written to tape
- D. Write operations must precede read operations

Answer: B

Q1442. What is the difference between the READ COMMITTED and REPEATABLE READ isolation levels?

- A. They provide the same guarantees
- B. READ COMMITTED prevents dirty reads while REPEATABLE READ also prevents non-repeatable reads
- C. REPEATABLE READ is less restrictive than READ COMMITTED
- D. READ COMMITTED prevents phantom reads while REPEATABLE READ does not

Answer: B

Q1443. What is the SERIALIZABLE isolation level and what anomalies does it prevent?

- A. It only prevents dirty reads
- B. It prevents all anomalies including dirty reads, non-repeatable reads, and phantom reads
- C. It only prevents phantom reads
- D. It provides no isolation guarantees

Answer: B

Q1444. What is a distributed transaction and what protocol manages it?

- A. A transaction that runs on multiple distributed disks; managed by RAID
- B. A transaction spanning multiple database nodes; managed by two-phase commit protocol
- C. A transaction distributed across time zones; managed by clock sync
- D. A transaction split into smaller parts; managed by thread pools

Answer: B

Q1445. What is a compensation transaction?

- A. A transaction that pays for database usage
- B. A transaction that semantically undoes the effects of a previously committed transaction
- C. A transaction that compensates for hardware failures
- D. A backup transaction that runs automatically

Answer: B

Q1446. What is snapshot isolation and how does it differ from true serializability?

- A. They are identical
- B. Snapshot isolation provides each transaction a consistent view at its start but may allow write skew anomalies that serializability prevents
- C. Snapshot isolation is stronger than serializability
- D. Snapshot isolation does not prevent dirty reads

Answer: B

Q1447. What is the write skew anomaly in transaction processing?

- A. When a write operation skews data distribution
- B. When two concurrent transactions read overlapping data and make disjoint updates that together violate a constraint
- C. When disk writes are not aligned properly
- D. When write operations are slower than reads

Answer: B

Q1448. What is the phantom problem in concurrency control and how does it differ from a non-repeatable read?

- A. They are the same problem
- B. Phantoms involve new rows appearing in a re-executed query while non-repeatable reads involve changes to existing rows
- C. Phantoms are caused by hardware issues
- D. Non-repeatable reads involve new rows

Answer: B

Q1449. What is predicate locking and why is it used?

- A. Locking based on column names
- B. Locking based on the condition (predicate) of a query to prevent phantom reads
- C. Locking only primary key columns
- D. Locking rows in a predetermined order

Answer: B

Q1450. What is index locking (next-key locking) as a practical alternative to predicate locking?

- A. Locking the entire index structure
- B. Locking index entries and gaps between them to prevent phantoms without the overhead of predicate locking
- C. Locking only the first index entry
- D. Creating a lock on every index in the database

Answer: B

Q1451. In the multiple-granularity locking protocol, what does an IS (Intention Shared) lock on a table indicate?

- A. The transaction intends to insert new rows
- B. The transaction intends to acquire shared locks on some rows within the table
- C. The table is being shared across databases
- D. The index structure is being modified

Answer: B

Q1452. What is the SIX (Shared with Intention Exclusive) lock mode used for?

- A. Locking six data items simultaneously
- B. A transaction that reads all rows but intends to update only some rows in the locked item
- C. A special lock for six-column tables
- D. A combination of six different lock types

Answer: B

Q1453. What is the validation phase in optimistic concurrency control?

- A. Validating SQL syntax before execution
- B. Checking at commit time whether the transaction has conflicted with other transactions during its execution
- C. Validating user credentials
- D. Checking database schema validity

Answer: B

Q1454. What is the difference between deadlock prevention and deadlock detection?

- A. They are the same approach
- B. Prevention avoids deadlocks proactively using protocols while detection allows deadlocks and resolves them when found
- C. Prevention is always more efficient
- D. Detection prevents deadlocks from occurring

Answer: B

Q1455. In timestamp ordering, what happens when a transaction tries to read a data item written by a younger transaction?

- A. The read proceeds normally
- B. The transaction is rolled back and restarted with a new timestamp
- C. The younger transaction is rolled back
- D. Both transactions are aborted

Answer: B

Q1456. What is the concept of lock escalation in database systems?

- A. Increasing the lock timeout duration
- B. Automatically converting many fine-grained locks to fewer coarse-grained locks to reduce overhead
- C. Escalating lock priorities for important transactions
- D. Moving locks from memory to disk

Answer: B

Q1457. What is the relationship between two-phase locking and serializability?

- A. 2PL does not guarantee serializability
- B. 2PL is a sufficient but not necessary condition for conflict serializability
- C. 2PL is both necessary and sufficient for serializability
- D. 2PL only guarantees view serializability

Answer: B

Q1458. In ARIES recovery, why does the redo phase redo all logged actions including those of uncommitted transactions?

- A. To simplify the algorithm
- B. To restore the exact state of the database at crash time (repeating history) before selectively undoing uncommitted changes
- C. To commit all active transactions
- D. To verify log integrity

Answer: B

Q1459. What is the role of the dirty page table in ARIES recovery?

- A. A list of pages with errors
- B. It tracks modified pages in the buffer pool with their recovery LSN to determine the starting point for redo
- C. A list of pages that need cleaning
- D. A table storing deleted pages

Answer: B

Q1460. What is the concept of idempotent redo in recovery algorithms?

- A. Redo operations that can only be performed once
- B. Redo operations that produce the same result regardless of how many times they are applied
- C. Redo operations that are twice as fast
- D. Redo operations that skip duplicate records

Answer: B

Q1461. What is the difference between physical and logical logging?

- A. Physical logging is done on paper while logical is digital
- B. Physical logging records the actual before/after data values while logical logging records the operation performed
- C. Physical logging is faster
- D. They produce identical log files

Answer: B

Q1462. In a no-steal, force buffer policy, why is recovery simpler but performance worse?

- A. Because no recovery is ever needed
- B. No undo is needed (uncommitted data never on disk) and no redo is needed (committed data always on disk), but forcing writes at commit is expensive
- C. Because the log is not needed
- D. Because all transactions are serialized

Answer: B

Q1463. What is the shadow paging recovery technique?

- A. Creating backup pages in shadow memory
- B. Maintaining a shadow page table pointing to the original pages while current modifications go to new pages
- C. Using dark mode for the database interface
- D. Logging shadows of transactions

Answer: B

Q1464. What is the nested top actions concept in ARIES?

- A. Transactions nested inside other transactions
- B. A mechanism to protect certain actions from being undone during rollback while still being part of the transaction
- C. Top-level actions that contain sub-actions
- D. Actions performed at the top of the log file

Answer: B

Q1465. How does log-based recovery handle distributed transactions after a crash?

- A. Each node recovers independently without coordination
- B. The coordinator consults its log to determine the commit decision and informs participants to redo or undo accordingly
- C. All distributed transactions are automatically aborted
- D. Recovery is not possible for distributed transactions

Answer: B

Q1466. What is the purpose of the transaction table in ARIES?

- A. A table listing all tables in the database
- B. It tracks the state and last LSN of each active transaction for determining which transactions to undo
- C. A table of transaction prices
- D. A lookup table for transaction types

Answer: B

Q1467. What is the difference between hot backup and cold backup?

- A. Hot backup uses heated storage media
- B. Hot backup is taken while the database is running while cold backup requires shutting down the database
- C. Cold backup is faster than hot backup
- D. They produce identical backups

Answer: B

Q1468. What is a function-based index?

- A. An index on a column that stores function names
- B. An index built on the result of a function or expression applied to one or more columns
- C. A function that returns index values
- D. An index that uses functional programming concepts

Answer: B

Q1469. What is the difference between a B+ tree index and a log-structured merge tree (LSM tree)?

- A. They are the same structure with different names
- B. B+ trees optimize for reads with in-place updates while LSM trees optimize for writes using sequential I/O and periodic compaction
- C. LSM trees cannot perform range queries
- D. B+ trees are always superior to LSM trees

Answer: B

Q1470. What is a partial index?

- A. An incomplete index that does not work correctly
- B. An index built on a subset of rows that satisfy a specified condition
- C. An index on half the columns of a table
- D. An index that partially sorts data

Answer: B

Q1471. What is the relationship between index height and query performance in a B+ tree?

- A. Index height has no effect on performance
- B. Each additional level of height adds one more disk I/O to the search path
- C. Taller indexes are always faster
- D. Height only affects insertion performance

Answer: B

Q1472. What is a space-partitioning index like an R-tree used for?

- A. Indexing relational tables only
- B. Indexing multidimensional spatial data such as geographic coordinates and geometric objects
- C. Partitioning disk space
- D. Indexing data across multiple tablespaces

Answer: B

Q1473. What is the write amplification problem in index maintenance?

- A. Writes become louder on disk
- B. A single logical write operation causes multiple physical writes due to index updates and page splits
- C. Writing is amplified to be faster
- D. The write buffer size increases

Answer: B

Q1474. What is an inverted index and where is it commonly used?

- A. An index that sorts data in reverse order
- B. A mapping from content (words or terms) to their locations in documents, commonly used in full-text search engines
- C. An index that inverts primary and foreign keys
- D. A reversed B-tree

Answer: B

Q1475. What is the query optimization search space problem?

- A. Finding the optimal physical location for the database
- B. The number of possible execution plans grows exponentially with the number of relations, making exhaustive search impractical
- C. Finding enough disk space for queries
- D. The search for optimal query syntax

Answer: B

Q1476. What is dynamic programming used for in query optimization?

- A. Dynamically creating database tables
- B. Efficiently finding optimal join orderings by building solutions from smaller subproblems
- C. Programming dynamic SQL statements
- D. Dynamically allocating memory for queries

Answer: B

Q1477. What is the concept of interesting orders in query optimization?

- A. Ordering results in a visually appealing way
- B. Sort orders produced by operations that are useful for later operations like merge joins or ORDER BY
- C. The most interesting queries to optimize
- D. Ordering tables by their creation date

Answer: B

Q1478. What is the difference between a left-deep join tree and a bushy join tree?

- A. Left-deep trees are deeper than bushy trees
- B. Left-deep trees have only base relations as the right input, enabling pipelining, while bushy trees allow any join result as input
- C. Bushy trees are always more efficient
- D. Left-deep trees cannot be optimized

Answer: B

Q1479. What is the impact of correlated subqueries on query performance?

- A. They always improve performance
- B. They can be very expensive because the subquery is re-evaluated for each row of the outer query
- C. They have no impact on performance
- D. They speed up the outer query

Answer: B

Q1480. What is the Semi-Join Reduction technique in distributed query optimization?

- A. Reducing the number of joins by half
- B. Reducing data transfer by sending only the join column values to a remote site to filter before transferring matching rows
- C. Joining only half the table
- D. Reducing the join condition to one column

Answer: B

Q1481. What is the role of a plan cache (query cache) in query optimization?

- A. To cache database backups
- B. To store previously computed execution plans for reuse, avoiding repeated optimization overhead
- C. To cache query results permanently
- D. To store database statistics

Answer: B

Q1482. What is the problem with parameter sniffing in query optimization?

- A. Parameters are stolen by unauthorized users
- B. The optimizer creates a plan based on the first parameter value which may be suboptimal for other values
- C. Parameters are not passed correctly to the query
- D. Sniffing causes network latency

Answer: B

Q1483. What is the Volcano/Iterator model of query execution?

- A. A model based on volcanic data processing
- B. Each operator implements a next() method, pulling one tuple at a time from child operators in a demand-driven fashion
- C. A model for processing data in eruptions
- D. A model that stores data in volcanic rock formations

Answer: B

Q1484. What is an inference attack in database security?

- A. An attack that infers database passwords from usernames
- B. An attack where users deduce confidential data from permitted queries by combining and analyzing non-sensitive results
- C. An attack on the database inference engine
- D. An attack that targets the CPU inference pipeline

Answer: B

Q1485. What is differential privacy in the context of databases?

- A. Using different passwords for different databases
- B. A mathematical framework that adds noise to query results to prevent identification of individuals while maintaining statistical utility
- C. Privacy between different database systems
- D. Different levels of privacy for different users

Answer: B

Q1486. What is the polyinstantiation technique in multilevel secure databases?

- A. Creating multiple instances of the database server
- B. Allowing different versions of the same data at different security levels to prevent inference
- C. Installing the database multiple times
- D. Creating multiple copies of tables for performance

Answer: B

Q1487. What is homomorphic encryption and its relevance to database security?

- A. Encryption that uses similar keys for all data
- B. Encryption that allows computations on encrypted data without decrypting it first
- C. Encryption that only works on homogeneous data
- D. Encryption applied uniformly across all tables

Answer: B

Q1488. What is the Biba model and how does it complement Bell-LaPadula?

- A. The Biba model is identical to Bell-LaPadula
- B. Biba focuses on integrity (no write up, no read down) while Bell-LaPadula focuses on confidentiality
- C. Biba focuses on availability while Bell-LaPadula focuses on integrity
- D. They cannot be used together

Answer: B

Q1489. What is k-anonymity and its limitations in database privacy?

- A. Anonymizing k users from the database
- B. Ensuring each record is indistinguishable from at least k-1 other records on quasi-identifiers, but vulnerable to homogeneity and background knowledge attacks
- C. Making data available to k users only
- D. A key management protocol for k users

Answer: B

Q1490. What is database activity monitoring (DAM)?

- A. Monitoring disk activity for defragmentation
- B. Independent monitoring of database activities in real-time to detect and prevent unauthorized access and policy violations
- C. Monitoring the dam that stores database water cooling
- D. Monitoring CPU activity during queries

Answer: B

Q1491. What is the covert channel problem in multilevel secure databases?

- A. A hidden database administrator account
- B. An unintended communication path that allows information to leak between security levels through indirect means
- C. A covert backup channel
- D. A channel used for database replication

Answer: B

Q1492. What is attribute-based access control (ABAC) and how does it extend RBAC?

- A. Controlling access based on data attributes only
- B. Making access decisions based on attributes of users, resources, actions, and environment, providing finer-grained control than role-based approaches
- C. Adding attributes to roles
- D. A type of encryption based on attributes

Answer: B

Q1493. What is the challenge of key management in database encryption?

- A. Keys are too small to manage
- B. Securely storing, rotating, and distributing encryption keys without exposing them while maintaining access to encrypted data
- C. Keys take too much storage space
- D. There are no challenges with key management

Answer: B

Q1494. What is the three-phase commit (3PC) protocol and what problem does it solve?

- A. A three-step backup process
- B. An extension of 2PC that adds a pre-commit phase to avoid blocking when the coordinator fails
- C. A three-step data migration process
- D. A protocol requiring three coordinators

Answer: B

Q1495. What is the Raft consensus algorithm and how does it compare to Paxos?

- A. Raft is unrelated to distributed systems
- B. Raft achieves similar consensus guarantees as Paxos but is designed to be more understandable with a clear leader-election mechanism
- C. Raft is less reliable than Paxos
- D. Raft works only in non-distributed settings

Answer: B

Q1496. What is eventual consistency in distributed databases?

- A. Consistency that is never achieved
- B. A model where all replicas will converge to the same state eventually if no new updates are made, trading immediate consistency for availability
- C. Consistent performance across all queries
- D. A guarantee that data is always consistent

Answer: B

Q1497. What is vector clock and how is it used in distributed databases?

- A. A synchronized physical clock across all sites
- B. A logical clock mechanism that tracks causal ordering of events across distributed nodes using a vector of counters
- C. A clock that measures query execution time
- D. A hardware clock in the database server

Answer: B

Q1498. What is the CALM theorem and its implication for distributed databases?

- A. It states that all distributed systems must be calm and stable
- B. It states that logically monotonic programs can be made consistent without coordination, guiding coordination-free distributed designs
- C. It defines the maximum load for distributed queries
- D. It specifies memory allocation for distributed systems

Answer: B

Q1499. What is a conflict-free replicated data type (CRDT)?

- A. A data type that prevents all database conflicts
- B. A data structure designed so concurrent updates from different replicas can be merged automatically without conflicts
- C. A data type that only allows read operations
- D. A replicated column type

Answer: B

Q1500. What is the quorum-based protocol in distributed databases?

- A. A vote by database administrators
- B. A protocol requiring read and write operations to access a minimum number of replicas (quorum) to ensure consistency
- C. A protocol for electing a new database coordinator
- D. A minimum number of users needed to access the database

Answer: B

Q1501. What is the network partition handling challenge in distributed databases related to the CAP theorem?

- A. Managing network cable partitions
- B. During a network partition, the system must choose between maintaining consistency (rejecting operations) or availability (allowing operations with potential inconsistency)
- C. Partitioning network traffic for different queries
- D. Managing database partitions across different networks

Answer: B

Q1502. What is Google Spanner's approach to distributed consistency?

- A. It ignores consistency for performance
- B. It uses TrueTime API with synchronized atomic clocks to achieve external consistency (linearizability) across globally distributed data
- C. It uses eventual consistency only
- D. It restricts all data to a single region

Answer: B

Q1503. What is the consistent hashing technique used in NoSQL databases?

- A. Using the same hash function across all operations
- B. A technique that maps both data and nodes to a ring, minimizing data redistribution when nodes are added or removed
- C. Hashing data to ensure consistency
- D. A type of encryption for NoSQL data

Answer: B

Q1504. What is the gossip protocol used for in distributed NoSQL systems?

- A. Spreading rumors about database performance
- B. A protocol where nodes periodically exchange state information with random peers to disseminate cluster membership and health data
- C. A chatting protocol between database users
- D. A protocol for sharing query results

Answer: B

Q1505. What is the LSM (Log-Structured Merge) tree and why do many NoSQL databases use it?

- A. A tree for logging system messages
- B. A write-optimized data structure that batches writes in memory and periodically merges sorted runs to disk
- C. A tree structure for merge operations only
- D. A logging mechanism for SQL databases

Answer: B

Q1506. What is tunable consistency in Cassandra?

- A. Consistency that tunes database performance
- B. The ability to configure the consistency level per query, choosing between ONE, QUORUM, ALL, and other levels
- C. Automatic consistency management
- D. A fixed consistency setting

Answer: B

Q1507. What is the concept of anti-entropy in distributed NoSQL databases?

- A. A measure of data disorder
- B. A mechanism that compares and synchronizes data across replicas to repair inconsistencies
- C. The opposite of data entropy
- D. A technique to compress data

Answer: B

Q1508. What are tombstones in NoSQL databases like Cassandra?

- A. Markers for inactive user accounts
- B. Special markers that indicate deleted data, retained temporarily to ensure deletion propagates across all replicas
- C. Physical markers on disk sectors
- D. A type of index entry

Answer: B

Q1509. What is the difference between CP and AP systems in the context of the CAP theorem?

- A. CP systems are faster than AP systems
- B. CP systems sacrifice availability during partitions to maintain consistency, while AP systems sacrifice consistency to remain available
- C. AP systems always have better performance
- D. CP and AP are identical in practice

Answer: B

Q1510. What is a Bloom filter and how is it used in NoSQL databases?

- A. A filter for cleaning database data
- B. A probabilistic data structure that efficiently tests whether an element might be in a set, used to avoid unnecessary disk reads
- C. A filter for bloom-type queries
- D. A data quality filter

Answer: B

Q1511. What is the Dynamo architecture model that influenced many NoSQL databases?

- A. A model for dynamic query processing
- B. A decentralized, highly available key-value architecture using consistent hashing, vector clocks, and sloppy quorum with hinted handoff
- C. A centralized database management model
- D. A model for database security

Answer: B

Q1512. What is a multi-model database and what advantage does it offer?

- A. A database that models multiple data centers
- B. A database supporting multiple data models (document, graph, key-value) in a single engine, reducing operational complexity
- C. A database with multiple backup models
- D. A database that runs multiple instances

Answer: B

Q1513. What is the Kimball methodology for data warehouse design?

- A. A methodology focused on building a centralized enterprise data warehouse first
- B. A bottom-up approach using dimensional modeling, building data marts first that can be integrated into an enterprise warehouse
- C. A methodology that avoids using star schemas
- D. A methodology that does not use ETL processes

Answer: B

Q1514. What is the Inmon methodology for data warehouse design?

- A. A bottom-up approach starting with data marts
- B. A top-down approach building a normalized enterprise data warehouse first, from which data marts are derived
- C. A methodology that uses only star schemas
- D. A methodology that avoids normalization

Answer: B

Q1515. What is a factless fact table?

- A. A fact table with errors
- B. A fact table that records events or conditions without any numeric measures, capturing only the relationship between dimensions
- C. A table that is not a fact table
- D. A fact table with null values

Answer: B

Q1516. What is a junk dimension in data warehouse design?

- A. A dimension containing useless data
- B. A dimension that combines miscellaneous low-cardinality flags and indicators into a single table
- C. A dimension that should be deleted
- D. A dimension with corrupted data

Answer: B

Q1517. What is a degenerate dimension?

- A. A dimension that has degraded over time
- B. A dimension key in the fact table that has no corresponding dimension table, such as an order number
- C. A dimension with no attributes
- D. A dimension that is no longer used

Answer: B

Q1518. What is change data capture (CDC) and how is it used in data warehousing?

- A. Capturing screenshots of data changes
- B. A technique that identifies and captures only the data that has changed in source systems since the last extraction for efficient ETL
- C. Capturing data from change management systems
- D. A method for tracking schema changes

Answer: B

Q1519. What is a data lake and how does it differ from a data warehouse?

- A. A data lake is a smaller version of a data warehouse
- B. A data lake stores raw, unprocessed data in its native format while a data warehouse stores processed, structured data
- C. They are the same concept
- D. A data lake only stores water-related data

Answer: B

Q1520. What is the concept of grain in dimensional modeling?

- A. The texture of stored data
- B. The level of detail represented by each row in a fact table, defining what one row means
- C. The granularity of storage hardware
- D. The size of each data block

Answer: B

Q1521. What is a periodic snapshot fact table versus a transaction fact table?

- A. They store the same data differently
- B. A transaction fact table records individual events while a periodic snapshot captures cumulative state at regular intervals
- C. Periodic snapshots are always larger
- D. Transaction fact tables contain no measures

Answer: B

Q1522. What is an accumulating snapshot fact table?

- A. A fact table that accumulates errors
- B. A fact table that tracks the lifecycle of a process with multiple date columns representing milestones, updating rows as the process progresses
- C. A fact table that only grows and never changes
- D. A temporary fact table

Answer: B

Q1523. What is the LEAD() window function used for in SQL?

- A. To create a leading index
- B. To access a row at a specified physical offset after the current row within the partition
- C. To lead data migration
- D. To find the first row in a partition

Answer: B

Q1524. What is the saga pattern for long-running transactions?

- A. A storytelling approach to database design
- B. A pattern that splits a long transaction into a sequence of local transactions, each with a compensating transaction for rollback
- C. A type of database narrative log
- D. A sequential access pattern for data

Answer: B

Q1525. What is the strict timestamp ordering protocol?

- A. Ordering transactions by their creation date
- B. A protocol where a transaction that attempts to read or write a data item written by a younger transaction is rolled back and restarted
- C. Ordering log entries by time
- D. Strictly formatting timestamps in the log

Answer: B

Q1526. What is the fill factor of a B+ tree index and why does it matter?

- A. The percentage of the database that is indexed
- B. The percentage of space in each index page that is filled with data, affecting split frequency and space utilization
- C. The total size of the index file
- D. The ratio of index pages to data pages

Answer: B

Q1527. What is a skip list and how is it used as an alternative index structure?

- A. A list that skips every other record
- B. A probabilistic data structure using multiple linked list levels where higher levels skip over elements for $O(\log n)$ average search time
- C. A list of skipped transactions
- D. An index that skips null values

Answer: B

Q1528. What is the cost model used to evaluate whether an index scan or table scan is more efficient?

- A. The cost of purchasing the index software
- B. Comparing estimated I/O costs: index scan cost = index traversal I/Os + data page I/Os versus table scan cost = total data pages
- C. The monetary cost of running the query
- D. The time it takes to create the index

Answer: B

Q1529. What is the Selinger optimization algorithm?

- A. An algorithm for selecting database hardware
- B. A dynamic programming-based algorithm from IBM System R that finds optimal join orderings by considering access paths and interesting orders
- C. A security algorithm for databases
- D. An algorithm for selecting storage structures

Answer: B

Q1530. What is the blocking problem in the two-phase commit protocol?

- A. Network traffic blocking data transfer
- B. If the coordinator fails after sending prepare but before sending the final decision, participants holding locks are blocked indefinitely waiting
- C. Users being blocked from accessing the database
- D. Queries being blocked by long-running transactions

Answer: B

Data Structures & Algorithms

1,080 Multiple Choice Questions

Data Structures & Algorithms — Easy

360 questions

Q1. What is a data structure?

- A. A specific programming language type
- B. A step-by-step problem procedure
- C. A physical hardware component unit
- D. A way to organize and store data

Answer: D

Q2. What does 'algorithm' mean?

- A. A compiled programming language
- B. A primitive data type definition
- C. A processing hardware component
- D. A step-by-step problem procedure

Answer: D

Q3. Which notation is used to describe the upper bound of an algorithm's time complexity?

- A. Small-o notation
- B. Theta notation
- C. Omega notation
- D. Big-O notation

Answer: D

Q4. What is the time complexity of accessing an element in an array by index?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q5. Which of the following is a linear data structure?

- A. Graph
- B. Array
- C. Heap
- D. Tree

Answer: B

Q6. What is the purpose of pseudocode?

- A. To execute low-level machine instructions
- B. To debug and test running software
- C. To compile a program into bytecode
- D. To describe an algorithm in readable form

Answer: D

Q7. Which term refers to the amount of memory an algorithm uses?

- A. Time complexity
- B. Code complexity
- C. Space complexity
- D. Cyclomatic complexity

Answer: C

Q8. What is $O(1)$ complexity called?

- A. Constant
- B. Quadratic
- C. Logarithmic
- D. Linear

Answer: A

Q9. Which of the following is a non-linear data structure?

- A. Linked List
- B. Stack
- C. Array
- D. Tree

Answer: D

Q10. What is an Abstract Data Type (ADT)?

- A. A concrete implementation of a data structure
- B. A reserved programming language keyword term
- C. A specific type of comparison sorting algorithm
- D. A mathematical model defined by its behavior

Answer: D

Q11. What is a stack?

- A. A LIFO data structure
- B. A FIFO data structure
- C. A random access data structure
- D. A hierarchical data structure

Answer: A

Q12. What is a queue?

- A. A sorted data structure
- B. A FIFO data structure
- C. A LIFO data structure
- D. A tree-based data structure

Answer: B

Q13. Which operation adds an element to the top of a stack?

- A. Push
- B. Dequeue
- C. Enqueue
- D. Pop

Answer: A

Q14. What is a linked list?

- A. Nodes where each node points to the next node
- B. A hierarchical tree-based data structure
- C. Elements stored in contiguous memory locations
- D. A hash-based key-value pair structure

Answer: A

Q15. What is the time complexity of inserting an element at the beginning of a singly linked list?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n)$

Answer: C

Q16. Which data structure is used to evaluate postfix expressions?

- A. Array
- B. Stack
- C. Queue
- D. Linked List

Answer: B

Q17. What is the main disadvantage of an array?

- A. Random access is not possible
- B. Fixed size in static arrays
- C. It cannot store integers
- D. Elements cannot be sorted

Answer: B

Q18. What does the 'dequeue' operation do?

- A. Adds an element to the front of a queue
- B. Removes an element from the front of a queue
- C. Adds an element to the rear of a queue
- D. Removes an element from the rear of a queue

Answer: B

Q19. In a singly linked list, the last node points to:

- A. The first node
- B. NULL (nothing)
- C. The middle node
- D. Itself (self)

Answer: B

Q20. Which operation removes an element from the top of a stack?

- A. Enqueue
- B. Push
- C. Peek
- D. Pop

Answer: D

Q21. What is a binary tree?

- A. A directed graph with no cycles at all
- B. A tree with exactly 2 total internal nodes
- C. A tree where each node has at most 2 children
- D. A tree where each node has at most 3 children

Answer: C

Q22. What is the root of a tree?

- A. The node with the most children
- B. The topmost node with no parent
- C. The node with no children at all
- D. The leftmost node in the tree

Answer: B

Q23. What is a leaf node?

- A. A node with two children
- B. A node with no children
- C. The root node itself
- D. A node with one child

Answer: B

Q24. What is a Binary Search Tree (BST)?

- A. A binary tree where left child > parent > right child
- B. A tree data structure with exactly two total nodes
- C. A binary tree where left child < parent < right child
- D. A balanced tree structure that is always complete

Answer: C

Q25. What is a graph in data structures?

- A. A chart used for data visualization
- B. A type of contiguous memory array
- C. A sequential linear data structure
- D. A collection of vertices and edges

Answer: D

Q26. What is the maximum number of nodes in a binary tree of height h?

- A. $2^h - 1$
- B. h^2
- C. $2h$
- D. $2^{(h+1)} - 1$

Answer: D

Q27. What is an undirected graph?

- A. A graph where edges have no direction
- B. A graph with no edges at all
- C. A hierarchical tree structure
- D. A graph where edges have direction

Answer: A

Q28. What is the degree of a vertex in an undirected graph?

- A. The assigned weight of the given vertex
- B. The number of edges incident to the vertex
- C. The total number of vertices in the graph
- D. The shortest path length from the vertex

Answer: B

Q29. What is a heap?

- A. A type of directed graph with cycles
- B. A complete binary tree with heap property
- C. A sorted array-based storage structure
- D. A variant of a hash table with chains

Answer: B

Q30. How is a graph typically represented?

- A. Using adjacency matrix or list
- B. Using singly linked lists only
- C. Using stack data structures
- D. Using simple arrays only

Answer: A

Q31. What is linear search?

- A. Searching using a hash table for lookups
- B. Searching only in a sorted array format
- C. Searching each element sequentially from start
- D. Searching by dividing the array in half

Answer: C

Q32. What is the time complexity of linear search in the worst case?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(1)$

Answer: C

Q33. What is the prerequisite for binary search?

- A. The array must be sorted
- B. The array must be of fixed size
- C. The array must contain unique elements
- D. The array must be unsorted

Answer: A

Q34. What is the time complexity of binary search?

- A. $O(\log n)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(1)$

Answer: A

Q35. In binary search, if the target is greater than the middle element, where do you search next?

- A. Start over again
- B. Middle element only
- C. Left half only
- D. Right half only

Answer: D

Q36. What is the best-case time complexity of linear search?

- A. $O(1)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: A

Q37. Which search algorithm does not require the data to be sorted?

- A. Interpolation search
- B. Linear search
- C. Fibonacci search
- D. Binary search

Answer: B

Q38. What does binary search return if the element is not found?

- A. The middle index of the array
- B. The value zero always
- C. The last index of the array
- D. An indicator such as -1 for not found

Answer: D

Q39. How many comparisons does binary search make for an array of 1024 elements in the worst case?

- A. 100
- B. 10
- C. 1024
- D. 512

Answer: B

Q40. What is the space complexity of iterative binary search?

- A. $O(\log n)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(1)$

Answer: D

Q41. What is bubble sort?

