- B. By splitting elements into two halves, enumerating all sums in each half, then combining using binary search or hashing
- C. By using dynamic programming instead of brute force
- D. By reducing the problem to a graph problem

Answer: B

Q1043. What is the difference between Las Vegas and Monte Carlo randomized algorithms?

- A. Las Vegas algorithms are deterministic
- B. Las Vegas algorithms always produce correct results (with variable runtime), while Monte Carlo may produce incorrect results (with bounded runtime)
- C. Monte Carlo algorithms are always faster
- D. They are the same type of algorithm

Answer: B

Q1044. What is the time complexity of solving the edit distance problem using DP?

- A. $O(n)$
- B. $O(n * m)$
- C. $O(n^3)$
- D. $O(2^n)$

Answer: B

Q1045. Which of the following problems violates Bellman's principle of optimality and therefore cannot be solved by standard DP?

- A. Shortest path problem
- B. Longest simple path in a general graph
- C. Matrix chain multiplication
- D. Edit distance

Answer: B

Q1046. What is the time complexity of the Held-Karp algorithm for the Traveling Salesman Problem?

- A. $O(n!)$
- B. $O(n^2 * 2^n)$
- C. $O(n^3)$
- D. $O(2^n)$

Answer: B

Q1047. What is the Knuth optimization for DP?

- A. Using hash tables for memoization
- B. An optimization for DP problems with the property that the optimal split point is monotone, reducing $O(n^3)$ to $O(n^2)$
- C. Parallelizing DP computations
- D. Converting recursion to iteration

Answer: B

Q1048. What is the Convex Hull Trick optimization in dynamic programming?

- A. Finding the convex hull of points
- B. An optimization for DP transitions of the form $dp[i] = \min(dp[j] + b[j] * a[i])$ using a set of lines
- C. Computing convex combinations of solutions
- D. A geometric algorithm for nearest neighbors

Answer: B

Q1049. What is the difference between online and offline algorithms?

- A. Online algorithms require internet access
- B. Online algorithms process input piece by piece as it arrives, while offline algorithms have access to the entire input upfront
- C. Offline algorithms are always slower
- D. Online algorithms cannot be analyzed

Answer: B

Q1050. What is the time complexity of solving the Subset Sum problem using DP?

- A. $O(n * S)$ where S is the target sum (pseudo-polynomial)
- B. $O(2^n)$
- C. $O(n^2)$
- D. $O(n \log n)$

Answer: A

Q1051. What is a van Emde Boas tree's space complexity?

- A. $O(n)$
- B. $O(U)$ where U is the universe size
- C. $O(\log U)$
- D. $O(n \log n)$

Answer: B

Q1052. What is a rope data structure and what advantage does it offer over arrays for string operations?

- A. A compressed string format
- B. A balanced binary tree of strings that supports $O(\log n)$ concatenation, split, and insertion instead of $O(n)$ for arrays
- C. A linked list of characters
- D. An encrypted string storage

Answer: B

Q1053. What is the order-statistic tree and what additional information does it maintain?

- A. A tree that only stores statistics
- B. An augmented BST that stores subtree sizes to support $O(\log n)$ rank and select queries
- C. A tree that orders nodes by creation time
- D. A tree that counts the number of queries

Answer: B

Q1054. What is a wavelet tree used for?

- A. Audio signal processing
- B. Answering rank, select, and range frequency queries on sequences in $O(\log \sigma)$ where σ is the alphabet size
- C. Compressing images
- D. Sorting wavelets

Answer: B

Q1055. Which underlying data structure does the link-cut tree use internally to maintain preferred paths?

- A. Red-Black trees
- B. AVL trees
- C. Splay trees
- D. B-trees

Answer: C

Q1056. How much space does a succinct data structure use relative to the information-theoretic minimum Z ?

- A. $O(Z)$ bits
- B. $Z + o(Z)$ bits, meaning within a lower-order additive term of the minimum
- C. Exactly Z bits
- D. $2Z$ bits

Answer: B

Q1057. What is a suffix tree and how does it relate to a suffix array?

- A. They are completely unrelated data structures
- B. A suffix tree is a compressed trie of all suffixes; a suffix array stores the same suffixes sorted, and they can be converted between in $O(n)$ time
- C. A suffix array is always preferred over a suffix tree
- D. A suffix tree stores prefix information while a suffix array stores suffix information

Answer: B

Q1058. What is the time complexity of the decrease-key operation in a Fibonacci heap?

- A. $O(\log n)$ amortized
- B. $O(1)$ amortized
- C. $O(n)$
- D. $O(\log \log n)$

Answer: B

Q1059. What is an x-fast trie and what time complexity does it achieve for predecessor queries?

- A. $O(\log n)$
- B. $O(\log \log U)$ using hash tables at each level of a binary trie over the universe
- C. $O(1)$
- D. $O(n)$

Answer: B

Q1060. What is the weight-balanced tree's balance condition?

- A. Left and right subtrees have equal height
- B. The ratio of sizes of left and right subtrees is bounded by a constant ; $\frac{1}{2} \leq \frac{B}{L} \leq 2$
- C. Each node has the same weight
- D. The total weight equals n

Answer: B

Q1061. What is the time complexity of Manacher's algorithm for finding the longest palindromic substring?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n^3)$

Answer: C

Q1062. What is the Aho-Corasick algorithm's time complexity for matching k patterns of total length m against a text of length n ?

- A. $O(n * k)$
- B. $O(n + m + z)$ where z is the number of matches
- C. $O(n * m)$
- D. $O(k * m * n)$

Answer: B

Q1063. What is the suffix automaton of a string?

- A. An automaton that accepts only the suffixes of the string
- B. A minimal DFA that accepts exactly all substrings of the string, built in $O(n)$ time and space
- C. An automaton that generates all permutations
- D. A finite automaton for sorting strings

Answer: B

Q1064. What is the Burrows-Wheeler Transform (BWT) primarily used for?

- A. Encrypting strings for security
- B. Rearranging a string to group similar characters together, enabling better compression
- C. Sorting strings in reverse order
- D. Finding palindromes in strings

Answer: B

Q1065. What key optimization technique does Ukkonen's suffix tree algorithm use to achieve linear time?

- A. Hash tables for each node
- B. Suffix links, implicit extensions, and the active point trick to avoid redundant traversal
- C. Divide and conquer on the string
- D. Binary search on suffix positions

Answer: B

Q1066. How can the number of distinct substrings of a string be computed using a suffix array and LCP array?

- A. Count = $n(n+1)/2$
- B. Count = $n(n+1)/2$ - sum of all LCP values
- C. Count = sum of all LCP values
- D. Count = n^2

Answer: B

Q1067. What is the worst-case time complexity of the Boyer-Moore algorithm?

- A. $O(n/m)$
- B. $O(n + m)$
- C. $O(n * m)$
- D. $O(n)$

Answer: C

Q1068. What is the LCP (Longest Common Prefix) array and how is it used with suffix arrays?

- A. An array of string lengths
- B. $LCP[i]$ stores the length of the longest common prefix between the i -th and $(i-1)$ -th sorted suffixes; it enables efficient pattern matching and string analysis
- C. An array of character frequencies
- D. An array mapping characters to positions

Answer: B

Q1069. What is the time complexity of the Kasai algorithm for constructing the LCP array from a suffix array?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n * m)$

Answer: C

Q1070. What is the palindromic tree (Eertree) data structure?

- A. A binary tree of palindrome lengths
- B. A data structure that stores all distinct palindromic substrings of a string in $O(n)$ time and space
- C. A trie of reversed strings
- D. A balanced BST of palindromes

Answer: B

Q1071. What is Cook's theorem and its significance?

- A. It proves $P = NP$
- B. It proves that the Boolean satisfiability problem (SAT) is NP-complete, establishing the first NP-complete problem
- C. It proves that all NP problems are unsolvable
- D. It provides a polynomial algorithm for SAT

Answer: B

Q1072. What is pseudo-polynomial time and why is it misleading?

- A. It is polynomial time disguised as exponential
- B. An algorithm runs in time polynomial in the numeric value of the input but exponential in the input size (number of bits)
- C. It is always faster than polynomial time
- D. It means the algorithm is approximately polynomial

Answer: B

Q1073. What is the complexity class co-NP?

- A. Problems whose complements are in P
- B. Problems whose complements are in NP; equivalently, problems with polynomial-time disproofs
- C. Problems harder than NP
- D. Problems that are not in NP

Answer: B

Q1074. What fundamental consequence does the time hierarchy theorem have for the P vs NP question?

- A. It proves $P = NP$
- B. It proves that strictly more time allows solving strictly more problems, implying $P \neq EXPTIME$
- C. It shows all problems are equally hard
- D. It proves $NP = PSPACE$

Answer: B

Q1075. What is the best known time complexity for matrix multiplication of two $n \times n$ matrices?

- A. $O(n^3)$
- B. $O(n^{2.807})$ (Strassen)
- C. $O(n^{2.371})$ approximately (current best)
- D. $O(n^2)$

Answer: C

Q1076. What is a Fixed-Parameter Tractable (FPT) algorithm?

- A. An algorithm with fixed running time
- B. An algorithm with time $O(f(k) * n^c)$ where k is a parameter, f is any computable function, and c is a constant independent of k
- C. An algorithm that fixes errors in parameters
- D. An algorithm with $O(n)$ time for any parameters

Answer: B

Q1077. What is the role of polynomial-time reductions in proving NP-completeness?

- A. They simplify the problem to make it solvable
- B. They show that if problem A reduces to problem B in polynomial time and A is NP-hard, then B is also NP-hard
- C. They reduce the time complexity of algorithms
- D. They convert NP problems to P problems

Answer: B

Q1078. What is the PSPACE complexity class?

- A. Problems solvable in polynomial time
- B. Problems solvable using polynomial space on a deterministic Turing machine
- C. Problems that use no space at all
- D. Problems solvable on parallel computers

Answer: B

Q1079. What is the approximation ratio and when is it used?

- A. The ratio of input size to output size
- B. For NP-hard optimization problems, the ratio of the algorithm's solution value to the optimal solution value, guaranteed to be within a bound
- C. The ratio of time complexity to space complexity
- D. The ratio of average case to worst case complexity

Answer: B

Q1080. What is the Exponential Time Hypothesis (ETH) and what does it imply?

- A. All problems require exponential time
- B. 3-SAT cannot be solved in $2^{o(n)}$ time, implying many NP-hard problems have no sub-exponential algorithms
- C. $P = NP$ is true
- D. Exponential algorithms are always impractical

Answer: B

SUBJECT

Operating Systems

1,080 Multiple Choice Questions

Operating Systems — Easy

360 questions

Q1. What is an operating system?

- A. System software that manages hardware and resources
- B. A physical component installed inside the computer
- C. A programming language for writing source code
- D. An application designed for end-user productivity

Answer: A

Q2. Which of the following is NOT a function of an operating system?

- A. Process management
- B. File system management
- C. Compiling user programs
- D. Memory management

Answer: C

Q3. Which of the following is an example of a mobile operating system?

- A. Android mobile OS
- B. Ubuntu desktop OS
- C. MS-DOS legacy OS
- D. Windows Server OS

Answer: A

Q4. What does the term 'booting' mean in the context of operating systems?

- A. Shutting down the computer safely
- B. Loading the OS into main memory
- C. Formatting the hard disk drive
- D. Installing new software packages

Answer: B

Q5. In a batch operating system, jobs are processed:

- A. Sequentially in submitted order
- B. Based on assigned priority
- C. Randomly without any order
- D. Simultaneously on all cores

Answer: A

Q6. Which type of operating system allows multiple users to use the computer simultaneously?

- A. Single-user OS
- B. Embedded OS
- C. Batch-job OS
- D. Time-sharing OS

Answer: D

Q7. The interface between the user and the operating system is called:

- A. The BIOS
- B. The API
- C. Shell
- D. Kernel

Answer: C

Q8. Which of the following is a real-time operating system characteristic?

- A. It does not support multitasking at all
- B. It only supports one single user at once
- C. It processes all jobs in large batches
- D. It guarantees response within strict time

Answer: D

Q9. UNIX was originally developed at:

- A. IBM Corporation
- B. Apple Computer
- C. AT&T Bell Labs
- D. Microsoft Research

Answer: C

Q10. The core component of an operating system is called the:

- A. Terminal
- B. Kernel
- C. Desktop
- D. Shell

Answer: B

Q11. Which of the following is a type of system call?

- A. Compiler optimization
- B. Syntax validation
- C. Process control
- D. Code refactoring

Answer: C

Q12. In a layered OS structure, the innermost layer is:

- A. Hardware layer
- B. Applications
- C. File systems
- D. User interface

Answer: A

Q13. Which of the following is an example of a command-line interpreter?

- A. Microsoft Word
- B. Bash shell
- C. Google Chrome
- D. Windows Explorer

Answer: B

Q14. System programs provide:

- A. Direct access to hardware resources
- B. Environment for program development
- C. Only file management service calls
- D. Gaming and multimedia functionality

Answer: B

Q15. The OS component that provides a graphical way to interact with the computer is called:

- A. SDK
- B. CLI
- C. API
- D. GUI

Answer: D

Q16. Which system call is used to create a new process in UNIX?

- A. exec()
- B. open()
- C. fork()
- D. wait()

Answer: C

Q17. A monolithic kernel is one where:

- A. The entire OS runs as one kernel program
- B. The OS is divided into separate modules
- C. Only the scheduler runs in kernel mode
- D. Each function runs as a separate process

Answer: A

Q18. Which of the following manages how data is stored and retrieved on a disk?

- A. Network manager
- B. File system
- C. Memory manager
- D. Process manager

Answer: B

Q19. What is the role of device drivers in an OS?

- A. To interface between the OS and hardware
- B. To manage user accounts and passwords
- C. To compile programs into machine code
- D. To execute user-level application programs

Answer: A

Q20. Linux is an example of which type of kernel?

- A. Monolithic kernel
- B. Nanokernel design
- C. Microkernel design
- D. Hybrid kernel

Answer: A

Q21. A process is:

- A. A single CPU register
- B. A program in execution
- C. A file held in memory
- D. A program stored on disk

Answer: B

Q22. Which of the following is NOT a state of a process?

- A. Compiling
- B. Ready
- C. Waiting
- D. Running

Answer: A

Q23. The Process Control Block (PCB) contains:

- A. Only the executable program code of the process
- B. Process state, program counter, CPU registers, etc
- C. Only the virtual and physical memory addresses
- D. Only the process name and its unique identifier

Answer: B

Q24. What system call creates a new process in UNIX/Linux?