- A. A sort that divides the array in half each time
- B. A sort that selects the minimum element each pass
- C. A sort that uses a heap for element ordering
- D. A sort that swaps adjacent out-of-order elements

Answer: D

Q42. What is the worst-case time complexity of bubble sort?

- A. $O(\log n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n)$

Answer: C

Q43. What is selection sort?

- A. A sort that works only on linked list nodes
- B. A sort that uses binary search for placement
- C. A sort that finds minimum and places it correctly
- D. A sort that selects a random pivot element

Answer: C

Q44. What is insertion sort?

- A. A sort that uses divide and conquer recursion
- B. A sort that inserts each element into correct position
- C. A sort that only works on integer data types
- D. A sort that inserts elements into a heap structure

Answer: B

Q45. Which sorting algorithm is best for nearly sorted data?

- A. Merge sort
- B. Quick sort
- C. Selection sort
- D. Insertion sort

Answer: D

Q46. Is bubble sort a stable sorting algorithm?

- A. Yes, it is stable
- B. Only for integer data
- C. Only for string data
- D. No, it is unstable

Answer: A

Q47. What is the best-case time complexity of insertion sort?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(1)$

Answer: C

Q48. What is the space complexity of selection sort?

- A. $O(n^2)$
- B. $O(1)$
- C. $O(n)$
- D. $O(\log n)$

Answer: B

Q49. How many passes does bubble sort need in the worst case for n elements?

- A. $n - 1$
- B. $\log n$
- C. n
- D. $n/2$

Answer: A

Q50. Is selection sort a stable sorting algorithm?

- A. Only for numeric data
- B. No, it is unstable
- C. Yes, it is stable
- D. Depends on implementation

Answer: B

Q51. What is a hash function?

- A. A function that encrypts all data
- B. A function that compresses file data
- C. A function that sorts data elements
- D. A function that maps data to fixed-size value

Answer: D

Q52. What is a hash table?

- A. A binary tree data structure
- B. A sorted array structure
- C. A type of linked list structure
- D. A key-value store using hash function

Answer: D

Q53. What is a collision in hashing?

- A. When a key is not found in the table
- B. When two keys hash to the same index
- C. When the hash table is completely full
- D. When the hash function fails to compute

Answer: B

Q54. What is the average time complexity of lookup in a hash table?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(1)$

Answer: D

Q55. What is chaining in hash tables?

- A. Linking multiple hash tables together
- B. Connecting hash functions in sequence
- C. Storing colliding elements in a linked list
- D. A type of hash function computation

Answer: C

Q56. What is the load factor of a hash table?

- A. The ratio of entries to number of slots
- B. The number of hash functions being used
- C. The total number of collisions occurred
- D. The total size of the hash table

Answer: A

Q57. Which of the following is a simple hash function for integers?

- A. $h(k) = k + \text{table\_size}$
- B. $h(k) = k \times \text{table\_size}$
- C. $h(k) = k / \text{table\_size}$
- D. $h(k) = k \bmod \text{table\_size}$

Answer: D

Q58. What is the worst-case time complexity of hash table lookup?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(n)$

Answer: D

Q59. What is the purpose of a hash table?

- A. To store data in sorted ascending order
- B. To compress data for storage saving
- C. To sort data elements efficiently
- D. To provide fast insert, delete, and lookup

Answer: D

Q60. What happens when you insert a key that already exists in a hash table?

- A. The insertion is silently ignored completely
- B. Both old and new values are stored
- C. The old value is typically updated with new
- D. It causes a runtime error exception

Answer: C

Q61. What is in-order traversal of a binary tree?

- A. Right, Root, Left
- B. Left, Right, Root
- C. Left, Root, Right
- D. Root, Left, Right

Answer: C

Q62. What is pre-order traversal of a binary tree?

- A. Right, Left, Root
- B. Root, Left, Right
- C. Left, Right, Root
- D. Left, Root, Right

Answer: B

Q63. What is post-order traversal of a binary tree?

- A. Right, Root, Left
- B. Root, Left, Right
- C. Left, Root, Right
- D. Left, Right, Root

Answer: D

Q64. What data structure is used for level-order (BFS) traversal of a tree?

- A. Array
- B. Queue
- C. Hash table
- D. Stack

Answer: B

Q65. What is the height of a single-node tree?

- A. 1
- B. 0
- C. -1
- D. 2

Answer: B

Q66. How do you find the minimum element in a BST?

- A. Check the root node
- B. Traverse to the rightmost node
- C. Perform in-order traversal
- D. Traverse to the leftmost node

Answer: D

Q67. How do you find the maximum element in a BST?

- A. Check the root node
- B. Traverse to the leftmost node
- C. Traverse to the rightmost node
- D. Use binary search method

Answer: C

Q68. What is the time complexity of searching for an element in a BST of height h?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(h)$
- D. $O(n)$

Answer: C

Q69. What is a binary tree's depth?

- A. The edge count from root to deepest leaf
- B. The total number of nodes in tree
- C. The number of internal non-leaf nodes
- D. The total number of leaf nodes only

Answer: A

Q70. Which traversal of a BST gives elements in sorted order?

- A. Level-order
- B. In-order
- C. Post-order
- D. Pre-order

Answer: B

Q71. What is Breadth-First Search (BFS)?

- A. A search that goes as deep as possible first
- B. A search only applicable to tree structures
- C. A search that uses a stack data structure
- D. A search exploring all neighbors at current depth

Answer: D

Q72. What is Depth-First Search (DFS)?

- A. A search going deep along each branch first
- B. A search only applicable to array structures
- C. A search that uses a queue data structure
- D. A search that explores all neighbors first

Answer: A

Q73. What data structure does BFS use?

- A. Hash table
- B. Heap
- C. Stack
- D. Queue

Answer: D

Q74. What data structure does DFS use?

- A. Array structure
- B. Stack or recursion
- C. Queue structure
- D. Heap structure

Answer: B

Q75. What is the time complexity of BFS on a graph with V vertices and E edges?

- A. $O(V + E)$
- B. $O(E)$
- C. $O(V \times E)$
- D. $O(V)$

Answer: A

Q76. What is the time complexity of DFS on a graph with V vertices and E edges?

- A. $O(V + E)$
- B. $O(V \times E)$
- C. $O(E^2)$
- D. $O(V^2)$

Answer: A

Q77. Can BFS find the shortest path in an unweighted graph?

- A. Yes, BFS can do this
- B. No, BFS cannot do this
- C. Only in tree structures
- D. Only in directed graphs

Answer: A

Q78. What is a connected component in an undirected graph?

- A. A cycle within the undirected graph
- B. A maximal set of vertices all connected by paths
- C. An edge connecting two vertices together
- D. A single isolated vertex in the graph

Answer: B

Q79. What is a cycle in a graph?

- A. An isolated vertex with no edges at all
- B. A path starting and ending at the same vertex
- C. A straight path between two vertices
- D. A tree edge connecting parent to child

Answer: B

Q80. What is a spanning tree of a connected graph?

- A. A subgraph with all vertices and all edges
- B. A complete subgraph with maximum edges
- C. A tree subgraph containing all graph vertices
- D. The shortest path tree from one source

Answer: C

Q81. What is the divide and conquer strategy?

- A. Breaking into subproblems, solving, and combining
- B. Solving all problems using bottom-up iteration
- C. Using a greedy approach at each step
- D. Solving problems by trying all possibilities

Answer: A

Q82. What is a greedy algorithm?

- A. An algorithm making locally optimal choices each step
- B. An algorithm that solves all subproblems first
- C. An algorithm that uses backtracking for search
- D. An algorithm that tries all possible combinations

Answer: A

Q83. Which of the following is an example of divide and conquer?

- A. Merge sort
- B. Linear search
- C. Insertion sort
- D. Bubble sort

Answer: A

Q84. What is dynamic programming?

- A. A type of greedy algorithm with memoization
- B. Solving problems by storing overlapping subproblem results
- C. Programming that changes dynamically at runtime
- D. An algorithm that uses only recursion for solving

Answer: B

Q85. What is backtracking?

- A. Sorting data elements in reverse descending order
- B. Trying solutions and abandoning invalid paths early
- C. Going back to the start of an algorithm run
- D. Reversing the input data before processing

Answer: B

Q86. What is memoization?

- A. Writing memos about code documentation
- B. A type of sorting with memory optimization
- C. Memorizing the algorithm steps by heart
- D. Caching results of function calls for reuse

Answer: D

Q87. Which approach builds solutions from smallest subproblems to larger ones?

- A. Greedy approach
- B. Top-down approach
- C. Bottom-up (tabulation)
- D. Brute force approach

Answer: C

Q88. What is brute force in algorithm design?

- A. An optimized search using heuristics
- B. Trying all possible solutions exhaustively
- C. The most efficient approach available
- D. A divide and conquer optimization

Answer: B

Q89. What two properties must a problem have to be solvable by dynamic programming?

- A. Optimal substructure and overlapping subproblems
- B. Linear structure and constant time operations
- C. Greedy choice property and unique solution
- D. Sorting and searching capabilities

Answer: A

Q90. Which algorithm design paradigm does the activity selection problem use?

- A. Backtracking search approach
- B. Dynamic programming approach
- C. Divide and conquer approach
- D. Greedy algorithm approach

Answer: D

Q91. What is a priority queue?

- A. A type of stack that also supports priority ordering
- B. A queue that processes all elements in strict FIFO order
- C. A sorted array of elements ordered by their value
- D. A structure where higher priority elements are served first

Answer: D

Q92. What data structure typically implements a priority queue?

- A. Stack structure
- B. Heap structure
- C. Array structure
- D. Linked list structure

Answer: B

Q93. What is a trie (prefix tree)?

- A. A tree for storing and retrieving strings by prefix
- B. A graph data structure for string matching
- C. A binary search tree for numeric keys
- D. A type of hash table for string storage

Answer: A

Q94. What is the time complexity of searching for a word of length L in a trie?

- A. $O(\log n)$
- B. $O(L)$
- C. $O(n)$
- D. $O(n \times L)$

Answer: B

Q95. What is a disjoint set (Union-Find)?

- A. A hash set with unique elements
- B. A structure tracking non-overlapping subsets
- C. A set with no elements at all
- D. A sorted set with ordered elements

Answer: B

Q96. What operation does 'find' perform in Union-Find?

- A. Determines which set an element belongs to
- B. Searches for an element in the set
- C. Finds the minimum element in all sets
- D. Finds all elements in a particular set

Answer: A

Q97. What is a min-heap?

- A. A heap where minimum element is at root
- B. A heap where maximum element is at root
- C. A sorted array of elements by value
- D. A balanced BST with min at leftmost

Answer: A

Q98. What is the main advantage of a trie over a hash table for string operations?

- A. Has a simpler implementation overall
- B. Uses less memory usage in practice
- C. Supports prefix-based queries efficiently
- D. Provides faster exact string lookups

Answer: C

Q99. What does 'union' operation do in Union-Find?

- A. Splits a set into two parts
- B. Finds common elements between sets
- C. Merges two disjoint sets into one
- D. Sorts the sets in ascending order

Answer: C

Q100. What is a multiset?

- A. A sorted set with unique elements
- B. A collection allowing duplicate elements
- C. A set with multiple data types
- D. A set of sets nested together

Answer: B

Q101. What is string matching?

- A. Comparing two strings for equality only
- B. Finding occurrences of a pattern in text
- C. Sorting strings in alphabetical order
- D. Concatenating two strings end to end

Answer: B

Q102. What is the brute force string matching time complexity for text of length n and pattern of length m ?

- A. $O(n)$
- B. $O(n + m)$
- C. $O(m)$
- D. $O(n \times m)$

Answer: D

Q103. What is a substring?

- A. A rearrangement of string characters
- B. A contiguous sequence of characters within a string
- C. A string of exactly length 1 character
- D. Any characters from a string in any order

Answer: B

Q104. What is a subsequence of a string?

- A. A sequence derived by deleting characters keeping order
- B. A contiguous part of the original string
- C. A sorted version of the original string
- D. A reversed version of the original string

Answer: A

Q105. What is a palindrome?

- A. A string with only repeated characters throughout
- B. A string with all unique characters
- C. A string with an even number of characters
- D. A string that reads the same forward and backward

Answer: D

Q106. What is an anagram?

- A. A palindrome of another word
- B. A prefix of another given word
- C. A substring of another word
- D. A rearrangement forming another word

Answer: D

Q107. How can you check if two strings are anagrams?

- A. Compare their lengths only for equality
- B. Check if they have the same first character
- C. Reverse one string and compare with the other
- D. Sort both strings and compare, or count frequencies

Answer: D

Q108. What is a prefix of a string?

- A. The middle portion of the string
- B. A reversed version of the string
- C. The last character of the string
- D. A substring starting from the beginning

Answer: D

Q109. What is a suffix of a string?

- A. A substring starting from the beginning
- B. A rotated version of the string
- C. The first character of the string
- D. A substring ending at the last character

Answer: D

Q110. What is string concatenation?

- A. Splitting a string into parts
- B. Reversing a string entirely
- C. Joining two strings end to end
- D. Sorting characters in a string

Answer: C

Q111. What does P stand for in computational complexity?

- A. Problems solvable in polynomial time
- B. Prime number problems class
- C. Probability problems class
- D. Parallel problems class

Answer: A

Q112. What does NP stand for in computational complexity?

- A. New computational Problems class
- B. Non-deterministic Polynomial time
- C. Not Polynomial time class
- D. No Proof available for it

Answer: B

Q113. What is the best time complexity achievable for comparison-based sorting?

- A. $O(\log n)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: B

Q114. Which is more efficient: $O(n)$ or $O(n \log n)$?

- A. Depends on constants
- B. $O(n)$ is more efficient
- C. $O(n \log n)$ is better
- D. They are equivalent

Answer: B

Q115. What is the time complexity of accessing an element in a hash table on average?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n)$

Answer: C

Q116. What is time-space tradeoff?

- A. Time complexity cannot affect space complexity
- B. Time and space are always equal in measure
- C. Using more time to save space or vice versa
- D. A method to reduce both time and space simultaneously

Answer: C

Q117. Which is faster: $O(\log n)$ or $O(n)$?

- A. They are equivalent
- B. $O(\log n)$ is faster
- C. $O(n)$ is faster
- D. Cannot compare them

Answer: B

Q118. What is the significance of $O(n!)$ complexity?

- A. It is essentially the same as $O(n^2)$ complexity class
- B. It is classified as a polynomial time complexity class
- C. It is very efficient for all possible input sizes given
- D. It is extremely inefficient, growing super-exponentially

Answer: D

Q119. What does 'in-place algorithm' mean?

- A. An algorithm that runs at a specific location
- B. An algorithm using only constant extra space
- C. An algorithm that cannot be relocated in memory
- D. An algorithm that only sorts data in place

Answer: B

Q120. What is the time complexity of finding the maximum element in an unsorted array?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(1)$
- D. $O(\log n)$

Answer: A

Q121. What does FIFO stand for in data structures?

- A. Fast Input Fast Output
- B. First Index First Order
- C. First In First Out
- D. Fixed In Fixed Out

Answer: C

Q122. Which term describes a function calling itself?

- A. Abstraction
- B. Iteration
- C. Recursion
- D. Selection

Answer: C

Q123. What is the base case in a recursive function?

- A. The largest subproblem solved by recursion
- B. The first recursive call made by function
- C. The condition that stops the recursion calls
- D. The condition that starts the recursion loop

Answer: C

Q124. What does LIFO stand for in data structures?

- A. Linear Input Fixed Output
- B. Last Index First Output
- C. Least Index First Order
- D. Last In First Out

Answer: D

Q125. Which complexity class grows the fastest?

- A. Linear
- B. Logarithmic
- C. Exponential
- D. Polynomial

Answer: C

Q126. What is the time complexity of a simple for loop iterating n times?

- A. $O(n)$
- B. $O(1)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: A

Q127. What does the term 'traversal' mean in data structures?

- A. Copying a structure into another one
- B. Sorting elements in ascending order only
- C. Deleting all elements from a structure
- D. Visiting each element exactly one time

Answer: D

Q128. Which data structure uses the LIFO principle?

- A. Stack
- B. Queue
- C. Graph
- D. Array

Answer: A

Q129. What is a primitive data type?

- A. A complex object-oriented class type
- B. A user-defined composite structure type
- C. A dynamically allocated reference type
- D. A basic built-in type provided by language

Answer: D

Q130. What is the purpose of a flowchart?

- A. To encrypt data for secure transmission
- B. To visually represent an algorithm's steps
- C. To compile source code into binary files
- D. To allocate memory for data structures

Answer: B

Q131. What is the maximum number of elements a stack can pop at once?

- A. Half of them
- B. All elements
- C. Two elements
- D. One element

Answer: D

Q132. Which operation adds an element to the rear of a queue?

- A. Enqueue
- B. Pop
- C. Push
- D. Dequeue

Answer: A

Q133. What is a singly linked list?

- A. Each node contains two separate data field values
- B. Each node points to both next and previous nodes
- C. Each node points only to the next node in list
- D. Each node has a direct link to every other node

Answer: C

Q134. What is stored in each node of a linked list?

- A. Data and a pointer to the next node
- B. Only the memory address of next node
- C. A pointer to both previous and next nodes
- D. Only the data value without any pointer

Answer: A

Q135. Which data structure is used for undo operations in editors?

- A. Queue
- B. Graph
- C. Stack
- D. Array

Answer: C

Q136. What happens when you dequeue from an empty queue?

- A. It inserts a default placeholder element
- B. It returns a null or zero value silently
- C. It causes an underflow error condition
- D. It resets the queue to initial capacity

Answer: C

Q137. What is the index of the first element in a zero-based array?

- A. n
- B. -1
- C. 1
- D. 0

Answer: D

Q138. Which linear structure allows insertion at both ends?

- A. Deque
- B. Array
- C. Queue
- D. Stack

Answer: A

Q139. What is the time complexity of inserting at the head of a linked list?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(\log n)$

Answer: A

Q140. What is a static array?

- A. An array that automatically sorts its elements
- B. An array with a fixed size set at creation
- C. An array whose size can grow dynamically
- D. An array that stores only string data types

Answer: B

Q141. What is the root node of a tree?

- A. Any leaf node at the bottom of the tree
- B. The node with the most children in tree
- C. The node at the deepest level of tree
- D. The topmost node with no parent at all

Answer: D

Q142. What is a leaf node in a tree?

- A. A node that connects to the root directly
- B. A node that has no children at all
- C. A node that has exactly two child nodes
- D. The first node added to the tree structure

Answer: B

Q143. How many children can a binary tree node have at most?

- A. Four
- B. Three
- C. Two
- D. One

Answer: C

Q144. What is an edge in a graph?

- A. A connection between two vertices
- B. A path visiting all graph vertices
- C. An isolated node with no neighbors
- D. The weight assigned to each vertex

Answer: A

Q145. What is an undirected graph?

- A. A graph where edges have specific direction only
- B. A graph where edges have no specific direction
- C. A graph where all vertices are fully connected
- D. A graph with no edges between any vertices

Answer: B

Q146. What is the height of a single-node tree?

- A. One
- B. Two
- C. Undefined
- D. Zero

Answer: D

Q147. What is a weighted graph?

- A. A graph where all vertices have the same degree
- B. A graph with no cycles between any of its nodes
- C. A graph where every node connects to all others
- D. A graph where edges have assigned numerical values

Answer: D

Q148. What is the degree of a vertex in an undirected graph?

- A. The total weight of all edges from that vertex
- B. The number of edges connected to the vertex
- C. The shortest path from that vertex to root
- D. The number of vertices in the entire graph

Answer: B

Q149. What is a complete binary tree?

- A. A tree where every internal node has no children
- B. A tree with only leaf nodes and no internal nodes
- C. A tree where every node has exactly one child node
- D. A tree where all levels are fully filled except last

Answer: D

Q150. What is an adjacency list used for?

- A. Finding shortest path in weighted graph directly
- B. Storing tree nodes in level-order arrangement
- C. Storing graph structure as lists of neighbors
- D. Sorting vertices in topological ordering only

Answer: C

Q151. What does linear search do?

- A. Uses hashing to find the target element value
- B. Sorts elements first then searches for target
- C. Checks elements sequentially from start to end
- D. Divides the array in half at each comparison

Answer: C

Q152. What is the best-case time complexity of linear search?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(1)$

Answer: D

Q153. What is required for binary search to work correctly?

- A. The array must be sorted beforehand
- B. The array must have an even number of items
- C. The array must contain unique elements only
- D. The array must be stored in a linked list

Answer: A

Q154. What is the worst-case time complexity of binary search?

- A. $O(\log n)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(1)$

Answer: A

Q155. In binary search, what happens if the target is less than the middle element?

- A. Search continues in the right half only
- B. The search terminates with element not found
- C. Search continues in the left half only
- D. Search restarts from the beginning again

Answer: C

Q156. Which search algorithm does not require sorted data?

- A. Binary search
- B. Fibonacci search
- C. Interpolation search
- D. Linear search

Answer: D

Q157. What is the space complexity of iterative binary search?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: D

Q158. What is the worst-case time complexity of linear search?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: B

Q159. What value does a search algorithm return if the element is not found?

- A. Typically negative one or a sentinel value
- B. The last index of the array searched
- C. The middle index of the array searched
- D. The first index of the array searched

Answer: A

Q160. How many comparisons does binary search make on 1024 sorted elements at most?

- A. 1024
- B. 10
- C. 100
- D. 512

Answer: B

Q161. What is the basic idea behind bubble sort?

- A. Insert each element into its correct sorted position
- B. Select the minimum element and place it at start
- C. Repeatedly swap adjacent elements if they are wrong
- D. Divide array into halves and merge them sorted

Answer: C

Q162. What is the time complexity of bubble sort in the worst case?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(n \log n)$
- D. $O(\log n)$

Answer: A

Q163. Which sorting algorithm picks the minimum and places it first?

- A. Insertion sort
- B. Merge sort
- C. Selection sort
- D. Quick sort

Answer: C

Q164. Is insertion sort a stable sorting algorithm?

- A. Yes, it is stable
- B. It depends on input
- C. Only for integers
- D. No, it is never stable

Answer: A

Q165. What is the best-case time complexity of insertion sort?

- A. $O(\log n)$
- B. $O(n^2)$
- C. $O(n \log n)$
- D. $O(n)$

Answer: D

Q166. What does the term 'in-place sorting' mean?

- A. Sorting that requires $O(n)$ extra memory space
- B. Sorting performed on an external disk storage device
- C. Sorting that creates a new copy of the input array
- D. Sorting done without significant extra memory use

Answer: D

Q167. Which sort is most efficient for nearly sorted data?

- A. Insertion sort
- B. Heap sort
- C. Merge sort
- D. Selection sort

Answer: A

Q168. What is the worst-case time complexity of selection sort?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: D

Q169. What does 'stable sort' mean?

- A. A sort preserving relative order of equal elements
- B. A sort with guaranteed $O(n \log n)$ time complexity
- C. A sort that always completes without crashing at all
- D. A sort that works on all data types without error

Answer: A

Q170. How many passes does bubble sort need for n elements?

- A. Exactly n passes
- B. Exactly one pass
- C. At most n-1 passes
- D. At most $\log n$ passes

Answer: C

Q171. What is a hash function?

- A. A function that sorts data into ordered buckets
- B. A function that compresses data to save disk space
- C. A function that encrypts data for secure storage
- D. A function that maps data to a fixed-size value

Answer: D

Q172. What is a hash table?

- A. A tree structure organized by hash value ordering
- B. A data structure using keys mapped to array indices
- C. A linked list with hash-based pointer connections
- D. A table that stores elements in sorted order only

Answer: B

Q173. What is a collision in hashing?

- A. When a hash table runs out of available memory
- B. When two keys map to the same hash table index
- C. When the hash function produces a negative value
- D. When an element is deleted from the hash table

Answer: B

Q174. What is the average time complexity of hash table lookup?

- A. $O(\log n)$
- B. $O(n^2)$
- C. $O(1)$
- D. $O(n)$

Answer: C

Q175. What is chaining in hash tables?

- A. Linking hash tables together in a sequence chain
- B. Connecting array slots with pointers to next slot
- C. Chaining multiple hash functions for better results
- D. Storing colliding elements in a linked list at each slot

Answer: D

Q176. What is the load factor of a hash table?

- A. The ratio of stored elements to table size
- B. The maximum key value stored in the table
- C. The number of collisions per hash operation
- D. The total memory allocated for the hash table

Answer: A

Q177. What is the division method of hashing?

- A. Dividing the key by two repeatedly until zero
- B. Splitting the key into digits and summing them up
- C. Dividing the table into equal-sized partitions only
- D. Computing hash as key modulo the table size value

Answer: D

Q178. What is an ideal property of a good hash function?

- A. It should distribute keys uniformly across the table
- B. It should always produce the same output value
- C. It should map all keys to a single table slot only
- D. It should produce values in strictly ascending order

Answer: A

Q179. What is direct addressing in hashing?

- A. Using random numbers to determine storage locations
- B. Using a linked list to store all elements together
- C. Using a tree structure to organize hash table entries
- D. Using the key itself as the index into the array

Answer: D

Q180. What data structure does a hash set implement?

- A. A collection of unique elements with fast lookup
- B. A hierarchical tree of categorized elements
- C. An ordered sequence of duplicate elements
- D. A sorted list of key-value paired entries

Answer: A

Q181. What is an in-order traversal of a binary tree?

- A. Visit root, then left subtree, then right subtree
- B. Visit left subtree, then root, then right subtree
- C. Visit root, then right subtree, then left subtree
- D. Visit left subtree, then right subtree, then root

Answer: B

Q182. What does pre-order traversal visit first?

- A. Right child
- B. Left child
- C. Leaf node
- D. Root node

Answer: D

Q183. What does post-order traversal visit last?

- A. Right child
- B. Leaf node
- C. Left child
- D. Root node

Answer: D

Q184. What is level-order traversal?

- A. Visiting nodes level by level from top to bottom
- B. Visiting only nodes at even numbered levels only
- C. Visiting nodes from deepest level to root level
- D. Visiting leaf nodes first then internal nodes last

Answer: A

Q185. Which data structure is used for level-order traversal?

- A. Array
- B. Queue
- C. Heap
- D. Stack

Answer: B

Q186. What is the time complexity of searching in a BST with n nodes?

- A. $O(n^2)$ always
- B. $O(n)$ in worst case
- C. $O(\log n)$ always
- D. $O(1)$ in worst case

Answer: B

Q187. What is the in-order successor of a node in a BST?

- A. The leftmost child of the given node always
- B. The parent node of the given node always
- C. The rightmost node in the entire BST tree
- D. The node with the next larger value in tree

Answer: D

Q188. What does in-order traversal of a BST produce?

- A. Elements in random unsorted order
- B. Elements in level-wise grouped order
- C. Elements in descending sorted order
- D. Elements in ascending sorted order

Answer: D

Q189. What is the minimum value node in a BST?

- A. The leftmost node in the whole tree
- B. The root node of the entire tree
- C. The rightmost node in the whole tree
- D. Any leaf node in the entire tree

Answer: A

Q190. How many traversal orders are standard for binary trees?

- A. Four
- B. Three
- C. Two
- D. Six

Answer: A

Q191. What is Breadth-First Search (BFS)?

- A. Randomly visiting nodes until target is found finally
- B. Searching only the leftmost path in the graph first
- C. Exploring as deep as possible before backtracking
- D. Exploring all neighbors at current depth before deeper

Answer: D

Q192. What is Depth-First Search (DFS)?

- A. Exploring as deep as possible then backtracking up
- B. Visiting nodes in alphabetical order of their labels
- C. Exploring all neighbors before going to next level
- D. Only visiting nodes that are directly connected to root

Answer: A

Q193. Which data structure does BFS use?

- A. Heap
- B. Queue
- C. Array
- D. Stack

Answer: B

Q194. Which data structure does DFS typically use?

- A. Queue
- B. Stack
- C. Heap
- D. Deque

Answer: B

Q195. What is the time complexity of BFS on a graph with V vertices and E edges?

- A. $O(E^2)$
- B. $O(V^2)$
- C. $O(V * E)$
- D. $O(V + E)$

Answer: D

Q196. What is a spanning tree of a graph?

- A. A complete copy of the original graph with all edges
- B. A tree containing only the leaf vertices of the graph
- C. A subgraph containing all vertices with minimum edges
- D. A subgraph that connects only half of the graph vertices

Answer: C

Q197. What is a connected graph?

- A. A graph with no isolated vertices but possible missing edges
- B. A graph where there is a path between every pair of nodes
- C. A graph where all vertices have the same degree exactly
- D. A graph where every pair of vertices has a direct edge

Answer: B

Q198. What is a path in a graph?

- A. A sequence of vertices connected by edges in graph
- B. A cycle that visits every vertex exactly once only
- C. The shortest distance between two vertices in graph
- D. A single edge connecting exactly two graph vertices

Answer: A

Q199. What is a cycle in a graph?

- A. A subgraph with all vertices having degree exactly two
- B. A path that starts and ends at the same vertex
- C. An edge that connects a vertex to itself directly
- D. A path that visits every edge in the graph once

Answer: B

Q200. What is the time complexity of DFS?

- A. $O(V^2)$
- B. $O(E^2)$
- C. $O(V + E)$
- D. $O(V * E)$

Answer: C

Q201. What is the greedy algorithm approach?

- A. Making the locally optimal choice at each step taken
- B. Breaking problems into subproblems and combining them
- C. Trying all possible solutions and picking the best one
- D. Using random choices to approximate the best solution

Answer: A

Q202. What is divide and conquer?

- A. Dividing resources equally among parallel processors
- B. Breaking a problem into subproblems, solving and combining
- C. Conquering the problem by brute force enumeration method
- D. Splitting input into two and sorting each half only

Answer: B

Q203. What is dynamic programming?

- A. Solving problems by storing solutions to subproblems
- B. Programming in a dynamic language like Python code
- C. Creating programs that dynamically allocate all memory
- D. A programming style that changes code at runtime

Answer: A

Q204. What is a brute force algorithm?

- A. An algorithm that uses force-directed graph layouts
- B. An algorithm that tries all possible candidate solutions
- C. An algorithm optimized for maximum efficiency speed
- D. An algorithm that aggressively prunes search space

Answer: B

Q205. What is the main advantage of dynamic programming over recursion?

- A. It does not use any memory for storing computations
- B. It uses less code and is simpler to implement
- C. It always runs in constant time for all input types
- D. It avoids recomputing overlapping subproblems using cache

Answer: D

Q206. Which algorithm technique does binary search use?

- A. Dynamic programming
- B. Greedy approach
- C. Divide and conquer
- D. Backtracking

Answer: C

Q207. What is backtracking?

- A. Going back to the previous version of code for fixes
- B. Backing up data structures before modifying them now
- C. Running the algorithm backwards from output to input
- D. Systematically trying options and undoing bad choices

Answer: D

Q208. What type of problems does the greedy approach work best for?

- A. Problems requiring all possible solutions enumerated
- B. Problems with optimal substructure and greedy property
- C. Problems that require exhaustive brute force searching
- D. Problems with overlapping subproblems needing caching

Answer: B

Q209. What is memoization?

- A. Memorizing the steps of an algorithm for quick recall
- B. Writing memos about algorithm design decisions made
- C. Creating documentation for each function in the code
- D. Caching results of function calls to avoid recomputation

Answer: D

Q210. What is an example of a greedy algorithm?

- A. Making change with fewest coins using largest first
- B. N-Queens problem solved using backtracking exploration
- C. Fibonacci sequence calculation using dynamic programming
- D. Matrix chain multiplication using optimal parenthesization

Answer: A

Q211. What is a priority queue?

- A. A stack that prioritizes the most recently added element
- B. A linked list sorted by element insertion time stamps
- C. A queue that processes elements in random arrival order
- D. A queue where elements are processed by priority order

Answer: D

Q212. What is a heap data structure?

- A. A hash table with elements ordered by insertion time
- B. A sorted array stored in dynamic heap memory allocation
- C. A complete binary tree satisfying the heap ordering rule
- D. A linked list where elements are organized by priority

Answer: C

Q213. What is the difference between a max-heap and a min-heap?

- A. Max-heap stores more elements; min-heap stores fewer items
- B. Max-heap uses arrays; min-heap uses linked list structure
- C. Max-heap has root as maximum; min-heap has root as min
- D. Max-heap has root as minimum; min-heap has root as max

Answer: C

Q214. What is a trie data structure?

- A. A tree for storing strings with shared prefix paths
- B. A generic tree with exactly three children per node
- C. A hash table variant that tries multiple hash functions
- D. A balanced binary tree for efficient numeric searching

Answer: A

Q215. What is the time complexity of inserting into a binary heap?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(\log n)$

Answer: D

Q216. What is a graph adjacency matrix?

- A. A tree representation of the graph traversal order
- B. A 2D array indicating edges between pairs of vertices
- C. A linked list of all vertices in the graph structure
- D. A hash map from vertex names to edge weight values

Answer: B

Q217. What is a disjoint set?

- A. A set that has been divided into two equal-sized halves
- B. A set that contains overlapping elements with other sets
- C. A collection of non-overlapping sets with no shared items
- D. A sorted set used for binary search on set elements

Answer: C

Q218. What is the extract-max operation in a max-heap?

- A. Adding a new maximum element to the top of the heap
- B. Removing and returning the maximum element from heap
- C. Finding the maximum element without removing it at all
- D. Swapping the maximum and minimum elements in the heap

Answer: B

Q219. How is a heap typically stored in memory?

- A. As a contiguous array with index-based navigation
- B. As a linked list with pointers between nodes
- C. As a hash table with heap position as the key
- D. As a 2D matrix with rows and columns for levels

Answer: A

Q220. What is the purpose of the heapify operation?

- A. Converting an arbitrary array into a valid heap structure
- B. Doubling the size of the heap for more element storage
- C. Removing all elements from the heap data structure now
- D. Sorting all elements of the heap in ascending order output

Answer: A

Q221. What is string matching?

- A. Sorting strings in lexicographic order for indexing
- B. Concatenating multiple strings into one single string
- C. Finding occurrences of a pattern within a longer text
- D. Comparing two strings for exact equality testing

Answer: C

Q222. What is the brute force string matching time complexity?

- A. $O(m)$
- B. $O(n * m)$
- C. $O(n)$
- D. $O(n + m)$

Answer: B

Q223. What is a substring?

- A. A sequence of non-adjacent characters from a string
- B. A reversed copy of the original complete string
- C. A rearrangement of characters in a given string
- D. A contiguous sequence of characters within a string

Answer: D

Q224. What is a palindrome?

- A. A string that contains only unique characters in it
- B. A string that reads the same forwards and backwards
- C. A string where all characters are in alphabetical order
- D. A string with an even number of total characters only

Answer: B

Q225. What is the length of the string 'hello'?

- A. Six
- B. Five
- C. Four
- D. Three

Answer: B

Q226. What is string concatenation?

- A. Splitting a string into individual characters apart
- B. Removing duplicate characters from a given string
- C. Reversing the order of characters within a string
- D. Joining two or more strings end to end together

Answer: D

Q227. What is a prefix of a string?

- A. The last character of the string only always
- B. Any substring starting from the first character
- C. The middle character of the string only always
- D. Any character appearing in the string at all

Answer: B

Q228. What is a suffix of a string?

- A. A reversed copy of the string prefix portion
- B. The string with all vowels removed from it
- C. Any substring ending at the last character point
- D. The first character of the string only always

Answer: C

Q229. What is lexicographic order?

- A. Ordering strings by their total length in characters
- B. Ordering strings by the frequency of their characters
- C. Ordering strings alphabetically like in a dictionary
- D. Ordering strings by their last character value only

Answer: C

Q230. How many substrings does a string of length n have?

- A. $n(n+1)/2$
- B. n^2
- C. $2n$
- D. n

Answer: A

Q231. What is time complexity?

- A. A measure of how runtime grows with input size
- B. The clock speed required to run the algorithm
- C. The actual runtime of a program in seconds only
- D. The time taken to write the algorithm pseudocode

Answer: A

Q232. What is space complexity?

- A. The disk space needed to store source code files
- B. The number of lines of code in the program total
- C. The physical space the computer occupies on a desk
- D. A measure of how memory usage grows with input size

Answer: D

Q233. Which is faster: $O(n)$ or $O(n^2)$?

- A. $O(n)$ is faster for sufficiently large input sizes
- B. $O(n^2)$ is faster for all possible input sizes
- C. Both have identical performance for any input size
- D. It depends entirely on the programming language used

Answer: A

Q234. What does $O(1)$ mean?

- A. The algorithm processes only one element at any time
- B. The algorithm takes exactly one single operation only
- C. The algorithm runs in constant time regardless of input
- D. The algorithm has exactly one line of code to execute

Answer: C

Q235. What is the Big-O of two nested loops each running n times?

- A. $O(n)$
- B. $O(2n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: C

Q236. Which complexity class represents logarithmic growth?

- A. $O(\log n)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(1)$

Answer: A

Q237. What is optimization in algorithm design?

- A. Converting the algorithm to a different language only
- B. Adding more features to the algorithm's functionality
- C. Improving algorithm efficiency in time or space usage
- D. Making the code look cleaner and more readable

Answer: C

Q238. What is the time complexity of a loop that halves n each iteration?

- A. $O(n)$
- B. $O(1)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: D

Q239. Why do we ignore constants in Big-O notation?

- A. Constants are only relevant in space complexity analysis
- B. Constants don't affect growth rate for large input sizes
- C. Constants are always equal to one in all algorithms
- D. Constants make the notation too hard to write out

Answer: B

Q240. What is the purpose of algorithm analysis?

- A. To create documentation for the algorithm implementation
- B. To predict resource usage and compare algorithm efficiency
- C. To determine the programming language to use for coding
- D. To find bugs and errors in the source code of program

Answer: B

Q241. What does asymptotic analysis focus on?

- A. Algorithm behavior for small inputs only
- B. Algorithm behavior as input size grows very large
- C. Exact running time in milliseconds
- D. The programming language used

Answer: B

Q242. Which of the following describes $O(\log n)$ complexity?

- A. The algorithm runs in constant time
- B. The running time doubles when the input size doubles
- C. The running time increases by a constant when the input size doubles
- D. The running time grows proportionally to the square of the input

Answer: C

Q243. What is the primary difference between a data structure and an algorithm?

- A. Data structures are faster than algorithms
- B. A data structure organizes data while an algorithm defines steps to solve a problem
- C. Algorithms store data while data structures process data
- D. There is no difference between them

Answer: B

Q244. What is the time complexity of performing two consecutive operations, one $O(n)$ and one $O(n^2)$?

- A. $O(n)$
- B. $O(n^3)$
- C. $O(n^2)$
- D. $O(2n^2)$

Answer: C

Q245. Which data structure follows the First-In-First-Out principle?

- A. Stack
- B. Queue
- C. Binary tree
- D. Hash table

Answer: B

Q246. What happens when a recursive function has no base case?

- A. It runs faster
- B. It returns zero
- C. It results in infinite recursion or a stack overflow
- D. It automatically stops after 100 calls

Answer: C

Q247. What is the Big-O complexity of an algorithm that does nothing regardless of input?

- A. $O(n)$
- B. $O(0)$
- C. $O(1)$
- D. $O(\log n)$

Answer: C

Q248. Which notation describes the best-case performance of an algorithm?

- A. Big-O (O)
- B. Big-Omega (Ω)
- C. Big-Theta (Θ)
- D. Little-o (o)

Answer: B

Q249. What is an iterative algorithm?

- A. An algorithm that calls itself
- B. An algorithm that uses loops to repeat steps
- C. An algorithm that solves problems using random choices
- D. An algorithm that cannot be analyzed

Answer: B

Q250. In Big-O notation, what is $O(n)$ commonly called?

- A. Constant time
- B. Logarithmic time
- C. Linear time
- D. Quadratic time

Answer: C

Q251. What is the time complexity of appending an element at the end of a dynamic array (without resizing)?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q252. What is the difference between a stack and a queue?

- A. A stack uses FIFO and a queue uses LIFO
- B. A stack uses LIFO and a queue uses FIFO
- C. Both use FIFO
- D. Both use LIFO

Answer: B

Q253. Why can a doubly linked list be traversed in both directions?

- A. Because it has two data fields per node
- B. Because each node stores pointers to both the next and previous nodes
- C. Because it stores data in pairs
- D. Because it uses two separate arrays

Answer: B

Q254. What is the time complexity of deleting the first element from a singly linked list?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q255. Which operation checks the top element of a stack without removing it?

- A. Pop
- B. Push
- C. Peek
- D. Enqueue

Answer: C

Q256. What is the main advantage of an array over a linked list?

- A. Dynamic size
- B. $O(1)$ random access to any element by index
- C. Easier insertion in the middle
- D. Less memory usage per element

Answer: B

Q257. What is a circular linked list?

- A. A linked list where the last node points back to the first node
- B. A linked list arranged in a circle shape on screen
- C. A linked list with circular data values
- D. A linked list that can only be traversed backwards

Answer: A

Q258. What is the time complexity of accessing the last element in a singly linked list?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: C

Q259. Which data structure is commonly used for function call management in programming languages?

- A. Queue
- B. Stack
- C. Linked list
- D. Hash table

Answer: B

Q260. What is a dynamic array?

- A. An array that stores only dynamic data types
- B. An array that automatically resizes when it runs out of capacity
- C. An array allocated at compile time
- D. An array that cannot change its values

Answer: B

Q261. How many edges does a tree with n nodes have?

- A. n
- B. $n + 1$
- C. $n - 1$
- D. $2n$

Answer: C

Q262. What is the difference between a directed and an undirected graph?

- A. Directed graphs have weighted edges
- B. In a directed graph, edges have a direction from one vertex to another
- C. Undirected graphs cannot have cycles
- D. Directed graphs always have fewer edges

Answer: B

Q263. What property does a min-heap maintain between parent and child nodes?

- A. Each parent is greater than its children
- B. Each parent is less than or equal to its children
- C. Each parent equals its children
- D. Children are sorted left to right

Answer: B

Q264. What defines a simple path in a graph?

- A. A path that visits every vertex
- B. A path where no vertex is repeated
- C. A path with exactly one edge
- D. A path that forms a cycle

Answer: B

Q265. What is the in-order traversal order for a binary tree?

- A. Root, Left, Right
- B. Left, Root, Right
- C. Left, Right, Root
- D. Right, Root, Left

Answer: B

Q266. What is an adjacency matrix?

- A. A list of all vertices in a graph
- B. A 2D matrix where entry (i, j) indicates if there is an edge between vertex i and vertex j
- C. A matrix storing the shortest paths
- D. A matrix of node values in a tree

Answer: B

Q267. What is the maximum number of children a node in a binary tree can have?

- A. 1
- B. 2
- C. 3
- D. Unlimited

Answer: B

Q268. What condition must an undirected graph satisfy to be considered connected?

- A. Every vertex must have the same degree
- B. There must be a path between every pair of vertices
- C. It must have no edges
- D. Every vertex must connect to every other vertex directly

Answer: B

Q269. Where is the maximum element located in a max-heap?

- A. At any leaf node
- B. At the last position in the array
- C. At the root
- D. At the middle of the array

Answer: C

Q270. Can a simple graph contain self-loops?

- A. Yes, simple graphs allow self-loops
- B. No, simple graphs do not allow self-loops or multiple edges between the same pair of vertices
- C. Only directed simple graphs allow self-loops
- D. Only weighted simple graphs allow self-loops

Answer: B

Q271. In linear search, where does the search begin?

- A. At the middle of the array
- B. At the end of the array
- C. At the first element of the array
- D. At a random position

Answer: C

Q272. What is the best-case time complexity of binary search?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q273. Can binary search be applied to a linked list?

- A. Yes, and it runs in $O(\log n)$
- B. No, because linked lists do not support efficient random access
- C. Yes, but only on doubly linked lists
- D. Yes, if the list is circular

Answer: B

Q274. What does binary search do at each step?

- A. Checks every element one by one
- B. Divides the search space in half by comparing with the middle element
- C. Swaps elements to sort the array
- D. Hashes the target value

Answer: B

Q275. What is the worst-case number of comparisons for linear search on an array of 100 elements?

- A. 50
- B. 10
- C. 100
- D. 7

Answer: C

Q276. Does linear search require the array to be sorted?

- A. Yes, it always requires sorting
- B. No, linear search works on both sorted and unsorted arrays
- C. Only for integer arrays
- D. Only when searching for the maximum element

Answer: B

Q277. In binary search on a sorted array, if the target equals the middle element, what happens?

- A. The search continues in the left half
- B. The search continues in the right half
- C. The search returns the index of the middle element
- D. The search restarts from the beginning

Answer: C

Q278. How many comparisons does binary search need at most for an array of 16 elements?

- A. 16
- B. 8
- C. 4
- D. 5

Answer: D

Q279. What is the average-case time complexity of linear search?

- A. $O(1)$
- B. $O(n/2)$, which simplifies to $O(n)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: B

Q280. Which searching algorithm is most suitable when the dataset is very small?

- A. Binary search
- B. Interpolation search
- C. Linear search
- D. Exponential search

Answer: C

Q281. What is the best-case time complexity of bubble sort?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(1)$

Answer: C

Q282. How does selection sort work?

- A. It inserts each element into its correct position
- B. It repeatedly finds the minimum element and places it at the beginning of the unsorted portion
- C. It divides the array and merges sorted halves
- D. It swaps adjacent elements

Answer: B

Q283. What is the space complexity of bubble sort?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(1)$

Answer: D

Q284. How does insertion sort process elements?

- A. It picks elements randomly and places them in sorted order
- B. It takes each element and inserts it into its correct position in the already sorted portion
- C. It divides the array into halves recursively
- D. It uses a hash function to determine positions

Answer: B

Q285. Which sorting algorithm is similar to how people typically sort playing cards in their hand?

- A. Bubble sort
- B. Selection sort
- C. Insertion sort
- D. Merge sort

Answer: C

Q286. What is the worst-case time complexity of insertion sort?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: C

Q287. Is bubble sort an in-place sorting algorithm?

- A. No, it requires $O(n)$ extra space
- B. Yes, it sorts the elements within the original array
- C. No, it creates a copy of the array
- D. It depends on the implementation

Answer: B

Q288. What does the term 'comparison-based sorting' mean?

- A. Sorting that only works on numbers
- B. Sorting that determines order only by comparing pairs of elements
- C. Sorting that compares the array with a sorted version
- D. Sorting that uses bit manipulation

Answer: B

Q289. How many swaps does selection sort perform in the worst case for n elements?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(1)$

Answer: C

Q290. After the first complete pass of bubble sort on [5, 3, 8, 1, 2], which element is guaranteed to be in its final position?

- A. 5
- B. 1
- C. 8
- D. 2

Answer: C

Q291. What is the primary purpose of a hash function?

- A. To sort data
- B. To map data of arbitrary size to fixed-size values
- C. To encrypt data
- D. To compress data

Answer: B

Q292. What is chaining in the context of hash table collision resolution?

- A. Linking hash tables together
- B. Storing all elements that hash to the same index in a linked list at that index
- C. Creating a chain of hash functions
- D. Connecting the first and last elements of the hash table

Answer: B

Q293. If a hash table has 10 slots and the hash function is $h(k) = k \bmod 10$, where does the key 27 go?

- A. Slot 2
- B. Slot 7
- C. Slot 3
- D. Slot 27

Answer: B

Q294. What is the time complexity of inserting an element into a hash table in the average case?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q295. What is a hash collision?

- A. When the hash table runs out of memory
- B. When two different keys produce the same hash value
- C. When a hash function produces a negative value
- D. When the hash table is empty

Answer: B

Q296. What is the load factor of a hash table with 15 elements and 20 slots?

- A. 0.25
- B. 0.75
- C. 1.33
- D. 15

Answer: B

Q297. What property should a good hash function have?

- A. It should always return the same value
- B. It should distribute keys uniformly across the hash table
- C. It should sort the keys
- D. It should only work with string keys

Answer: B

Q298. Can two different keys have the same hash value?

- A. No, hash functions always produce unique values
- B. Yes, this is called a collision
- C. Only if the keys are equal
- D. Only in broken hash functions

Answer: B

Q299. What is the worst-case time complexity of searching in a hash table?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: C

Q300. What is the difference between a hash map and a hash table?

- A. Hash maps are always faster
- B. A hash map stores key-value pairs while a hash set stores only keys; both use hashing internally
- C. Hash tables cannot handle collisions
- D. There is no difference at all

Answer: B

Q301. What is the time complexity of finding the height of a binary tree?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: C

Q302. Where is the in-order successor located if a BST node has a right subtree?

- A. It is the parent of the node
- B. It is the leftmost node in the right subtree
- C. It is the root of the tree
- D. It is the rightmost node in the left subtree

Answer: B

Q303. What is the result of an in-order traversal of a BST?

- A. Elements in reverse order
- B. Elements in random order
- C. Elements in sorted (ascending) order
- D. Elements level by level

Answer: C

Q304. What data structure is used to implement level-order traversal of a tree?

- A. Stack
- B. Queue
- C. Hash table
- D. Priority queue

Answer: B

Q305. How do you count the total number of nodes in a binary tree?

- A. Count only the leaf nodes
- B. Recursively count nodes in left subtree, right subtree, and add 1 for the root
- C. Count only the internal nodes
- D. Use binary search

Answer: B

Q306. What is the time complexity of inserting a new element into a BST?

- A. $O(1)$
- B. $O(n)$ in the worst case
- C. $O(n^2)$
- D. $O(\log n)$ always

Answer: B

Q307. In which traversal order is the root node visited before its subtrees?

- A. Post-order
- B. In-order
- C. Pre-order
- D. Level-order only

Answer: C

Q308. Which direction do you traverse in a BST to find the maximum element?

- A. Always go left until a leaf is reached
- B. Alternate between left and right
- C. Always go right until a node with no right child is reached
- D. Go to the root and stop

Answer: C

Q309. Which tree traversal is commonly used to delete a binary tree safely (deleting children before the parent)?

- A. Pre-order traversal
- B. In-order traversal
- C. Post-order traversal
- D. Level-order traversal

Answer: C

Q310. How many leaf nodes does a full binary tree with n internal nodes have?

- A. n
- B. $n + 1$
- C. $n - 1$
- D. $2n$

Answer: B

Q311. What is the difference between BFS and DFS?

- A. BFS uses a stack and DFS uses a queue
- B. BFS explores neighbors level by level using a queue, while DFS goes deep using a stack
- C. BFS is faster than DFS
- D. DFS finds shortest paths but BFS does not

Answer: B

Q312. What does DFS stand for?

- A. Direct First Search
- B. Depth First Search
- C. Double Find Search
- D. Data Flow System

Answer: B

Q313. How many edges does a spanning tree of a connected graph with V vertices contain?

- A. V
- B. $V - 1$
- C. $V + 1$
- D. $2V$

Answer: B

Q314. Can BFS be used to find the shortest path in an unweighted graph?

- A. No, only Dijkstra's algorithm can find shortest paths
- B. Yes, BFS finds the shortest path in terms of number of edges in an unweighted graph
- C. Only if the graph is a tree
- D. Only if the graph has no cycles

Answer: B

Q315. What is the space complexity of BFS on a graph with V vertices?

- A. $O(1)$
- B. $O(V)$
- C. $O(V^2)$
- D. $O(E)$

Answer: B

Q316. What is an acyclic graph?

- A. A graph with exactly one cycle
- B. A graph that contains no cycles
- C. A graph with all vertices connected
- D. A graph with no edges

Answer: B

Q317. In a weighted graph, what do the edge weights typically represent?

- A. The number of vertices
- B. Costs, distances, or capacities associated with traveling along that edge
- C. The color of the edge
- D. The degree of adjacent vertices

Answer: B

Q318. How is a graph typically represented in code using an adjacency list?

- A. As a 2D array of size $V \times V$
- B. As an array of linked lists (or arrays), where each vertex has a list of its neighbors
- C. As a single sorted array
- D. As a hash table mapping edges to vertices

Answer: B

Q319. What happens if DFS visits a vertex that has already been visited in a directed graph?

- A. It always means a cycle exists
- B. It depends on whether the previously visited vertex is still on the current DFS path
- C. DFS stops immediately
- D. The graph is invalid

Answer: B

Q320. What is the minimum number of edges in a connected undirected graph with V vertices?

- A. V
- B. $V - 1$
- C. $V + 1$
- D. $V / 2$

Answer: B

Q321. What is the divide and conquer approach?

- A. Solving a problem by trying all possible solutions
- B. Breaking a problem into smaller subproblems, solving them, and combining the solutions
- C. Using a greedy choice at each step
- D. Storing solutions to avoid recomputation

Answer: B

Q322. What are the two key properties required for a dynamic programming solution?

- A. Greedy choice and local optima
- B. Optimal substructure and overlapping subproblems
- C. Random choices and large inputs
- D. Divide and conquer and backtracking

Answer: B

Q323. What is an example of a problem solved by the greedy approach?

- A. 0/1 Knapsack problem
- B. Making change with the fewest coins (when denominations are canonical)
- C. Traveling Salesman Problem
- D. Matrix chain multiplication

Answer: B

Q324. What is the key difference between greedy algorithms and dynamic programming?

- A. Greedy algorithms are always slower
- B. Greedy algorithms make locally optimal choices without reconsidering, while DP considers all subproblem solutions
- C. Dynamic programming never gives optimal solutions
- D. They are the same approach

Answer: B

Q325. What is the bottom-up approach in dynamic programming?

- A. Solving the problem using recursion from the top
- B. Solving smaller subproblems first and building up to the original problem using a table
- C. Randomly solving subproblems
- D. Starting from the solution and working backwards

Answer: B

Q326. How does backtracking reduce the search space compared to brute force?

- A. It sorts the candidates first
- B. It abandons partial solutions as soon as they are determined to be invalid, avoiding exploration of dead-end branches
- C. It uses hashing to skip solutions
- D. It randomly selects solutions to test

Answer: B

Q327. What is the time complexity of computing Fibonacci numbers using memoization?

- A. $O(2^n)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(\log n)$

Answer: C

Q328. Which algorithm design paradigm does merge sort belong to?

- A. Greedy
- B. Dynamic programming
- C. Divide and conquer
- D. Backtracking

Answer: C

Q329. What is the purpose of the top-down approach in dynamic programming?

- A. To sort elements from top to bottom
- B. To solve the original problem recursively and cache results to avoid redundant computation
- C. To iterate through the array from beginning to end
- D. To find the maximum element first

Answer: B

Q330. What is a brute force approach to problem solving?

- A. An optimized algorithm
- B. An approach that tries every possible solution and checks which one is correct
- C. An approach that uses heuristics
- D. An approach based on random sampling

Answer: B

Q331. What is the time complexity of inserting a word of length L into a trie?

- A. $O(1)$
- B. $O(L)$
- C. $O(n)$
- D. $O(L * n)$

Answer: B

Q332. What is the advantage of a priority queue over a sorted array for maintaining a dynamic set?

- A. Priority queues use less memory
- B. Priority queues support $O(\log n)$ insertion while sorted arrays require $O(n)$ for insertion
- C. Priority queues allow $O(1)$ random access
- D. Sorted arrays cannot store integers

Answer: B

Q333. What does the find operation do in a Union-Find data structure?

- A. Finds the minimum element in a set
- B. Returns the representative (root) of the set containing a given element
- C. Finds the union of two sets
- D. Searches for an element in a sorted array

Answer: B

Q334. What is a min-heap's property regarding the root element?

- A. The root is the largest element
- B. The root is the median element
- C. The root is the smallest element
- D. The root has no special property

Answer: C

Q335. What is the time complexity of the extract-min operation in a binary min-heap?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: B

Q336. What is a trie primarily used for?

- A. Sorting numbers
- B. Efficient storage and retrieval of strings, supporting prefix-based operations
- C. Graph traversal
- D. Matrix operations

Answer: B

Q337. What is the union operation in Union-Find?

- A. Finding all elements in a set
- B. Merging two disjoint sets into one
- C. Splitting a set into two parts
- D. Sorting elements within a set

Answer: B

Q338. For a node at index i in a binary heap stored in an array (0-indexed), what is the index of its left child?

- A. $i + 1$
- B. $2i$
- C. $2i + 1$
- D. $i / 2$

Answer: C

Q339. What is a multimap data structure?

- A. A map that can store multiple values for the same key
- B. A map that uses multiple hash functions
- C. A map with multiple levels
- D. A map that can only store maps

Answer: A

Q340. What is the delete operation in a binary heap called?

- A. Remove
- B. Extract
- C. Pop
- D. Decrease-key followed by extract-min

Answer: D

Q341. What is the time complexity of comparing two strings of length n for equality?

- A. $O(1)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: B

Q342. Is 'ace' a valid subsequence of 'abcde'?

- A. No, because the characters are not contiguous
- B. Yes, because the characters appear in the same relative order in the original string
- C. Only if we rearrange the original string
- D. No, because 'ace' is not a word

Answer: B

Q343. How many total substrings does a string of length n have (including the empty string)?

- A. n
- B. n^2
- C. $n(n+1)/2 + 1$
- D. 2^n

Answer: C

Q344. In lexicographic order, which string comes first: 'apple' or 'application'?

- A. 'application' because it is longer
- B. 'apple' because at the first differing position, 'e' < 'i'
- C. They are considered equal
- D. 'apple' because shorter strings always come first

Answer: B

Q345. What is the time complexity of reversing a string of length n?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: C

Q346. What is the time complexity of the naive (brute force) pattern matching algorithm?

- A. $O(n + m)$
- B. $O(n * m)$ in the worst case
- C. $O(n)$
- D. $O(m)$

Answer: B

Q347. How can you check if a string is a palindrome?

- A. Sort the string and check if it's the same
- B. Compare the string with its reverse
- C. Check if all characters are the same
- D. Count the number of vowels

Answer: B

Q348. What is the difference between a substring and a subsequence?

- A. They are the same thing
- B. A substring is contiguous characters; a subsequence can skip characters but maintains order
- C. A subsequence is always longer
- D. A substring can skip characters

Answer: B

Q349. What does the term 'pattern matching' mean in the context of strings?

- A. Creating patterns from strings
- B. Finding occurrences of a pattern string within a text string
- C. Matching two strings for equality
- D. Sorting strings by pattern

Answer: B

Q350. What is string immutability?

- A. Strings that can be modified in place
- B. Strings that cannot be changed after creation; any modification creates a new string
- C. Strings stored in read-only memory
- D. Strings with fixed length

Answer: B

Q351. What is the Big-O complexity of an algorithm with running time $3n + 5$?

- A. $O(5)$
- B. $O(3n)$
- C. $O(n)$
- D. $O(n + 5)$

Answer: C

Q352. Which grows faster: $O(n^2)$ or $O(2^n)$?

- A. $O(n^2)$ grows faster
- B. They grow at the same rate
- C. $O(2^n)$ grows faster
- D. It depends on n

Answer: C

Q353. What is the time complexity of a loop that runs from 1 to n and increments by 2 each time?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(n/2)$, which is $O(n)$
- D. $O(\log n)$

Answer: C

Q354. What does it mean to optimize an algorithm?

- A. To make the code longer
- B. To improve the algorithm's time or space efficiency
- C. To add more features
- D. To translate it to a faster programming language

Answer: B

Q355. What is the time complexity of checking if a number n is even or odd?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q356. Why is $O(1)$ the most efficient time complexity?

- A. Because it means the algorithm does nothing
- B. Because the execution time does not increase with input size
- C. Because it uses no memory
- D. Because it always runs in exactly 1 millisecond

Answer: B

Q357. What is the space complexity of an algorithm that uses only a fixed number of variables?

- A. $O(n)$
- B. $O(1)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: B

Q358. What does it mean when we say an algorithm runs in 'polynomial time'?

- A. It always finishes in under a second
- B. Its running time is bounded by n^k for some constant k
- C. It uses polynomial equations
- D. It can only process polynomials

Answer: B

Q359. If an algorithm has two independent steps with complexities $O(n)$ and $O(m)$, what is the overall complexity?

- A. $O(n * m)$
- B. $O(n + m)$
- C. $O(\max(n, m))$
- D. $O(n^2)$

Answer: B

Q360. Why do we use Big-O notation instead of measuring exact execution time?

- A. Because exact time is always the same
- B. Because Big-O describes how the algorithm scales with input size, independent of hardware and implementation
- C. Because Big-O is more precise
- D. Because exact time cannot be measured

Answer: B

Data Structures & Algorithms — Medium

360 questions

Q361. What is the time complexity of the recurrence $T(n) = 2T(n/2) + n$?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: D

Q362. Which case of the Master Theorem applies when $f(n) = 9, \log n$?

- A. Case 3 applies
- B. No case applies
- C. Case 2 applies
- D. Case 1 applies

Answer: C

Q363. What does Omega (Ω) represent?

- A. Exact tight bound complexity
- B. Worst-case upper bound complexity
- C. Best-case or lower bound complexity
- D. Average-case expected complexity

Answer: C

Q364. If an algorithm has complexities $O(n^2)$ in the worst case and $\Omega(n)$ in the best case, which is true?

- A. The algorithm always runs in $O(n)$ time
- B. The algorithm always runs in $O(n^2)$ time
- C. The algorithm runs in $O(n \log n)$ always
- D. Performance varies between $\Omega(n)$ and $O(n^2)$

Answer: D

Q365. What is amortized analysis?

- A. Analyzing the worst case of each operation individually
- B. Averaging the cost of operations over a sequence
- C. Analyzing only the best case of each operation
- D. Computing the cost using a sorting-based analysis

Answer: B

Q366. Which growth rate is faster: $O(2^n)$ or $O(n^3)$?

- A. They are the same
- B. $O(n^3)$ is faster
- C. $O(2^n)$ is faster
- D. Depends on input size

Answer: C

Q367. What is the time complexity of a nested loop where both loops run n times?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(2n)$
- D. $O(n)$

Answer: B

Q368. In asymptotic analysis, which of these is the correct ordering from slowest to fastest growth?