- A. new()
- B. spawn()
- C. create()
- D. fork()

Answer: D

Q25. A context switch occurs when:

- A. A file is saved to secondary storage
- B. The user logs out of the session
- C. The CPU switches between processes
- D. A new program is installed on disk

Answer: C

Q26. An orphan process is:

- A. A process that has no memory allocated
- B. A child process whose parent has terminated
- C. A process that is waiting for I/O
- D. A process that is in the ready queue

Answer: B

Q27. A zombie process is:

- A. A process that is stuck inside an infinite loop
- B. A process running with very high execution priority
- C. A terminated process whose exit status is uncollected
- D. A process consuming excessive CPU cycles continuously

Answer: C

Q28. The program counter in a process stores:

- A. The address of the next instruction to execute
- B. The scheduling priority assigned to the process
- C. The total amount of memory currently in use
- D. The total count of programs currently running

Answer: A

Q29. Inter-process communication (IPC) allows:

- A. A process to access hardware directly
- B. A process to run faster on the CPU
- C. A process to compile source code files
- D. Processes to exchange data and synchronize

Answer: D

Q30. When a fork() system call is executed successfully, what does it return to the child process?

- A. Parent PID value
- B. Zero is returned
- C. Child PID value
- D. Negative one val

Answer: B

Q31. CPU scheduling decides:

- A. How much memory to allocate to each process
- B. Which ready process gets the CPU execution next
- C. Which files to open for the running processes
- D. Which device to use for the I/O operations

Answer: B

Q32. In First-Come, First-Served (FCFS) scheduling, processes are executed:

- A. In the order they arrive in the queue
- B. Based on their assigned priority level
- C. With the shortest job running first
- D. Randomly without any specific order

Answer: A

Q33. Turnaround time of a process is defined as:

- A. Total time from submission to completion of process
- B. Time the process spends waiting in the ready queue
- C. Time spent performing input and output operations
- D. Time the CPU is busy executing process instructions

Answer: A

Q34. Waiting time of a process is:

- A. The total time from arrival to completion
- B. The time spent waiting in the ready queue
- C. The time spent in I/O operations
- D. The time spent executing on the CPU

Answer: B

Q35. Round Robin scheduling uses:

- A. Random process allocation
- B. Longest job first execution
- C. A fixed time quantum per process
- D. Priority-based CPU allocation

Answer: C

Q36. Preemptive scheduling means:

- A. The OS can interrupt and reassign the CPU to another
- B. Processes schedule themselves without any OS control
- C. Only one process can ever run at a time on the CPU
- D. A process always runs until it completes execution

Answer: A

Q37. Non-preemptive scheduling means:

- A. The CPU can be taken away from a running process at any time
- B. Once a process starts, it runs until it finishes or blocks
- C. The scheduler never runs and the CPU sits idle indefinitely
- D. Multiple processes share the CPU at the same exact instant

Answer: B

Q38. Which scheduling algorithm gives the minimum average waiting time for a given set of processes?

- A. First-Come First-Served
- B. Priority Scheduling
- C. Shortest Job First SJF
- D. Round Robin scheduling

Answer: C

Q39. The dispatcher is responsible for:

- A. Selecting the next process to execute on CPU
- B. Managing main memory allocation for process
- C. Giving control of CPU to the selected process
- D. Handling file system operations for process

Answer: C

Q40. CPU utilization refers to:

- A. The number of processes completed per unit time
- B. The number of context switches performed per second
- C. The percentage of time the CPU is busy executing
- D. The total time a process waits in the ready queue

Answer: C

Q41. A thread is:

- A. A type of volatile memory block
- B. A lightweight execution unit in process
- C. A physical hardware component part
- D. A complete standalone process

Answer: B

Q42. Threads within the same process share all of the following EXCEPT:

- A. Data section
- B. Stack space
- C. Open files
- D. Code section

Answer: B

Q43. What is the main advantage of using threads over processes?

- A. Threads can run on different machines
- B. Threads are inherently more secure overall
- C. Thread creation and switching are faster
- D. Threads use significantly more memory

Answer: C

Q44. User-level threads are managed by:

- A. The file system layer
- B. A user-level thread library
- C. The hardware platform
- D. The kernel directly

Answer: B

Q45. Kernel-level threads are managed by:

- A. A web browser
- B. A compiler tool
- C. User applications
- D. The OS kernel

Answer: D

Q46. Multithreading benefits include all EXCEPT:

- A. Resource sharing across threads
- B. Responsiveness to user input
- C. Economy of creation and switching
- D. Guaranteed elimination of bugs

Answer: D

Q47. POSIX Pthreads is:

- A. A standard API for thread management
- B. A file system for multithreading
- C. A hardware component for threads
- D. An operating system distribution

Answer: A

Q48. In a single-threaded process, how many threads of control exist?

- A. One thread
- B. Many threads
- C. Two threads
- D. Zero threads

Answer: A

Q49. Which of the following is a benefit of multithreading in web server applications?

- A. It handles multiple client requests concurrently
- B. It reduces overall system security
- C. It simplifies the server source code logic
- D. It eliminates the need for any networking

Answer: A

Q50. A process can contain:

- A. One or more threads
- B. No threads at all
- C. Only two threads
- D. Only one thread

Answer: A

Q51. A race condition occurs when:

- A. Two processes have the same scheduling priority level
- B. Outcome depends on execution order of shared data access
- C. A process runs too fast for the system to handle
- D. Two processes run on the CPU simultaneously

Answer: B

Q52. The critical section is:

- A. The most important section of a running program
- B. Code segment accessing shared resources exclusively
- C. The first section executed when a program starts
- D. A section within the operating system kernel code

Answer: B

Q53. Mutual exclusion means:

- A. Processes must exclude each other from the system
- B. Two processes can be in critical sections at once
- C. No process is ever allowed to enter any section
- D. Only one process can be in its critical section

Answer: D

Q54. A mutex lock is:

- A. A hardware component on the motherboard
- B. A type of running process in the system
- C. A synchronization tool using acquire and release
- D. A type of physical memory module

Answer: C

Q55. A semaphore is:

- A. A type of hardware interrupt signal
- B. A CPU scheduling algorithm technique
- C. A type of boolean flag variable
- D. A variable accessed via wait and signal

Answer: D

Q56. A binary semaphore can have values:

- A. Only negative value range
- B. Any positive integer value
- C. Only zero and one values
- D. Any integer value at all

Answer: C

Q57. A counting semaphore can have values:

- A. Any non-negative integer value
- B. Only negative value ranges
- C. Only zero and one values
- D. Unrestricted integer domain

Answer: D

Q58. Busy waiting (spinlock) means:

- A. A process is waiting for I/O completion
- B. A process is terminated by the operating system
- C. A process continuously loops testing a condition
- D. A process is sleeping and waiting for a signal

Answer: C

Q59. What are the three requirements for a solution to the critical section problem?

- A. Atomicity, consistency, and isolation
- B. Fairness, priority, and preemption
- C. Mutual exclusion, progress, bounded waiting
- D. Speed, efficiency, and simplicity

Answer: C

Q60. The wait() operation on a semaphore is also known as:

- A. P operation (proberen)
- B. V operation (verhogen)
- C. Lock operation call
- D. Signal operation call

Answer: A

Q61. A deadlock occurs when:

- A. Processes wait indefinitely for resources held by each other
- B. A process enters an infinite loop consuming all CPU time
- C. The CPU is overloaded with too many running processes
- D. A process terminates unexpectedly due to an error

Answer: A

Q62. How many necessary conditions must hold simultaneously for a deadlock to occur?

- A. Three
- B. Four
- C. Two
- D. Five

Answer: B

Q63. Which of the following is NOT a necessary condition for deadlock?

- A. Mutual exclusion
- B. Hold and wait
- C. Circular wait
- D. Preemption

Answer: D

Q64. The 'hold and wait' condition means:

- A. A process waits without holding any resource
- B. A process holds no resources at all currently
- C. A process releases all resources before waiting
- D. A process holds resources while waiting for more

Answer: D

Q65. Circular wait means:

- A. Processes are scheduled in a circular fashion
- B. Each process waits for the next, forming a cycle
- C. Processes simply wait in a standard queue
- D. Only one single process is actively waiting

Answer: B

Q66. Deadlock prevention works by:

- A. Ignoring deadlocks entirely and hoping they pass
- B. Ensuring at least one necessary condition fails
- C. Recovering from deadlocks by terminating tasks
- D. Detecting deadlocks after they already occurred

Answer: B

Q67. A resource allocation graph is used to:

- A. Display the memory layout of processes
- B. Represent resource allocation and requests
- C. Show the CPU scheduling execution order
- D. Show the file system directory structure

Answer: B

Q68. If a resource allocation graph has no cycle, then:

- A. Deadlock definitely exists in system
- B. Deadlock may or may not exist here
- C. Deadlock definitely does not exist
- D. The resource allocation graph invalid

Answer: C

Q69. Deadlock avoidance requires:

- A. Advance info about resource requests
- B. Using only one resource at a time
- C. Killing processes periodically needed
- D. No additional information at all

Answer: A

Q70. The Banker's Algorithm is used for:

- A. Checking if granting request is safe
- B. Processing banking transactions safely
- C. Memory allocation for new processes
- D. CPU scheduling of running processes

Answer: A

Q71. Main memory (RAM) is:

- A. Volatile storage the CPU accesses directly
- B. A backup device for storing archives
- C. Non-volatile persistent storage on disk
- D. A type of secondary storage for backup

Answer: A

Q72. Logical address is:

- A. The network address assigned to a device
- B. An address generated by CPU for translation
- C. The physical location in hardware memory
- D. The address of data on the hard disk drive

Answer: B

Q73. Physical address is:

- A. An address generated by the CPU logic
- B. A virtual address used by programs
- C. An IP address on the local network
- D. The actual address in memory hardware

Answer: D

Q74. The Memory Management Unit (MMU) is responsible for:

- A. Managing I/O device controllers
- B. Scheduling processes on the CPU
- C. Translating logical to physical addresses
- D. Managing the file system on disk

Answer: C

Q75. Paging divides:

- A. The disk into sectors and track clusters
- B. Processes into variable-size logical segments
- C. Physical memory into frames, logical into pages
- D. The CPU into separate processing partitions

Answer: C

Q76. A page table stores:

- A. CPU register contents
- B. File names and paths
- C. Process priority values
- D. Page to frame mappings

Answer: D

Q77. External fragmentation occurs when:

- A. The disk is completely full and cannot store data
- B. The allocated pages are much too large for use
- C. Internal memory within blocks is wasted by padding
- D. Free memory is scattered, cannot satisfy requests

Answer: D

Q78. Internal fragmentation occurs when:

- A. No memory is available to allocate to processes
- B. The file system is corrupted and cannot allocate blocks
- C. Allocated block is larger than requested, wasting space
- D. Free memory is scattered in small pieces across RAM

Answer: C

Q79. Virtual memory allows:

- A. Only one process to run at any given time
- B. Programs larger than physical memory to execute
- C. Faster CPU execution by clock overclocking
- D. Direct access to underlying hardware devices

Answer: B

Q80. A page fault occurs when:

- A. A referenced page is not in physical memory
- B. A page has become corrupted in memory
- C. The page table is completely full of entries
- D. A page is too large to fit in any frame

Answer: A

Q81. A file is:

- A. A physical storage device like a hard drive
- B. A hardware component on the computer motherboard
- C. A type of process running in the operating system
- D. A named collection of data on secondary storage

Answer: D

Q82. A directory in a file system:

- A. Is the same as a disk partition or volume
- B. Contains file info like names and locations
- C. Is a file type that stores only text content
- D. Stores raw data directly on the disk surface

Answer: B

Q83. Which file access method reads records in order, one after another?

- A. Random access
- B. Indexed access
- C. Sequential access
- D. Direct access

Answer: C

Q84. The absolute path of a file starts from:

- A. The root directory
- B. The home directory
- C. The current directory
- D. The parent directory

Answer: A

Q85. File attributes typically include:

- A. Name, type, size, location, timestamps
- B. Only the file creation date stored
- C. Only the file size in bytes stored
- D. Only the file name string value

Answer: A

Q86. An inode in UNIX/Linux file systems stores:

- A. Metadata: permissions, size, pointers
- B. The actual file content data itself
- C. The file name string value
- D. The directory name for this entry

Answer: A

Q87. A hard link in UNIX:

- A. Creates a complete copy of the original file
- B. Links to a file located on another disk drive
- C. Creates a shortcut file with a different path
- D. Creates another entry pointing to same inode

Answer: D

Q88. A symbolic (soft) link is:

- A. A compressed version of original file
- B. A file containing path to another file
- C. A full copy of the original source file
- D. The same as a hard link to a file

Answer: B

Q89. File system mounting is the process of:

- A. Deleting a file system from a partition
- B. Compressing a file system for archiving
- C. Creating a new file system on disk
- D. Making a file system accessible at a point

Answer: D

Q90. FAT (File Allocation Table) file system uses:

- A. Inodes for each file entry
- B. A table of linked block lists
- C. Hash tables for fast lookup
- D. B-trees for indexing entries

Answer: B

Q91. Secondary storage refers to:

- A. Processor register files
- B. Non-volatile storage like disks
- C. Random access memory chips
- D. CPU cache memory modules

Answer: B

Q92. A hard disk drive (HDD) stores data on:

- A. Flash memory components
- B. Semiconductor memory chips
- C. Rotating magnetic platters
- D. Optical disc technology

Answer: C

Q93. Seek time in a disk drive is:

- A. Time for the disk to spin to correct sector
- B. Time to transfer requested data from disk
- C. Time for the head to move to correct track
- D. Time to process and queue the I/O request

Answer: C

Q94. Rotational latency is:

- A. Time to start the disk motor from stopped
- B. Time for desired sector to rotate under head
- C. Time for the head to move to correct track
- D. Time to format a disk sector with structure

Answer: B

Q95. A Solid State Drive (SSD) stores data using:

- A. Magnetic tape reels
- B. Magnetic platters
- C. Flash memory chips
- D. Optical technology

Answer: C

Q96. FCFS disk scheduling processes disk I/O requests:

- A. Based on closest track first
- B. In the order they arrive
- C. In reverse arrival order
- D. Based on request priority

Answer: B

Q97. The SSTF (Shortest Seek Time First) disk scheduling algorithm:

- A. Services the closest request to head
- B. Always moves the head toward outer
- C. Services the largest request first
- D. Services all requests in arrival order

Answer: A

Q98. Disk formatting prepares a disk for use by:

- A. Deleting all viruses from the disk
- B. Creating file system structure on disk
- C. Increasing the disk rotational speed
- D. Adding more storage space to a disk

Answer: B

Q99. A disk partition is:

- A. A physical disk drive unit in chassis
- B. A type of data file stored on the disk
- C. A backup copy of the entire disk drive
- D. An independent section with own file system

Answer: D

Q100. Disk access time is the sum of:

- A. Only the seek time component alone
- B. Only the data transfer time component
- C. Only the rotational latency component
- D. Seek time, rotational latency, transfer time

Answer: D

Q101. I/O devices communicate with the CPU through:

- A. The file system interface
- B. Direct wiring to CPU
- C. Shared memory regions only
- D. Device controllers and buses

Answer: D

Q102. Polling in I/O means:

- A. CPU repeatedly checks device status register
- B. Voting on which device to use for the task
- C. Automatically detecting new devices on the bus
- D. Prioritizing I/O requests based on their urgency

Answer: A

Q103. Interrupt-driven I/O means:

- A. I/O operations are interrupted frequently
- B. The CPU is constantly being interrupted
- C. The CPU stops all I/O until processing done
- D. The device signals CPU when I/O is complete

Answer: D

Q104. DMA (Direct Memory Access) allows:

- A. Direct access to the motherboard components
- B. Devices to transfer data to memory without CPU
- C. The CPU to access main memory much faster
- D. Memory to access the CPU directly for data

Answer: B

Q105. A device driver is:

- A. Software providing OS-to-hardware interface
- B. A type of cable connecting to the bus
- C. A person who physically operates devices
- D. A diagnostic tool for testing hardware

Answer: A

Q106. Block devices transfer data in:

- A. Variable packets
- B. Single characters
- C. Continuous streams
- D. Fixed-size blocks

Answer: D

Q107. Character devices transfer data:

- A. One byte at a time in a stream
- B. In fixed-size data blocks
- C. In variable-size network packets
- D. In fixed-size memory page frames

Answer: A

Q108. A bus in computer architecture is:

- A. A type of vehicle for transport use
- B. A type of volatile memory used in computers
- C. A processing unit that executes instructions
- D. A shared pathway transferring data between parts

Answer: D

Q109. Buffering in I/O systems means:

- A. Encrypting I/O data for security purposes
- B. Compressing I/O data for disk storage
- C. Temporarily storing data during transfer
- D. Slowing down I/O operations intentionally

Answer: C

Q110. Spooling is commonly used for:

- A. CPU scheduling for processes
- B. Network routing of data packets
- C. Memory management of processes
- D. Managing print jobs via spooling

Answer: D

Q111. Protection in operating systems refers to:

- A. Controlling process and user access to resources
- B. Antivirus software scanning for malware threats
- C. Firewall configuration for network protection
- D. Physical security of the computer hardware

Answer: A

Q112. Security in operating systems deals with:

- A. Only network security from remote attacks
- B. Defending against internal and external attacks
- C. Only internal threats from local users
- D. Only physical security of the server room

Answer: B

Q113. Authentication is the process of:

- A. Verifying identity of a user
- B. Encrypting data for security
- C. Authorizing resource access
- D. Backing up critical data

Answer: A

Q114. Authorization determines:

- A. When to back up data for disaster recovery
- B. How to encrypt data for secure communication
- C. Who the user is based on their credentials
- D. What resources a verified user may access

Answer: D

Q115. The principle of least privilege states that:

- A. All users should have full administrator access rights
- B. The least privileged user should have no access at all
- C. Users get only the minimum access needed for tasks
- D. All privileges should be equal for all system users

Answer: C

Q116. A virus in computer security is:

- A. Self-replicating malicious program on host
- B. A network communication protocol standard
- C. A hardware malfunction in the CPU unit
- D. A type of data encryption algorithm used

Answer: A

Q117. A worm differs from a virus in that:

- A. A worm only affects the physical hardware parts
- B. A worm replicates across networks without host
- C. A worm is less harmful than a virus overall
- D. A worm cannot spread to other network systems

Answer: B

Q118. A Trojan horse in computer security is:

- A. A system backup utility tool for data
- B. A type of network firewall tool used
- C. A type of hardware peripheral device
- D. Malicious program disguised as legitimate

Answer: D

Q119. Encryption is the process of:

- A. Converting plaintext to ciphertext with key
- B. Backing up data to a remote server
- C. Deleting data permanently from disk
- D. Compressing data for efficient storage

Answer: A

Q120. A firewall is:

- A. A system monitoring and controlling network traffic
- B. A physical wall in the server room for safety
- C. A type of computer virus that spreads via network
- D. A backup system for disaster recovery procedures

Answer: A

Q121. Which component loads the operating system into memory during startup?

- A. The application manager
- B. The device controller
- C. The bootstrap loader
- D. The system compiler

Answer: C

Q122. What does a distributed operating system manage?

- A. Multiple networked computers together
- B. A single standalone desktop machine
- C. Only mobile phone applications here
- D. Exclusively embedded device controllers

Answer: A

Q123. Which of the following best describes firmware?

- A. Programs permanently stored in hardware
- B. Software stored in volatile RAM chips
- C. Temporary data written to disk drives
- D. User applications installed externally

Answer: A

Q124. What is the primary purpose of an interrupt in a computer system?

- A. To delete all currently running tasks
- B. To signal the CPU about an event
- C. To format all storage device media
- D. To permanently halt all processors

Answer: B

Q125. Which type of OS is designed for devices with very limited resources?

- A. Embedded system OS
- B. Desktop general OS
- C. Mainframe batch OS
- D. Enterprise server OS

Answer: A

Q126. What does GUI stand for in the context of operating systems?

- A. Graphical User Interface
- B. General Unified Interface
- C. Global Usage Indicator
- D. Generated Utility Index

Answer: A

Q127. Which OS function manages the allocation and deallocation of main memory?

- A. Network management
- B. User authentication
- C. Disk formatting
- D. Memory management

Answer: D

Q128. What is spooling in an operating system context?

- A. Buffering data for slow output devices
- B. Compressing files to save disk storage
- C. Defragmenting the hard disk sectors
- D. Encrypting data before transmitting out

Answer: A

Q129. Which of the following is NOT a type of operating system?

- A. Real-time operating system
- B. Network operating system
- C. Distributed operating system
- D. Compiled operating system

Answer: D

Q130. What is the role of device drivers in an operating system?

- A. They enable OS-hardware communication
- B. They translate high-level languages
- C. They manage user account passwords
- D. They compile user application code

Answer: A

Q131. What is a monolithic kernel operating system?

- A. An OS where all services run in kernel space
- B. An OS that only runs a single application task
- C. An OS designed for mobile devices exclusively
- D. An OS with no kernel component present at all

Answer: A

Q132. Which of the following is an example of a system call category?

- A. Process control
- B. Web browsing
- C. Graphics rendering
- D. Text formatting

Answer: A

Q133. What is the purpose of an API in an operating system?

- A. It manages physical hardware components alone
- B. It replaces the kernel entirely in modern OS
- C. It provides functions for programmers to use
- D. It handles only network communication protocol

Answer: C

Q134. What does the command interpreter do in an operating system?

- A. It controls hardware interrupt processing now
- B. It compiles all programs into machine code
- C. It manages virtual memory page tables only
- D. It reads and executes user commands directly

Answer: D

Q135. Which layer is at the bottom in a layered operating system design?

- A. File system layer
- B. Hardware layer
- C. Application layer
- D. User interface layer

Answer: B

Q136. What is a system program in the context of an operating system?

- A. A utility program bundled with the OS itself
- B. A virus that attacks the operating system now
- C. A program that only runs during system boot
- D. A diagnostic tool built into the CPU hardware

Answer: A

Q137. What type of system call is used to create a new process?

- A. Communication call
- B. File management call
- C. Device management call
- D. Process control call

Answer: D

Q138. What is the function of a linker in program execution?

- A. It translates source code to assembly code
- B. It handles input and output device operation
- C. It manages memory allocation during runtime
- D. It combines object modules into executable

Answer: D

Q139. Which of the following is a communication system call?

- A. open() call
- B. exit() call
- C. pipe() call
- D. fork() call

Answer: C

Q140. What is the role of a loader in program execution?

- A. It manages the network connections system
- B. It designs the user interface for programs
- C. It writes source code for the programmer
- D. It loads executable files into main memory

Answer: D

Q141. What is a process in an operating system?

- A. A program in execution in main memory
- B. A type of network protocol standard
- C. A hardware component inside the CPU
- D. A file stored on the hard disk drive

Answer: A

Q142. Which of the following is a valid process state?

- A. Formatting
- B. Installing
- C. Waiting
- D. Compiling

Answer: C

Q143. What does the Process Control Block contain?

- A. All user passwords and credentials
- B. Only the program source code text
- C. Information about a specific process
- D. The entire operating system kernel

Answer: C

Q144. What system call creates a new process in Unix?

- A. exec()
- B. fork()
- C. kill()
- D. wait()

Answer: B

Q145. What is a parent process in operating system terminology?

- A. The first process created during boot only
- B. A process with the highest priority in queue
- C. A process that created one or more children
- D. A process managing all hardware device drivers

Answer: C

Q146. What happens when a process moves from running to waiting state?

- A. The process begins on a different CPU core
- B. The process is permanently terminated now
- C. The process waits for an event like I/O
- D. The process moves back to the ready queue

Answer: C

Q147. What is the ready queue in process management?

- A. Processes that are ready and waiting for CPU
- B. A list of processes waiting to load from disk
- C. Blocked processes waiting for user keyboard input
- D. A queue of completed processes to be deleted

Answer: A

Q148. What is the purpose of the process scheduler?

- A. To handle network packet routing operations
- B. To manage file system directory structures now
- C. To select a process from ready queue for CPU
- D. To compile programs into executable files

Answer: C

Q149. What is process termination in operating systems?

- A. Pausing a process temporarily for later
- B. Ending a process and releasing its resources
- C. Changing the priority of a running process
- D. Moving a process to another computer node

Answer: B

Q150. What is an orphan process in Unix/Linux systems?

- A. A process consuming no memory or CPU at all
- B. A process whose parent has terminated first
- C. A process running only during system shutdown
- D. A process that has no executable code to run

Answer: B

Q151. What is CPU scheduling in an operating system?

- A. Overclocking the CPU for better processing performance
- B. Installing new processors into the computer motherboard
- C. Deciding which process gets the CPU next for execution
- D. Measuring the temperature of the CPU chip continuously

Answer: C

Q152. What does FCFS stand for in CPU scheduling?

- A. First Cache First Store
- B. Fast CPU Flexible Scheduling
- C. Fully Controlled File System
- D. First Come First Served

Answer: D

Q153. What is turnaround time in CPU scheduling?

- A. Time to switch between two processes
- B. Total time from submission to completion
- C. The speed at which the CPU clock runs
- D. The time to restart the computer

Answer: B

Q154. What is waiting time in CPU scheduling?

- A. Time needed to compile a program from source
- B. Time required to boot the operating system
- C. Time a process spends in the ready queue
- D. Time taken to save a file to the disk drive

Answer: C

Q155. What is the time quantum in Round Robin scheduling?

- A. The time required for a context switch now
- B. The clock speed of the processor chip now
- C. The total time to complete all processes
- D. A fixed time slice given to each process

Answer: D

Q156. Which scheduling algorithm selects the shortest job first?

- A. First Come First Served
- B. Round Robin scheduling
- C. Shortest Job First
- D. Priority scheduling only

Answer: C

Q157. What is throughput in CPU scheduling metrics?

- A. The speed of data transfer to the disk drive
- B. Number of processes completed per time unit
- C. The temperature of CPU during operation
- D. The size of the ready queue at a given moment

Answer: B

Q158. What is a preemptive scheduling algorithm?

- A. One where OS can take CPU from a process
- B. One that only works with a single process
- C. One that requires manual user intervention
- D. One that never interrupts a running process

Answer: A

Q159. What is a CPU burst in process execution?

- A. A period of continuous CPU computation time
- B. A malfunction causing the CPU to overheat now
- C. A type of interrupt from external hardware now
- D. A period when the CPU is powered off safely

Answer: A

Q160. In priority scheduling, which process gets the CPU first?

- A. The process with lowest priority value
- B. The process with highest priority value
- C. The process arriving most recently now
- D. The process with longest burst time

Answer: B

Q161. What is a thread in operating system terminology?

- A. A network connection between two machines
- B. A type of file stored on the hard disk
- C. A lightweight execution unit in a process
- D. A separate physical CPU core in system

Answer: C

Q162. What do threads within the same process share?

- A. Nothing at all between them
- B. Individual stack memory only
- C. Code, data, and file resources
- D. Only the process identifier

Answer: C

Q163. What is multithreading in operating systems?

- A. Running multiple threads within a single process
- B. Running multiple operating systems simultaneously
- C. Using multiple monitors for display output only
- D. Connecting multiple keyboards to one computer

Answer: A

Q164. Which of the following is a benefit of using threads?

- A. Threads prevent all forms of parallel execution
- B. Thread creation is faster than process creation
- C. Threads consume more resources than processes
- D. Threads restrict programs to a single CPU core

Answer: B

Q165. What is a user-level thread managed by?

- A. The operating system kernel directly
- B. A user-level thread library only
- C. The network interface card alone
- D. The hardware CPU scheduler chip

Answer: B

Q166. What is a kernel-level thread?

- A. A thread that manages hardware device interrupts
- B. A thread that only runs during system boot time
- C. A thread managed and scheduled by the kernel
- D. A thread that exists only in embedded OS systems

Answer: C

Q167. What does each thread have that is unique to itself?

- A. Its own copy of all open file handles now
- B. Its own operating system kernel instance
- C. Its own stack and program counter value
- D. Its own copy of entire process memory

Answer: C

Q168. What is the main advantage of multithreading in a web server?

- A. It prevents any client from accessing the server
- B. It reduces the server network bandwidth usage
- C. It eliminates the need for any network protocol
- D. It handles multiple client requests concurrently

Answer: D

Q169. What is the Pthreads API?

- A. A POSIX standard for thread management
- B. A network protocol for file transferring
- C. A graphics library for rendering images
- D. A database query language for data access

Answer: A

Q170. What happens when one thread in a process calls exit()?

- A. Other threads continue running without any impact
- B. Only that specific thread is terminated safely
- C. The entire process and all its threads terminate
- D. The thread is moved to a different process now

Answer: C

Q171. What is a race condition in concurrent programming?

- A. A technique for sorting data in parallel
- B. A way to synchronize clocks between PCs
- C. When output depends on timing of threads
- D. A method to speed up program execution

Answer: C

Q172. What is mutual exclusion in process synchronization?

- A. Allowing multiple processes to access resources
- B. Preventing any process from executing on CPU
- C. Deleting shared resources to prevent any access
- D. Ensuring only one process in critical section now

Answer: D

Q173. What is a critical section in concurrent programming?

- A. The first section of code executed by program
- B. The most important function in program code
- C. A section of code needing no synchronization
- D. A code segment accessing shared resources here

Answer: D

Q174. What is a semaphore in operating systems?

- A. A synchronization variable with atomic ops
- B. A memory allocation technique for processes
- C. A scheduling algorithm for real-time tasks
- D. A type of hardware interrupt signal line

Answer: A

Q175. What is the purpose of a mutex lock?

- A. To handle network packet routing faster
- B. To speed up single-thread execution
- C. To ensure mutual exclusion in critical section
- D. To manage memory allocation for processes

Answer: C

Q176. What does the wait() operation do on a semaphore?

- A. It creates a new semaphore with given value
- B. It decrements value and blocks if negative
- C. It increments the semaphore value by one
- D. It destroys the semaphore variable for good

Answer: B

Q177. What does signal() do on a semaphore?

- A. It increments value and may wake a process
- B. It deletes the semaphore from the system
- C. It resets semaphore to its initial value now
- D. It decrements semaphore value by one unit

Answer: A

Q178. What is a binary semaphore?

- A. A semaphore requiring two processes only
- B. A semaphore restricted to zero or one
- C. A semaphore holding any integer value
- D. A semaphore for binary search algorithms

Answer: B

Q179. What is busy waiting in the context of synchronization?

- A. A thread sleeps until explicitly woken up
- B. A thread exits when a resource is locked
- C. A thread continuously checks a condition
- D. A thread creates more threads to help out

Answer: C

Q180. What is a counting semaphore used for?

- A. Measuring CPU clock speed in gigahertz
- B. Counting total processes in the OS system
- C. Controlling access to finite resource instances
- D. Counting the number of files on the disk

Answer: C

Q181. What is a deadlock in an operating system?

- A. When processes wait for each other forever
- B. When memory is fully available to all tasks
- C. When the CPU overheats and shuts down
- D. When a program runs faster than expected

Answer: A

Q182. How many conditions must hold simultaneously for deadlock?

- A. One
- B. Four
- C. Two
- D. Three

Answer: B

Q183. What is the mutual exclusion condition for deadlock?

- A. Processes can preempt resources from other ones
- B. Resources can be shared by multiple processes
- C. All resources are always available to every process
- D. At least one resource must be held non-sharably

Answer: D

Q184. What is the hold and wait condition for deadlock?

- A. Processes never hold more than one resource at a time
- B. Processes wait without holding any resources at all
- C. Processes hold resources while waiting for others
- D. Processes release resources before requesting new ones

Answer: C

Q185. What is a resource allocation graph used for?

- A. Designing the layout of network infrastructure
- B. Measuring CPU utilization over time periods
- C. Drawing flowcharts for program logic design
- D. Visualizing allocation and detecting deadlock

Answer: D

Q186. What is the circular wait condition for deadlock?

- A. Processes wait for resources in random order
- B. A circular chain where each waits for the next
- C. Processes wait in a linear queue for resources
- D. All processes wait for the same single resource

Answer: B

Q187. What is the no preemption condition for deadlock?

- A. Only the OS kernel can hold resources permanently
- B. Resources cannot be preempted from holders now
- C. Resources can be forcibly taken from processes
- D. All resources are preemptible at any time freely

Answer: B

Q188. What is deadlock prevention as a strategy?

- A. Recovering by terminating all running processes
- B. Ignoring deadlocks and hoping they never occur
- C. Detecting deadlocks after they already occurred
- D. Ensuring at least one deadlock condition fails

Answer: D

Q189. What is starvation in resource allocation?

- A. A process runs out of memory and crashes fast
- B. A process is denied needed resources indefinitely
- C. A process completes too quickly and wastes resources
- D. A process gets all resources it needs quickly

Answer: B

Q190. What is a safe state in deadlock avoidance?

- A. A state where resources can be allocated avoiding deadlock
- B. A state where all resources are fully allocated already
- C. A state where the system has no processes running
- D. A state where CPU temperature is within safe limits

Answer: A

Q191. What is the main purpose of memory management?

- A. To permanently store data like a hard drive
- B. To increase the physical size of RAM chips
- C. To manage network bandwidth between hosts
- D. To allocate and track memory for processes

Answer: D

Q192. What is virtual memory in an operating system?

- A. A type of cache memory inside the CPU chip
- B. A technique giving illusion of larger memory
- C. Physical RAM installed in the computer
- D. A backup copy of files stored on the disk

Answer: B

Q193. What is a page in the context of virtual memory?

- A. A type of hardware interrupt signal to CPU
- B. A section of the operating system kernel
- C. A unit of data stored on the hard disk now
- D. A fixed-size block of virtual memory space

Answer: D

Q194. What is a page table used for?

- A. Displaying a table of contents for docs
- B. Storing user passwords and credentials now
- C. Mapping virtual addresses to physical ones
- D. Scheduling CPU time for running processes

Answer: C

Q195. What is a page fault in virtual memory systems?

- A. A syntax error in the running program code
- B. An access to a page not in main memory now
- C. A hardware malfunction in memory module
- D. A failure of CPU to execute an instruction

Answer: B

Q196. What is a frame in physical memory?

- A. A fixed-size block of physical RAM memory
- B. A unit of data transmitted over a network
- C. A type of CPU register storing addresses
- D. A decorative border around monitor screen

Answer: A

Q197. What is swapping in memory management?

- A. Exchanging CPU cores between processes
- B. Replacing old hardware with new hardware
- C. Switching between different user accounts
- D. Moving process between memory and disk

Answer: D

Q198. What is internal fragmentation in memory?

- A. Memory corrupted due to hardware failure
- B. File fragments scattered across the disk
- C. Free memory between allocated blocks here
- D. Wasted space inside an allocated partition

Answer: D

Q199. What is external fragmentation in memory?

- A. A process using more than available memory
- B. Memory corruption from external hardware
- C. Free memory scattered in small pieces now
- D. Memory allocated to already exited processes

Answer: C

Q200. What is the logical address space of a process?

- A. Address of the process control block here
- B. Set of all addresses generated by process
- C. Total amount of RAM installed in computer
- D. Physical location of process on the disk

Answer: B

Q201. What is a file in operating system terminology?

- A. A network protocol for data transfer
- B. A physical storage device like a disk
- C. A type of CPU instruction for processing
- D. A named collection of related data items

Answer: D

Q202. What is a directory in a file system?

- A. A hardware device for reading media
- B. A physical partition on the hard disk
- C. A structure containing info about files
- D. A file type that cannot be modified now

Answer: C

Q203. What is a file extension used for?

- A. To indicate the type or format of a file
- B. To increase the file size beyond limits
- C. To encrypt the file contents securely now
- D. To compress files for saving disk space

Answer: A

Q204. What is the root directory in a file system?

- A. Where all temporary files are stored
- B. A directory only for administrators here
- C. A directory storing the OS kernel files
- D. The topmost directory in the hierarchy

Answer: D

Q205. What is a file's access permission used for?

- A. Determining the file size on the disk
- B. Setting the creation date of the entry
- C. Controlling who can read, write, execute
- D. Choosing which app opens the file type

Answer: C

Q206. What is sequential file access?

- A. Writing files in reverse order from the end
- B. Accessing files from multiple disks at once
- C. Accessing any record directly by position
- D. Reading records one after another in order

Answer: D

Q207. What is the purpose of file system mounting?

- A. Creating a backup copy of the file system
- B. Making a file system accessible at a location
- C. Physically installing new hard drive hardware
- D. Removing a file system from the OS entirely

Answer: B

Q208. What does the open() system call do for files?

- A. It permanently deletes a file from system
- B. It creates a brand new empty file on disk
- C. It prepares a file for reading or writing
- D. It changes the permissions of a file now

Answer: C

Q209. What is an absolute path in a file system?

- A. A path containing only the file name itself
- B. A path relative to current working directory
- C. A complete path starting from root directory
- D. A path that points to a deleted file now

Answer: C

Q210. What is a symbolic link in a file system?

- A. A file containing a path to another file
- B. A physical copy of a file in another place
- C. A special file storing encrypted disk data
- D. A temporary file created during system boot

Answer: A

Q211. What is secondary storage in a computer system?

- A. Non-volatile storage for permanent data
- B. The main memory used by running procs
- C. The CPU cache memory for fast access
- D. Registers inside the CPU for computation

Answer: A

Q212. What is a hard disk drive composed of?

- A. Optical discs using laser beams to read the data
- B. Solid-state flash memory chips sealed in case
- C. Spinning magnetic platters with read-write heads
- D. Volatile memory modules losing data when off now

Answer: C

Q213. What is disk seek time?

- A. Time to transfer data from disk to memory
- B. Time to format the entire disk from scratch
- C. Time to move head to the correct track now
- D. Time for platter to complete one rotation

Answer: C

Q214. What is a solid-state drive (SSD)?

- A. A mechanical drive with spinning platters
- B. A volatile device requiring constant power now
- C. Storage using flash memory, no moving parts
- D. A type of optical disc using laser for data

Answer: C

Q215. What is disk rotational latency?

- A. Total time to read an entire disk platter now
- B. Time for head to move to the correct track
- C. Time for desired sector to rotate under head
- D. Time required to start spinning disk platters

Answer: C

Q216. What is a disk partition?

- A. A hardware device connecting disks to CPU
- B. A logical division of disk into sections
- C. A type of disk error corrupting stored data
- D. A physical break in disk platter surface

Answer: B

Q217. What is the transfer rate of a disk?

- A. Speed at which disk platters rotate per minute
- B. Time taken to partition the disk into sections
- C. Rate of data flow between disk and computer now
- D. Rate at which disk head moves across all tracks

Answer: C

Q218. What is a disk track on a magnetic hard drive?

- A. A type of error correction code on the disk
- B. A line connecting disk to the motherboard now
- C. A physical groove cut into disk for head path
- D. A concentric circle on disk platter surface

Answer: D

Q219. What is a sector on a hard disk drive?

- A. Total storage capacity of one disk platter now
- B. A complete circular track on the platter now
- C. Smallest addressable unit of storage on disk
- D. Hardware component controlling the read head

Answer: C

Q220. What is RAID in secondary storage?

- A. A method to encrypt data on single disk
- B. A type of RAM for caching disk operations
- C. A protocol for transferring data on network
- D. Combining multiple disks for redundancy

Answer: D

Q221. What is an I/O device in a computer system?

- A. A device that only stores the OS kernel
- B. A device generating electrical power supply
- C. A device used for input, output, or both
- D. A device that only processes internal data

Answer: C

Q222. What is a device driver in an operating system?

- A. Software controlling a specific hardware device
- B. A person who operates hardware devices
- C. A physical cable connecting devices to the PC
- D. A tool for testing hardware functionality now

Answer: A

Q223. What is programmed I/O for device communication?

- A. Data transfers directly between device and memory
- B. OS ignores device until a user requests the data
- C. CPU continuously checks device status for data
- D. Device notifies CPU when it completes operation

Answer: C

Q224. What is interrupt-driven I/O?

- A. CPU continuously polls device for data status
- B. OS disables all interrupts during I/O operations
- C. Data transfers without any CPU involvement here
- D. Device signals CPU via interrupt when it is ready

Answer: D

Q225. What is Direct Memory Access used for?

- A. Transferring data between I/O devices and memory
- B. Directly accessing CPU registers from a program
- C. Providing direct access to the OS kernel code now
- D. Managing memory allocation for running processes

Answer: A

Q226. What is a block device in I/O classification?

- A. A device transferring data one character at a time
- B. A device that blocks all other devices from running
- C. A device transferring data in fixed-size blocks now
- D. A device working only when the system is blocked

Answer: C

Q227. What is a character device in I/O classification?

- A. A device storing character encoding tables on disk
- B. A device displaying only text characters on screen
- C. A device transferring data one character at a time
- D. A device used for character recognition in documents

Answer: C

Q228. What is the purpose of an I/O port?

- A. An address for CPU to communicate with devices
- B. A physical hole for ventilation of the case
- C. A port used only for internet connections now
- D. A type of software app for managing printers

Answer: A

Q229. What is buffering in I/O systems?

- A. Encrypting data before sending to output devices
- B. Temporarily storing data in transit between devices
- C. Permanently storing data on the hard disk drive now
- D. Deleting data no longer needed by any process here

Answer: B

Q230. What is the I/O request lifecycle?

- A. Time from device manufacture to its disposal
- B. Lifespan of cable connecting device to computer
- C. Sequence from application request to I/O completion
- D. Period when I/O device is powered on and running

Answer: C

Q231. What is the difference between protection and security?

- A. Protection controls internal; security guards external
- B. Neither is relevant to modern operating systems
- C. Security controls internal; protection guards external
- D. Protection and security mean the same thing

Answer: A

Q232. What is authentication in OS security?

- A. Installing antivirus software on the system
- B. Compressing data to save storage on disk
- C. Verifying the identity of a user or process
- D. Encrypting all files stored on the disk

Answer: C

Q233. What is an access control list in operating systems?

- A. A list specifying user permissions for objects
- B. A list of all network connections currently
- C. A list of all hardware devices attached now
- D. A list of all software installed on PC

Answer: A

Q234. What is a password used for in OS security?

- A. Encrypting the entire hard disk contents
- B. Compressing files to save storage on disk
- C. Increasing the processing speed of the CPU
- D. Authenticating user identity before access

Answer: D

Q235. What is malware in computer security?

- A. A type of hardware failure in the computer
- B. Malicious software designed to harm systems
- C. Software improving computer performance
- D. A legitimate tool for administration tasks

Answer: B

Q236. What is encryption used for in OS security?

- A. Converting data to unreadable format for privacy
- B. Deleting sensitive files permanently from the disk
- C. Compressing files to reduce their storage size now
- D. Increasing the speed of data transfer on network

Answer: A

Q237. What is a firewall in computer security?

- A. A tool for formatting hard drives securely now
- B. A device supplying emergency power to the PC
- C. A physical wall preventing computer overheating
- D. A system filtering network traffic based on rules

Answer: D

Q238. What is a computer virus?

- A. A tool for legitimate system maintenance tasks
- B. A type of operating system for mobile phones
- C. A self-replicating program attaching to files
- D. A hardware malfunction from overheating chips

Answer: C

Q239. What is the principle of least privilege?

- A. Granting users only minimum permissions needed
- B. Assigning same permissions to every system user
- C. Giving every user full administrator access
- D. Preventing all users from accessing the system

Answer: A

Q240. What is a Trojan horse in computer security?

- A. A security tool protecting against all viruses
- B. A hardware device used for network security
- C. A backup system storing copies of vital files
- D. Malware disguised as legitimate software here

Answer: D

Q241. Which of the following is a primary goal of an operating system?

- A. Convenience for the user
- B. Designing hardware circuits
- C. Writing application software
- D. Manufacturing peripheral devices

Answer: A

Q242. What is a batch operating system?

- A. An OS that processes jobs in groups without user interaction
- B. An OS that allows real-time user input during execution
- C. An OS designed only for mobile devices
- D. An OS that runs a single program at a time with user control

Answer: A

Q243. Which of the following best describes a time-sharing operating system?