- A. $O(1) < O(\log n) < O(n) < O(n^2)$
- B. $O(1) < O(n) < O(\log n) < O(n^2)$
- C. $O(n) < O(\log n) < O(1) < O(n^2)$
- D. $O(\log n) < O(1) < O(n) < O(n^2)$

Answer: A

Q369. What is the recurrence relation for binary search?

- A. $T(n) = 2T(n/2) + 1$
- B. $T(n) = T(n-1) + 1$
- C. $T(n) = T(n/2) + n$
- D. $T(n) = T(n/2) + 1$

Answer: D

Q370. What does Theta (Θ) represent?

- A. Only upper bound estimate
- B. Tight bound (both upper and lower)
- C. Only lower bound estimate
- D. Average case analysis only

Answer: B

Q371. What is a circular queue?

- A. A queue implemented using a linked list
- B. A queue where the rear connects back to front
- C. A double-ended queue with two pointers
- D. A queue that automatically sorts elements

Answer: B

Q372. What is a doubly linked list?

- A. A list with pointers to both next and previous
- B. A list that stores two data values per node
- C. A list structure with two separate heads
- D. A circular list with bidirectional traversal

Answer: A

Q373. What is a deque (double-ended queue)?

- A. A stack implemented as a queue structure
- B. A priority queue with weighted elements
- C. A queue allowing deletion from both ends only
- D. A structure allowing insert and delete at both ends

Answer: D

Q374. What is the time complexity of deleting a node from the middle of a singly linked list (given a pointer to the previous node)?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: A

Q375. How can you implement a queue using two stacks?

- A. It is not possible to implement using stacks
- B. Use both stacks for enqueue operations only
- C. Use one stack for enqueue and another for dequeue
- D. Merge both stacks into a single combined structure

Answer: C

Q376. What is the advantage of a linked list over an array?

- A. Better CPU cache performance overall
- B. Faster random access by index
- C. Dynamic size and efficient insertion
- D. Less memory usage per element

Answer: C

Q377. What is a sentinel node in a linked list?

- A. A dummy node to simplify boundary conditions
- B. The node containing the maximum data value
- C. A node that stores the total list size
- D. The last node in the list structure

Answer: A

Q378. What is the condition for a circular queue being full (array implementation with size N)?

- A. $\text{front} == 0 \ \&\& \ \text{rear} == N - 1$
- B. $(\text{rear} + 1) \% N == \text{front}$
- C. $\text{rear} == N - 1$
- D. $\text{front} == \text{rear}$

Answer: B

Q379. What is the time complexity of searching for an element in an unsorted linked list?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n)$

Answer: D

Q380. Which application commonly uses a stack?

- A. Breadth-first graph search traversal
- B. Level-order tree traversal processing
- C. Function call management (call stack)
- D. Round-robin job scheduling system

Answer: C

Q381. What is the time complexity of searching in a balanced BST?

- A. $O(\log n)$
- B. $O(n \log n)$
- C. $O(1)$
- D. $O(n)$

Answer: A

Q382. What is the worst-case time complexity of search in an unbalanced BST?

- A. $O(\log n)$
- B. $O(n^2)$
- C. $O(1)$
- D. $O(n)$

Answer: D

Q383. What is the space complexity of an adjacency matrix for a graph with V vertices?

- A. $O(V)$
- B. $O(V + E)$
- C. $O(E)$
- D. $O(V^2)$

Answer: D

Q384. What is a complete binary tree?

- A. A tree where every node has exactly 2 children always
- B. A tree where all leaf nodes are at the same level
- C. A tree with the maximum possible depth for its nodes
- D. A tree with all levels full except possibly the last level

Answer: D

Q385. In a max-heap, where is the maximum element?

- A. At the root
- B. At the last level
- C. At a leaf node
- D. It could be anywhere

Answer: A

Q386. What is the space complexity of an adjacency list for a graph with V vertices and E edges?

- A. $O(E)$
- B. $O(V^2)$
- C. $O(V + E)$
- D. $O(V)$

Answer: C

Q387. What is the in-order traversal of a BST with values 4, 2, 6, 1, 3, 5, 7 (root=4)?

- A. 1, 2, 3, 4, 5, 6, 7
- B. 4, 2, 1, 3, 6, 5, 7
- C. 4, 2, 6, 1, 3, 5, 7
- D. 1, 3, 2, 5, 7, 6, 4

Answer: A

Q388. What type of graph has edges with associated weights?

- A. Weighted graph
- B. Directed graph
- C. Bipartite graph
- D. Complete graph

Answer: A

Q389. What is a full binary tree?

- A. A tree with the maximum number of nodes
- B. A tree where every level is completely filled
- C. A tree where every node has 0 or 2 children
- D. A tree where all leaves are at same depth

Answer: C

Q390. What is the time complexity of inserting an element into a max-heap?

- A. $O(n)$
- B. $O(1)$
- C. $O(\log n)$
- D. $O(n \log n)$

Answer: C

Q391. What is interpolation search?

- A. A recursive linear search with memoization cache
- B. A search that always checks the middle element
- C. A search that uses a hash table for fast lookups
- D. A search that estimates position based on value distribution

Answer: D

Q392. What is the average time complexity of interpolation search on uniformly distributed data?

- A. $O(\log n)$
- B. $O(1)$
- C. $O(n)$
- D. $O(\log \log n)$

Answer: D

Q393. What is jump search?

- A. A search that uses recursion to jump elements
- B. A search that jumps by blocks then does linear scan
- C. A search that jumps to random positions in array
- D. A search that skips every other element each pass

Answer: B

Q394. What is the optimal block size for jump search on an array of n elements?

- A. $\log n$
- B. $\sqrt{n}$
- C. n
- D. $n/2$

Answer: B

Q395. What is exponential search?

- A. A search with exponential time complexity overall
- B. A search designed for exponentially growing datasets
- C. A search that doubles the index then uses binary search
- D. A search that uses exponential mathematical functions

Answer: C

Q396. What is the time complexity of exponential search?

- A. $O(n)$
- B. $O(\sqrt{n})$
- C. $O(n \log n)$
- D. $O(\log n)$

Answer: D

Q397. What is ternary search?

- A. A three-pass sequential linear search method
- B. A search specifically for the third element only
- C. A search dividing array into three parts each step
- D. A search that checks three elements at a time

Answer: C

Q398. Why is binary search preferred over ternary search in practice?

- A. Binary search uses less memory per recursive call
- B. Binary search is always faster in every case
- C. Ternary search does not work on sorted arrays at all
- D. Ternary search makes more comparisons per step overall

Answer: D

Q399. What is the space complexity of recursive binary search?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(1)$

Answer: C

Q400. In which scenario is linear search more efficient than binary search?

- A. When the array has millions of elements
- B. Linear search is never more efficient
- C. Large sorted arrays with many elements
- D. When the array is unsorted and small

Answer: D

Q401. What is the time complexity of merge sort?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: C

Q402. What is the space complexity of merge sort?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(1)$
- D. $O(\log n)$

Answer: A

Q403. What is the average-case time complexity of quick sort?

- A. $O(\log n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n)$

Answer: B

Q404. What is the worst-case time complexity of quick sort?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(n \log n)$

Answer: C

Q405. What is heap sort's time complexity?

- A. $O(\log n)$
- B. $O(n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: C

Q406. Is merge sort a stable sorting algorithm?

- A. Only for linked lists
- B. Yes, it is stable
- C. Only for array inputs
- D. No, it is unstable

Answer: B

Q407. What is the divide-and-conquer strategy in merge sort?

- A. Divide the array into three equal parts
- B. Divide in half, sort each half, then merge
- C. Divide by selecting a random pivot element
- D. Divide into sorted and unsorted portions

Answer: B

Q408. What is the role of the pivot in quick sort?

- A. It is always the first element chosen
- B. It is always the exact median value
- C. It partitions into smaller and larger groups
- D. It merges two sorted subarrays together

Answer: C

Q409. What is counting sort?

- A. A comparison-based sorting method
- B. A non-comparison sort counting occurrences
- C. A sort that uses a heap structure
- D. A divide-and-conquer sorting approach

Answer: B

Q410. What is the space complexity of heap sort?

- A. $O(n \log n)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: D

Q411. What is open addressing in hash tables?

- A. Using multiple hash tables for distribution
- B. Finding another open slot when collision occurs
- C. Doubling the table size on every collision
- D. Using linked lists for collision resolution

Answer: B

Q412. What is linear probing?

- A. Using a linear hash function for keys
- B. Checking next consecutive slots on collision
- C. Using a linked list for collision handling
- D. Probing with a linear mathematical equation

Answer: B

Q413. What is the primary clustering problem in linear probing?

- A. Keys are stored in sorted order clusters
- B. Consecutive occupied slots form long clusters
- C. Hash values clustering near zero index
- D. Multiple hash functions produce same values

Answer: B

Q414. What is quadratic probing?

- A. Using four different hash functions total
- B. Squaring the hash value before modding
- C. Using a quadratic hash function for keys
- D. Probing at positions $h+1^2$, $h+2^2$, $h+3^2$, etc.

Answer: D

Q415. What is double hashing?

- A. Using two hash functions for probe step size
- B. Hashing the hash value itself recursively
- C. Hashing a value twice in succession
- D. Using two separate hash tables for storage

Answer: A

Q416. Why should the hash table size be a prime number?

- A. It is required by all hash functions
- B. It distributes hash values more uniformly
- C. It speeds up the hash value computation
- D. It makes the table smaller in memory

Answer: B

Q417. What is rehashing?

- A. Hashing the same key multiple times in a row
- B. Removing all elements and starting fresh over
- C. Changing the hash function to a new one
- D. Creating a larger table and reinserting all elements

Answer: D

Q418. What is the multiplication method for hashing?

- A. $h(k) = k \bmod (m \times 2)$
- B. $h(k) = k^2 \bmod m$
- C. $h(k) = \text{floor}(m \times (k \times A \bmod 1))$ where $0 < A < 1$
- D. $h(k) = k \times m$

Answer: C

Q419. What is the advantage of chaining over open addressing?

- A. Chaining is always faster for all operations
- B. Chaining uses less memory per element overall
- C. Chaining handles high load factors and deletion better
- D. Chaining has better CPU cache performance overall

Answer: C

Q420. What is a hash set?

- A. A multiset allowing duplicate elements
- B. A set using hashing for fast unique lookups
- C. A sorted set with ordered elements
- D. A set implemented using sorted arrays

Answer: B

Q421. What is an AVL tree?

- A. A tree with at most 3 children per node always
- B. A self-balancing BST with height difference at most 1
- C. A tree data structure used only for searching
- D. A binary tree with no balancing guarantees

Answer: B

Q422. What are the rotation operations in an AVL tree?

- A. Merge and split operations on subtrees
- B. Insert and delete operations on tree nodes
- C. Push and pop operations on internal nodes
- D. Left, right, left-right, and right-left rotations

Answer: D

Q423. When is a left rotation performed in an AVL tree?

- A. When the tree is already perfectly balanced
- B. When the right subtree is too heavy (RR case)
- C. When the left subtree is too heavy overall
- D. After every single insertion operation occurs

Answer: B

Q424. How do you delete a node with two children in a BST?

- A. Simply remove the node directly from tree
- B. Swap with the root node then remove it
- C. Replace with in-order successor then delete it
- D. Set the node value to null and leave it

Answer: C

Q425. What is the time complexity of insertion in a Red-Black tree?

- A. $O(1)$
- B. $O(n)$
- C. $O(n \log n)$
- D. $O(\log n)$

Answer: D

Q426. What properties must a Red-Black tree satisfy?

- A. All internal and external nodes must always be colored red only
- B. Root is black, red nodes have black children, equal black-height on all paths
- C. Height is always kept at exactly $\log n$ for any n total nodes
- D. All leaf nodes are always colored red throughout the entire tree

Answer: B

Q427. What is the Lowest Common Ancestor (LCA) of two nodes in a tree?

- A. The deepest node that is ancestor of both
- B. The node with the smallest key value
- C. The root node of the entire tree
- D. The immediate parent of both given nodes

Answer: A

Q428. What is Morris traversal?

- A. A traversal technique for graphs only
- B. An in-order traversal using $O(1)$ extra space
- C. A traversal using an explicit stack structure
- D. A breadth-first traversal using a queue

Answer: B

Q429. How can you check if a binary tree is a valid BST?

- A. Check if each node has at most 2 children
- B. Count the number of nodes in the tree
- C. Verify in-order traversal is strictly increasing
- D. Check if the root is the minimum value node

Answer: C

Q430. What is a segment tree used for?

- A. Storing sorted segments of linked lists
- B. Efficient range queries and point updates on arrays
- C. Segmenting a network into subnetworks
- D. Storing geometric line segments only

Answer: B

Q431. What is Dijkstra's algorithm used for?

- A. Finding all cycles in a given graph
- B. Finding shortest paths with non-negative weights
- C. Sorting all vertices by their degree
- D. Finding connected components in a graph

Answer: B

Q432. What is the time complexity of Dijkstra's algorithm using a binary heap?

- A. $O(V \times E)$
- B. $O(V + E)$
- C. $O((V + E) \log V)$
- D. $O(V^2)$

Answer: C

Q433. What is Kruskal's algorithm used for?

- A. Shortest path computation
- B. Topological sorting of vertices
- C. Cycle detection in graphs
- D. Finding Minimum Spanning Tree

Answer: D

Q434. What is Prim's algorithm used for?

- A. Shortest path computation
- B. Finding Minimum Spanning Tree
- C. Graph coloring assignment
- D. Topological sort ordering

Answer: B

Q435. What is topological sorting?

- A. Linear ordering of DAG vertices respecting edge directions
- B. Sorting edges by their assigned weight values
- C. Sorting all vertices by their numeric label values
- D. Sorting all vertices by their in-degree values

Answer: A

Q436. What type of graph is required for topological sorting?

- A. An undirected graph type
- B. A complete graph type
- C. A weighted graph type
- D. Directed Acyclic Graph (DAG)

Answer: D

Q437. What is the Bellman-Ford algorithm used for?

- A. Finding connected components in undirected graphs
- B. Finding the Minimum Spanning Tree of a graph
- C. Finding shortest paths even with negative weights
- D. Topological sorting of directed acyclic graphs

Answer: C

Q438. What is the time complexity of the Bellman-Ford algorithm?

- A. $O(V \times E)$
- B. $O(V + E)$
- C. $O(V^2)$
- D. $O(E \log V)$

Answer: A

Q439. How can you detect a cycle in a directed graph?

- A. By counting edges in the graph
- B. Using DFS and checking for back edges
- C. Using BFS traversal only
- D. By finding the shortest path first

Answer: B

Q440. What is the Union-Find (Disjoint Set Union) data structure used for?

- A. Finding shortest paths between graph vertices
- B. Storing key-value pairs with fast lookup
- C. Tracking set membership and merging sets efficiently
- D. Sorting elements into ordered groups

Answer: C

Q441. What is the time complexity of the dynamic programming solution for the 0/1 knapsack problem with n items and capacity W ?

- A. $O(n \log n)$
- B. $O(2^n)$
- C. $O(n \times W)$
- D. $O(n)$

Answer: C

Q442. What is the Longest Common Subsequence (LCS) problem?

- A. Finding the longest subsequence present in both sequences
- B. Finding the longest increasing subsequence in an array
- C. Finding the longest common substring between two strings
- D. Finding the longest common prefix of two strings

Answer: A

Q443. What is the greedy choice property?

- A. Always choosing the most expensive option first
- B. A locally optimal choice leads to global optimum
- C. A property that all algorithms must have
- D. A property unique to dynamic programming only

Answer: B

Q444. What is the coin change problem (minimum coins)?

- A. Finding minimum coins to make a target amount
- B. Sorting coins by their face value order
- C. Counting total coins in a collection
- D. Finding the maximum number of coins used

Answer: A

Q445. What is the time complexity of the recursive Fibonacci without memoization?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(2^n)$

Answer: D

Q446. How does memoization improve the Fibonacci computation?

- A. It reduces time from $O(2^n)$ to $O(n)$ by caching
- B. It makes the computation run in $O(\log n)$ time
- C. It does not improve it at all
- D. It makes the computation run in $O(1)$ time

Answer: A

Q447. What is the N-Queens problem?

- A. A graph traversal problem with N vertices
- B. Sorting N queens by their rank and position
- C. Finding N queens in a given dataset collection
- D. Placing N queens so no two attack each other

Answer: D

Q448. What is the difference between top-down and bottom-up dynamic programming?

- A. Top-down is always faster in practice than the bottom-up approach overall
- B. Top-down uses recursion with memoization; bottom-up uses tabulation
- C. Bottom-up always uses significantly more memory than the top-down approach
- D. They are exactly the same fundamental approach overall

Answer: B

Q449. What is Huffman coding an example of?

- A. Greedy algorithm
- B. Backtracking
- C. Dynamic programming
- D. Divide and conquer

Answer: A

Q450. What is the Longest Increasing Subsequence (LIS) problem's time complexity with DP?

- A. $O(n)$
- B. $O(2^n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: D

Q451. What is path compression in Union-Find?

- A. Making every node in find path point to root
- B. Compressing the storage used by the structure
- C. Shortening paths between nodes in a graph
- D. Compressing the data stored in each node

Answer: A

Q452. What is union by rank in Union-Find?

- A. Attaching shorter tree under taller tree during union
- B. Sorting all elements by their assigned rank
- C. Ranking all elements before performing union
- D. Using ranked hash functions for set operations

Answer: A

Q453. What is the nearly constant amortized time complexity of Union-Find with path compression and union by rank?

- A. $O(1)$ constant time
- B. $O(\log \log n)$ iterated log
- C. $O(\log n)$ logarithmic
- D. $O(\alpha(n))$ inverse Ackermann

Answer: D

Q454. What is a Fibonacci heap?

- A. A heap with better amortized decrease-key and insert
- B. A Fibonacci sequence number generator structure
- C. A binary heap variant with extra child pointers
- D. A heap that stores Fibonacci numbers only

Answer: A

Q455. What is a suffix array?

- A. An array of string prefixes
- B. A compressed trie structure
- C. A sorted array of all string suffixes
- D. An array suffix pointer

Answer: C

Q456. What is a sparse table?

- A. A table with many empty cells throughout
- B. A compressed hash table for sparse data
- C. A sparse matrix representation structure
- D. A structure for $O(1)$ static range minimum queries

Answer: D

Q457. What is a k-d tree?

- A. A space-partitioning tree for k-dimensional data
- B. A tree with k children per node always
- C. A tree of exactly depth k levels
- D. A k-ary heap data structure

Answer: A

Q458. What is a circular buffer?

- A. A buffer shaped like a circle visually
- B. A buffer for circular linked list nodes
- C. A double-ended buffer with two pointers
- D. A fixed-size buffer that wraps around when full

Answer: D

Q459. What is an interval tree?

- A. A tree for querying overlapping intervals efficiently
- B. A tree storing time intervals as keys
- C. A segment tree with interval-based updates
- D. A tree with regular spacing between nodes

Answer: A

Q460. What is the time complexity of inserting into a trie for a word of length L?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(L)$
- D. $O(1)$

Answer: C

Q461. What is the KMP (Knuth-Morris-Pratt) algorithm?

- A. A string compression algorithm for reducing text size
- B. A hash-based search method for substring matching tasks
- C. A pattern matcher using failure function to skip redundancy
- D. A comparison-based sorting algorithm for string arrays

Answer: C

Q462. What is the time complexity of the KMP algorithm?

- A. $O(n + m)$
- B. $O(m \log n)$
- C. $O(n \times m)$
- D. $O(n^2)$

Answer: A

Q463. What is the Rabin-Karp algorithm?

- A. A divide and conquer string matching algorithm
- B. A string matching algorithm using rolling hashes
- C. A string sorting algorithm by character values
- D. A tree-based matching algorithm using tries

Answer: B

Q464. What is a rolling hash in Rabin-Karp?

- A. A hash that updates efficiently as the window slides
- B. A multi-level hash with cascading computation
- C. A hash that changes randomly each call
- D. A hash stored in a circular buffer structure

Answer: A

Q465. What is the longest palindromic substring problem?

- A. Finding the longest string in a collection
- B. Reversing a string to find palindromes
- C. Finding the longest contiguous palindrome substring
- D. Finding all palindromes in a given string

Answer: C

Q466. What is the time complexity of finding the longest palindromic substring using dynamic programming?

- A. $O(n^3)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(n \log n)$

Answer: C

Q467. What is string hashing used for?

- A. Efficiently comparing strings via hash values
- B. Encrypting strings for secure storage
- C. Compressing strings to save disk space
- D. Sorting strings into alphabetical order

Answer: A

Q468. What is the Boyer-Moore algorithm?

- A. A pattern matcher using bad character and good suffix rules
- B. A brute force matching algorithm for strings
- C. A string sorting algorithm by character frequency
- D. A compression algorithm for text data files

Answer: A

Q469. What is the Z-array of a string?

- A. An array where $Z[i]$ is longest prefix match starting at i
- B. The reverse of the original string as array
- C. An array of character frequencies for the string
- D. An array of zeros for initialization

Answer: A

Q470. How is the Z-algorithm used for pattern matching?

- A. By hashing the pattern and comparing values
- B. By using a suffix tree of the text string
- C. By sorting the text characters first
- D. By concatenating pattern and text then computing Z-array

Answer: D

Q471. What is an NP-complete problem?

- A. A problem that cannot be solved at all
- B. A problem with no known algorithm existing
- C. A problem in NP as hard as any NP problem
- D. A problem that runs in constant time always

Answer: C

Q472. What is an NP-hard problem?

- A. A problem with a known polynomial time solution
- B. A problem that is always in the class P
- C. A problem that is easy to solve efficiently
- D. A problem at least as hard as NP-complete problems

Answer: D

Q473. What is memoization's space-time tradeoff?

- A. It uses no extra space at all
- B. It uses extra space to avoid redundant computation
- C. It increases time to save storage space
- D. It reduces both space and time simultaneously

Answer: B

Q474. What is the relationship between P and NP?

- A. P and NP are completely disjoint sets
- B. $P = NP$ has been proven true conclusively
- C. $NP \neq P$ has been proven true conclusively
- D. $P \neq NP$, but whether $P = NP$ is open

Answer: D

Q475. What is a polynomial reduction?

- A. Reducing the degree of a polynomial expression
- B. Transforming one problem into another in polynomial time
- C. Reducing the time complexity of an algorithm
- D. Simplifying an algorithm's code implementation

Answer: B

Q476. What is tail recursion optimization?

- A. Adding a tail data structure to the recursion stack
- B. Removing all recursive calls from the entire program
- C. Making recursive call the last operation for iteration optimization
- D. Making the recursion run in reverse backward order

Answer: C

Q477. What is loop unrolling?

- A. Removing all loops from the source code base entirely
- B. Making loops run in the reverse backward execution order
- C. Executing multiple iterations per loop cycle to reduce overhead
- D. Converting all iterative loops to recursion-based calls

Answer: C

Q478. What is cache-friendly code?

- A. Code with no memory access at all
- B. Code that runs entirely in cache memory
- C. Code that uses caching library APIs
- D. Code that maximizes CPU cache hit rates

Answer: D

Q479. What is the difference between best case, worst case, and average case complexity?

- A. Best is minimum time, worst is maximum, average is expected
- B. Worst case is purely theoretical and never practical
- C. They are always the same value for any algorithm
- D. Best case only applies to small input sizes

Answer: A

Q480. Why is $O(n \log n)$ considered efficient for sorting?

- A. It works only for small input sizes efficiently
- B. It uses the least memory of all algorithms
- C. It matches the comparison-based sorting lower bound
- D. It is the fastest possible for all sorting

Answer: C

Q481. What is the time complexity of $T(n) = T(n-1) + n$?

- A. $O(n)$
- B. $O(2^n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: D

Q482. Which notation gives both upper and lower asymptotic bounds?

- A. Small-o notation
- B. Big-O notation
- C. Theta notation
- D. Omega notation

Answer: C

Q483. What is the space complexity of a recursive function with depth n ?

- A. $O(n)$ due to call stack frames
- B. $O(1)$ constant space always
- C. $O(n^2)$ due to nested recursion
- D. $O(\log n)$ due to stack halving

Answer: A

Q484. Which recurrence relation represents binary search?

- A. $T(n) = 2T(n/2) + n$
- B. $T(n) = 2T(n-1) + 1$
- C. $T(n) = T(n-1) + 1$
- D. $T(n) = T(n/2) + 1$

Answer: D

Q485. What is amortized analysis used for?

- A. Measuring best-case time for a single run
- B. Finding worst case of each single operation
- C. Calculating space used by a single function
- D. Computing the average cost over many operations

Answer: D

Q486. What is tail recursion?

- A. Recursion where the call is the last operation
- B. Recursion that uses an explicit stack structure
- C. Recursion with no defined base case at all
- D. Recursion with multiple simultaneous recursive calls

Answer: A

Q487. Which complexity is better for large inputs: $O(n \log n)$ or $O(n^2)$?

- A. $O(n^2)$ is always better for large inputs
- B. $O(n \log n)$ is better for large inputs
- C. Neither is better; they alternate in speed
- D. Both have identical growth for large inputs

Answer: B

Q488. What is the difference between an algorithm and a heuristic?

- A. Algorithms guarantee solutions; heuristics may not
- B. Algorithms use hardware; heuristics use software
- C. Heuristics guarantee correctness; algorithms do not
- D. Heuristics are faster; algorithms are always slower

Answer: A

Q489. What does the substitution method prove in recurrence solving?

- A. It proves by guessing and verifying via induction
- B. It proves by converting recurrence to iteration
- C. It proves by drawing a complete recursion tree
- D. It proves by applying the Master Theorem formula

Answer: A

Q490. What is the recurrence for merge sort?

- A. $T(n) = 2T(n/2) + n$
- B. $T(n) = T(n/2) + n$
- C. $T(n) = 2T(n-1) + 1$
- D. $T(n) = T(n-1) + n$

Answer: A

Q491. What is the advantage of a circular queue over a linear queue?

- A. It stores more elements in the same memory space
- B. It allows random access to any element directly
- C. It efficiently reuses vacated front space in array
- D. It automatically sorts elements during insertion

Answer: C

Q492. How does a doubly linked list differ from a singly linked list?

- A. Each node has pointers to both next and previous
- B. It stores two data fields in each single node
- C. It uses half the memory of a singly linked list
- D. It can only be traversed in the forward direction

Answer: A

Q493. What is the time complexity of searching in an unsorted linked list?

- A. $O(1)$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(n)$

Answer: D

Q494. What is a sentinel node in a linked list?

- A. A dummy node used to simplify boundary operations
- B. A node that stores the list's total length value
- C. A special node that stores metadata about types
- D. A node that points to the middle of the list

Answer: A

Q495. How is a stack implemented using two queues?

- A. Push to both queues; pop alternates between the two
- B. Push to Q2 always; pop alternates and merges both queues
- C. Push and pop both operate on Q1; Q2 stores overflow
- D. Push to Q1 always; for pop, move Q1 to Q2 and dequeue

Answer: D

Q496. What is the time complexity of inserting at a specific position in an array?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(1)$

Answer: A

Q497. What problem does a circular linked list solve?

- A. It automatically maintains elements in sorted order
- B. It reduces memory usage by half compared to singly
- C. It allows continuous traversal without null termination
- D. It enables $O(1)$ search for any element in list

Answer: C

Q498. Which data structure is best for implementing a browser's back button?

- A. Deque
- B. Array
- C. Stack
- D. Queue

Answer: C

Q499. What is the disadvantage of an array-based stack?

- A. It requires $O(n)$ time for every push operation
- B. It cannot store primitive data type values at all
- C. It has a fixed capacity that can cause overflow
- D. It does not support push and pop operations well

Answer: C

Q500. What is the amortized cost of appending to a dynamic array?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n)$

Answer: C

Q501. What is the maximum number of nodes in a binary tree of height h ?

- A. $2^{(h+1)} - 1$
- B. $h^2 + 1$
- C. 2^h
- D. $2h + 1$

Answer: A

Q502. What is the difference between adjacency list and adjacency matrix?

- A. Lists cannot represent weighted graphs but matrices can
- B. Lists use $O(V+E)$ space; matrices use $O(V^2)$ space
- C. Both always use exactly the same amount of space
- D. Lists use $O(V^2)$ space; matrices use $O(V+E)$ space

Answer: B

Q503. What is a binary search tree (BST) property?

- A. Nodes are arranged in ascending order left to right
- B. Left child is less; right child is greater than parent
- C. All nodes have exactly two children always
- D. Every level must be completely filled with nodes

Answer: B

Q504. What is a full binary tree?

- A. A tree where each node has exactly one child node
- B. A tree where all leaf nodes are at the same level
- C. A tree where every node has zero or two children
- D. A tree with the maximum possible number of nodes

Answer: C

Q505. How is a graph different from a tree?

- A. Trees have weighted edges; graphs have unweighted ones
- B. Graphs must be connected; trees can be disconnected
- C. Trees can have cycles; graphs cannot have any cycles
- D. Graphs can have cycles; trees are always acyclic

Answer: D

Q506. What is a self-loop in a graph?

- A. An edge shared between two separate graph components
- B. A path that returns to the starting vertex via others
- C. A cycle that passes through every vertex exactly once
- D. An edge that connects a vertex to itself directly

Answer: D

Q507. What is the space complexity of an adjacency matrix for V vertices?

- A. $O(V)$
- B. $O(V + E)$
- C. $O(E)$
- D. $O(V^2)$

Answer: D

Q508. What is a balanced binary tree?

- A. A tree where left and right subtree heights differ by at most one
- B. A tree where all nodes have exactly two children always
- C. A tree where all leaf nodes store the same data value
- D. A tree that contains equal number of left and right nodes

Answer: A

Q509. What is a directed acyclic graph (DAG)?

- A. An undirected graph with at least one cycle present
- B. A tree with multiple root nodes and directed edges
- C. A graph where all edges are bidirectional and acyclic
- D. A directed graph with no cycles between any vertices

Answer: D

Q510. What is the depth of a node in a tree?

- A. The maximum number of nodes at that particular level
- B. The total number of nodes in the entire tree structure
- C. The number of edges from the root to that specific node
- D. The number of children that the node currently has

Answer: C

Q511. How does interpolation search improve over binary search?

- A. It estimates position based on value distribution
- B. It uses extra memory to cache previous search results
- C. It works on unsorted arrays unlike binary search
- D. It always guarantees $O(1)$ time for any input data

Answer: A

Q512. What is the average-case time complexity of interpolation search on uniform data?

- A. $O(\log n)$
- B. $O(\log \log n)$
- C. $O(\sqrt{n})$
- D. $O(n)$

Answer: B

Q513. What is exponential search used for?

- A. Finding range for binary search on unbounded arrays
- B. Searching in a hash table with open addressing
- C. Finding an element in an unsorted linked list
- D. Searching in a balanced binary search tree structure

Answer: A

Q514. What is the time complexity of searching in a balanced BST?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(1)$

Answer: B

Q515. What is ternary search?