- A. An OS that allocates dedicated hardware to each user
- B. An OS that allows multiple users to share CPU time interactively
- C. An OS that processes only one task at a time
- D. An OS used exclusively for scientific calculations

Answer: B

Q244. What does the term 'kernel mode' mean in an operating system?

- A. A privileged execution mode with full hardware access
- B. A mode where only user applications can run
- C. A power-saving mode that reduces CPU speed
- D. A mode used exclusively during system shutdown

Answer: A

Q245. Which component of a computer system directly executes instructions?

- A. Central Processing Unit (CPU)
- B. Hard disk drive
- C. Network interface card
- D. Power supply unit

Answer: A

Q246. What is multiprogramming in operating systems?

- A. Running multiple programs in memory to maximize CPU utilization
- B. Running the same program on multiple computers
- C. Writing programs in multiple programming languages
- D. Using multiple monitors for display output

Answer: A

Q247. What is the function of an operating system's resource manager?

- A. Allocating and managing hardware and software resources
- B. Designing new hardware components
- C. Writing user application programs
- D. Connecting to the internet

Answer: A

Q248. Which of the following is a network operating system?

- A. Windows Server
- B. MS-DOS
- C. Android
- D. Embedded Linux

Answer: A

Q249. What is the purpose of a command-line interface in an operating system?

- A. To allow users to interact with the OS by typing text commands
- B. To display graphical windows and icons
- C. To manage the file allocation table
- D. To compile source code into machine language

Answer: A

Q250. What is an embedded operating system?

- A. An OS designed for specialized devices with limited resources
- B. An OS used only on desktop computers
- C. An OS that requires a graphical user interface
- D. An OS that runs only in cloud environments

Answer: A

Q251. What is a system call used for in an operating system?

- A. Requesting services from the OS kernel
- B. Directly accessing hardware without the OS
- C. Compiling programs into machine code
- D. Formatting a hard disk drive

Answer: A

Q252. What is a shell in an operating system?

- A. A command interpreter that accepts and executes user commands
- B. The innermost part of the operating system kernel
- C. A hardware component on the motherboard
- D. A type of system memory

Answer: A

Q253. What type of system call is 'read()' in Unix?

- A. File management system call
- B. Process control system call
- C. Device management system call
- D. Communication system call

Answer: A

Q254. In a layered OS design, which layer interacts directly with the hardware?

- A. The lowest layer (Layer 0)
- B. The highest layer (user interface)
- C. The middle layer
- D. All layers equally

Answer: A

Q255. What is a device management system call used for?

- A. Requesting and releasing hardware devices
- B. Creating new files on disk
- C. Terminating running processes
- D. Sending messages between computers

Answer: A

Q256. What is the purpose of a boot loader?

- A. To load the operating system kernel into memory during startup
- B. To install new application software
- C. To manage user login credentials
- D. To defragment the hard disk

Answer: A

Q257. Which of the following is a process control system call?

- A. fork()
- B. open()
- C. read()
- D. chmod()

Answer: A

Q258. What is an operating system kernel?

- A. The core component of the OS that is always resident in memory
- B. A user-level application for managing files
- C. An external hardware device controller
- D. A network communication protocol

Answer: A

Q259. What is a system utility program?

- A. A program that provides common system functions like file management
- B. The core kernel of the operating system
- C. A hardware diagnostic chip on the motherboard
- D. An application for browsing the internet

Answer: A

Q260. What does the 'write()' system call do?

- A. Writes data to a file or output device
- B. Creates a new directory
- C. Deletes a file from disk
- D. Changes file permissions

Answer: A

Q261. What is a process state in operating systems?

- A. The current activity or condition of a process during its lifecycle
- B. The physical location of the process on disk
- C. The programming language used to write the process
- D. The amount of memory installed in the system

Answer: A

Q262. What happens when a running process requests an I/O operation?

- A. It moves from the running state to the waiting state
- B. It moves from the running state to the terminated state
- C. It continues executing without any state change
- D. It is permanently removed from memory

Answer: A

Q263. What information does the process ID (PID) provide?

- A. A unique numerical identifier assigned to each process by the OS
- B. The memory address where the process is stored
- C. The priority level of the process
- D. The name of the user who started the process

Answer: A

Q264. What is a child process?

- A. A process created by another process using a system call like fork()
- B. A process that has the highest priority in the system
- C. A process that manages hardware devices
- D. A process that is waiting for user input

Answer: A

Q265. What is the 'new' state of a process?

- A. The process is being created and has not yet been admitted to the ready queue
- B. The process is currently executing on the CPU
- C. The process is waiting for an I/O event to complete
- D. The process has finished execution

Answer: A

Q266. What is the 'terminated' state of a process?

- A. The process has finished execution and is being cleaned up by the OS
- B. The process is actively running on the CPU
- C. The process is waiting in the ready queue
- D. The process is blocked on an I/O request

Answer: A

Q267. What does the wait() system call do in Unix?

- A. Causes the parent process to wait until a child process terminates
- B. Pauses the CPU clock for a specified duration
- C. Waits for user keyboard input
- D. Delays the boot sequence of the operating system

Answer: A

Q268. What is a process table in an operating system?

- A. A data structure that stores information about all active processes
- B. A physical table of hardware components in the computer
- C. A list of all installed software applications
- D. A directory of files stored on the hard disk

Answer: A

Q269. What is the ready state of a process?

- A. The process is loaded in memory and waiting for CPU allocation
- B. The process is currently executing instructions
- C. The process is waiting for an I/O device to respond
- D. The process has not yet been created

Answer: A

Q270. What does the exit() system call do?

- A. Terminates the calling process and returns a status to the parent
- B. Restarts the operating system
- C. Closes all open files on the system
- D. Logs the user out of the system

Answer: A

Q271. What is the main goal of CPU scheduling?

- A. To maximize CPU utilization and ensure fair process execution
- B. To increase the physical clock speed of the CPU
- C. To add more cores to the processor
- D. To reduce the amount of installed RAM

Answer: A

Q272. What is a scheduling algorithm in operating systems?

- A. A method that determines which process gets the CPU next
- B. A formula for calculating memory addresses
- C. A technique for compressing files on disk
- D. A procedure for installing device drivers

Answer: A

Q273. In Round Robin scheduling, what happens when a process's time quantum expires?

- A. The process is preempted and moved to the end of the ready queue
- B. The process is terminated immediately
- C. The process continues running until it finishes
- D. The process is moved to a higher priority queue

Answer: A

Q274. What is a non-preemptive scheduling algorithm?

- A. An algorithm where a running process keeps the CPU until it voluntarily releases it
- B. An algorithm that can interrupt any process at any time
- C. An algorithm that runs all processes simultaneously
- D. An algorithm used only for real-time systems

Answer: A

Q275. What does response time measure in CPU scheduling?

- A. The time from submission of a request until the first response is produced
- B. The total time a process takes to complete execution
- C. The time a process spends waiting in the ready queue
- D. The time the CPU is idle between processes

Answer: A

Q276. Which scheduling algorithm is the simplest to implement?

- A. First-Come, First-Served (FCFS)
- B. Multilevel Feedback Queue
- C. Completely Fair Scheduler
- D. Rate Monotonic Scheduling

Answer: A

Q277. What is CPU burst in the context of process execution?

- A. A period during which a process is actively using the CPU for computation
- B. The maximum speed at which the CPU can operate
- C. A hardware failure that causes the CPU to overheat
- D. The time it takes to boot the CPU

Answer: A

Q278. In priority scheduling, what happens when two processes have the same priority?

- A. They are typically scheduled using FCFS among equal-priority processes
- B. The process with the larger PID always runs first
- C. Both processes run simultaneously on the same core
- D. One process is terminated to resolve the conflict

Answer: A

Q279. What is an I/O burst in process execution?

- A. A period during which a process waits for an I/O operation to complete
- B. A spike in CPU processing speed
- C. A burst of data transmitted over the network
- D. A sudden increase in available memory

Answer: A

Q280. What does the dispatcher module do in CPU scheduling?

- A. Gives control of the CPU to the process selected by the scheduler
- B. Selects which process should run next from the ready queue
- C. Calculates the priority of each process
- D. Manages memory allocation for processes

Answer: A

Q281. Which component is NOT shared between threads of the same process?

- A. Global variables
- B. Stack
- C. Code section
- D. Open file descriptors

Answer: B

Q282. What is the primary reason thread creation is faster than process creation?

- A. Threads use faster CPUs
- B. Threads share the address space and resources of their parent process
- C. Threads do not need an operating system
- D. Threads are stored on the hard disk

Answer: B

Q283. Which of the following best describes a single-threaded process?

- A. A process that can run on multiple CPUs simultaneously
- B. A process with exactly one thread of execution
- C. A process that cannot perform I/O operations
- D. A process that runs only in kernel mode

Answer: B

Q284. What is the role of a thread library?

- A. To manage hardware interrupts
- B. To provide an API for creating and managing threads
- C. To compile multithreaded programs
- D. To allocate disk space for threads

Answer: B

Q285. Context switching between threads of the same process is generally faster than between processes because:

- A. Threads have smaller program counters
- B. No need to switch the memory address space
- C. Threads do not use the CPU
- D. The operating system does not track threads

Answer: B

Q286. Which threading model maps many user-level threads to many kernel threads?

- A. One-to-one model
- B. Many-to-one model
- C. Many-to-many model
- D. One-to-many model

Answer: C

Q287. In Java, which interface must a class implement to define a task that can be executed by a thread?

- A. Serializable
- B. Runnable
- C. Callable only
- D. Throwable

Answer: B

Q288. What does the term 'multicore programming' refer to?

- A. Programming with multiple monitors
- B. Writing programs that can utilize multiple processing cores
- C. Running multiple operating systems simultaneously
- D. Using multiple keyboards for input

Answer: B

Q289. What is the difference between concurrency and parallelism in threading?

- A. They are identical concepts
- B. Concurrency means tasks make progress over time; parallelism means tasks run simultaneously
- C. Parallelism requires only one CPU core
- D. Concurrency is only possible with GPUs

Answer: B

Q290. Which register is unique to each thread and tracks the next instruction to execute?

- A. Base register
- B. Program counter
- C. Memory address register
- D. I/O register

Answer: B

Q291. What is the purpose of process synchronization?

- A. To make all processes run at the same speed
- B. To coordinate the execution of processes that share resources to prevent data inconsistency
- C. To synchronize the system clock with an external server
- D. To ensure all processes start at the same time

Answer: B

Q292. The 'progress' requirement for the critical section problem states that:

- A. All processes must execute at the same speed
- B. Only processes not in their remainder section can participate in deciding which process enters the critical section next
- C. A process must never leave the critical section
- D. All processes must enter the critical section simultaneously

Answer: B

Q293. The 'bounded waiting' requirement for the critical section problem ensures that:

- A. The critical section has a fixed size
- B. There is a limit on the number of times other processes can enter the critical section after a process has made a request
- C. Processes wait for exactly 10 seconds
- D. Only bounded variables are used

Answer: B

Q294. What does a mutex lock provide?

- A. Unlimited concurrent access to shared data
- B. Mutual exclusion so that only one thread can hold the lock at a time
- C. Automatic parallelization of code
- D. Network synchronization between computers

Answer: B

Q295. What operation decreases the value of a semaphore?

- A. signal()
- B. post()
- C. wait()
- D. release()

Answer: C

Q296. What is a spinlock?

- A. A lock that puts the waiting thread to sleep
- B. A lock where the waiting thread continuously checks if the lock is available in a loop
- C. A lock that only works on single-core systems
- D. A lock that spins the hard disk for faster access

Answer: B

Q297. In the producer-consumer problem, what shared resource do the producer and consumer access?

- A. The CPU registers
- B. A bounded buffer
- C. The page table
- D. The file system journal

Answer: B

Q298. What is an atomic operation?

- A. An operation related to nuclear physics
- B. An operation that completes entirely without interruption
- C. An operation that can be partially executed
- D. An operation that requires multiple CPU cycles

Answer: B

Q299. What does the signal() operation do on a semaphore?

- A. Decreases its value by one
- B. Increases its value by one and may wake a waiting process
- C. Destroys the semaphore
- D. Resets the semaphore to zero

Answer: B

Q300. What is the key difference between a binary semaphore and a counting semaphore?

- A. Binary semaphores are faster
- B. A binary semaphore has only values 0 and 1, while a counting semaphore can range over an unrestricted domain
- C. Counting semaphores cannot be used for mutual exclusion
- D. Binary semaphores work only in user mode

Answer: B

Q301. Which of the following is a necessary condition for deadlock?

- A. Preemption of all resources
- B. Mutual exclusion
- C. Unlimited resources
- D. Single-threaded execution

Answer: B

Q302. In a resource allocation graph, what does an edge from a process to a resource indicate?

- A. The process has finished using the resource
- B. The process is requesting the resource
- C. The resource is allocated to the process
- D. The process has released the resource

Answer: B

Q303. What are the four necessary conditions for deadlock?

- A. Speed, memory, I/O, CPU
- B. Mutual exclusion, hold and wait, no preemption, circular wait
- C. Scheduling, paging, caching, buffering
- D. Authentication, authorization, encryption, logging

Answer: B

Q304. What is deadlock avoidance?

- A. Ignoring the possibility of deadlock
- B. Using additional information about future resource requests to ensure the system never enters an unsafe state
- C. Terminating all processes periodically
- D. Removing all shared resources from the system

Answer: B

Q305. What does deadlock recovery involve?

- A. Preventing deadlock from ever occurring
- B. Detecting that a deadlock has occurred and taking action to break it
- C. Ignoring the deadlock permanently
- D. Adding more resources to the system preemptively

Answer: B

Q306. An unsafe state means:

- A. Deadlock has already occurred
- B. The system may potentially lead to deadlock; there is no guarantee of a safe sequence
- C. All processes have terminated
- D. The system has run out of memory

Answer: B

Q307. In deadlock handling, what does the 'no preemption' condition mean?

- A. Resources can be forcibly taken from processes at any time
- B. Resources cannot be forcibly taken away from a process; they must be released voluntarily
- C. Processes cannot be scheduled on the CPU
- D. No process has higher priority than another

Answer: B

Q308. Which of the following is an example of a reusable resource?

- A. A CPU interrupt signal
- B. A printer or a memory block
- C. A network packet
- D. A one-time password

Answer: B

Q309. What is the simplest method to deal with deadlocks?

- A. Use the Banker's Algorithm
- B. Ignore the problem entirely (ostrich algorithm)
- C. Preempt all resources
- D. Allow only one process to run at a time

Answer: B

Q310. What type of graph is used specifically for deadlock detection with single-instance resources?

- A. A binary tree
- B. A wait-for graph
- C. A B+ tree
- D. A hash table

Answer: B

Q311. What is the primary function of a Memory Management Unit (MMU)?

- A. To increase the size of physical RAM
- B. To translate logical addresses to physical addresses at runtime
- C. To manage the file system
- D. To schedule CPU processes

Answer: B

Q312. What is a frame in the context of paging?

- A. A division of logical memory
- B. A fixed-size block of physical memory
- C. A type of CPU register
- D. A section of the hard disk

Answer: B

Q313. What is the difference between a logical address and a physical address?

- A. They are always the same value
- B. A logical address is generated by the CPU and a physical address is the actual location in memory hardware
- C. A physical address is virtual and a logical address is real
- D. Logical addresses are used only for disk storage

Answer: B

Q314. What is the purpose of a base register in memory management?

- A. To store the process's name
- B. To define the starting physical address of a process's memory space
- C. To count the number of pages
- D. To store the program counter

Answer: B

Q315. What is the role of the limit register in memory protection?

- A. It stores the maximum speed of memory access
- B. It specifies the size of the range of legal addresses for a process
- C. It limits the number of processes in the system
- D. It controls the clock speed of the CPU

Answer: B

Q316. What is dynamic loading?

- A. Loading all routines into memory at program start
- B. Loading a routine into memory only when it is called, reducing memory usage
- C. Loading programs onto the hard disk
- D. Loading the operating system into the GPU

Answer: B

Q317. What is the difference between first-fit and best-fit memory allocation?

- A. They always produce the same result
- B. First-fit allocates the first hole large enough; best-fit allocates the smallest hole large enough
- C. Best-fit is always slower than first-fit
- D. First-fit only works with paging

Answer: B

Q318. What problem does compaction solve?

- A. Internal fragmentation
- B. External fragmentation by shuffling memory contents to place all free memory together
- C. Page faults
- D. CPU cache misses

Answer: B

Q319. What does demand paging mean?

- A. All pages are loaded into memory at startup
- B. Pages are loaded into memory only when they are accessed and needed
- C. The CPU demands faster memory
- D. Pages are stored only on the hard disk

Answer: B

Q320. What is the valid-invalid bit in a page table entry used for?

- A. To indicate whether the data in the page has errors
- B. To indicate whether the page is currently in physical memory (valid) or not (invalid)
- C. To store the page number
- D. To count the number of accesses to the page

Answer: B

Q321. What is the purpose of a file system?

- A. To manage CPU scheduling
- B. To organize, store, and retrieve files on storage media
- C. To control network connections
- D. To manage power distribution to hardware

Answer: B

Q322. What is a relative path in a file system?

- A. A path that always starts from the root directory
- B. A path specified relative to the current working directory
- C. A path that points to a network resource
- D. A path that can only reference directories, not files

Answer: B

Q323. What file attribute indicates the number of bytes in a file?

- A. File type
- B. File size
- C. File name
- D. File permissions

Answer: B

Q324. What does the close() system call do in file operations?

- A. Deletes the file permanently
- B. Releases the file's resources and removes the entry from the open-file table
- C. Creates a backup of the file
- D. Changes the file's permissions

Answer: B

Q325. What is a directory entry?

- A. A CPU register that stores directory information
- B. A record in a directory that maps a file name to its location on storage
- C. A type of file that cannot be opened
- D. A network address for remote files

Answer: B

Q326. What is a single-level directory structure?

- A. A hierarchy of nested directories
- B. A single directory containing all files in the system
- C. A directory structure with exactly two levels
- D. A directory that stores only one file

Answer: B

Q327. What does 'mounting' a file system mean?

- A. Physically installing a hard drive
- B. Making a file system accessible by attaching it to a point in the existing directory tree
- C. Formatting a disk partition
- D. Encrypting the file system

Answer: B

Q328. What type of file access reads data sequentially from beginning to end?

- A. Random access
- B. Sequential access
- C. Indexed access
- D. Direct access

Answer: B

Q329. What is a two-level directory structure?

- A. A directory with two files
- B. Each user has a separate directory under a master file directory
- C. A directory stored on two different disks
- D. A directory accessible by only two users

Answer: B

Q330. What are file permissions used for?

- A. To compress files to save storage space
- B. To control which users can read, write, or execute a file
- C. To speed up file access times
- D. To encrypt file contents automatically

Answer: B

Q331. What is the main advantage of secondary storage over primary memory (RAM)?

- A. It is faster than RAM
- B. It is non-volatile and retains data when power is off
- C. It is directly accessible by the CPU
- D. It has lower latency than RAM

Answer: B

Q332. What is a cylinder in the context of hard disk drives?

- A. The motor that spins the disk
- B. The set of tracks at the same position across all platters
- C. A single sector on the disk
- D. The disk controller chip

Answer: B

Q333. What is the FCFS (First-Come, First-Served) disk scheduling algorithm?

- A. Requests are served based on their distance from the current head position
- B. Requests are served in the order they arrive in the queue
- C. Requests are served from the innermost track to the outermost track
- D. Requests are served based on their priority

Answer: B

Q334. Why do SSDs have no seek time or rotational latency?

- A. They use faster motors
- B. They have no moving parts; data is accessed electronically from flash memory cells
- C. They use optical technology instead of magnetic
- D. They spin at infinite speed

Answer: B

Q335. What does RAID stand for?

- A. Random Array of Independent Data
- B. Redundant Array of Independent Disks
- C. Rapid Access to Internal Drives
- D. Reliable Access to Indexed Data

Answer: B

Q336. What is the purpose of disk formatting?

- A. To make the disk spin faster
- B. To prepare a disk for use by creating the necessary data structures for a file system
- C. To encrypt all data on the disk
- D. To physically clean the disk platters

Answer: B

Q337. What is the function of the disk controller?

- A. To physically manufacture the disk
- B. To interface between the disk drive and the computer, managing data transfer and disk operations
- C. To supply power to the disk
- D. To cool the disk platters

Answer: B

Q338. What is swap space used for?

- A. Swapping data between two hard drives
- B. Extending virtual memory by storing pages that are not currently in physical RAM
- C. Exchanging files between users
- D. Temporarily storing CPU registers

Answer: B

Q339. What is a platter in a hard disk drive?

- A. The cable connecting the disk to the motherboard
- B. A circular, flat disk coated with magnetic material that stores data
- C. The electronic circuit board of the drive
- D. The protective case of the drive

Answer: B

Q340. What is an I/O port?

- A. A physical port for connecting displays
- B. A set of registers through which the CPU communicates with an I/O device controller
- C. A network port used for internet connections
- D. A type of RAM used for I/O caching

Answer: B

Q341. What is the main disadvantage of polling (programmed I/O)?

- A. It does not work with any devices
- B. The CPU wastes cycles repeatedly checking the device status instead of doing useful work
- C. It is too fast for most devices
- D. It requires special hardware

Answer: B

Q342. How does DMA (Direct Memory Access) benefit the system?

- A. It eliminates the need for memory entirely
- B. It allows devices to transfer data directly to or from memory without CPU involvement for each byte
- C. It doubles the CPU's clock speed during I/O
- D. It replaces the operating system's I/O management

Answer: B

Q343. What is spooling in the context of I/O?

- A. Rewinding magnetic tape
- B. Storing output data in a buffer (usually on disk) for a device that cannot accept interleaved data from multiple sources
- C. Speeding up I/O operations
- D. Connecting multiple printers together

Answer: B

Q344. What is the difference between a block device and a character device?

- A. Block devices are slower than character devices
- B. Block devices transfer data in fixed-size blocks and support random access; character devices transfer data one character at a time in a stream
- C. Character devices can only handle text files
- D. Block devices do not use device drivers

Answer: B

Q345. What is an interrupt in the context of I/O?

- A. A power outage affecting the system
- B. A signal from a device to the CPU indicating that an I/O event needs attention
- C. A type of memory error
- D. A command from the CPU to stop a device

Answer: B

Q346. What role does a device driver play in the I/O system?

- A. It physically connects devices to the computer
- B. It provides a uniform interface for the OS to interact with a specific hardware device
- C. It generates electricity for the device
- D. It manufactures new devices

Answer: B

Q347. What is I/O buffering?

- A. Removing data from I/O devices
- B. Temporarily storing data in memory during transfer between a device and an application to handle speed differences
- C. Encrypting I/O data for security
- D. Compressing data before sending it to a device

Answer: B

Q348. What is a bus in a computer system?

- A. A vehicle for transporting computer equipment
- B. A shared communication pathway that transfers data between components of a computer
- C. A type of secondary storage
- D. A software program for managing I/O

Answer: B

Q349. What happens when an interrupt occurs during program execution?

- A. The program is permanently deleted
- B. The CPU saves the current state and transfers control to the appropriate interrupt handler routine
- C. The computer shuts down
- D. The interrupt is ignored until the program finishes

Answer: B

Q350. What is authorization in operating system security?

- A. Verifying a user's identity
- B. Determining what resources a verified user is permitted to access
- C. Encrypting user data
- D. Logging user activity

Answer: B

Q351. What is a worm in computer security?

- A. A program that modifies other programs by inserting its code
- B. A self-replicating program that spreads across networks without needing a host program
- C. A program that disguises itself as legitimate software
- D. A hardware device that protects against malware

Answer: B

Q352. What is a denial-of-service (DoS) attack?

- A. Stealing data from a computer
- B. An attack that overwhelms a system's resources to make it unavailable to legitimate users
- C. Installing malware on a computer
- D. Breaking encryption to access protected data

Answer: B

Q353. What is the purpose of a user account password?

- A. To encrypt files automatically
- B. To authenticate the user's identity before granting system access
- C. To speed up the login process
- D. To store the user's preferences

Answer: B

Q354. What is the difference between a virus and a Trojan horse?

- A. Viruses are hardware; Trojans are software
- B. A virus self-replicates by attaching to other programs; a Trojan disguises itself as legitimate software but does not self-replicate
- C. A Trojan self-replicates; a virus does not
- D. There is no difference between them

Answer: B

Q355. What does the principle of least privilege mean in practice?

- A. Users should have the maximum possible privileges
- B. Users and programs should only have the minimum privileges necessary to complete their tasks
- C. All users should have equal privileges
- D. Privileges should be assigned randomly

Answer: B

Q356. What is the purpose of a security audit log?

- A. To speed up system performance
- B. To record security-relevant events for later review and analysis
- C. To encrypt system files
- D. To authenticate users automatically

Answer: B

Q357. What is biometric authentication?

- A. Authentication using passwords only
- B. Authentication using unique physical characteristics such as fingerprints, facial recognition, or iris patterns
- C. Authentication using security tokens only
- D. Authentication using encryption keys

Answer: B

Q358. What is a protection domain in operating system security?

- A. A geographic region where the computer is located
- B. A set of access rights that defines what resources a process can access and what operations it can perform
- C. A physical barrier around the server room
- D. A type of antivirus software

Answer: B

Q359. What is the function of a firewall?

- A. To cool down the CPU to prevent overheating
- B. To filter network traffic based on security rules, blocking unauthorized access while permitting legitimate communication
- C. To encrypt all files on the hard drive
- D. To scan files for viruses

Answer: B

Q360. What is the relationship between disk access time and its components?

- A. Access time equals seek time only
- B. Access time is the sum of seek time, rotational latency, and data transfer time
- C. Access time equals rotational latency only
- D. Access time equals transfer time minus seek time

Answer: B

Operating Systems — Medium

360 questions

Q361. What is the difference between multiprogramming and multitasking?

- A. Multiprogramming uses multiple CPUs; multitasking one
- B. Multiprogramming maximizes CPU; multitasking adds sharing
- C. There is no meaningful difference between them
- D. Multitasking is an older technique than multiprogramming

Answer: B

Q362. What is a system call?

- A. A call made from one user to another user
- B. A function call within user-level programs
- C. A programmatic interface to request OS services
- D. A type of hardware interrupt signal to CPU

Answer: C

Q363. Which mode of CPU operation has unrestricted access to all hardware resources?

- A. User mode
- B. Safe mode
- C. Debug mode
- D. Kernel mode

Answer: D

Q364. What is the purpose of the mode bit in the CPU?

- A. To store the current instruction address
- B. To manage the CPU cache memory size
- C. To count the total CPU clock cycles
- D. To distinguish user mode from kernel mode

Answer: D

Q365. Spooling in operating systems refers to:

- A. A type of interrupt handling method
- B. Overlapping I/O with CPU computation
- C. A type of CPU scheduling algorithm
- D. A memory management technique used

Answer: B

Q366. An interrupt is:

- A. A type of software error in code
- B. A signal needing immediate CPU attention
- C. A specific type of system call request
- D. A process scheduling technique in OS

Answer: B

Q367. What is the difference between a trap and an interrupt?

- A. A trap is software-generated, interrupt is hardware
- B. There is no real difference between them
- C. A trap executes faster than an interrupt does
- D. A trap is hardware-generated, interrupt is software

Answer: A

Q368. DMA (Direct Memory Access) is used to:

- A. Speed up internal CPU processing tasks
- B. Transfer data to memory without the CPU
- C. Increase the processor clock speed rate
- D. Manage virtual memory paging on disk

Answer: B

Q369. A distributed operating system:

- A. Makes independent computers appear as one system
- B. Runs only on a single standalone machine
- C. Cannot share resources between multiple machines
- D. Is the same as a standard network operating system

Answer: A

Q370. What is the bootstrap program?

- A. A program that manages user accounts and groups
- B. A program that handles active network connections
- C. A program that compiles other user-level programs
- D. The first program run at power-on to load the OS

Answer: D

Q371. In a microkernel OS, which of the following typically runs in user space?

- A. Interrupt handling routines
- B. Core CPU scheduling
- C. Hardware-level memory mgmt
- D. File system services

Answer: D

Q372. What is the primary mechanism microkernels use for communication between services?

- A. Message passing IPC
- B. Shared memory only
- C. Continuous polling
- D. Direct function calls

Answer: A

Q373. System calls are typically invoked by user programs through:

- A. Direct hardware manipulation
- B. Application Programming APIs
- C. Bootloader entry points
- D. Device driver interfaces

Answer: B

Q374. What is the main disadvantage of the layered approach to OS design?

- A. It does not provide any file system support
- B. Difficulty defining layers and traversal overhead
- C. It is too simple and basic to be practical
- D. It cannot support any form of multitasking

Answer: B

Q375. What is a loadable kernel module (LKM)?

- A. Code loaded into the kernel at runtime dynamically
- B. A user application loaded on demand by the OS
- C. A type of system call for interprocess messaging
- D. A bootloader component for starting the OS kernel

Answer: A

Q376. Which of the following is a category of system calls?