- A. A search that compares three elements at each single step
- B. A search that uses three different search algorithms together
- C. A search that requires three sorted arrays simultaneously
- D. A search that divides the search space into three equal parts

Answer: D

Q516. What is jump search and what is its optimal block size?

- A. Search every other element; block size is always two
- B. Jump to random positions; block size is chosen randomly
- C. Skip logarithmic blocks; block size is always $\log n$
- D. Skip fixed blocks then linear search; block size is $\sqrt{n}$

Answer: D

Q517. What is the space complexity of recursive binary search?

- A. $O(1)$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(n)$

Answer: C

Q518. How does Fibonacci search determine the split point?

- A. It always splits the array exactly at the golden ratio
- B. It uses Fibonacci numbers to divide the search space
- C. It uses random Fibonacci-like sequences for splitting
- D. It hashes elements using Fibonacci number as the key

Answer: B

Q519. What is the key advantage of binary search over linear search?

- A. It can find multiple elements in a single search
- B. It has $O(\log n)$ time versus $O(n)$ on sorted data
- C. It uses less memory than linear search algorithm
- D. It works on any type of data without restrictions

Answer: B

Q520. What happens if binary search is applied to an unsorted array?

- A. It will automatically sort the array first then search
- B. It will always return the correct result anyway
- C. It will convert to linear search as a fallback mode
- D. It may skip the target and return incorrect result

Answer: D

Q521. What is the time complexity of merge sort in all cases?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: B

Q522. What is the worst-case pivot selection in quick sort?

- A. Randomly selecting the pivot element each time
- B. Always picking the median as pivot element
- C. Always picking smallest or largest as pivot element
- D. Picking the middle index element as the pivot

Answer: C

Q523. What is the space complexity of merge sort?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(1)$

Answer: A

Q524. How does counting sort achieve $O(n+k)$ time complexity?

- A. It counts occurrences of each value and computes positions
- B. It divides elements into buckets based on digit values
- C. It recursively splits and merges the input array halves
- D. It compares pairs of elements to find their order

Answer: A

Q525. Why is quick sort preferred over merge sort in practice?

- A. Quick sort has better cache performance and low overhead
- B. Quick sort uses more memory which speeds up sorting
- C. Quick sort has better worst-case time complexity
- D. Quick sort is always stable unlike merge sort algorithm

Answer: A

Q526. What is the time complexity of heap sort?

- A. $O(\log n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n)$

Answer: B

Q527. What is radix sort and when is it used?

- A. A comparison sort that divides data by value ranges
- B. A recursive sort that always selects median as pivot
- C. A non-comparison sort processing digits from least significant
- D. A sorting method that uses hashing for element placement

Answer: C

Q528. What is the key operation in the partition step of quick sort?

- A. Merging two sorted halves into a single sorted array
- B. Finding the minimum element in the unsorted portion
- C. Rearranging elements around a chosen pivot value point
- D. Comparing every pair of elements and swapping if needed

Answer: C

Q529. Is selection sort a stable algorithm?

- A. It is stable only when elements are all distinct
- B. It is stable only for arrays under a certain size
- C. No, it is not stable due to long-range swapping
- D. Yes, it is always stable for all possible inputs

Answer: C

Q530. What is shell sort?

- A. A generalized insertion sort using decreasing gap sizes
- B. A comparison sort based on the shell command utility
- C. A variant of merge sort using shell-like structures
- D. A sorting algorithm that uses a shell data structure

Answer: A

Q531. What is open addressing in hash tables?

- A. Storing colliding elements in a separate overflow area
- B. Using open-source hash functions for all key types
- C. Finding alternative slots within the same table for collisions
- D. Leaving table slots open and unoccupied permanently

Answer: C

Q532. What is linear probing?

- A. Checking slots at quadratically increasing intervals
- B. Checking sequential slots one by one after collision
- C. Using a second hash function to find alternate slots
- D. Probing in a linear linked list attached to each slot

Answer: B

Q533. What is the primary clustering problem in linear probing?

- A. Occupied slots form long contiguous runs over time
- B. Clusters form in the linked lists at each slot
- C. All keys hash to the same single slot in table
- D. Keys cluster at the end of the hash table only

Answer: A

Q534. How does quadratic probing reduce clustering?

- A. It uses a secondary hash function for probing step
- B. It probes at quadratically increasing intervals from hash
- C. It uses random slot selection for each collision
- D. It sorts the table after each insertion operation

Answer: B

Q535. What is double hashing?

- A. Using the same hash function twice on the same key
- B. Applying one hash function to the result of another
- C. Hashing both the key and value separately for storage
- D. Using two different hash functions for probe sequence

Answer: D

Q536. When should a hash table be resized?

- A. When the first collision occurs in the table structure
- B. When all slots in the table are completely occupied
- C. When the load factor exceeds a certain threshold value
- D. When the hash function starts producing negative values

Answer: C

Q537. What is the multiplication method of hashing?

- A. Multiplying the key by the table size directly
- B. Multiplying the hash by the load factor for index
- C. Multiplying key by constant, extracting fractional part
- D. Multiplying all keys together to get a single hash

Answer: C

Q538. What is rehashing?

- A. Removing all elements and starting with an empty table
- B. Rebuilding the hash table with a new size or hash function
- C. Reversing the hash function to retrieve original keys
- D. Recomputing hash values using the same table and function

Answer: B

Q539. What is the birthday paradox's relevance to hashing?

- A. It explains why hash functions must use prime table sizes
- B. It shows collisions are more likely than intuition suggests
- C. It demonstrates that larger tables always prevent collisions
- D. It proves that hash tables never experience collisions

Answer: B

Q540. What is the difference between a hash map and a hash set?

- A. Hash maps are faster; hash sets use more memory space
- B. Hash maps store key-value pairs; hash sets store keys only
- C. Hash maps use chaining; hash sets use open addressing
- D. Hash sets allow duplicates; hash maps do not allow them

Answer: B

Q541. What is an AVL tree?

- A. A multi-way tree used primarily for database indexing
- B. A self-balancing BST with height difference at most one
- C. A BST where all leaves are at the exact same level
- D. A tree where each node stores at most two keys only

Answer: B

Q542. What rotation is performed for a left-left imbalance in an AVL tree?

- A. Left rotation
- B. Right-left rotation
- C. Right rotation
- D. Left-right rotation

Answer: C

Q543. What is a red-black tree?

- A. A binary tree that alternates red and black at each level
- B. A BST where nodes are colored red or black with rules
- C. A tree using red and black to indicate data priority
- D. A tree where red nodes are leaves and black are internal

Answer: B

Q544. What is the maximum height of an AVL tree with n nodes?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(\sqrt{n})$

Answer: C

Q545. How does deletion work in a BST when the node has two children?

- A. Simply remove the node and leave children as orphan nodes
- B. Delete both children and reconnect their subtrees together
- C. Swap with the root node and then delete the root node
- D. Replace with in-order successor or predecessor, then delete it

Answer: D

Q546. What is the purpose of a B-tree?

- A. Minimizing disk I/O for database and file system access
- B. Compressing tree data for network data transmission
- C. Storing data in a binary format for fast processing
- D. Balancing workload across multiple processor threads

Answer: A

Q547. What is a segment tree used for?

- A. Segmenting data into equal-sized portions for sorting
- B. Creating visual segments for graphical tree rendering
- C. Answering range queries and updates on an array efficiently
- D. Storing segments of text for string matching algorithms

Answer: C

Q548. What is a binary heap?

- A. A binary tree where all nodes have the exact same value
- B. A sorted binary tree with elements in ascending order
- C. A complete binary tree satisfying the heap property order
- D. A binary tree where leaves store minimum values always

Answer: C

Q549. What is the time complexity of building a heap from an array?

- A. $O(n \log n)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: B

Q550. How is a node inserted into an AVL tree?

- A. Insert as in BST, then rotate to fix any imbalance
- B. Always insert at the root and push other nodes down
- C. Insert at the deepest level regardless of key value
- D. Insert at a random position and then sort the tree

Answer: A

Q551. What does Dijkstra's algorithm find?

- A. All possible paths between two specific graph vertices
- B. Shortest paths from a single source to all vertices
- C. Minimum spanning tree of a weighted graph structure
- D. Maximum flow through a network with capacity constraints

Answer: B

Q552. What is the time complexity of Dijkstra's algorithm with a binary heap?

- A. $O(V + E)$
- B. $O(E * V)$
- C. $O((V+E) \log V)$
- D. $O(V^2)$

Answer: C

Q553. What does Kruskal's algorithm compute?

- A. Minimum spanning tree using edge sorting approach
- B. Shortest path between two specific vertices only
- C. All connected components of an undirected graph
- D. Topological ordering of a directed acyclic graph

Answer: A

Q554. What does Prim's algorithm compute?

- A. Minimum spanning tree by growing from a vertex
- B. Shortest paths from all sources to all destinations
- C. Strongly connected components of a directed graph
- D. Maximum matching in a bipartite graph structure

Answer: A

Q555. What is topological sorting?

- A. Arranging vertices in a circle for visual graph display
- B. Sorting edges by weight for minimum spanning tree building
- C. Sorting graph vertices by their degree in ascending order
- D. Linear ordering of vertices so each edge goes forward

Answer: D

Q556. Can topological sort be performed on a graph with cycles?

- A. Yes, but the result may not be unique or deterministic
- B. No, topological sort requires a directed acyclic graph
- C. No, but it can be performed on undirected cyclic graph
- D. Yes, cycles are handled by ignoring back edges only

Answer: B

Q557. What limitation does Dijkstra's algorithm have?

- A. It only works on undirected graphs not directed ones
- B. It requires the graph to be a complete graph always
- C. It cannot handle graphs with more than 100 vertices
- D. It fails on graphs with negative weight edge values

Answer: D

Q558. What is the Union-Find data structure used for?

- A. Storing vertex and edge data in compressed format
- B. Searching for elements in a sorted graph structure
- C. Finding unions and intersections of sorted arrays
- D. Tracking connected components and detecting cycles

Answer: D

Q559. What is the Bellman-Ford algorithm used for?

- A. Finding maximum flow in a network with capacities
- B. Finding minimum spanning trees in undirected graphs
- C. Finding shortest paths even with negative edge weights
- D. Finding all bridges and articulation points in graphs

Answer: C

Q560. What is the time complexity of the Floyd-Warshall algorithm?

- A. $O(E^2)$
- B. $O(V^3)$
- C. $O(V^2)$
- D. $O(V * E)$

Answer: B

Q561. What is the difference between memoization and tabulation?

- A. Memoization uses tables; tabulation uses recursive calls
- B. Both are identical approaches with different naming only
- C. Memoization is bottom-up; tabulation is top-down approach
- D. Memoization is top-down; tabulation is bottom-up approach

Answer: D

Q562. What are the two key properties for dynamic programming applicability?

- A. Optimal substructure and overlapping subproblems present
- B. Greedy choice property and matroid structure correctness
- C. Logarithmic depth and polynomial branching factor only
- D. Divide and conquer with non-overlapping subproblem cases

Answer: A

Q563. What is the time complexity of the 0/1 knapsack problem using DP?

- A. $O(n * W)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(2^n)$

Answer: A

Q564. What is the longest common subsequence (LCS) problem?

- A. Finding the longest substring that appears in one string
- B. Finding the longest path between two nodes in a graph
- C. Finding the longest sorted subsequence in one sequence
- D. Finding the longest subsequence common to two sequences

Answer: D

Q565. What is the activity selection problem?

- A. Selecting activities based on their priority level values
- B. Selecting maximum non-overlapping activities by finish time
- C. Selecting activities that require the minimum total cost
- D. Selecting the activity with the longest duration possible

Answer: B

Q566. What is the rod cutting problem?

- A. Finding the minimum number of cuts to divide a rod evenly
- B. Cutting a rod into equal pieces for uniform distribution
- C. Cutting a rod into pieces to maximize total sale revenue
- D. Cutting rods from a sheet to minimize material waste cost

Answer: C

Q567. How does branch and bound differ from backtracking?

- A. Branch and bound uses bounds to prune unpromising branches
- B. Backtracking uses bounds; branch and bound does not use any
- C. Branch and bound only works on graph problems specifically
- D. They are identical algorithms with different names only

Answer: A

Q568. What is the coin change problem using dynamic programming?

- A. Finding minimum coins needed to make a given amount value
- B. Sorting coins by value for efficient change distribution
- C. Finding the total value of all coins combined together
- D. Counting the total number of coins in a given collection

Answer: A

Q569. What is the fractional knapsack problem?

- A. A problem of dividing a knapsack into fractional parts
- B. A knapsack problem where items must be taken completely
- C. A knapsack problem where items can be taken partially
- D. A problem of distributing items into fractional groups

Answer: C

Q570. What is the time complexity of the LCS problem using DP?

- A. $O(m + n)$
- B. $O(m * n)$
- C. $O(2^{(m+n)})$
- D. $O(m^2 + n^2)$

Answer: B

Q571. What is a Fibonacci heap?

- A. A min-heap that stores only Fibonacci numbers as values
- B. A binary heap where the size follows Fibonacci sequence
- C. A heap with amortized $O(1)$ insert and decrease-key time
- D. A heap based on Fibonacci numbers for index calculation

Answer: C

Q572. What is a suffix array?

- A. An array storing the frequency of each character in string
- B. An array of all prefixes of a string sorted in order
- C. An array of all suffixes of a string sorted lexicographically
- D. An array of indices where a specific pattern is found

Answer: C

Q573. What is path compression in Union-Find?

- A. Compressing file paths for efficient storage in memory
- B. Shortening the physical path between two graph vertices
- C. Making each node point directly to the root during find
- D. Compressing data along the path in a tree structure

Answer: C

Q574. What is union by rank in Union-Find?

- A. Attaching the shorter tree under the root of taller tree
- B. Ranking all elements before performing any union operation
- C. Unioning sets based on alphabetical rank of elements
- D. Sorting elements by rank before adding to disjoint sets

Answer: A

Q575. What is a trie's space complexity for n strings of average length m?

- A. $O(m)$
- B. $O(n^2)$
- C. $O(n * m)$
- D. $O(n)$

Answer: C

Q576. What is an interval tree?

- A. A binary tree with nodes at regular interval positions
- B. A tree that stores intervals for overlap and point queries
- C. A tree where node values differ by a constant interval
- D. A tree that stores time intervals for scheduling queries

Answer: B

Q577. What is the time complexity of decrease-key in a Fibonacci heap?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(1)$ amortized
- D. $O(\log n)$

Answer: C

Q578. What is a k-d tree used for?

- A. Dividing a tree into k balanced subtrees for search
- B. Storing k different data types in a single tree node
- C. Organizing points in k-dimensional space for queries
- D. Creating k copies of a binary tree for redundancy

Answer: C

Q579. What is the advantage of a balanced BST over a hash table?

- A. It provides faster average-case lookup than hashing does
- B. It has simpler implementation than hash table structures
- C. It maintains elements in sorted order for range queries
- D. It uses less memory than a hash table for same elements

Answer: C

Q580. What is a binomial heap?

- A. A binary heap with binomial distribution of element values
- B. A heap that performs binomial search for extract min
- C. A collection of binomial trees satisfying heap property
- D. A heap using binomial coefficients for priority values

Answer: C

Q581. What is the KMP algorithm?

- A. A string sorting algorithm using key-median partitioning
- B. A pattern matching algorithm using a prefix failure table
- C. A string compression algorithm using key-mapped patterns
- D. A substring search using kernel-mapped positioning index

Answer: B

Q582. What is the time complexity of the KMP algorithm?

- A. $O(n^2)$
- B. $O(m^2)$
- C. $O(n * m)$
- D. $O(n + m)$

Answer: D

Q583. What is the Rabin-Karp algorithm?

- A. A text compression algorithm using repeated substrings
- B. A string sorting algorithm based on radix computation
- C. A pattern matching algorithm using rolling hash function
- D. A string encryption algorithm using the Karp cipher key

Answer: C

Q584. What is the failure function in KMP?

- A. A table mapping each character to its failure position
- B. A table storing longest proper prefix that is also suffix
- C. A function that detects when the algorithm has failed
- D. A function that counts the number of failed comparisons

Answer: B

Q585. What is a rolling hash?

- A. A hash that changes completely for each new substring
- B. A hash that rotates character positions in the input string
- C. A hash computed by rolling through all possible hash functions
- D. A hash updated incrementally by adding and removing characters

Answer: D

Q586. What is the longest palindromic substring problem?

- A. Finding the longest string that contains a palindrome inside
- B. Finding the longest contiguous palindrome within a string
- C. Generating the longest possible palindrome from characters
- D. Finding all palindromes in a string and returning longest

Answer: B

Q587. What is the Boyer-Moore algorithm's key idea?

- A. Comparing only the first and last characters of pattern
- B. Comparing every other character for faster matching speed
- C. Comparing pattern from right to left with shift heuristics
- D. Comparing characters from left to right systematically

Answer: C

Q588. What is the Z-algorithm used for in string processing?

- A. Sorting strings in reverse lexicographic Z to A order
- B. Compressing strings using Z-encoding for smaller storage
- C. Encrypting strings using the Z-cipher transformation
- D. Computing Z-array for pattern matching in linear time

Answer: D

Q589. What is string hashing used for?

- A. Sorting strings in hash-based order for faster access
- B. Compressing strings to reduce storage space requirements
- C. Efficiently comparing strings and finding pattern matches
- D. Encrypting strings for secure network communication only

Answer: C

Q590. What is the time complexity of checking if a string is a palindrome?

- A. $O(n \log n)$
- B. $O(1)$
- C. $O(n^2)$
- D. $O(n)$

Answer: D

Q591. What is the difference between best, average, and worst case?

- A. They describe input scenarios giving minimum, expected, and maximum cost
- B. They represent different programming languages and their speeds
- C. They measure performance for small, medium, and large inputs
- D. They describe memory, disk, and network usage respectively

Answer: A

Q592. What is the time complexity of an algorithm with three sequential loops of $O(n)$?

- A. $O(3n)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(n^3)$

Answer: B

Q593. What is the space-time tradeoff?

- A. Trading code readability for faster execution time always
- B. Trading algorithm correctness for improved speed results
- C. Trading disk space for network bandwidth in algorithms
- D. Trading space complexity for time complexity or vice versa

Answer: D

Q594. What is the complexity of matrix multiplication of two $n \times n$ matrices?

- A. $O(n^2)$
- B. $O(n^3)$
- C. $O(n \log n)$
- D. $O(n)$

Answer: B

Q595. What is loop unrolling as an optimization technique?

- A. Converting recursive loops into iterative ones for speed
- B. Removing all loops from the algorithm entirely always
- C. Unrolling nested loops into a single flat loop structure
- D. Reducing loop overhead by executing multiple iterations per cycle

Answer: D

Q596. What is memoization's effect on the Fibonacci sequence computation?

- A. It changes complexity from $O(n^2)$ to $O(n \log n)$ time
- B. It has no effect on the time complexity of Fibonacci
- C. It changes complexity from $O(n)$ to $O(1)$ constant time
- D. It changes complexity from $O(2^n)$ to $O(n)$ linear time

Answer: D

Q597. What is the significance of polynomial vs exponential complexity?

- A. Polynomial algorithms are considered efficient; exponential are not
- B. Exponential algorithms are always faster than polynomial ones
- C. Both are equally efficient for all practical input sizes
- D. Polynomial algorithms are impractical; exponential are efficient

Answer: A

Q598. What is cache-friendly code?

- A. Code that disables caching for more predictable performance
- B. Code that accesses memory in patterns that maximize cache hits
- C. Code that uses a custom cache data structure for lookups
- D. Code that stores all data in the CPU cache permanently

Answer: B

Q599. What is the complexity class P?

- A. Problems solvable in polynomial time by deterministic machine
- B. Problems that have no known solution in any time bound
- C. Problems solvable in polynomial time by nondeterministic machine
- D. Problems solvable only in exponential time by any machine

Answer: A

Q600. What is tail call optimization?

- A. Removing the last call in a function for faster returns
- B. Optimizing function calls at the tail of a linked list
- C. Optimizing the last element of an array for faster access
- D. Reusing the current stack frame for a tail recursive call

Answer: D

Q601. What is the time complexity of $T(n) = 4T(n/2) + n$ using the Master Theorem?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n^2 \log n)$

Answer: C

Q602. What is the difference between recursion and iteration in terms of space usage?

- A. Recursion always uses less space
- B. Iteration typically uses less space because it doesn't require a call stack
- C. They always use the same amount of space
- D. Iteration always uses more space due to loop variables

Answer: B

Q603. What is the solution to the recurrence $T(n) = T(n/2) + O(1)$?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: C

Q604. If $f(n) = 5n^3 + 2n^2 + 100n + 42$, what is the Big-O classification?

- A. $O(n^2)$
- B. $O(5n^3)$
- C. $O(n^3)$
- D. $O(n^4)$

Answer: C

Q605. What does it mean if an algorithm is said to run in polynomial time?

- A. Its running time is $O(2^n)$
- B. Its running time can be expressed as $O(n^k)$ for some constant k
- C. Its running time is always $O(n)$
- D. It cannot be analyzed using Big-O notation

Answer: B

Q606. What is the recursion tree method used for?

- A. Sorting elements in a tree
- B. Visualizing the work done at each level of a recurrence to find the total cost
- C. Converting iterative code to recursive code
- D. Building binary search trees

Answer: B

Q607. Which of the following is NOT a valid step in the substitution method for solving recurrences?

- A. Guess the form of the solution
- B. Use mathematical induction to prove the guess
- C. Assume the solution holds for smaller values
- D. Differentiate the recurrence with respect to n

Answer: D

Q608. What is the space complexity of an algorithm that creates a new array of size n within a loop that runs n times?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(1)$

Answer: A

Q609. What does little-o notation $o(f(n))$ signify?

- A. The growth rate is exactly $f(n)$
- B. The growth rate is strictly less than $f(n)$ asymptotically
- C. The growth rate is at least $f(n)$
- D. The growth rate is strictly greater than $f(n)$

Answer: B

Q610. How does the accounting method of amortized analysis work?

- A. It counts the total number of function calls
- B. It assigns different charges to operations so cheap operations subsidize expensive ones
- C. It measures the actual runtime on a specific machine
- D. It ignores expensive operations in the analysis

Answer: B

Q611. How can you implement a min-queue that supports enqueue, dequeue, and getMin all in amortized $O(1)$?

- A. Use a single array with sorting
- B. Use two stacks, each augmented to track minimums
- C. Use a linked list sorted by value
- D. Use a binary search tree

Answer: B

Q612. What is the time complexity of inserting an element at a specific position i in an array of size n ?

- A. $O(1)$
- B. $O(i)$
- C. $O(n - i)$
- D. $O(n)$

Answer: D

Q613. What is the advantage of using a circular buffer over a linear array for a queue?

- A. Circular buffers use less memory
- B. They avoid the need to shift elements after dequeue operations
- C. They support random access faster
- D. They can store more elements

Answer: B

Q614. What happens when a dynamic array doubles its size upon reaching capacity?

- A. Elements are sorted into the new array
- B. A new array of double the size is allocated and all elements are copied over
- C. The old array is extended in place without copying
- D. Only the new elements are placed in the new array

Answer: B

Q615. How can you use a stack to check if parentheses in an expression are balanced?

- A. Count opening and closing parentheses
- B. Push opening brackets onto the stack and pop when a matching closing bracket is found
- C. Sort the brackets and compare halves
- D. Use two stacks, one for each type

Answer: B

Q616. What is the time complexity of reversing a singly linked list using iteration?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(1)$
- D. $O(n)$

Answer: D

Q617. What is a priority queue and how does it differ from a regular queue?

- A. A priority queue is the same as a regular queue but faster
- B. Elements are dequeued based on priority rather than insertion order
- C. A priority queue only stores integers
- D. A priority queue reverses the order of insertion

Answer: B

Q618. What is the space overhead of a singly linked list compared to an array for storing n integers?

- A. No extra space
- B. $O(1)$ extra space
- C. $O(n)$ extra space for storing next pointers
- D. $O(n^2)$ extra space

Answer: C

Q619. How does a deque (double-ended queue) differ from a standard queue?

- A. A deque is slower than a queue
- B. A deque allows insertion and deletion at both the front and rear
- C. A deque only allows deletion from both ends
- D. A deque can only store two elements

Answer: B

Q620. What is the time complexity of finding the middle element of a singly linked list in one pass?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: B

Q621. What is the time complexity of inserting an element into a binary search tree in the average case?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: B

Q622. What is the relationship between the number of edges and vertices in a complete graph K_n ?

- A. n edges
- B. $n(n-1)/2$ edges
- C. n^2 edges
- D. $2n$ edges

Answer: B

Q623. What is the advantage of an adjacency list representation over an adjacency matrix for sparse graphs?

- A. Adjacency lists use $O(V^2)$ space regardless of edges
- B. Adjacency lists use $O(V + E)$ space, which is much less than $O(V^2)$ for sparse graphs
- C. Adjacency lists allow $O(1)$ edge lookup
- D. Adjacency lists are always slower

Answer: B

Q624. What is the time complexity of deleting the minimum element from a min-heap with n elements?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: B

Q625. What is a perfect binary tree?

- A. A tree where every node has exactly one child
- B. A tree where all internal nodes have two children and all leaves are at the same depth
- C. A tree where nodes are sorted
- D. A tree with the minimum possible height for n nodes

Answer: B

Q626. What is the difference between a tree and a graph?

- A. Trees can have cycles but graphs cannot
- B. A tree is a connected acyclic graph, while a graph can have cycles and disconnected components
- C. Graphs always have fewer edges than trees
- D. Trees can only store numbers

Answer: B

Q627. How is a binary heap typically stored in memory?

- A. As a linked list of nodes
- B. As a contiguous array using index formulas for parent and children
- C. As a hash table
- D. As a 2D matrix

Answer: B

Q628. What is the in-degree of a vertex in a directed graph?

- A. The number of edges going out from the vertex
- B. The total number of edges in the graph
- C. The number of edges coming into the vertex
- D. The number of self-loops at the vertex

Answer: C

Q629. What is the sum of degrees of all vertices in an undirected graph with E edges?

- A. E
- B. $2E$
- C. E^2
- D. $V + E$

Answer: B

Q630. What is a degenerate (skewed) binary tree?

- A. A tree where every node has exactly two children
- B. A tree where every node has at most one child, resembling a linked list
- C. A tree with all leaves at the same level
- D. A tree stored using an adjacency matrix

Answer: B

Q631. What is the time complexity of jump search on a sorted array of n elements?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(\sqrt{n})$
- D. $O(n \log n)$

Answer: C

Q632. How does exponential search work?

- A. It searches all elements exponentially faster
- B. It finds the range where the target lies by doubling the index, then applies binary search within that range
- C. It multiplies each element by 2
- D. It sorts the array first, then searches linearly

Answer: B

Q633. What is the worst-case time complexity of ternary search?

- A. $O(n)$
- B. $O(\log_3 n)$, which is $O(\log n)$
- C. $O(\sqrt{n})$
- D. $O(n \log n)$

Answer: B

Q634. What is the key condition that makes interpolation search perform better than binary search?

- A. The array must be in descending order
- B. The data must be uniformly distributed
- C. The array size must be a power of 2
- D. The array must contain only integers

Answer: B

Q635. How can binary search be modified to find the leftmost (first) occurrence of a duplicate element?

- A. Return the first match found
- B. When the target is found, continue searching in the left half instead of returning immediately
- C. Sort the array again after finding the element
- D. Use linear search after finding any occurrence

Answer: B

Q636. What is the Fibonacci search technique?

- A. Searching for Fibonacci numbers in an array
- B. A search method that divides the array using Fibonacci numbers instead of halving
- C. A recursive search that calls itself twice
- D. A hash-based search technique

Answer: B

Q637. What is the time complexity of searching in an unsorted hash table versus a sorted array using binary search?

- A. Hash table: $O(n)$, Binary search: $O(\log n)$
- B. Hash table: $O(1)$ average, Binary search: $O(\log n)$
- C. Both are $O(\log n)$
- D. Both are $O(1)$

Answer: B

Q638. What is a search tree and what operation does it optimize?

- A. A tree used for sorting elements
- B. A tree data structure that organizes data to optimize search operations to $O(\log n)$
- C. A tree that stores only search queries
- D. A tree with a fixed number of nodes

Answer: B

Q639. How does binary search on answer (parametric search) work?

- A. It searches for the answer in a sorted array of answers
- B. It binary searches over the answer space using a feasibility check function
- C. It sorts the answers before searching
- D. It applies binary search twice

Answer: B

Q640. What is the primary advantage of exponential search over binary search for searching in an unbounded or infinite list?

- A. It uses less memory
- B. It does not require knowing the array size beforehand
- C. It is always faster
- D. It does not require the array to be sorted

Answer: B

Q641. What is the recurrence relation for the time complexity of merge sort?

- A. $T(n) = T(n-1) + n$
- B. $T(n) = 2T(n/2) + O(n)$
- C. $T(n) = T(n/2) + O(1)$
- D. $T(n) = 4T(n/2) + O(n)$

Answer: B

Q642. Why is quicksort generally faster than merge sort in practice despite having the same average complexity?

- A. Quicksort has a lower worst-case complexity
- B. Quicksort has better cache performance and smaller constant factors due to in-place operations
- C. Quicksort uses less stack space
- D. Quicksort is always stable

Answer: B

Q643. What pivot selection strategy helps avoid quicksort's worst case?

- A. Always picking the first element
- B. Always picking the last element
- C. Choosing the median of the first, middle, and last elements
- D. Picking the largest element

Answer: C

Q644. What is counting sort's key limitation?

- A. It cannot sort integers
- B. It requires $O(k)$ extra space where k is the range of input values, making it impractical for large ranges
- C. It is always slower than quicksort
- D. It cannot sort arrays larger than 100 elements

Answer: B

Q645. How does radix sort achieve linear time complexity?

- A. By using comparison-based sorting internally
- B. By sorting digit by digit from least significant to most significant using a stable sort like counting sort
- C. By randomly partitioning the array
- D. By using a binary search tree

Answer: B

Q646. What is the time complexity of heap sort and is it stable?

- A. $O(n^2)$ and stable
- B. $O(n \log n)$ and stable
- C. $O(n \log n)$ and not stable
- D. $O(n)$ and stable

Answer: C

Q647. What is shell sort and how does it improve insertion sort?

- A. It sorts only the outer shell of the array
- B. It insertion-sorts elements that are far apart first, reducing the gap progressively
- C. It uses a shell data structure
- D. It sorts the array into a shell shape

Answer: B

Q648. Is merge sort preferred over quicksort for sorting linked lists? Why?

- A. No, quicksort is always preferred
- B. Yes, because merge sort does not require random access and linked list merge is $O(1)$ extra space
- C. No, because merge sort is slower on linked lists
- D. Yes, but only for doubly linked lists

Answer: B

Q649. What is the purpose of the partition step in quicksort?