- A. Compilation control
- B. Code optimization
- C. Information maintenance
- D. Syntax analysis

Answer: C

Q377. Parameters to system calls can be passed by placing them in:

- A. Only through CPU registers
- B. Only via the system stack
- C. Registers, stack, or memory block
- D. Only through shared memory

Answer: C

Q378. The POSIX API is:

- A. A Windows-specific system API
- B. A file format specification
- C. A portable UNIX interface standard
- D. A networking protocol standard

Answer: C

Q379. What is the purpose of the system call interface?

- A. To link API calls to kernel implementations
- B. To format disks and storage partitions
- C. To manage user passwords and accounts
- D. To execute hardware instructions directly

Answer: A

Q380. Windows NT uses which type of kernel architecture?

- A. Hybrid kernel
- B. Pure microkernel
- C. Pure monolithic
- D. Exokernel type

Answer: A

Q381. In the producer-consumer problem using shared memory, what role does the buffer play?

- A. It handles hardware interrupt processing
- B. It is a shared region for producer-consumer
- C. It stores the executable program code
- D. It manages the CPU scheduling algorithm

Answer: B

Q382. What is the difference between shared memory and message passing IPC?

- A. Shared memory faster for large data; message passing for remote
- B. There is no difference between these two approaches
- C. Shared memory uses common region; message passing uses kernel
- D. Both B and C are correct descriptions of their differences

Answer: D

Q383. What happens during a context switch?

- A. Current process state is saved, next is loaded
- B. All of main memory is cleared completely
- C. All running processes are terminated at once
- D. The CPU is shut down and then restarted

Answer: A

Q384. In UNIX, what does the exec() family of system calls do?

- A. Terminates the currently running process
- B. Replaces process image with new program
- C. Suspends the process until a signal
- D. Creates a brand new child process

Answer: B

Q385. What is cascading termination?

- A. Terminating processes one by one sequentially
- B. OS terminates all children when parent exits
- C. Restarting processes in a specific sequence
- D. Suspending processes in a particular order

Answer: B

Q386. A pipe in UNIX provides:

- A. Bidirectional communication between any processes
- B. Network communication across remote machines
- C. Direct communication with the hardware devices
- D. Unidirectional communication between parent-child

Answer: D

Q387. What is a named pipe (FIFO) and how does it differ from an ordinary pipe?

- A. It only works on Microsoft Windows platforms
- B. It provides faster data communication speed
- C. It has a name and works between unrelated processes
- D. It is identical to an ordinary pipe

Answer: C

Q388. Which scheduling queue holds processes that are in main memory and ready to execute?

- A. Wait queue
- B. Device queue
- C. Ready queue
- D. Job queue

Answer: C

Q389. The long-term scheduler (job scheduler) controls:

- A. Which process gets I/O device access next
- B. Which process gets swapped out to the disk
- C. Which process gets the CPU execution next
- D. Which processes are admitted to the system

Answer: D

Q390. What is the role of the short-term scheduler (CPU scheduler)?

- A. To swap processes between memory and disk
- B. To select which ready process gets the CPU
- C. To admit new jobs into the system queue
- D. To terminate processes that have finished

Answer: B

Q391. What is the convoy effect in FCFS scheduling?

- A. Processes are grouped into convoys for batch runs
- B. Short processes wait for long ones, raising wait time
- C. CPU utilization increases dramatically and suddenly
- D. All processes finish at exactly the same time

Answer: B

Q392. In Shortest Remaining Time First (SRTF) scheduling, what happens when a new process arrives?

- A. The current process is always preempted regardless of timing
- B. The new process always waits until the current one completes
- C. The scheduler compares remaining times and preempts if shorter
- D. The new process automatically gets the highest priority level

Answer: C

Q393. What is starvation in the context of CPU scheduling?

- A. A process running completely out of allocated memory
- B. A process consuming too much CPU time from the system
- C. A deadlock situation between two or more blocked tasks
- D. A low-priority process waiting indefinitely for the CPU

Answer: D

Q394. Aging is a technique used to:

- A. Track how long each process has been running on the CPU
- B. Increase process priority over time to prevent starvation
- C. Decrease the priority of a process as it runs much longer
- D. Remove old processes from the system to free up resources

Answer: B

Q395. If the time quantum in Round Robin is very large, it behaves like:

- A. Multilevel queues
- B. Priority scheduling
- C. SJF scheduling
- D. FCFS scheduling

Answer: D

Q396. If the time quantum in Round Robin is very small, what problem occurs?

- A. Excessive switching
- B. System deadlocking
- C. Memory overflowing
- D. Process starvation

Answer: A

Q397. In Multilevel Queue Scheduling, processes are:

- A. Permanently assigned to queues by type
- B. All placed in one single queue
- C. Moved between queues based on priority
- D. Randomly assigned to available queues

Answer: A

Q398. What distinguishes Multilevel Feedback Queue from Multilevel Queue scheduling?

- A. It only uses the Round Robin algorithm
- B. Processes can move between queues by behavior
- C. It does not support priority scheduling
- D. It uses fewer scheduling queues overall

Answer: B

Q399. Dispatch latency is:

- A. The time a process waits in the ready queue
- B. The time between two consecutive CPU interrupts
- C. The time to stop one process and start another
- D. The total execution time of a single process

Answer: C

Q400. Response time in scheduling is defined as:

- A. The time between two context switches
- B. The time to complete all system processes
- C. The total CPU execution time of process
- D. Time from submission until first response

Answer: D

Q401. What is the many-to-one threading model?

- A. Each user thread maps to one kernel thread
- B. Many kernel threads map to one user thread
- C. Many user-level threads map to one kernel thread
- D. One user thread maps to many kernel threads

Answer: C

Q402. What is the one-to-one threading model?

- A. One process only ever has one thread
- B. One kernel thread maps to many user threads
- C. One user thread maps to one kernel thread
- D. All threads share one single CPU together

Answer: C

Q403. What is the disadvantage of the many-to-one threading model?

- A. If one thread blocks, all threads in process block
- B. It cannot create more than two threads total
- C. It uses too many kernel resources overall
- D. It is too slow for practical usage scenarios

Answer: A

Q404. What is a thread pool?

- A. A memory allocation area used for threads
- B. Pre-created threads that wait for work tasks
- C. A collection of currently unused threads
- D. A debugging tool for analyzing thread bugs

Answer: B

Q405. What happens to threads when fork() is called in a multithreaded program?

- A. The child process is created with no threads
- B. All threads are always duplicated in the child
- C. Fork cannot be used in multithreaded programs
- D. It depends on the system; some dup all, some one

Answer: D

Q406. What is thread cancellation?

- A. Terminating a thread before completion
- B. Creating a brand new thread from scratch
- C. Moving a thread to a different process
- D. Suspending a thread temporarily in place

Answer: A

Q407. What is the difference between asynchronous and deferred thread cancellation?

- A. Asynchronous is safer because it checks all resources before acting
- B. Asynchronous terminates immediately; deferred checks at safe points
- C. Deferred cancellation is always much faster than asynchronous type
- D. There is no difference between the two cancellation types

Answer: B

Q408. Thread-Local Storage (TLS) allows:

- A. Threads to communicate with each other via messages
- B. Each thread to have its own copy of certain data
- C. All threads to share the exact same data copies
- D. Data to be stored persistently on disk for threads

Answer: B

Q409. What is implicit threading?

- A. Threads that remain invisible to the programmer
- B. Threads that run implicitly without any OS scheduling
- C. Threads that do not use any system resources at all
- D. Transferring thread management to compilers and runtimes

Answer: D

Q410. OpenMP is used for:

- A. File compression utilities
- B. Parallel shared-memory programming
- C. Database management systems
- D. Network programming via APIs

Answer: B

Q411. What is Peterson's solution for the critical section problem?

- A. A solution implemented using monitors
- B. A hardware-based solution only
- C. A solution implemented using semaphores
- D. A software solution using turn and flag

Answer: D

Q412. The test-and-set instruction is:

- A. A specific type of semaphore implementation
- B. An atomic hardware instruction to test and set
- C. A scheduling algorithm for critical sections
- D. A software-only algorithm for locking

Answer: B

Q413. The compare-and-swap (CAS) instruction:

- A. Compares two files and swaps their contents
- B. Compares the speeds of two different CPUs
- C. Atomically compares and swaps a memory value
- D. Swaps two processes in the scheduling queue

Answer: C

Q414. A monitor is:

- A. A specific type of counting semaphore lock mechanism
- B. A construct encapsulating shared data with mutual exclusion
- C. A hardware lock on the system memory bus interface
- D. A display device or screen monitor unit

Answer: B

Q415. Condition variables in monitors are used with which operations?

- A. push() and pop()
- B. acquire() and release()
- C. wait() and signal()
- D. lock() and unlock()

Answer: C

Q416. In the bounded buffer problem, what are the semaphores typically used?

- A. One counting semaphore for the buffer
- B. Only a single mutex lock for the buffer
- C. Mutex plus empty and full semaphores
- D. Two binary semaphores for the buffer

Answer: C

Q417. In the readers-writers problem, what is the key synchronization challenge?

- A. Only one reader can read the data at a time
- B. Only one process can ever access the shared database
- C. Writers can write while readers are actively reading
- D. Multiple readers can read; writers need exclusive access

Answer: D

Q418. What is a spinlock most useful for?

- A. Short critical sections on multiprocessor systems
- B. Any critical section on single processor only
- C. I/O-bound processes waiting for disk access
- D. Long critical sections on single processors

Answer: A

Q419. What is priority inversion?

- A. Changing process priorities dynamically at runtime
- B. Assigning priorities in reverse numerical order
- C. A scheduling bug in all operating system kernels
- D. High-priority blocked by low-priority holding resource

Answer: D

Q420. Priority inheritance protocol solves priority inversion by:

- A. Raising low-priority to match highest waiting
- B. Blocking all medium-priority from running
- C. Terminating the low-priority resource holder
- D. Removing all priorities from every process

Answer: A

Q421. A safe state is one where:

- A. A safe sequence exists for all processes
- B. No process is waiting for any resource
- C. All system resources are fully available
- D. No process is currently running at all

Answer: A

Q422. What is the relationship between safe state and deadlock?

- A. An unsafe state always guarantees that deadlock exists
- B. Safe state means deadlock currently exists in system
- C. Safe and unsafe states are unrelated to deadlock at all
- D. Safe means no deadlock; unsafe means deadlock may occur

Answer: D

Q423. To prevent the 'hold and wait' condition, a process must:

- A. Use only shared resources that do not need locking
- B. Never request any resources from the operating system
- C. Request all resources at once, or release before requesting
- D. Hold all needed resources indefinitely without releasing

Answer: C

Q424. To prevent circular wait, one approach is:

- A. Remove all shared resources from system
- B. Allow processes to request in any order
- C. Impose ordering and require increasing order
- D. Use only a single resource type allowed

Answer: C

Q425. In the Banker's Algorithm, the 'Need' matrix represents:

- A. Currently allocated resources to each process
- B. The total number of resources in whole system
- C. Remaining resources each process may still need
- D. Total resources currently available to allocate

Answer: C

Q426. What is deadlock detection?

- A. Allowing deadlocks then detecting and recovering
- B. Ignoring deadlocks completely in all situations
- C. Avoiding deadlocks using the Banker Algorithm
- D. Preventing deadlocks from occurring in system

Answer: A

Q427. For deadlock detection with single-instance resources, which algorithm is used?

- A. Wait-for graph cycling
- B. Banker's Algorithm test
- C. Round Robin scheduling
- D. Best Fit allocating

Answer: A

Q428. Which deadlock recovery method terminates processes?

- A. Resource preemption from deadlocked processes
- B. Restarting the entire system from the beginning
- C. Ignoring the deadlock and hoping it resolves
- D. Process termination - abort all or one at a time

Answer: D

Q429. When recovering from deadlock by process termination, which factor is NOT typically considered?

- A. Time it has been running
- B. Process priority level
- C. Resources it now holds
- D. The color of terminal

Answer: D

Q430. The ostrich algorithm for handling deadlocks refers to:

- A. Ignoring deadlocks when rare and costly to handle
- B. A recovery mechanism for resolving deadlocks
- C. A sophisticated deadlock detection algorithm
- D. A prevention technique eliminating conditions

Answer: A

Q431. The Translation Lookaside Buffer (TLB) is:

- A. A disk cache for swap file contents
- B. A fast cache for page table entries
- C. A type of random access memory chip
- D. A backup copy of the main page table

Answer: B

Q432. In demand paging, pages are loaded into memory:

- A. All at once when the process first starts
- B. Based on a predetermined schedule
- C. Only when they are actually referenced
- D. Randomly without any specific order

Answer: C

Q433. The FIFO page replacement algorithm replaces:

- A. The page that has been in memory longest
- B. The least recently used page in memory
- C. The most frequently used page in memory
- D. A random page selected from the frames

Answer: A

Q434. The LRU (Least Recently Used) page replacement algorithm replaces:

- A. The page that was loaded into memory first
- B. The page not used for the longest time period
- C. The largest page currently loaded in a frame
- D. The page with the lowest assigned page number

Answer: B

Q435. Belady's anomaly states that:

- A. More frames can increase faults for some algorithms
- B. More memory always reduces total page faults
- C. LRU always outperforms FIFO in every situation
- D. Optimal page replacement causes most page faults

Answer: A

Q436. The optimal page replacement algorithm (OPT) replaces:

- A. The page unused for longest future time
- B. The smallest page currently in a frame
- C. The least recently used page in memory
- D. The first page that was loaded in memory

Answer: A

Q437. Thrashing occurs when:

- A. The CPU is idle and not running tasks
- B. Memory is completely free and available
- C. A process pages more than it executes
- D. Too few processes are currently running

Answer: C

Q438. Segmentation divides a program into:

- A. Equal-sized partitions of memory
- B. Fixed-size pages of equal length
- C. Variable-size segments like code and data
- D. Random blocks of varying sizes

Answer: C

Q439. The first-fit memory allocation algorithm:

- A. Allocates memory blocks at random
- B. Searches for the smallest suitable hole
- C. Allocates the first hole large enough
- D. Allocates the largest available hole

Answer: C

Q440. The best-fit memory allocation algorithm:

- A. Is the fastest allocation algorithm
- B. Allocates the first hole it finds
- C. Allocates the largest available hole
- D. Searches for the smallest sufficient hole

Answer: D

Q441. What is the difference between contiguous, linked, and indexed file allocation?

- A. They only differ in the speed of read and write operations
- B. Contiguous uses adjacent; linked chains; indexed uses pointers
- C. They only differ in the security settings for file access
- D. They are all identical in behavior and performance

Answer: B

Q442. Free space on disk can be managed using:

- A. Only the FAT table for tracking
- B. Only bit vectors for tracking
- C. Only linked lists for tracking
- D. Bit vectors, lists, or counting

Answer: D

Q443. A tree-structured directory organizes files in:

- A. A randomly organized structure
- B. A flat single-level structure
- C. A hierarchical parent-child structure
- D. A circular connected structure

Answer: C

Q444. An acyclic-graph directory structure allows:

- A. Only one single link per file in the system
- B. Circular file references between directories
- C. No file sharing between any user accounts
- D. Sharing files via links while preventing cycles

Answer: D

Q445. What is the Virtual File System (VFS) layer?