- A. To merge two sorted subarrays
- B. To place the pivot in its correct sorted position with smaller elements before it and larger after
- C. To find the median of the array
- D. To count the number of elements

Answer: B

Q650. What is the difference between LSD (Least Significant Digit) and MSD (Most Significant Digit) radix sort?

- A. LSD processes from the least significant digit and requires a stable sort; MSD processes from the most significant digit and can use recursion
- B. They are identical algorithms
- C. LSD is faster for all inputs
- D. MSD cannot sort strings

Answer: A

Q651. How does quadratic probing resolve collisions?

- A. By probing at positions $h(k)+1$, $h(k)+2$, $h(k)+3$, ...
- B. By probing at positions $h(k)+1^2$, $h(k)+2^2$, $h(k)+3^2$, ...
- C. By using a second hash function
- D. By rehashing the entire table

Answer: B

Q652. What is secondary clustering in hash tables?

- A. When all elements hash to the first slot
- B. When keys that hash to the same slot follow the same probe sequence
- C. When the hash table is divided into two clusters
- D. When the load factor exceeds 2

Answer: B

Q653. What is the expected number of probes for a successful search in a hash table with open addressing at load factor α ?

- A. $1/(1-\alpha)$
- B. $(1/\alpha) \ln(1/(1-\alpha^2))$
- C. $1/\alpha$
- D. $\log(1/(1-\alpha))$

Answer: B

Q654. Why is it recommended to use a prime number for hash table size when using the division method?

- A. Prime numbers are faster to compute
- B. It helps distribute keys more uniformly by reducing patterns from common factors
- C. Prime numbers use less memory
- D. It is not recommended; powers of 2 are always better

Answer: B

Q655. What is the typical threshold load factor at which a hash table should be resized?

- A. 0.25
- B. 0.5
- C. 0.75
- D. 1.0

Answer: C

Q656. What is the time complexity of rehashing a hash table with n elements?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: C

Q657. How does double hashing avoid clustering?

- A. It uses two hash tables
- B. It uses a second hash function to determine the probe step size, making each key's probe sequence different
- C. It hashes the value twice before inserting
- D. It doubles the table size on each collision

Answer: B

Q658. What is the advantage of open addressing over chaining?

- A. Open addressing is always faster
- B. Open addressing has better cache performance because all data is stored in the table array itself
- C. Open addressing handles higher load factors better
- D. Open addressing never needs resizing

Answer: B

Q659. After approximately how many insertions into a hash table with m slots does the probability of at least one collision exceed 50%?

- A. m insertions
- B. $m/2$ insertions
- C. About $\sqrt{2m}$ insertions
- D. About $\log(m)$ insertions

Answer: C

Q660. What is the difference between separate chaining and open addressing?

- A. Separate chaining uses linked lists at each slot while open addressing probes for the next empty slot
- B. They are the same technique with different names
- C. Open addressing uses linked lists while chaining uses arrays
- D. Separate chaining never has collisions

Answer: A

Q661. What is the balance factor in an AVL tree?

- A. The number of nodes in the tree
- B. The difference in heights of the left and right subtrees of a node
- C. The total height of the tree
- D. The number of rotations performed

Answer: B

Q662. When is a right-left (RL) rotation performed in an AVL tree?

- A. When a node is inserted in the left subtree of the left child
- B. When a node is inserted in the right subtree of the left child
- C. When a node is inserted in the left subtree of the right child
- D. When a node is inserted in the right subtree of the right child

Answer: C

Q663. How is a node with two children deleted from a BST?

- A. Simply remove the node
- B. Replace it with its in-order successor or predecessor, then delete that replacement node
- C. Swap it with the root and remove the root
- D. Delete both children first, then remove the node

Answer: B

Q664. What is Morris traversal and what is its space complexity?

- A. A traversal using two stacks with $O(n)$ space
- B. An in-order traversal using threading to achieve $O(1)$ space without a stack or recursion
- C. A traversal that visits nodes randomly in $O(n)$ space
- D. A BFS traversal using $O(n)$ space

Answer: B

Q665. What is a Red-Black tree's maximum height in terms of the number of nodes n ?

- A. Exactly $\log_2(n)$
- B. At most $2 * \log_2(n + 1)$
- C. Exactly n
- D. At most $n/2$

Answer: B

Q666. What is a segment tree's time complexity for a range sum query after $O(n)$ construction?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(" n)$

Answer: B

Q667. How can you verify if a given binary tree is a valid BST?

- A. Check if each node is greater than its children
- B. Perform in-order traversal and verify the result is strictly increasing
- C. Check if the root is the median value
- D. Count the number of nodes and compare with height

Answer: B

Q668. Why is bottom-up heap construction $O(n)$ rather than $O(n \log n)$?

- A. Because it skips half the elements
- B. Because most nodes are near the leaves and require very few sift-down operations, forming a convergent series
- C. Because it uses insertion sort internally
- D. Because it only processes the root node

Answer: B

Q669. What is a B-tree primarily used for?

- A. In-memory sorting
- B. Maintaining sorted data in database and file systems with minimal disk reads
- C. Network routing
- D. String pattern matching

Answer: B

Q670. What is the LCA (Lowest Common Ancestor) of two nodes in a binary tree?

- A. The root of the tree
- B. The deepest node that is an ancestor of both given nodes
- C. The parent of the deeper node
- D. The node at the midpoint between the two nodes

Answer: B

Q671. What is the time complexity of Dijkstra's algorithm using a Fibonacci heap?

- A. $O(V^2)$
- B. $O(V \log V + E)$
- C. $O(E \log V)$
- D. $O(V * E)$

Answer: B

Q672. How does Kruskal's algorithm find a minimum spanning tree?

- A. By starting from a vertex and adding the cheapest edge to a neighbor
- B. By sorting all edges by weight and adding them if they don't create a cycle, using Union-Find
- C. By finding the shortest path from source to all vertices
- D. By removing the most expensive edges

Answer: B

Q673. What is topological sorting and on which type of graph is it performed?

- A. Sorting vertices by degree on any graph
- B. A linear ordering of vertices such that for every directed edge (u, v) , u comes before v ; only on DAGs
- C. Sorting edges by weight in an undirected graph
- D. Ordering vertices alphabetically

Answer: B

Q674. How does the Bellman-Ford algorithm differ from Dijkstra's algorithm?

- A. Bellman-Ford is always faster
- B. Bellman-Ford can handle negative edge weights and detect negative cycles, while Dijkstra cannot
- C. Dijkstra handles negative weights but Bellman-Ford does not
- D. They produce different results on the same graph

Answer: B

Q675. What is the time complexity of Prim's algorithm using a binary heap?

- A. $O(V^2)$
- B. $O(E \log V)$
- C. $O(V * E)$
- D. $O(V + E)$

Answer: B

Q676. How can you detect a cycle in an undirected graph using DFS?

- A. Check if any vertex has degree > 2
- B. If DFS visits an already-visited vertex that is not the parent of the current vertex, a cycle exists
- C. Count the number of edges; a cycle exists if $E > V$
- D. Use topological sort

Answer: B

Q677. What does the Union-Find path compression optimization do?

- A. It compresses the data stored at each node
- B. It flattens the tree by making every node point directly to the root during find operations
- C. It removes unused paths from the graph
- D. It compresses the graph into fewer vertices

Answer: B

Q678. What is the Floyd-Warshall algorithm used for?

- A. Finding the minimum spanning tree
- B. Finding shortest paths between all pairs of vertices
- C. Topological sorting
- D. Detecting bipartite graphs

Answer: B

Q679. What is the time complexity of finding connected components in an undirected graph?

- A. $O(V^2)$
- B. $O(V + E)$
- C. $O(V * E)$
- D. $O(E^2)$

Answer: B

Q680. What is a back edge in DFS and what does it indicate?

- A. An edge going from a node to its parent
- B. An edge from a node to an ancestor in the DFS tree, indicating a cycle in directed graphs
- C. An edge that was removed during DFS
- D. An edge connecting two different components

Answer: B

Q681. What is the time complexity of the dynamic programming solution for the Longest Common Subsequence?

- A. $O(n)$
- B. $O(n * m)$ where n and m are the lengths of the two sequences
- C. $O(n^3)$
- D. $O(2^n)$

Answer: B

Q682. Why does the greedy approach fail for the 0/1 Knapsack problem but work for the fractional Knapsack?

- A. The greedy approach is always incorrect
- B. In 0/1 Knapsack, items cannot be divided, so a locally optimal choice may block a better global solution
- C. The fractional Knapsack has fewer items
- D. Both can be solved greedily

Answer: B

Q683. How does the N-Queens backtracking solution work?

- A. It places all queens randomly and checks if the placement is valid
- B. It places queens one row at a time, backtracking when a placement conflicts with existing queens
- C. It sorts the board positions and assigns queens greedily
- D. It uses dynamic programming to find all placements

Answer: B

Q684. What is the Longest Increasing Subsequence (LIS) problem's optimal time complexity?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(2^n)$

Answer: B

Q685. What is Huffman coding and which algorithm design paradigm does it use?

- A. A sorting algorithm using divide and conquer
- B. An optimal prefix-free encoding algorithm using the greedy approach
- C. A string matching algorithm using dynamic programming
- D. A graph algorithm using backtracking

Answer: B

Q686. What is the difference between the 0/1 Knapsack and the fractional Knapsack problem?

- A. 0/1 Knapsack allows fractions while fractional does not
- B. In 0/1 Knapsack items are taken whole or not at all; in fractional Knapsack items can be divided
- C. They are the same problem
- D. Fractional Knapsack is always harder

Answer: B

Q687. What is the rod cutting problem in dynamic programming?

- A. Cutting a graph into components
- B. Finding the maximum revenue by cutting a rod of length n into pieces with given prices for each length
- C. Dividing an array into equal parts
- D. Cutting a string at specific positions

Answer: B

Q688. What is branch and bound and how does it differ from backtracking?

- A. They are the same algorithm
- B. Branch and bound uses bounds (upper/lower) to prune branches that cannot yield better solutions than the current best
- C. Branch and bound only works on trees
- D. Backtracking uses bounds while branch and bound does not

Answer: B

Q689. What is the space optimization technique for the 0/1 Knapsack DP solution?

- A. Use a 3D array instead of 2D
- B. Use only two 1D arrays (or one array traversed in reverse) since each row only depends on the previous row
- C. Use a hash table
- D. Use a linked list

Answer: B

Q690. What is the activity selection problem and which approach solves it optimally?

- A. Selecting the minimum number of activities; solved by DP
- B. Selecting the maximum number of non-overlapping activities; solved by a greedy algorithm that sorts by finish time
- C. Selecting activities with maximum total weight; solved by brute force
- D. Assigning activities to workers; solved by backtracking

Answer: B

Q691. What is the amortized time complexity of Union-Find operations with both path compression and union by rank?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(\alpha(n))$ where α is the inverse Ackermann function
- D. $O(n)$

Answer: C

Q692. What is a Fibonacci heap's key advantage over a binary heap?

- A. Simpler implementation
- B. $O(1)$ amortized decrease-key operation instead of $O(\log n)$
- C. Less memory usage
- D. Faster extract-min

Answer: B

Q693. What is a suffix array and what problem does it help solve?

- A. An array of suffix sums for range queries
- B. A sorted array of all suffixes of a string, enabling efficient pattern matching and string analysis
- C. An array storing the suffixes of Fibonacci numbers
- D. A compressed version of a string

Answer: B

Q694. What is a sparse table used for?

- A. Storing sparse matrices
- B. Answering static range minimum/maximum queries in $O(1)$ after $O(n \log n)$ preprocessing
- C. Building sparse graphs
- D. Compressing data

Answer: B

Q695. How does a k-d tree determine which dimension to split on at each level?

- A. It always splits on the first dimension
- B. It cycles through the dimensions at each level (depth mod k)
- C. It randomly selects a dimension
- D. It splits on the dimension with the most variance

Answer: B

Q696. What is the time complexity of merge operation in a binomial heap?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n \log n)$

Answer: B

Q697. What is an interval tree used for?

- A. Storing time intervals for scheduling
- B. Finding all intervals that overlap with a given query interval efficiently
- C. Measuring time intervals
- D. Sorting intervals by length

Answer: B

Q698. What is the space complexity of a trie storing n strings with average length m over an alphabet of size $< 2^b$

- A. $O(n)$
- B. $O(n * m * < 2^b)$
- C. $O(n * m)$
- D. $O(< 2^b)$

Answer: B

Q699. What is a balanced BST's advantage over a hash table for ordered operations?

- A. Balanced BSTs have $O(1)$ lookup
- B. Balanced BSTs support ordered operations like range queries, in-order traversal, and predecessor/successor in $O(\log n)$
- C. Hash tables cannot store strings
- D. Balanced BSTs use less memory

Answer: B

Q700. What is a circular buffer and where is it commonly used?

- A. A buffer that stores data in a circle shape on disk
- B. A fixed-size buffer that wraps around, commonly used in streaming, producer-consumer patterns, and I/O buffering
- C. A buffer that can grow infinitely
- D. A buffer used only for circular linked lists

Answer: B

Q701. What is the failure function (partial match table) in the KMP algorithm?

- A. A table indicating which characters to skip in the text
- B. A table storing the length of the longest proper prefix that is also a suffix for each prefix of the pattern
- C. A table of hash values for the pattern
- D. A table mapping characters to their positions

Answer: B

Q702. How does the Rabin-Karp algorithm handle spurious matches?

- A. It ignores them completely
- B. It performs a character-by-character comparison when hash values match to verify the actual match
- C. It uses a different hash function each time
- D. It rehashes the entire text

Answer: B

Q703. What is the Z-array for a string S?

- A. An array of zeros
- B. $Z[i]$ = length of the longest substring starting at i that matches a prefix of S
- C. An array sorting characters alphabetically
- D. The reverse of the string stored as an array

Answer: B

Q704. What is the key idea behind the Boyer-Moore algorithm?

- A. Searching from left to right in the pattern
- B. Comparing the pattern from right to left and using bad character and good suffix heuristics to skip positions
- C. Using hash values for comparison
- D. Building a trie of all substrings

Answer: B

Q705. What is the time complexity of computing the longest palindromic substring using dynamic programming?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n^3)$

Answer: C

Q706. What is a rolling hash and how does it enable efficient string matching?

- A. A hash that rolls dice for randomness
- B. A hash function that can compute the hash of the next window in $O(1)$ by removing the leading character and adding the trailing character
- C. A hash that is computed once and never changes
- D. A hash function specific to number sequences

Answer: B

Q707. How does the KMP algorithm achieve $O(n + m)$ time complexity?

- A. By sorting the text first
- B. By never re-comparing characters that have already been matched, using the failure function to resume matching
- C. By using hash values instead of character comparison
- D. By dividing the text into blocks

Answer: B

Q708. What is the time complexity of checking if one string is a rotation of another?

- A. $O(n^2)$
- B. $O(n)$ by concatenating the string with itself and searching for the other string
- C. $O(n \log n)$
- D. $O(2^n)$

Answer: B

Q709. In polynomial string hashing, what values are typically chosen for the base p and modulus M ?

- A. $p = 1$ and $M = 10$
- B. p greater than the alphabet size and M a large prime to minimize collisions
- C. Both should be powers of 2
- D. $p = 0$ and $M =$ the string length

Answer: B

Q710. What is the best-case time complexity of the Boyer-Moore algorithm for pattern matching?

- A. $O(n * m)$
- B. $O(n + m)$
- C. $O(n / m)$
- D. $O(n)$

Answer: C

Q711. What is the relationship between the complexity classes P and NP ?

- A. P is a strict subset of NP and $P = NP$ is proven
- B. $P \neq NP$ (P is contained in NP), but whether $P = NP$ is unknown
- C. $NP \subset P$ (NP is a strict subset of P)
- D. P and NP are disjoint sets

Answer: B

Q712. What is the time complexity of Strassen's matrix multiplication algorithm?

- A. $O(n^3)$
- B. $O(n^2)$
- C. $O(n^{(\log_2 7)})$ or $O(n^{2.807})$
- D. $O(n^2 \log n)$

Answer: C

Q713. Which of the following is a well-known NP-complete problem?

- A. Binary search
- B. Sorting an array
- C. The Boolean Satisfiability Problem (SAT)
- D. Finding the minimum in an array

Answer: C

Q714. What is the difference between time complexity and space complexity?

- A. They always have the same value
- B. Time complexity measures the number of operations as a function of input size; space complexity measures the memory used
- C. Space complexity is always larger
- D. Time complexity measures clock time in seconds

Answer: B

Q715. What is the significance of the $O(n \log n)$ barrier for comparison-based sorting?

- A. It can be beaten by any sorting algorithm
- B. No comparison-based sorting algorithm can have a worst case better than $O(n \log n)$
- C. $O(n \log n)$ is the average case but $O(n)$ is achievable in the worst case
- D. Only merge sort achieves this bound

Answer: B

Q716. How does loop unrolling improve performance at the hardware level?

- A. By reducing the total number of operations
- B. By reducing branch overhead and enabling better instruction pipelining and cache utilization
- C. By converting the loop to recursion
- D. By eliminating the need for variables

Answer: B

Q717. What is the time-space tradeoff in memoization?

- A. Memoization uses more time to save space
- B. Memoization uses extra space to store computed results, reducing time by avoiding redundant computation
- C. Memoization has no tradeoff
- D. Memoization reduces both time and space

Answer: B

Q718. What is the complexity of adding two n-digit numbers?

- A. $O(1)$
- B. $O(n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: B

Q719. What is cache-oblivious algorithm design?

- A. Algorithms that don't use any cache
- B. Algorithms designed to efficiently use the memory hierarchy without knowing cache parameters
- C. Algorithms that ignore memory constraints
- D. Algorithms that clear the cache before running

Answer: B

Q720. What is the difference between worst-case and average-case complexity?

- A. They are always the same
- B. Worst-case gives the maximum time over all inputs of size n ; average-case gives the expected time over a distribution of inputs
- C. Average-case is always worse than worst-case
- D. Worst-case only considers the best input

Answer: B

Data Structures & Algorithms — Hard

360 questions

Q721. What is the time complexity of the recurrence $T(n) = 3T(n/4) + n \log n$?

- A. $O(n^{(\log_4(3))})$
- B. $O(n^2)$
- C. $O(n \log^2 n)$
- D. $O(n \log n)$

Answer: D

Q722. Which of the following recurrences cannot be solved by the Master Theorem?

- A. $T(n) = T(n-1) + n$
- B. $T(n) = 2T(n/2) + n \log n$
- C. $T(n) = 2T(n/2) + n$
- D. $T(n) = 4T(n/2) + n^2$

Answer: A

Q723. What is the amortized cost of insertion in a dynamic array that doubles its size when full?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(n)$

Answer: A

Q724. Using the substitution method, what is the solution to $T(n) = T(n-1) + n$ with $T(1) = 1$?

- A. $O(2^n)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: D

Q725. What is the lower bound for any comparison-based sorting algorithm?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(n)$

Answer: A

Q726. In the potential method of amortized analysis, the amortized cost is defined as:

- A. Actual cost $\times$ potential function
- B. Actual cost + change in potential
- C. Actual cost - change in potential
- D. Actual cost / potential function

Answer: B

Q727. What complexity class does the problem of finding the median of an unsorted array belong to?

- A. $O(n^2)$ minimum brute force
- B. $O(n \log n)$ using sort first
- C. $O(n)$ using deterministic selection
- D. $O(\log n)$ using binary search

Answer: C

Q728. What is the space complexity of a recursive algorithm with depth d and $O(1)$ space per call?

- A. $O(d)$
- B. $O(2^d)$
- C. $O(d^2)$
- D. $O(1)$

Answer: A

Q729. Which of the following is true about the relationship between time and space complexity?

- A. Space complexity can exceed time complexity
- B. Space complexity cannot exceed time complexity
- C. Time complexity is always greater than space
- D. Time and space complexity are always equal

Answer: B

Q730. What is the time complexity of $T(n) = 2T(n/2) + n/\log n$?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n \log \log n)$
- D. $O(n (\log n)^2)$

Answer: C

Q731. What is the amortized time complexity of enqueue and dequeue operations when implementing a queue with two stacks?

- A. $O(1)$ amortized for both
- B. $O(1)$ enqueue, $O(n)$ dequeue
- C. $O(n)$ enqueue, $O(1)$ dequeue
- D. $O(n)$ for both operations

Answer: A

Q732. How can you detect a cycle in a linked list efficiently?

- A. By sorting the list nodes first in order
- B. By converting the list into an array form
- C. Using two nested loops over all nodes
- D. Using Floyd's tortoise and hare algorithm

Answer: D

Q733. What is the time complexity of reversing a singly linked list iteratively?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: C

Q734. In a skip list, what is the expected time complexity of search?

- A. $O(n)$
- B. $O(1)$
- C. $O(\log n)$
- D. $O(n \log n)$

Answer: C

Q735. What is an XOR linked list?

- A. A circular linked list variant with XOR pointers
- B. A linked list that stores only odd-valued elements
- C. A linked list using XOR for data encryption purposes
- D. A doubly linked list using XOR of addresses to save memory

Answer: D

Q736. How do you find the starting node of a cycle in a linked list using Floyd's algorithm?

- A. Use a hash table to store all visited node addresses
- B. Count all nodes in the list and compute the start
- C. Reset one pointer to head and move both one step
- D. Reverse the entire list and then detect the cycle

Answer: C

Q737. What is the minimum number of stacks needed to implement a deque?

- A. 1
- B. 3
- C. 2
- D. 4

Answer: C

Q738. What is the space overhead per node in a doubly linked list compared to a singly linked list?

- A. One extra data field
- B. No extra overhead
- C. Two extra pointers
- D. One extra pointer

Answer: D

Q739. What is the time complexity of merging two sorted linked lists into one sorted list?

- A. $O(n \times m)$
- B. $O(n + m)$
- C. $O(n \log m)$
- D. $O(n^2)$

Answer: B

Q740. What is a self-organizing list?

- A. A list that reorders based on access patterns
- B. A list that balances itself like a tree structure
- C. A list that maintains sorted order automatically
- D. A list that automatically deletes duplicate items

Answer: A

Q741. What is the time complexity of building a heap from an unsorted array of n elements?

- A. $O(n \log n)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: B

Q742. What is a threaded binary tree?

- A. A tree where null pointers become in-order links
- B. A binary tree with multiple root nodes
- C. A tree with thread-safe atomic operations
- D. A tree used in multithreading concurrency

Answer: A

Q743. What is the minimum number of nodes in an AVL tree of height h ?

- A. $N(h) = N(h-1) + N(h-2) + 1$
- B. $2^{(h+1)} - 1$
- C. 2^h
- D. $h + 1$

Answer: A

Q744. In a directed graph with V vertices, what is the maximum number of edges?

- A. V^2
- B. V
- C. $V(V-1)$
- D. $V(V-1)/2$

Answer: C

Q745. What is a B-tree of order m ?

- A. A tree data structure with m distinct roots
- B. A self-balancing tree with at most m children
- C. A binary tree with exactly m total levels
- D. A graph with m connected components total

Answer: B

Q746. What is a Red-Black tree's maximum height for n nodes?

- A. $n/2$
- B. n
- C. $\log n$
- D. $2 \log(n+1)$

Answer: D

Q747. What is a bipartite graph?

- A. A graph divisible into two disjoint vertex sets
- B. A fully connected complete graph structure
- C. A graph with exactly two vertices in total
- D. A graph with exactly two connected components

Answer: A

Q748. What is the time complexity of deleting the root from a max-heap of n elements?

- A. $O(n \log n)$
- B. $O(n)$
- C. $O(1)$
- D. $O(\log n)$

Answer: D

Q749. How many distinct BSTs can be formed with n distinct keys?

- A. 2^n (powers of two)
- B. n^2 (square of n)
- C. $C(n)$ the Catalan number
- D. $n!$ (factorial of n)

Answer: C

Q750. What is the difference between a strongly connected and weakly connected directed graph?

- A. Strongly connected means directed paths exist between all pairs; weakly only without directions
- B. There is no meaningful difference between strongly and weakly connected directed graphs
- C. Strongly connected graphs always contain more edges than weakly connected directed graphs
- D. Weakly connected graphs always have more vertices and edges than strongly connected ones

Answer: A

Q751. What is the worst-case time complexity of interpolation search?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(\log \log n)$
- D. $O(\sqrt{n})$

Answer: A

Q752. What is Fibonacci search?

- A. A search on Fibonacci heap data structures
- B. A recursive search with Fibonacci-like recurrence
- C. Searching for Fibonacci numbers in an array
- D. A search using Fibonacci numbers to divide array

Answer: D

Q753. What is the time complexity of searching in a balanced binary search tree?

- A. $O(n \log n)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: C

Q754. How does binary search handle finding the first occurrence of a duplicate element in a sorted array?

- A. Standard binary search always finds the first occurrence automatically
- B. Binary search cannot handle duplicate elements in sorted arrays
- C. By using linear search after binary search locates any occurrence
- D. By modifying binary search to continue searching left after finding it

Answer: D

Q755. What is the order-statistic problem?

- A. Counting elements in a range
- B. Finding the median of sorted data
- C. Finding the k-th smallest element
- D. Sorting all elements into order

Answer: C

Q756. What is the time complexity of the Quickselect algorithm in the average case?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(n)$

Answer: D

Q757. How can you search in a sorted and rotated array?

- A. Interpolation search handles rotation natively
- B. Only linear search works for this case
- C. Modified binary search identifies the sorted half
- D. Ternary search is the only viable approach

Answer: C

Q758. What is the time complexity of searching in a skip list?

- A. $O(\log n)$ expected
- B. $O(1)$ constant
- C. $O(n)$ linear
- D. $O(n \log n)$ total

Answer: A

Q759. What is two-pointer technique in searching?

- A. Using two separate arrays for searching data
- B. Searching for two distinct elements at once
- C. Binary search implemented with two mid points
- D. Using two pointers from different positions to converge

Answer: D

Q760. What is the time complexity of finding the median of two sorted arrays of sizes m and n ?

- A. $O((m + n) \log(m + n))$
- B. $O(m \times n)$
- C. $O(m + n)$
- D. $O(\log(\min(m, n)))$

Answer: D

Q761. What is radix sort's time complexity for n integers with d digits?

- A. $O(n \times d^2)$
- B. $O(d \times (n + k))$ where k is the base
- C. $O(n^2)$
- D. $O(n \log n)$

Answer: B

Q762. What is the worst-case time complexity of randomized quick sort?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(n \log^2 n)$
- D. $O(n \log n)$

Answer: B

Q763. What is bucket sort?

- A. A sort that only works on string data
- B. A sort distributing elements into buckets then merging
- C. A merge sort variant with fixed partitions
- D. A comparison sort using memory buckets

Answer: B

Q764. When is bucket sort most efficient?

- A. When data is in reverse sorted order
- B. When the array is extremely large in size
- C. When input is uniformly distributed over a range
- D. When data has many duplicate values present

Answer: C

Q765. What is introsort?

- A. A merge sort variant with optimizations
- B. A pure insertion sort variant
- C. A hybrid starting with quicksort switching to heapsort
- D. A non-comparison sort using radix method

Answer: C

Q766. What is TimSort?

- A. A real-time sorting algorithm for streaming data
- B. A sort that runs in constant time for all input
- C. A sort named after its time complexity class
- D. A hybrid stable sort using merge and insertion sort

Answer: D

Q767. Is quick sort a stable sorting algorithm?

- A. Only with Lomuto partition scheme
- B. Only when using random pivots
- C. Yes, always stable
- D. No, in its standard implementation

Answer: D

Q768. What is the time complexity of sorting n strings of maximum length s using radix sort?

- A. $O(s \log n)$
- B. $O(n^2 \times s)$
- C. $O(n \times s)$
- D. $O(n \log n)$

Answer: C

Q769. What is the Dutch National Flag problem in the context of sorting?

- A. Coloring a graph with three distinct colors
- B. Sorting elements of three different colors
- C. Sorting using three different algorithms
- D. Three-way partitioning around a pivot value

Answer: D

Q770. What is external sorting?

- A. Sorting using network-based remote requests
- B. Sorting data too large for memory using disk
- C. Sorting using external third-party libraries
- D. Sorting on external hardware devices only

Answer: B

Q771. What is universal hashing?

- A. Hashing all elements to the same single bucket
- B. Using the same hash function across all applications
- C. Randomly selecting a hash function from a family of functions
- D. A single hash function that works for all data types

Answer: C

Q772. What is perfect hashing?

- A. A hash function that always distributes keys evenly
- B. A hash function with no collisions for any input set
- C. A hashing technique that requires no table at all
- D. A two-level scheme guaranteeing $O(1)$ worst-case lookup

Answer: D

Q773. What is a Bloom filter?

- A. A type of hash table with chaining
- B. A comparison-based sorting algorithm
- C. A filter for removing duplicate elements
- D. A probabilistic structure testing set membership

Answer: D

Q774. What is cuckoo hashing?

- A. A technique using random hash function selection
- B. A technique using two hash functions with displacement
- C. A hashing technique inspired by bird nesting
- D. A type of perfect hashing for static keys

Answer: B

Q775. What is consistent hashing?

- A. Using the same hash function consistently always
- B. A collision-free hashing technique for all inputs
- C. A hashing that always produces the same output
- D. A scheme remapping only a fraction of keys on change

Answer: D

Q776. What is the expected maximum chain length in a hash table with n elements and n slots using chaining?

- A. $O(\log n / \log \log n)$
- B. $O(n)$
- C. $O(1)$
- D. $O(n)$

Answer: A

Q777. What is Robin Hood hashing?

- A. A two-level hashing scheme with perfect balance
- B. A charitable hashing distribution across buckets
- C. Stealing hash values from other tables entirely
- D. Open addressing where longer probes displace shorter ones

Answer: D

Q778. What is the purpose of a cryptographic hash function?

- A. To speed up hash table lookups efficiently
- B. To compress files to smaller size format
- C. To produce collision-resistant irreversible fixed output
- D. To sort data in a deterministic order

Answer: C

Q779. What is hopscotch hashing?

- A. An open addressing scheme with bounded neighborhoods
- B. A random displacement hashing for load balance
- C. A hashing game-based approach to distribution
- D. A chaining variant using skip list buckets

Answer: A

Q780. What is the false positive probability of a Bloom filter with m bits, k hash functions, and n inserted elements?

- A. $(1 - e^{-(kn/m)})^k$ approx
- B. n / m ratio
- C. $1 / 2^k$ value
- D. k / m ratio

Answer: A

Q781. What is a splay tree?

- A. A B-tree variant used in database indexing
- B. A self-adjusting BST that moves accessed nodes to root
- C. A tree that spreads elements across multiple arrays
- D. A tree that is always perfectly balanced

Answer: B

Q782. What is the time complexity of range query and update in a segment tree?

- A. $O(n)$ for both operations
- B. $O(n)$ query, $O(1)$ update
- C. $O(1)$ query, $O(n)$ update
- D. $O(\log n)$ for both operations

Answer: D

Q783. What is a Fenwick tree (Binary Indexed Tree)?

- A. A balanced BST variant with extra pointers
- B. A structure for $O(\log n)$ prefix sums and updates
- C. A tree used in networking protocols
- D. A binary tree indexed by key values

Answer: B

Q784. What is lazy propagation in a segment tree?

- A. Deferring updates to children until they are queried
- B. Lazily inserting elements one at a time
- C. Skipping unnecessary queries for performance
- D. Delaying the tree construction until needed

Answer: A

Q785. What is a treap?

- A. A BST-heap hybrid with keys and random priorities
- B. A tree-shaped trap data structure
- C. A triple-ended queue data structure
- D. A tree with array-like access properties

Answer: A

Q786. What is the Euler tour technique for trees?

- A. Linearizing a tree by recording DFS visit times
- B. A graph coloring technique for tree nodes
- C. Touring all leaf nodes in level order
- D. Finding Euler paths in tree structures

Answer: A

Q787. What is Heavy-Light Decomposition (HLD) of a tree?

- A. Decomposing into chains for efficient path queries
- B. Separating heavy and light weight nodes
- C. Removing heavy edges from the tree structure
- D. Balancing an unbalanced tree by restructuring

Answer: A

Q788. What is the time complexity of LCA using binary lifting (sparse table)?

- A. $O(n^2)$ per query with no preprocessing needed
- B. $O(n)$ per query with no preprocessing
- C. $O(1)$ per query after $O(n^2)$ preprocessing
- D. $O(\log n)$ per query after $O(n \log n)$ preprocessing

Answer: D

Q789. What is a persistent segment tree?

- A. A segment tree preserving all versions via path copying
- B. A segment tree that never changes after construction
- C. A segment tree stored on disk permanently
- D. A compressed segment tree with reduced memory use

Answer: A

Q790. How does a B+ tree differ from a B-tree?

- A. B+ tree is not a balanced tree structure
- B. B+ tree has more levels than a B-tree
- C. B+ tree stores all data at leaves with linked leaf nodes
- D. B+ tree has fewer keys per node overall

Answer: C

Q791. What is the Floyd-Warshall algorithm?

- A. An all-pairs shortest path DP algorithm
- B. A minimum spanning tree algorithm only
- C. A single-source shortest path algorithm
- D. A graph coloring assignment algorithm

Answer: A

Q792. What is the time complexity of Floyd-Warshall algorithm?

- A. $O(V^3)$
- B. $O(V^2)$
- C. $O(V \times E)$
- D. $O(V + E)$

Answer: A

Q793. What are Strongly Connected Components (SCCs) in a directed graph?

- A. Maximal subgraphs with mutual reachability
- B. Components with no cycles at all
- C. Components with the most vertices total
- D. Components with the most edges overall

Answer: A

Q794. Which algorithms can find Strongly Connected Components?

- A. Dijkstra's shortest path algorithm
- B. Prim's spanning tree algorithm
- C. Kosaraju's and Tarjan's algorithms
- D. Floyd-Warshall all-pairs algorithm

Answer: C

Q795. What is an articulation point (cut vertex) in a graph?

- A. A vertex with no edges connected to it
- B. The vertex with the smallest key value
- C. A vertex whose removal disconnects the graph
- D. A vertex with the maximum degree overall

Answer: C

Q796. What is a bridge in a graph?

- A. An edge with the maximum weight assigned
- B. An edge whose removal disconnects the graph
- C. The longest edge in the graph by weight
- D. An edge connecting two separate components

Answer: B

Q797. What is the maximum flow problem?

- A. Finding the maximum number of vertices
- B. Finding maximum flow from source to sink
- C. Finding the maximum edge weight in graph
- D. Sorting edges by their flow capacity

Answer: B

Q798. What is the Ford-Fulkerson method for maximum flow?

- A. An iterative method finding augmenting paths until none remain
- B. A divide and conquer approach for solving network flows
- C. A greedy algorithm for computing the minimum cut value
- D. A dynamic programming approach for computing max flow

Answer: A

Q799. What does the Max-Flow Min-Cut theorem state?

- A. Maximum flow equals the number of all paths
- B. Maximum flow equals minimum edge weight
- C. Maximum flow equals the minimum cut capacity
- D. Minimum cut equals the total number of edges

Answer: C

Q800. What is the time complexity of Dijkstra's algorithm with a Fibonacci heap?

- A. $O(V \times E)$
- B. $O((V + E) \log V)$
- C. $O(V \log V + E)$
- D. $O(V^2)$

Answer: C

Q801. What is the matrix chain multiplication problem's time complexity using DP?

- A. $O(n^3)$
- B. $O(n!)$
- C. $O(2^n)$
- D. $O(n^2)$

Answer: A

Q802. What is the Traveling Salesman Problem (TSP)?

- A. Finding the shortest path between two specific cities
- B. Finding the fastest route avoiding all toll roads
- C. Finding minimum cost Hamiltonian cycle visiting all cities
- D. A minimum spanning tree problem for city networks

Answer: C

Q803. What is the time complexity of solving TSP using dynamic programming (Held-Karp)?

- A. $O(n^3)$
- B. $O(n^2 \times 2^n)$
- C. $O(n!)$
- D. $O(2^n)$

Answer: B

Q804. What is branch and bound?

- A. A hashing technique for collision resolution
- B. A type of comparison-based sorting method
- C. An optimization technique pruning suboptimal branches
- D. A graph traversal method for shortest paths

Answer: C

Q805. What is the edit distance (Levenshtein distance) problem?

- A. The minimum single-character edits between two strings
- B. The difference in the lengths of two strings
- C. The number of common characters in two strings
- D. The distance between two arrays in memory

Answer: A

Q806. What is the difference between the 0/1 knapsack and fractional knapsack?

- A. 0/1 uses greedy approach; fractional uses DP approach
- B. Fractional knapsack is computationally harder overall
- C. They are exactly the same problem formulation
- D. 0/1 requires whole items (DP); fractional allows fractions (greedy)

Answer: D

Q807. What is a randomized algorithm?

- A. An algorithm with random bugs in code
- B. An algorithm using random numbers in its decisions
- C. An algorithm that shuffles input before sorting
- D. An algorithm that produces random wrong output

Answer: B

Q808. What is an approximation algorithm?

- A. An algorithm that gives approximate time complexity
- B. An algorithm finding near-optimal solutions in polynomial time
- C. An imprecise algorithm with unreliable output
- D. An algorithm that estimates the input data size

Answer: B

Q809. What is the subset sum problem?

- A. Finding the sum of all array elements
- B. Summing consecutive elements in an array
- C. Finding the maximum valued subset overall
- D. Determining if a subset sums to a target value

Answer: D

Q810. What is the meet-in-the-middle technique?

- A. A two-pointer approach for sorted arrays
- B. A median-finding technique using partitioning
- C. Dividing the array in half for sorting
- D. Splitting input in half and combining to reduce complexity

Answer: D

Q811. What is a suffix tree?

- A. A tree that stores all string prefixes
- B. A compressed trie of all suffixes for $O(m)$ matching
- C. An array of suffix pointers with sorting
- D. A binary tree of sorted suffix indices

Answer: B

Q812. What is a van Emde Boas tree?

- A. A tree with $O(\log \log U)$ operations for integer keys
- B. A tree with variable branching factor per level
- C. A cache-oblivious tree for external memory
- D. A self-balancing BST with color properties

Answer: A

Q813. What is a rope data structure?

- A. A linked list variant for characters
- B. A hash map for string key-value pairs
- C. A graph connecting strings with edges
- D. A balanced binary tree for efficient string operations

Answer: D

Q814. What is a count-min sketch?

- A. A data structure for exact element counting
- B. A compressed hash table with min values
- C. A min-heap variant tracking element counts
- D. A probabilistic structure for approximate frequency counts

Answer: D

Q815. What is a link-cut tree?

- A. A tree where links can be physically cut
- B. A doubly linked tree with removable nodes
- C. A dynamic forest supporting link, cut, and path queries
- D. A tree with removable edges but fixed vertices

Answer: C

Q816. What is a wavelet tree?

- A. A tree for signal processing operations
- B. A frequency-based heap for priority ordering
- C. A Fourier transform data structure for arrays
- D. A tree for rank, select, and range queries on sequences

Answer: D

Q817. What is a persistent data structure?

- A. A data structure saved to disk permanently
- B. A data structure that cannot ever be deleted
- C. A data structure that persists across program runs
- D. A structure preserving all previous versions on modification

Answer: D

Q818. What is a binomial heap?

- A. A heap with binomial probability distribution
- B. A heap used in statistical analysis methods
- C. A binary heap with extra pointer fields added
- D. A collection of binomial trees with $O(\log n)$ merge

Answer: D

Q819. What is an order-statistic tree?

- A. An augmented BST supporting $O(\log n)$ rank and select
- B. A tree for statistical analysis of data sets
- C. A tree that orders elements statistically
- D. A heap that tracks insertion order of elements

Answer: A

Q820. What is a succinct data structure?

- A. A brief textual description of a data structure
- B. A structure using near information-theoretic minimum space
- C. A small fixed-capacity array with limited size
- D. A compressed hash table designed for very dense data

Answer: B

Q821. What is the Aho-Corasick algorithm?

- A. A multi-pattern matcher building a trie-based automaton
- B. A compression algorithm for pattern libraries
- C. A single pattern matching algorithm only
- D. A string sorting algorithm for multiple strings

Answer: A

Q822. What is Manacher's algorithm?

- A. A string sorting algorithm for arrays
- B. A pattern matching algorithm for text
- C. A string compression algorithm for storage
- D. An $O(n)$ algorithm finding all palindromic substrings

Answer: D

Q823. What is the time complexity of building a suffix array using the DC3/skew algorithm?

- A. $O(n \log^2 n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n)$

Answer: D

Q824. What is the LCP (Longest Common Prefix) array?

- A. An array storing longest common prefix lengths between consecutive sorted suffixes
- B. An array storing character frequencies found within a given string
- C. An array storing the lengths of all strings within a collection
- D. An array storing prefix sums computed over numeric data elements

Answer: A

Q825. What is Burrows-Wheeler Transform (BWT)?

- A. A string matching algorithm for patterns
- B. A reversible transformation aiding text compression
- C. A string encryption method for security
- D. A hash function designed for string data

Answer: B

Q826. What is a suffix automaton?

- A. An automaton that generates all suffixes
- B. A pattern matching machine for any text
- C. A minimal DFA recognizing all suffixes of a string
- D. A suffix tree variant with compressed nodes

Answer: C

Q827. What is the time complexity of the Boyer-Moore algorithm in the best case?

- A. $O(n/m)$
- B. $O(n \times m)$
- C. $O(n)$
- D. $O(n + m)$

Answer: A

Q828. What is polynomial string hashing?

- A. Hashing using polynomial long division
- B. Computing hash as sum of characters times powers of a base
- C. Hashing that produces polynomial-length hash output
- D. Using polynomial time algorithms for hash computation

Answer: B

Q829. What is the longest repeated substring problem's optimal solution?

- A. $O(n^3)$ brute force approach
- B. $O(n^2)$ using dynamic programming
- C. $O(n \log^2 n)$ using rolling hashing
- D. $O(n)$ using suffix array with LCP array

Answer: D

Q830. What is the number of distinct substrings of a string of length n ?

- A. $n(n+1)/2$ minus $\text{sum}(\text{LCP})$
- B. 2^n (exponential count)
- C. n^2 (quadratic count)
- D. $n!$ (factorial of n)

Answer: A

Q831. What is the complexity class PSPACE?

- A. Problems solvable using polynomial space amount
- B. Problems requiring exponential space to solve
- C. Problems solvable in constant space only
- D. Problems with no space requirement at all

Answer: A

Q832. What is Cook's theorem?

- A. P equals NP has been conclusively proven
- B. Every NP problem is fundamentally unsolvable
- C. Every problem is solvable in polynomial time
- D. The Boolean satisfiability problem (SAT) is NP-complete

Answer: D

Q833. What is the difference between a decision problem and an optimization problem?

- A. Decision has yes/no answer; optimization seeks best solution
- B. They are exactly the same type of problem
- C. Optimization problems are always solvable in P
- D. Decision problems are always computationally harder

Answer: A

Q834. What is pseudo-polynomial time?

- A. An algorithm that pretends to be efficient
- B. Time polynomial in input value rather than input size
- C. False polynomial time that does not exist
- D. The same as polynomial time in all cases

Answer: B

Q835. What is the 3-SAT problem?

- A. A Boolean satisfiability problem with 3 literals per clause
- B. A problem with exactly 3 valid solutions
- C. A sorting problem with 3 distinct elements
- D. Satisfying exactly 3 linear equations

Answer: A

Q836. What is the vertex cover problem?

- A. Coloring all vertices with minimum colors
- B. Finding all connected vertices in a graph
- C. Finding smallest vertex set covering all edges
- D. Covering all vertices with color assignments

Answer: C

Q837. What is the approximation ratio of the 2-approximation algorithm for vertex cover?

- A. The solution is at most twice the optimal
- B. The solution is at most 1.5 times optimal
- C. The solution is at most 3 times the optimal
- D. The solution always equals the optimal exactly

Answer: A

Q838. What is the class co-NP?

- A. The class whose complement problems are in NP
- B. The complement of NP problems
- C. Problems that are harder than NP class
- D. Problems that are not in NP at all

Answer: A

Q839. What is a parameterized algorithm?

- A. An algorithm that dynamically changes its parameters at runtime
- B. An algorithm whose complexity depends on input size and a fixed parameter
- C. A tunable sorting algorithm that uses an adjustable pivot element
- D. An algorithm that has many user-tunable parameter values

Answer: B

Q840. What is the time hierarchy theorem?

- A. All problems can be solved in the same time
- B. Time complexity is always fixed and unchanging
- C. More time allows a Turing machine to solve more problems
- D. There is no hierarchy in time complexity classes

Answer: C

Q841. What is the time complexity of $T(n) = 3T(n/4) + n \log n$ by Master Theorem?

- A. $O(n \log^2 n)$
- B. $O(n^2 \log n)$
- C. $O(n \log n)$
- D. $O(n^{\log_4 3})$

Answer: C

Q842. Which method handles recurrences not solvable by the Master Theorem?

- A. Simple iteration counting method
- B. Akra-Bazzi generalized method
- C. Direct formula application method
- D. Basic substitution guess method

Answer: B

Q843. What is the complexity of $T(n) = 2T(n/2) + n \log n$?

- A. $O(n^2 \log n)$
- B. $O(n \log n)$
- C. $O(n \log^2 n)$
- D. $O(n^2)$

Answer: C

Q844. In amortized analysis, what is the potential method?

- A. Assigning actual cost to each operation directly
- B. Assigning a potential energy function to data structure
- C. Counting total operations divided by total time
- D. Measuring memory usage across all operations run

Answer: B

Q845. What is the significance of the P vs NP problem?

- A. It asks if space complexity equals time complexity always
- B. It asks if all algorithms can run in constant time always
- C. It asks if polynomial verification implies polynomial solving
- D. It asks if every problem has a brute force solution path

Answer: C

Q846. What does the recursion tree method visualize?

- A. The sorted order of elements after each comparison
- B. The memory allocation pattern of the algorithm run
- C. The branching cost at each level of the recurrence
- D. The input-output mapping of the algorithm function

Answer: C

Q847. What is the time complexity of $T(n) = T(n/3) + T(2n/3) + n$?

- A. $O(n)$
- B. $O(n \log^2 n)$
- C. $O(n^2)$
- D. $O(n \log n)$

Answer: D

Q848. When does the Master Theorem not apply directly?

- A. When b is greater than a in the recurrence
- B. When the recurrence has exactly two subproblems
- C. When subproblems have different unequal sizes
- D. When $f(n)$ is a simple polynomial function

Answer: C

Q849. What is the aggregate method in amortized analysis?

- A. Using a potential function to track stored credits
- B. Assigning different costs to different operation types
- C. Counting only the most expensive operation each time
- D. Summing total cost of n operations then dividing by n

Answer: D

Q850. What is the difference between deterministic and nondeterministic algorithms?

- A. Deterministic ones use randomness; nondeterministic do not
- B. Deterministic ones are slower; nondeterministic are faster
- C. Nondeterministic ones always find the optimal solution path
- D. Nondeterministic ones can explore multiple paths at once

Answer: D

Q851. How does the XOR linked list reduce memory usage?

- A. It stores XOR of next and previous addresses per node
- B. It stores only even-indexed nodes and skips odd ones
- C. It removes half the nodes and links remaining ones
- D. It compresses data values using XOR encoding scheme

Answer: A

Q852. What is the time complexity of reversing a singly linked list iteratively?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(n \log n)$
- D. $O(n)$

Answer: D

Q853. How can you detect a cycle in a linked list in $O(1)$ space?

- A. Use Floyd's cycle detection with two pointer speeds
- B. Sort the list and check for duplicate node values
- C. Use a hash set to store all visited node addresses
- D. Store visited flags inside each node data field

Answer: A

Q854. What is the worst-case time for dynamic array resizing?

- A. $O(\log n)$ due to binary copy optimization
- B. $O(1)$ per single resize operation performed
- C. $O(n)$ to copy all elements to new array
- D. $O(n^2)$ due to nested copy and shift steps

Answer: C

Q855. How is a min-stack implemented with $O(1)$ getMin?

- A. Store min value only at the bottom of the stack
- B. Sort the stack after every push operation call
- C. Scan the entire stack each time getMin is called
- D. Maintain an auxiliary stack tracking current minimums

Answer: D

Q856. What is the skip list and how does it improve linked list search?

- A. A multi-level linked list with express lane pointers
- B. A balanced tree structure embedded in a linked list
- C. A sorted array overlay that replaces the linked list
- D. A hash table combined with a singly linked list node

Answer: A

Q857. What is an unrolled linked list?

- A. A linked list where each node stores an array of elements
- B. A linked list with randomized pointer assignments only
- C. A linked list where nodes are stored in reverse order
- D. A linked list that has been converted into a flat array

Answer: A

Q858. How do you find the intersection point of two linked lists efficiently?

- A. Reverse both lists and compare from the tail forward
- B. Hash all elements of both lists and compare buckets
- C. Sort both lists and perform a binary search on each
- D. Compute lengths, align starts, then traverse together

Answer: D

Q859. What is the time complexity of merging k sorted linked lists using a min-heap?

- A. $O(nk \log k)$
- B. $O(nk^2)$
- C. $O(nk)$
- D. $O(n \log k)$

Answer: A

Q860. What is a gap buffer and where is it used?

- A. An array with a movable gap used in text editors
- B. A circular array used for network packet buffering
- C. A stack-based buffer used for function call storage
- D. A linked list variant used in database indexing

Answer: A

Q861. What is a bipartite graph?

- A. A graph whose vertices can be split into two disjoint independent sets
- B. A directed graph with edges going in exactly two directions only
- C. A graph where every vertex has exactly two edges connected to it
- D. A graph that contains exactly two connected components in total

Answer: A

Q862. How many edges does a tree with n vertices have?

- A. $n + 1$
- B. n
- C. $n - 1$
- D. $n / 2$

Answer: C

Q863. What is the worst-case height of an unbalanced BST with n nodes?

- A. $O(\sqrt{n})$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(n)$

Answer: D

Q864. What is a strongly connected component in a directed graph?

- A. A subgraph where every vertex is reachable from every other vertex
- B. A subgraph containing exactly one vertex with no outgoing edges
- C. A subgraph where all vertices have the same in-degree value
- D. A maximal set of vertices with no edges between any of them

Answer: A

Q865. What is the Euler's formula for connected planar graphs?

- A. $V + E - F = 2$
- B. $V + E + F = 2$
- C. $V - E - F = 2$
- D. $V - E + F = 2$

Answer: D

Q866. What is a threaded binary tree?

- A. A binary tree where null pointers are replaced with in-order links
- B. A binary tree where each node stores a thread identifier
- C. A binary tree stored across multiple threads of execution
- D. A binary tree that requires multi-threaded access for traversal

Answer: A

Q867. What is a hypergraph?

- A. A graph where edges can connect any number of vertices
- B. A three-dimensional representation of a standard graph
- C. A graph where vertices are organized in a grid pattern
- D. A graph where each edge connects exactly two vertices

Answer: A

Q868. What is the chromatic number of a graph?

- A. The maximum degree of any single vertex in the graph
- B. The minimum number of colors needed to color all vertices
- C. The number of connected components in the given graph
- D. The total count of edges present in the entire graph

Answer: B

Q869. What is the maximum number of edges in a simple undirected graph with n vertices?

- A. n^2
- B. $n(n-1)$
- C. $n(n+1)/2$
- D. $n(n-1)/2$

Answer: D

Q870. What is a k -ary tree?

- A. A tree with k root nodes and shared leaf structure
- B. A tree where each node has exactly k children always
- C. A tree where each node has at most k children nodes
- D. A tree that has exactly k levels from root to leaves

Answer: C

Q871. What is the worst-case time complexity of interpolation search?

- A. $O(n)$
- B. $O(\sqrt{n})$
- C. $O(\log \log n)$
- D. $O(\log n)$

Answer: A

Q872. How does exponential search combine with binary search?

- A. It uses exponentiation to compute hash for direct access
- B. It finds a range by doubling then binary searches within
- C. It applies binary search on exponentially growing subarrays
- D. It sorts the array exponentially then searches linearly

Answer: B

Q873. What is the time complexity of search in a skip list?

- A. $O(\log n)$ expected with $O(n)$ worst case
- B. $O(n \log n)$ expected and $O(n^2)$ worst case
- C. $O(n)$ in both average and worst cases
- D. $O(1)$ in all cases due to direct access

Answer: A

Q874. What is the lower bound for comparison-based searching in sorted arrays?

- A. $O(\log n)$
- B. $O(1)$
- C. $O(\sqrt{n})$
- D. $O(n)$

Answer: A

Q875. How does search work in a van Emde Boas tree?

- A. It exploits universe size for $O(\log \log u)$ operations
- B. It uses comparison-based binary search on tree nodes
- C. It performs breadth-first search on a balanced binary tree
- D. It hashes each element for constant time access always

Answer: A

Q876. What is a fractional cascading technique?

- A. Dividing search space into fractional geometric sections
- B. Cascading hash functions for multi-level collision handling
- C. Sharing elements between catalogs to speed up searches
- D. Splitting arrays into fractions for parallel search

Answer: C

Q877. What is the time complexity of searching in an optimal binary search tree?

- A. $O(1)$ since the tree is precomputed optimally
- B. $O(n)$ for every possible search query
- C. $O(n^2)$ due to the overhead of optimal structure
- D. $O(\log n)$ or better based on access frequencies

Answer: D

Q878. What is the two-pointer search technique?

- A. Using two separate arrays for parallel search
- B. Using two recursive calls to divide the search space
- C. Using two hash tables to resolve search collisions
- D. Using two indices moving toward each other or same direction

Answer: D

Q879. What is the complexity of searching in a perfectly balanced k-d tree?

- A. $O(k * \log n)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(n^{(1-1/d)} + k)$

Answer: D

Q880. What is the sentinel linear search optimization?

- A. Adding a sentinel at the end to eliminate bound checking
- B. Using multiple sentinels to divide array into segments
- C. Replacing all elements with sentinels then binary search
- D. Sorting the array first and placing sentinel in middle

Answer: A

Q881. What is the lower bound for comparison-based sorting?

- A. $O(\log n)$
- B. $O(n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: C

Q882. What is the worst-case time complexity of randomized quick sort?

- A. $O(n \log^2 n)$ amortized
- B. $O(n \log n)$ guaranteed always
- C. $O(n^2)$ but extremely unlikely
- D. $O(n)$ with high probability

Answer: C

Q883. What is introsort and why is it used?

- A. A sort using interpolation search within sorting passes
- B. A sort based on introspective analysis of data patterns
- C. A sort combining insertion, heap, and quick sort strategies
- D. A sort that introduces randomness into merge sort steps

Answer: C

Q884. How does Tim sort combine merge sort and insertion sort?

- A. It merge sorts odd indices and insertion sorts even ones
- B. It finds natural runs, extends them with insertion sort, merges
- C. It uses merge sort first then refines with insertion sort
- D. It alternates between merge and insertion on each pass

Answer: B

Q885. What is the time complexity of bucket sort in the average case?

- A. $O(n + k)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(k \log k)$

Answer: A

Q886. What is the median-of-three strategy in quick sort?

- A. Sorting the first three elements as a preprocessing step
- B. Dividing the array into three parts instead of two parts
- C. Choosing the median of first, middle, and last elements
- D. Running three separate quick sorts and taking the median

Answer: C

Q887. What is the worst-case time of radix sort for n d -digit numbers?

- A. $O(n \log n)$
- B. $O(d * n^2)$
- C. $O(n^2)$
- D. $O(d * n)$

Answer: D

Q888. Why is merge sort preferred for sorting linked lists?

- A. Merge sort automatically handles duplicate values better
- B. Merge sort is simpler to implement than other sorts
- C. Merge sort has better time complexity for linked lists
- D. Merge sort needs no random access and merges in $O(1)$ space

Answer: D

Q889. What is the Dutch National Flag problem in sorting?

- A. A problem of sorting flags in alphabetical country order
- B. Sorting elements from multiple countries by region codes
- C. Arranging colored blocks using merge sort partitioning
- D. Sorting elements by color: red, white, and blue efficiently

Answer: D

Q890. What is the adaptive property in sorting algorithms?

- A. The algorithm automatically selects the best data type
- B. The algorithm takes advantage of existing order in input
- C. The algorithm adapts to different programming languages
- D. The algorithm changes its memory usage based on input

Answer: B

Q891. What is universal hashing?

- A. A single hash function that works for all input types
- B. Using the same hash function universally in all tables
- C. A hash function standardized across all programming uses
- D. Randomly selecting a hash function from a designed family

Answer: D

Q892. What is perfect hashing?

- A. A hash function that produces perfectly sequential values
- B. A hashing method that uses perfectly balanced tree nodes
- C. A hashing scheme with zero collisions for a static set
- D. A hash table with load factor of exactly one point zero

Answer: C

Q893. What is a cuckoo hash table?

- A. A table using bird-like migration patterns for elements
- B. A table that randomly evicts elements when it gets full
- C. A table using cuckoo search optimization for hash values
- D. A table using two hash functions with element displacement

Answer: D

Q894. What is consistent hashing used for?

- A. Maintaining sorted order of keys in the hash table
- B. Ensuring hash values are always consecutive integers
- C. Distributing keys across nodes with minimal reassignment
- D. Guaranteeing the same hash for same input every time

Answer: C

Q895. What is a Bloom filter?

- A. A sorting filter applied before inserting into hash table
- B. A hash table variant that filters out duplicate key entries
- C. A deterministic set membership data structure using hashing
- D. A probabilistic structure that may give false positives only

Answer: D

Q896. What is Robin Hood hashing?

- A. A chaining method where collisions are sorted by hash value
- B. Stealing slots from rich elements to give to poor elements
- C. Using a tree structure within each hash table bucket slot
- D. Probing by comparing displacement distances and swapping

Answer: D

Q897. What is the expected longest probe sequence with linear probing at load factor 0.5?

- A. $O(1)$
- B. $O(\sqrt{n})$
- C. $O(\log n)$
- D. $O(n)$

Answer: C

Q898. What is the space complexity of a Bloom filter with n elements and false positive rate p ?

- A. $O(n * \log(1/p))$
- B. $O(\log n)$
- C. $O(n^2)$
- D. $O(n)$

Answer: A

Q899. What is hopscotch hashing?

- A. Each element must be within a fixed neighborhood of its hash
- B. Elements are sorted by hop count from their hash position
- C. Probing follows a randomized hopping pattern each time
- D. Elements hop between two completely separate tables

Answer: A

Q900. What is the worst-case lookup time in a hash table with chaining?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n \log n)$
- D. $O(n)$

Answer: D

Q901. What is a splay tree?

- A. A multi-way search tree used for external data storage
- B. A self-adjusting BST that moves accessed nodes to root
- C. A tree that splays leaves outward for balanced structure
- D. A tree that spreads nodes evenly across all levels always

Answer: B

Q902. What is a treap?

- A. A tree with trap-based deletion for security purposes
- B. A combination of a BST and a heap using random priorities
- C. A binary tree that operates as both stack and queue
- D. A tree that traps duplicate elements in separate nodes

Answer: B

Q903. What is the time complexity of range query in a segment tree?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: B

Q904. What is a B+ tree and how does it differ from a B-tree?

- A. B+ trees have fewer keys per node than standard B-trees
- B. B+ trees store all data in leaves with linked leaf nodes
- C. B+ trees do not maintain sorted order within their nodes
- D. B+ trees store data only in internal nodes not in leaves

Answer: B

Q905. What is lazy propagation in a segment tree?

- A. Deferring updates to child nodes until they are accessed
- B. Propagating updates to all nodes immediately upon change
- C. Lazily constructing the tree only when queries are made
- D. Propagating values from leaves to root after every update

Answer: A

Q906. What is an Euler tour of a tree?

- A. A traversal listing each node when entering and leaving
- B. A tour that visits only leaf nodes of the given tree
- C. A traversal that processes nodes in reverse level order
- D. A path visiting every edge exactly once in entire tree

Answer: A

Q907. What is the amortized time of splay tree operations?

- A. $O(\log n)$ per operation in the amortized analysis
- B. $O(n)$ per operation in the amortized analysis
- C. $O(1)$ per operation in the amortized analysis
- D. $O(n \log n)$ per operation in the amortized analysis

Answer: A

Q908. What is a Fenwick tree (Binary Indexed Tree)?

- A. A tree that indexes binary representations of all keys
- B. A full binary tree storing prefix sums at each node
- C. A binary tree indexed by Fenwick encoding of data keys
- D. A tree using binary indexing for prefix sum queries

Answer: D

Q909. What is a persistent data structure in the context of trees?

- A. A tree that persists on disk rather than in memory
- B. A tree that cannot be modified once it is created
- C. A tree stored in a persistent database management system
- D. A tree that preserves all previous versions after updates

Answer: D

Q910. What is the order of a B-tree?

- A. The total number of keys stored in the entire tree
- B. The maximum number of children each node can have
- C. The minimum number of keys in the root node only
- D. The height of the tree from root to deepest leaf

Answer: B

Q911. What is Tarjan's algorithm used for?

- A. Finding shortest paths in weighted directed graph
- B. Finding minimum spanning tree of an undirected graph
- C. Finding strongly connected components in directed graph
- D. Finding maximum matching in a bipartite graph only

Answer: C

Q912. What is an articulation point in a graph?

- A. A vertex that lies on the shortest path between two nodes
- B. A vertex whose removal disconnects the graph components
- C. A vertex with the highest degree in the entire graph
- D. A vertex that connects two spanning trees together only

Answer: B

Q913. What is the Ford-Fulkerson method?

- A. Computing maximum flow in a flow network iteratively
- B. Finding shortest path between two vertices in a graph
- C. Finding minimum cut in an unweighted undirected graph
- D. Computing minimum spanning tree using edge relaxation

Answer: A

Q914. What is the max-flow min-cut theorem?

- A. Maximum flow equals the minimum cut capacity value
- B. Minimum flow equals the maximum cut capacity value
- C. Maximum cut always exceeds the minimum flow amount
- D. Maximum flow equals minimum number of edges in graph

Answer: A

Q915. What is Kosaraju's algorithm?

- A. A two-pass DFS algorithm for strongly connected components
- B. A dynamic programming approach for all-pairs shortest paths
- C. A greedy algorithm for finding minimum spanning trees
- D. A divide and conquer method for planar graph coloring

Answer: A

Q916. What is a bridge in a graph?

- A. A vertex that connects two separate components together
- B. An edge whose removal disconnects the graph into parts
- C. The shortest edge in the entire graph by edge weight
- D. An edge that forms part of every spanning tree found

Answer: B

Q917. What is the A* search algorithm?

- A. A brute-force search examining all paths exhaustively
- B. A random walk search with probabilistic path selection
- C. An uninformed search using only edge weight for priority
- D. A heuristic-guided search combining cost and estimate

Answer: D

Q918. What is the time complexity of finding all bridges in a graph?

- A. $O(V + E)$
- B. $O(V * E)$
- C. $O(E^2)$
- D. $O(V^2)$

Answer: A

Q919. What is a minimum cut in a graph?

- A. The smallest set of edges whose removal disconnects source from sink
- B. The edge with the minimum weight in the entire graph structure
- C. The minimum number of vertices needed to cover all edges
- D. The shortest path between any two vertices in graph

Answer: A

Q920. What is the Johnson's algorithm for all-pairs shortest paths?

- A. Running Bellman-Ford from every vertex in the given graph
- B. Using Floyd-Warshall with optimized matrix multiplication
- C. Using BFS from each vertex for unweighted graph paths
- D. Reweighting edges then running Dijkstra from each vertex

Answer: D

Q921. What is the matrix chain multiplication problem?

- A. Multiplying all matrices in a chain from left to right
- B. Multiplying chains of numbers using matrix representation
- C. Finding optimal parenthesization to minimize scalar multiplications
- D. Finding the chain of matrices with the largest determinant

Answer: C

Q922. What is the traveling salesman problem (TSP)?

- A. Finding the fastest way to deliver mail in one city only
- B. Finding the shortest route visiting all cities exactly once
- C. Finding the minimum spanning tree of a city road network
- D. Finding the cheapest flight between two specific airports

Answer: B

Q923. What is the time complexity of the DP solution for TSP?

- A. $O(n!)$
- B. $O(n^2 * 2^n)$
- C. $O(n^3)$
- D. $O(2^n)$

Answer: B

Q924. What is the principle of optimality in dynamic programming?

- A. The first feasible solution found is always the optimal one
- B. An optimal solution contains optimal solutions to subproblems
- C. Every subproblem must be solved before the main problem
- D. The optimal solution always uses the greedy choice at start

Answer: B

Q925. What is a randomized algorithm?

- A. An algorithm that only works on randomly generated inputs
- B. An algorithm that uses random numbers to guide decisions
- C. An algorithm that produces random incorrect output values
- D. An algorithm that randomly skips steps for faster speed

Answer: B

Q926. What is the edit distance problem?

- A. Finding the distance between two nodes in an edit graph
- B. Counting the number of edits made to a document over time
- C. Finding minimum operations to transform one string to another
- D. Measuring the physical distance between edit buttons on screen

Answer: C

Q927. What is the difference between Las Vegas and Monte Carlo algorithms?

- A. Las Vegas always gives correct answer; Monte Carlo may not
- B. Monte Carlo always gives correct answer; Las Vegas may not
- C. Both may give wrong answers but differ in probability only
- D. Both always give correct answers but differ in time only

Answer: A

Q928. What is the subset sum problem?

- A. Finding the sum of all elements in a given set of numbers
- B. Partitioning a set into subsets with equal element counts
- C. Determining if a subset exists that sums to a target value
- D. Finding the largest subset with maximum element sum total

Answer: C

Q929. What is the time complexity of the edit distance DP solution?

- A. $O(\max(m, n))$
- B. $O(m^2 * n^2)$
- C. $O(m + n)$
- D. $O(m * n)$

Answer: D

Q930. What is the approximation ratio of a 2-approximation algorithm?

- A. It runs in twice the time of the optimal algorithm speed
- B. It finds a solution at most twice the optimal cost value
- C. It finds a solution exactly half of the optimal cost value
- D. It uses twice the memory of the optimal algorithm space

Answer: B

Q931. What is a van Emde Boas tree?

- A. A BST variant with van Emde Boas balancing rotations
- B. A hash tree using van Emde Boas hashing for collisions
- C. A tree supporting $O(\log \log u)$ operations on integers
- D. A tree named after its visual Van-like branching pattern

Answer: C

Q932. What is a splay tree's working set property?

- A. Elements in the working set are stored in a separate list
- B. The working set of the program determines tree structure
- C. Accessing recently accessed elements is faster than others
- D. Recently accessed elements are always at leaf positions

Answer: C

Q933. What is a link-cut tree?

- A. A binary tree where links between nodes can be toggled
- B. A linked list that can be cut and reconnected efficiently
- C. A tree that measures the number of cuts needed to split
- D. A tree that links and cuts edges to maintain forest paths

Answer: D

Q934. What is the inverse Ackermann function's role in Union-Find?

- A. It generates the sequence of ranks for union operations
- B. It determines the initial size of the disjoint set array
- C. It computes the Ackermann value used for hashing keys
- D. It describes the amortized time per operation with optimizations

Answer: D

Q935. What is a persistent segment tree?

- A. A segment tree stored persistently on disk for backup
- B. A segment tree that persists in memory and never freed
- C. A segment tree that preserves all versions after updates
- D. A segment tree with persistent root node that never changes

Answer: C

Q936. What is a suffix tree?

- A. A binary tree where values are string suffix indices
- B. A tree storing all prefixes of a given input string
- C. A tree that sorts strings by their suffix characters
- D. A compressed trie of all suffixes of a given string

Answer: D

Q937. What is the time complexity to build a suffix array?

- A. $O(n \log^2 n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(n)$

Answer: D

Q938. What is a range tree?

- A. A tree storing ranges of IP addresses for routing
- B. A multi-level tree for orthogonal range queries on points
- C. A binary tree where nodes represent value range intervals
- D. A tree that stores the range of values at each level

Answer: B

Q939. What is the merge operation complexity in a binomial heap?

- A. $O(n \log n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n)$

Answer: B

Q940. What is a weight-balanced tree?

- A. A tree where each node stores its subtree weight for balancing
- B. A tree that assigns weights to nodes based on depth level
- C. A tree balanced by the total data size in each subtree
- D. A tree where all edges have equal weight values assigned

Answer: A

Q941. What is Manacher's algorithm?

- A. An algorithm for computing edit distance in linear time
- B. An algorithm for sorting strings in optimal $O(n \log n)$ time
- C. An algorithm for building suffix trees in constant space
- D. An algorithm for finding all palindromic substrings in $O(n)$

Answer: D

Q942. What is the Aho-Corasick algorithm?

- A. A text indexing algorithm using Aho-style balanced trees
- B. A single-pattern matching algorithm using dynamic tables
- C. A multi-pattern matching algorithm using automaton and trie
- D. A string compression algorithm using coarse approximation

Answer: C

Q943. What is the suffix automaton?

- A. A pushdown automaton that processes suffix expressions
- B. An automaton that generates all possible suffixes randomly
- C. A finite automaton accepting all suffixes of a given string
- D. A deterministic automaton that sorts suffixes alphabetically

Answer: C

Q944. What is the Burrows-Wheeler Transform used for?

- A. Transforming binary data into readable text string format
- B. Sorting strings using Wheeler's specialized comparison
- C. Encrypting strings for secure data transmission purposes
- D. Transforming strings to improve compressibility of data

Answer: D

Q945. What is the LCP array in suffix array construction?

- A. An array mapping each character position to its prefix identifier
- B. An array of longest common prefixes between consecutive sorted suffixes
- C. An array storing the length of each suffix in the original string
- D. An array of least common patterns found across all string suffixes

Answer: B

Q946. What is the time complexity of building a suffix tree using Ukkonen's algorithm?

- A. $O(n^2)$
- B. $O(n^3)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: C

Q947. What is the longest repeated substring problem?

- A. Finding the longest substring that occurs at least twice
- B. Finding the longest string that can be formed by repeating
- C. Finding any substring that repeats in consecutive positions
- D. Finding the substring that appears most frequently overall

Answer: A

Q948. What is the worst-case time of Boyer-Moore algorithm?

- A. $O(n / m)$
- B. $O(n + m)$
- C. $O(n * m)$
- D. $O(n)$

Answer: C

Q949. What is the difference between Rabin-Karp and KMP algorithms?

- A. Rabin-Karp is recursive; KMP is always purely iterative
- B. Rabin-Karp is for numbers; KMP is only for text strings
- C. Rabin-Karp uses hashing; KMP uses prefix table comparison
- D. Rabin-Karp uses sorting; KMP uses dynamic programming tables

Answer: C

Q950. What is the time complexity of computing the Z-array?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n * m)$

Answer: C

Q951. What is Strassen's algorithm and what complexity does it achieve?

- A. A matrix multiplication algorithm achieving $O(n^{2.81})$ time
- B. A string matching algorithm achieving $O(n + m)$ time bound
- C. A graph search algorithm achieving $O(V + E)$ complexity
- D. A sorting algorithm achieving $O(n \log n)$ complexity always

Answer: A

Q952. What is an NP-complete problem?

- A. A problem that can only be solved using nondeterministic steps
- B. A problem that has been completely solved in polynomial time
- C. A problem in NP that is at least as hard as all NP problems
- D. A problem with no possible solution by any known algorithm

Answer: C

Q953. What is the significance of NP-hardness?

- A. NP-hard problems can only be solved using quantum computers
- B. NP-hard problems are easy to solve in polynomial time
- C. NP-hard problems are at least as hard as all problems in NP
- D. NP-hard problems have exactly one unique correct solution

Answer: C

Q954. What is the Cook-Levin theorem?

- A. It proves that SAT is the first NP-complete problem known
- B. It proves that P equals NP for all practical problems
- C. It proves that all NP-hard problems are also in the class P
- D. It proves that no NP problem can be solved in polynomial time

Answer: A

Q955. What is the complexity class PSPACE?

- A. Problems where space equals time complexity for all inputs
- B. Problems requiring exponential space for any solution found
- C. Problems solvable in polynomial time with unlimited space
- D. Problems solvable using polynomial amount of memory space

Answer: D

Q956. What is an FPT (Fixed-Parameter Tractable) algorithm?

- A. An algorithm with fixed running time for all parameter values
- B. An algorithm where exponential cost depends only on parameter k
- C. An algorithm using fixed-point arithmetic for optimization
- D. An algorithm that fixes parameters to reduce space complexity

Answer: B

Q957. What is the gap between P and NP problems practically?

- A. P problems are deterministic; NP problems are always randomized
- B. P problems use less memory; NP problems use more memory only
- C. P problems are solved in seconds; NP takes millennia for large input
- D. There is no practical gap; all NP problems run fast in practice

Answer: C

Q958. What is a polynomial-time reduction?

- A. Reducing the polynomial degree of a time complexity function
- B. Transforming one problem into another in polynomial time steps
- C. Converting exponential algorithms into polynomial ones always
- D. Reducing the running time of any algorithm to polynomial time

Answer: B

Q959. What is the complexity of the best known matrix multiplication algorithm?

- A. $O(n^2)$ matching the lower bound for matrix multiplication
- B. $O(n^3)$ with no improvement possible over standard method
- C. $O(n^{2.373})$ using advanced algebraic technique approaches
- D. $O(n^{2.5})$ using a combination of Strassen and standard methods

Answer: C

Q960. What is the role of reductions in proving NP-completeness?

- A. Reductions simplify NP-complete problems to make them solvable
- B. Reductions convert NP-complete problems into polynomial ones
- C. Reductions eliminate the need to prove problem membership in NP
- D. Reductions show a known NP-complete problem transforms to new one

Answer: D

Q961. What is the solution to the recurrence $T(n) = 2T(n/4) + n$?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: B

Q962. What is the Akra-Bazzi method used for?

- A. Sorting elements in an array
- B. Solving recurrences with unequal subproblem sizes that the Master Theorem cannot handle
- C. Finding shortest paths in graphs
- D. Balancing binary search trees

Answer: B

Q963. In amortized analysis, what does the potential function represent?

- A. The actual cost of each operation
- B. The stored-up energy in the data structure that can pay for future expensive operations
- C. The maximum possible running time
- D. The probability of an expensive operation occurring

Answer: B

Q964. What complexity class does an algorithm with running time $O(n^{\log_2 3})$ belong to when compared to $O(n^2)$?

- A. Faster than $O(n^2)$ since $\log_2 3 \approx 1.585 < 2$
- B. Slower than $O(n^2)$ since $\log_2 3 > 2$
- C. Exactly $O(n^2)$
- D. Incomparable to $O(n^2)$

Answer: A

Q965. What is the smoothed complexity analysis of an algorithm?

- A. Analysis after rounding input sizes to powers of 2
- B. Analysis of the algorithm on inputs with small random perturbations added to worst-case inputs
- C. Analysis that ignores the first n operations
- D. Analysis only on uniformly random inputs

Answer: B

Q966. What is the time complexity of $T(n) = T(n-1) + T(n-2) + O(1)$?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(2^n)$
- D. $O(n \log n)$

Answer: C

Q967. What is the difference between output-sensitive and input-sensitive algorithms?

- A. Output-sensitive algorithms depend on both input and output size, while input-sensitive depend only on input size
- B. They are the same thing
- C. Output-sensitive algorithms are always faster
- D. Input-sensitive algorithms cannot be analyzed

Answer: A

Q968. What is the complexity of $T(n) = T(\lceil n \rceil) + O(1)$ after the substitution $m = \log n$?

- A. $O(\log n)$
- B. $O(\log \log n)$
- C. $O(\lceil n \rceil)$
- D. $O(n)$

Answer: B

Q969. What does the Extended Church-Turing thesis imply about algorithm complexity?

- A. All problems can be solved in polynomial time
- B. Any model of computation can be simulated by a Turing machine with at most a polynomial slowdown
- C. Quantum computers can solve NP-complete problems efficiently
- D. Recursion is always faster than iteration

Answer: B

Q970. What is the worst-case space complexity of a recursive algorithm with branching factor b and depth d ?

- A. $O(b^d)$
- B. $O(b * d)$
- C. $O(d)$
- D. $O(b + d)$

Answer: C

Q971. What is the time complexity of sorting a stack using only one additional stack?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(2^n)$

Answer: C

Q972. What is the time complexity of the LRU cache eviction using a doubly linked list and a hash map?

- A. $O(n)$ for get and $O(1)$ for put
- B. $O(1)$ for both get and put
- C. $O(\log n)$ for both get and put
- D. $O(n)$ for both get and put

Answer: B

Q973. What is a self-organizing list using the move-to-front heuristic?

- A. A list that sorts elements on each access
- B. A list that moves the most recently accessed element to the front
- C. A list that randomly rearranges elements
- D. A list that deletes rarely accessed elements

Answer: B

Q974. What is the worst-case time complexity of the skip list's insertion operation?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n \log n)$

Answer: C

Q975. How does a lock-free concurrent queue typically achieve thread safety?

- A. Using mutexes on every operation
- B. Using Compare-And-Swap (CAS) atomic operations
- C. By making copies of the entire queue for each thread
- D. By allowing only one thread to use the queue

Answer: B

Q976. What is the amortized time complexity of the multipop operation on a stack that pops k elements?

- A. $O(k)$ amortized per multipop
- B. $O(1)$ amortized per element across all operations
- C. $O(n)$ amortized per multipop
- D. $O(k^2)$ amortized per multipop

Answer: B

Q977. What problem does the 'Next Greater Element' algorithm solve using a stack?

- A. Finding the maximum element in an array
- B. For each element, finding the next element in the array that is strictly greater
- C. Sorting the array in descending order
- D. Finding the median of the array

Answer: B

Q978. What is the cache performance advantage of arrays over linked lists?

- A. Arrays support faster deletion
- B. Arrays store elements contiguously in memory, enabling better spatial locality and prefetching
- C. Arrays use less total memory
- D. Arrays have faster pointer operations

Answer: B

Q979. What is the maximum number of elements that can be stored in a circular queue of array size n ?

- A. n
- B. $n - 1$
- C. $n + 1$
- D. $2n$

Answer: B

Q980. What is the time complexity of flattening a multilevel doubly linked list?

- A. $O(n)$ where n is the total number of nodes across all levels
- B. $O(n^2)$
- C. $O(n \log n)$
- D. $O(2^n)$

Answer: A

Q981. What is the minimum number of nodes in a Red-Black tree of height h (counting black height)?

- A. $2^h - 1$
- B. $2^{(h/2)}$
- C. $h + 1$
- D. 2^h

Answer: A

Q982. What is the time complexity of checking if an undirected graph is bipartite?

- A. $O(V^2)$
- B. $O(V + E)$
- C. $O(V * E)$
- D. $O(2^V)$

Answer: B

Q983. How many distinct binary trees can be formed with n nodes?

- A. $n!$
- B. 2^n
- C. The n th Catalan number $C(2n, n)/(n+1)$
- D. n^2

Answer: C

Q984. What is the time complexity of building a min-heap from an array of n elements using the bottom-up approach?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(\log n)$

Answer: C

Q985. What is a multigraph?

- A. A graph with multiple connected components
- B. A graph that allows multiple edges between the same pair of vertices
- C. A graph where all vertices have the same degree
- D. A graph that is both directed and undirected

Answer: B

Q986. What is the constant factor in the upper bound of AVL tree height relative to $\log_2(n)$?

- A. Exactly 1.0
- B. Approximately 1.44
- C. Approximately 2.0
- D. Approximately 0.5

Answer: B

Q987. What is the minimum number of edges to remove to make a connected graph a tree?

- A. $V - 1$
- B. $E - V + 1$
- C. $E - 1$
- D. V

Answer: B

Q988. What property does a B-tree of order m guarantee about node occupancy?

- A. Every node has exactly m children
- B. Every non-root internal node has at least $\text{ceil}(m/2)$ children
- C. Every node has at most 2 children
- D. Leaf nodes store no keys

Answer: B

Q989. What is the isomorphism problem for trees?

- A. Checking if two trees have the same number of nodes
- B. Determining if two trees are structurally identical by finding a bijection between their nodes
- C. Finding the largest common subtree
- D. Checking if a tree is balanced

Answer: B

Q990. What is the graph density and how is it calculated for an undirected simple graph?

- A. The number of vertices divided by the number of edges
- B. $2E / (V(V-1))$, representing the ratio of actual edges to maximum possible edges
- C. $E * V$
- D. V^2 / E

Answer: B

Q991. What is the worst-case time complexity of the Quickselect algorithm?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(n^2)$
- D. $O(\log n)$

Answer: C

Q992. What is the Median of Medians algorithm used for?

- A. Sorting arrays efficiently
- B. Guaranteeing $O(n)$ worst-case selection of the k -th smallest element
- C. Finding the mode of an array
- D. Building a balanced binary search tree

Answer: B

Q993. How can you search in a row-wise and column-wise sorted 2D matrix in optimal time?

- A. Binary search every row: $O(n \log n)$
- B. Start from the top-right corner and eliminate a row or column at each step: $O(n + m)$
- C. Linear search: $O(n * m)$
- D. Sort the entire matrix first: $O(n * m * \log(n * m))$

Answer: B

Q994. What is the time complexity of searching for a key in a sorted and rotated array using modified binary search?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(n)$

Answer: C

Q995. What is a van Emde Boas tree's search time complexity?

- A. $O(\log n)$
- B. $O(\log \log U)$ where U is the universe size
- C. $O(1)$
- D. $O(n)$

Answer: B

Q996. What is the lower bound on the number of comparisons needed for searching in a sorted array?

- A. $O(1)$
- B. $O(\log n)$
- C. $\Omega(\log n)$ — worst case for comparison-based algorithms
- D. $O(n)$

Answer: C

Q997. What is the time complexity of searching in a balanced k-d tree with n points in d dimensions?

- A. $O(n)$
- B. $O(\log n)$ always
- C. $O(n^{1-1/d} + k)$ for range search returning k points
- D. $O(d * n)$

Answer: C

Q998. What is the fractional cascading technique and what speedup does it provide?

- A. It sorts fractional numbers faster
- B. It speeds up searching the same key in k sorted lists from $O(k \log n)$ to $O(k + \log n)$
- C. It divides the search space into fractions
- D. It cascades hash functions for faster lookup

Answer: B

Q999. What is the expected search time in a skip list with n elements?

- A. $O(n)$
- B. $O(n)$
- C. $O(\log n)$ with high probability
- D. $O(1)$

Answer: C

Q1000. What is the time complexity of the A* search algorithm in the worst case?

- A. $O(V + E)$ always
- B. $O(b^d)$ where b is the branching factor and d is the solution depth
- C. $O(V \log V)$
- D. $O(E \log V)$

Answer: B

Q1001. What is the time complexity of TimSort in the worst case?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n \cdot n)$

Answer: B

Q1002. What is the worst-case time complexity of introsort?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n \log^2 n)$
- D. $O(n)$

Answer: B

Q1003. What is the information-theoretic lower bound for comparison-based sorting expressed in terms of comparisons?

- A. n comparisons
- B. $n \log n$ comparisons
- C. $\lceil \log_2(n!) \rceil$ comparisons, which is $\Theta(n \log n)$
- D. n^2 comparisons

Answer: C

Q1004. What is the three-way partitioning (Dutch National Flag) algorithm's advantage for quicksort?

- A. It eliminates the need for recursion
- B. It handles arrays with many duplicate elements efficiently by partitioning into three groups: less, equal, and greater
- C. It always selects the optimal pivot
- D. It reduces space complexity to $O(1)$ for merge sort

Answer: B

Q1005. What is external sorting and when is it used?

- A. Sorting data stored in external variables
- B. Sorting large datasets that do not fit in main memory by using disk-based merge strategies
- C. Sorting data received from external APIs
- D. Sorting arrays using an external library

Answer: B

Q1006. What is the time complexity of patience sorting?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n \cdot n)$

Answer: B

Q1007. How does block sort (WikiSort) achieve $O(n \log n)$ sorting with $O(1)$ extra memory and stability?

- A. By using quicksort internally
- B. By using block-based merging strategies that rotate and swap fixed-size blocks in-place
- C. By sacrificing stability for space efficiency
- D. By using hash tables for comparisons

Answer: B

Q1008. What is the optimal number of comparisons needed to sort 5 elements?

- A. 5
- B. 7
- C. 8
- D. 10

Answer: B

Q1009. What is the worst-case time complexity of the best known gap sequence for shell sort?

- A. $O(n^2)$
- B. $O(n \log^2 n)$
- C. $O(n^{4/3})$
- D. $O(n \log n)$

Answer: C

Q1010. What is a sorting network and what is the depth of the optimal sorting network for n inputs?

- A. A neural network for sorting with $O(n)$ depth
- B. A fixed sequence of comparators; optimal depth is $O(\log^2 n)$ by the AKS network
- C. A graph that represents sorting comparisons; depth is $O(n)$
- D. A distributed system for parallel sorting; depth is $O(n \log n)$

Answer: B

Q1011. What is the expected maximum chain length in a hash table with n elements and n slots using universal hashing?

- A. $O(1)$
- B. $O(\log n / \log \log n)$
- C. $O(n)$
- D. $O(n)$

Answer: B

Q1012. How does cuckoo hashing achieve $O(1)$ worst-case lookup?

- A. By using a single hash function with a large table
- B. By using two hash functions and two tables, where each key is in exactly one of two possible locations
- C. By sorting the keys before inserting
- D. By maintaining a sorted linked list at each slot

Answer: B

Q1013. What is the false positive rate of a Bloom filter with m bits, k hash functions, and n inserted elements?

- A. $(1 - e^{-(kn/m)})^k$ approximately
- B. k/m
- C. n/m
- D. $1 - (1 - 1/m)^n$

Answer: A

Q1014. What is consistent hashing and why is it important in distributed systems?

- A. A hash function that always returns the same value
- B. A technique where adding or removing a server only requires remapping $O(K/n)$ keys on average, where K is keys and n is servers
- C. Hashing that guarantees zero collisions
- D. A hash function that works across different programming languages

Answer: B

Q1015. What is the amortized insertion time of cuckoo hashing?

- A. $O(1)$ amortized
- B. $O(\log n)$ amortized
- C. $O(n)$ amortized
- D. $O(n^2)$ amortized

Answer: A

Q1016. What is a minimal perfect hash function?

- A. A hash function with minimal computation
- B. A hash function that maps n keys to n consecutive integers with no collisions
- C. The simplest possible hash function
- D. A hash function that only works for small inputs

Answer: B

Q1017. What is the count-min sketch data structure used for?

- A. Exact counting of elements
- B. Approximate frequency estimation of elements in a data stream using sub-linear space
- C. Sorting elements by frequency
- D. Storing minimum and maximum values

Answer: B

Q1018. What is tabulation hashing and what property does it guarantee?

- A. A hash function stored in a table that guarantees $O(n \log n)$ sorting
- B. A hash function that XORs values from lookup tables for each byte of the key, providing 3-wise independence
- C. A hashing method that creates a truth table
- D. A method of hashing that only works for table-structured data

Answer: B

Q1019. What is the space complexity of a Bloom filter achieving false positive rate ϵ ?

- A. $O(n)$
- B. $O(n \log(1/\epsilon))$
- C. $O(1/\epsilon)$
- D. $O(n^2)$

Answer: B

Q1020. What is Robin Hood hashing's key invariant?

- A. Each slot has exactly one element
- B. Elements with longer probe distances displace elements with shorter probe distances to equalize probe lengths
- C. The hash table is always sorted
- D. Each element is hashed twice

Answer: B

Q1021. What is the time complexity of LCA computation using Euler tour and sparse table after $O(n \log n)$ preprocessing?

- A. $O(\log n)$ per query
- B. $O(1)$ per query
- C. $O(n)$ per query
- D. $O(n^2)$ per query

Answer: B

Q1022. What is Heavy-Light Decomposition (HLD) used for?

- A. Balancing binary trees
- B. Decomposing a tree into chains so that any root-to-leaf path crosses $O(\log n)$ chains, enabling efficient path queries
- C. Finding the heaviest subtree
- D. Removing heavy nodes from the tree

Answer: B

Q1023. Without lazy propagation, what is the time complexity of a range update on a segment tree, and how does lazy propagation improve it?

- A. $O(n)$ without, $O(\log n)$ with lazy propagation
- B. $O(n \log n)$ without, $O(n)$ with lazy propagation
- C. $O(\log n)$ without, $O(1)$ with lazy propagation
- D. Both are $O(n)$

Answer: A

Q1024. What is the amortized time complexity of splay tree operations?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n)$

Answer: B

Q1025. What is a Fenwick tree's advantage over a segment tree?

- A. Fenwick trees support more operations
- B. Fenwick trees use less memory (n elements vs $4n$) and have smaller constant factors while supporting prefix operations
- C. Fenwick trees have better worst-case complexity
- D. Fenwick trees support range updates natively

Answer: B

Q1026. How much extra space does each update operation use in a persistent segment tree?

- A. $O(1)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(n \log n)$

Answer: C

Q1027. What is the Centroid Decomposition of a tree used for?

- A. Finding the center of mass of weighted nodes
- B. Recursively finding and removing centroids to create a decomposition tree enabling efficient path-based queries
- C. Balancing unbalanced trees
- D. Finding the median node

Answer: B

Q1028. What is the time complexity of range update and point query in a Fenwick tree?

- A. $O(n)$ for each
- B. $O(\log n)$ for each
- C. $O(1)$ for update, $O(n)$ for query
- D. $O(n \log n)$ for each

Answer: B

Q1029. What is the time complexity of constructing an optimal BST given n keys with known access probabilities?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(n^3)$
- D. $O(2^n)$

Answer: C

Q1030. How does a treap maintain both BST and heap properties simultaneously?

- A. By using two separate trees
- B. Each node has a key (BST-ordered) and a random priority (heap-ordered); rotations maintain both properties
- C. By sorting elements twice
- D. By storing elements in two arrays

Answer: B

Q1031. What is the time complexity of Tarjan's algorithm for finding strongly connected components?

- A. $O(V^2)$
- B. $O(V + E)$
- C. $O(V * E)$
- D. $O(V^3)$

Answer: B

Q1032. According to the duality principle in network flow, what is equal to the capacity of the minimum s - t cut?

- A. The number of edges in the graph
- B. The maximum flow from source s to sink t
- C. The minimum spanning tree weight
- D. The number of vertices on the shortest path

Answer: B

Q1033. What is the time complexity of the Edmonds-Karp algorithm for maximum flow?

- A. $O(V * E)$
- B. $O(V * E^2)$
- C. $O(V^2 * E)$
- D. $O(V^3)$

Answer: C

Q1034. What is an Euler path in a graph?

- A. A path that visits every vertex exactly once
- B. A path that traverses every edge exactly once
- C. The shortest path between two vertices
- D. A path with minimum total weight

Answer: B

Q1035. What is the time complexity of finding all articulation points in an undirected graph?

- A. $O(V^2)$
- B. $O(V + E)$
- C. $O(V * E)$
- D. $O(E^2)$

Answer: B

Q1036. What is Johnson's algorithm for all-pairs shortest paths?

- A. Running Dijkstra from every vertex without preprocessing
- B. Reweighting edges using Bellman-Ford to eliminate negative weights, then running Dijkstra from every vertex
- C. Using Floyd-Warshall on a reduced graph
- D. A divide-and-conquer approach for shortest paths

Answer: B

Q1037. What is a Hamiltonian path and why is finding one computationally hard?

- A. A shortest path in a weighted graph, solvable in polynomial time
- B. A path visiting every vertex exactly once; the decision problem is NP-complete
- C. A path traversing every edge exactly once; solvable in $O(V + E)$
- D. The longest path in a tree

Answer: B

Q1038. What is the Dinic's algorithm time complexity for maximum flow?

- A. $O(V * E)$
- B. $O(V^2 * E)$
- C. $O(V * E^2)$
- D. $O(V^3)$

Answer: B

Q1039. What is the 2-SAT problem and how is it related to graph algorithms?

- A. Finding two satisfying assignments using brute force
- B. A satisfiability problem solvable in polynomial time by building an implication graph and finding SCCs
- C. A graph coloring problem
- D. An NP-complete problem with no efficient solution

Answer: B

Q1040. What is the time complexity of finding a minimum spanning tree using Borůvka's algorithm?

- A. $O(V^2)$
- B. $O(E \log V)$
- C. $O(V + E)$
- D. $O(E \log E)$

Answer: B

Q1041. What is the time complexity of the matrix chain multiplication DP solution?

- A. $O(n^2)$
- B. $O(n^3)$
- C. $O(2^n)$
- D. $O(n \log n)$

Answer: B

Q1042. How does the meet-in-the-middle technique reduce the Subset Sum time from $O(2^n)$ to approximately $O(2^{(n/2)})$?

- A. By sorting the subsets before checking