- A. An abstraction for uniform file system interface
- B. A file system stored in virtual memory
- C. A compressed file system saving disk space
- D. A file system designed for virtual machines

Answer: A

Q446. NTFS (New Technology File System) is primarily used by:

- A. Linux
- B. macOS
- C. Android
- D. Windows

Answer: D

Q447. ext4 is:

- A. A database system format
- B. The default Linux file system
- C. A Windows file system format
- D. A macOS file system format

Answer: B

Q448. File system consistency checking is needed because:

- A. Users make frequent file handling errors
- B. Files grow too large for disk capacity
- C. Hardware never fails in normal practice
- D. A crash during ops leaves inconsistent state

Answer: D

Q449. Access control lists (ACLs) in file systems provide:

- A. File versioning for tracking changes over time
- B. File data encryption for security and privacy
- C. File data compression for saving disk space
- D. Fine-grained permissions for users and groups

Answer: D

Q450. Direct access (random access) to a file means:

- A. Reading or writing any block directly without prior reads
- B. Reading the file sequentially from start to end
- C. Accessing the file at random without any specific pattern
- D. Accessing the file exclusively through the OS kernel layer

Answer: A

Q451. The SCAN (elevator) disk scheduling algorithm:

- A. Moves head one direction servicing, then reverses
- B. Only scans tracks that have pending I/O requests
- C. Scans files for viruses and malware threats
- D. Scans all tracks in a random selection order

Answer: A

Q452. The C-SCAN (Circular SCAN) algorithm differs from SCAN in that:

- A. It only works on solid state drives not on HDDs
- B. It is slower than the standard SCAN algorithm is
- C. Returns to start without servicing for uniform wait
- D. It never reverses the head direction at all

Answer: C

Q453. The LOOK disk scheduling algorithm differs from SCAN in that:

- A. It is significantly slower than the SCAN algorithm
- B. Reverses when no more requests ahead, not at end
- C. It only handles one single request at a time
- D. It looks at all pending requests before starting

Answer: B

Q454. Why is disk scheduling less important for SSDs compared to HDDs?

- A. SSDs use a completely different data interface
- B. SSDs are actually slower than HDDs overall
- C. SSDs have no moving parts, so seek is negligible
- D. SSDs cannot handle multiple concurrent requests

Answer: C

Q455. RAID 0 provides:

- A. Data redundancy only for safety
- B. Performance via striping, no redundancy
- C. Mirroring of data across two disks
- D. Parity-based protection from failure

Answer: B

Q456. RAID 1 provides:

- A. No data protection of any kind
- B. Striping data across disks only
- C. Parity-based protection on disks
- D. Mirroring via duplicate on disks

Answer: D

Q457. RAID 5 uses:

- A. Double parity across all the disks
- B. Block striping with distributed parity
- C. No redundancy of any kind at all
- D. Only mirroring for redundancy

Answer: B

Q458. Low-level (physical) formatting creates:

- A. Logical partitions and volume table structures
- B. A high-level file system and all its metadata
- C. Sector structure with headers and error correction
- D. Directories and user files on the disk surface

Answer: C

Q459. A swap space on a disk is used for:

- A. Disk defragmentation temporary workspace
- B. Exchanging files between different users
- C. Temporary file storage for applications
- D. Storing pages swapped out from memory

Answer: D

Q460. The boot block on a disk contains:

- A. Bootstrap code to load OS
- B. User data and documents
- C. Error correction for sectors
- D. File system metadata tables

Answer: A

Q461. What is the difference between programmed I/O, interrupt-driven I/O, and DMA?

- A. Programmed polls; interrupt frees CPU; DMA bypasses CPU
- B. They only work with specific hardware device types
- C. They only differ in speed of the data transfer
- D. They are all identical in behavior and speed

Answer: A

Q462. What is memory-mapped I/O?

- A. Storing I/O data into a temporary buffer
- B. Mapping device registers to memory addresses
- C. A type of virtual memory for page tables
- D. Mapping files from disk into virtual memory

Answer: B

Q463. What is the purpose of the I/O subsystem in the OS kernel?

- A. To manage user accounts and authentication
- B. To compile programs into executable binaries
- C. To provide games and multimedia for users
- D. Uniform interfaces for buffering and scheduling

Answer: D

Q464. Double buffering uses:

- A. No buffers needed at all ever
- B. Three buffers in a rotation cycle
- C. One buffer for all data transfers
- D. Two buffers: fill one, process other

Answer: D

Q465. Caching in the I/O system differs from buffering in that:

- A. They are identical in purpose and behavior
- B. Buffering stores during transfer; cache keeps copies
- C. Caching is always slower than buffering in practice
- D. Buffering is used only for output data operations

Answer: B

Q466. What is a device controller's role?

- A. To manage hardware and translate OS commands
- B. To manage virtual memory paging and swapping
- C. To compile device driver source code files
- D. To schedule processes for CPU execution time

Answer: A

Q467. What is the difference between blocking and non-blocking I/O?

- A. Blocking is always faster than non-blocking I/O
- B. They are identical in every way and behavior
- C. Non-blocking prevents all I/O from starting
- D. Blocking suspends until done; non-blocking returns

Answer: D

Q468. What is the purpose of an interrupt controller?

- A. To block all incoming interrupt signals
- B. To generate interrupt signals to CPU
- C. To manage, prioritize, route interrupts
- D. To count total number of interrupts

Answer: C

Q469. What is the unified buffer cache?

- A. A cache located inside the CPU for all instructions
- B. Single cache for files and mapped memory, no duplication
- C. A cache shared by all system users equally
- D. A universal cache for every device in the system

Answer: B

Q470. Error handling in I/O systems typically involves:

- A. Shutting down the entire system on any error
- B. Deleting the faulty device from the system table
- C. Returning codes, retrying, logging, informing users
- D. Ignoring all errors that occur during I/O

Answer: C

Q471. An access control matrix is:

- A. A type of encryption algorithm for data security
- B. A type of visual display device for output
- C. A hardware protection mechanism in the CPU unit
- D. A model specifying subject access rights to objects

Answer: D

Q472. Access Control Lists (ACLs) are a column-based implementation of the access control matrix where:

- A. Each object stores subjects and their access rights
- B. A central authority stores all access control rights
- C. Access rights are not stored anywhere in the system
- D. Each subject stores its own access rights list

Answer: A

Q473. Capability lists are a row-based implementation of the access control matrix where:

- A. Capabilities are stored in a central directory
- B. Each object stores its own capability tokens
- C. Each subject holds objects and allowed operations
- D. Capabilities are not used in any modern system

Answer: C

Q474. A denial-of-service (DoS) attack:

- A. Modifies system files to gain higher access levels
- B. Steals confidential data from the system quietly
- C. Overwhelms a system to deny service to users
- D. Encrypts user files and demands ransom payment

Answer: C

Q475. A buffer overflow attack exploits:

- A. Too much available memory in the system overall
- B. Overwriting memory beyond a buffer boundary
- C. Network buffer limits causing packet loss
- D. Disk buffer overflow causing data corruption

Answer: B

Q476. In UNIX file permissions, the permission mode 755 means:

- A. Owner has rwx, group and others have r-x access
- B. Everyone has full unrestricted access to file
- C. The file is hidden from all users in system
- D. Only the owner can access and modify the file

Answer: A

Q477. What is the difference between symmetric and asymmetric encryption?

- A. Asymmetric is faster than symmetric in practice
- B. Symmetric uses one key; asymmetric uses key pair
- C. They are the same algorithm for encryption use
- D. Symmetric is always more secure than asymmetric

Answer: B

Q478. What is a protection domain?

- A. A set of access rights for process resources
- B. A physical area in the server room building
- C. A network domain managed by a DNS server
- D. A type of firewall zone for network security

Answer: A

Q479. Multifactor authentication combines:

- A. Using multiple different usernames
- B. Combining different auth factor types
- C. Allowing multiple login attempts
- D. Using multiple passwords for login

Answer: B

Q480. What is the role of a digital certificate in security?

- A. To encrypt files for security
- B. To manage user passwords securely
- C. To bind public key to identity via CA
- D. To compress data for efficient storage

Answer: C

Q481. What distinguishes a microkernel architecture from a monolithic kernel?

- A. Microkernels run all services in kernel space for speed
- B. Microkernels move most services to user space processes
- C. Monolithic kernels keep only minimal services in kernel
- D. Both architectures are identical in design and approach

Answer: B

Q482. What is the purpose of dual-mode operation in an operating system?

- A. To double the processing speed of the CPU cores
- B. To protect the system from errant user programs
- C. To run two operating systems simultaneously here
- D. To allow two separate users to log in together

Answer: B

Q483. How does a hypervisor differ from a traditional operating system?

- A. A hypervisor is just another name for an OS kernel
- B. A hypervisor only runs on mobile phone platforms
- C. A hypervisor manages virtual machines on hardware
- D. A hypervisor cannot manage hardware resources ever

Answer: C

Q484. What is the key advantage of time-sharing over batch processing?

- A. Batch processing provides faster interactive response
- B. Time-sharing eliminates the need for any memory
- C. Time-sharing provides interactive response to users
- D. Time-sharing consumes less CPU than batch does here

Answer: C

Q485. What role does the DMA controller play in an operating system?

- A. It compiles source code into machine language
- B. It schedules processes for execution on processors
- C. It manages user authentication and access control
- D. It transfers data between memory and I/O directly

Answer: D

Q486. Which statement about system programs is correct?

- A. They replace the need for an operating system here
- B. They provide convenient environment for development
- C. System programs only include text editor programs
- D. System programs are the same as the OS kernel

Answer: B

Q487. What is the trap instruction used for in operating systems?

- A. To physically trap faulty hardware in the system
- B. To prevent users from logging into the system
- C. To switch from user mode to kernel mode safely
- D. To catch and eliminate computer virus threats

Answer: C

Q488. What is the difference between policy and mechanism in OS design?

- A. They are interchangeable terms with the same meaning
- B. Policy refers to hardware; mechanism to software here
- C. Mechanism decides what; policy decides how it is done
- D. Policy decides what to do; mechanism decides how

Answer: D

Q489. What happens during a context switch in an operating system?

- A. The computer restarts and reloads the entire system
- B. All running processes are terminated and then removed
- C. The OS saves one process state and loads another
- D. The kernel is replaced with a newer version of code

Answer: C

Q490. What is the purpose of the OS system call interface?

- A. It controls voltage supply to all peripheral devices
- B. It connects the monitor cable directly to CPU chip
- C. It manages the physical layout of the motherboard
- D. It provides a layer between user programs and kernel

Answer: D

Q491. What is the main advantage of a layered OS structure?

- A. It eliminates the need for any system call interfaces
- B. It provides the fastest possible system performance now
- C. It requires less memory than all other architectures
- D. Each layer can be debugged and verified independently

Answer: D

Q492. How do loadable kernel modules benefit the operating system?

- A. They allow extending kernel functionality at runtime easily
- B. They eliminate all system calls from the OS call interface
- C. They require the entire kernel to be recompiled each time
- D. They replace the need for any device drivers completely now

Answer: A

Q493. What is the role of the system call interface in OS architecture?

- A. It only manages file system operations and nothing else
- B. It replaces the kernel in all microkernel architectures
- C. It serves as boundary between user programs and the OS
- D. It provides direct hardware access to user-level programs

Answer: C

Q494. What is a key disadvantage of the simple monolithic structure?

- A. It cannot access any hardware devices at all currently
- B. It is very slow due to many excessive mode switches
- C. It does not support any form of multitasking operation
- D. It is hard to maintain because parts are tightly coupled

Answer: D

Q495. How does message passing work in a microkernel OS design?

- A. Services exchange messages through microkernel's IPC
- B. Services call each other like regular function calls
- C. All communication happens directly in shared memory
- D. Services communicate through shared global variables

Answer: A

Q496. What is the parameter table approach for passing system call arguments?

- A. It limits system calls to only three parameters total
- B. It stores system call results on the hard disk drive
- C. Parameters are stored in a table; address passed in register
- D. It eliminates the need for any CPU registers entirely

Answer: C

Q497. What advantage does a microkernel have over a monolithic kernel?

- A. Microkernels have more code running inside kernel space
- B. Microkernels always have better raw system performance
- C. Microkernels are easier to extend and port to new hardware
- D. Microkernels eliminate the need for device driver support

Answer: C

Q498. What is the difference between static and dynamic linking?

- A. Dynamic libraries must be recompiled with each application
- B. Static libraries are linked at compile time into binary
- C. Static libraries are always smaller than dynamic libraries
- D. Dynamic libraries are slower but use more total disk space

Answer: B

Q499. Why is debugging a layered OS more straightforward than others?

- A. Because layered systems do not use system calls at all
- B. Because errors in one layer are isolated from other ones
- C. Because all layers share the exact same address space
- D. Because layered systems have no kernel component in them

Answer: B

Q500. What role does the POSIX standard play in operating system design?

- A. It describes physical network topologies for computers
- B. It specifies a standard OS interface for portability use
- C. It defines a mandatory hardware specification for PCs
- D. It is a language used specifically to write OS kernels

Answer: B

Q501. What differs between the short-term and long-term scheduler?

- A. Short-term selects from ready queue; long-term from disk
- B. Long-term runs more frequently than short-term scheduler
- C. Short-term controls the degree of multiprogramming level
- D. They are the same scheduler with two different OS names

Answer: A

Q502. What is a zombie process and why does it occur?

- A. A process created but never actually started running
- B. A terminated process whose parent has not called wait
- C. A process paused by the operating system permanently
- D. A process that runs forever consuming all resources

Answer: B

Q503. How does exec() differ from fork() in Unix systems?

- A. Neither affects the process structure in any way here
- B. exec() creates a new process; fork() replaces image
- C. Both create new processes in exactly identical fashion
- D. fork() creates new process; exec() replaces the image

Answer: D

Q504. What is inter-process communication (IPC) used for?

- A. Connecting a computer to external network devices
- B. Compiling multiple source files at the same time here
- C. Managing CPU scheduling algorithms exclusively now
- D. Allowing processes to exchange data and synchronize

Answer: D

Q505. How do shared memory and message passing IPC differ?

- A. Neither mechanism allows processes to exchange any data
- B. Both mechanisms work identically in all systems always
- C. Message passing uses shared region; shared uses kernel
- D. Shared memory uses common region; messages use kernel

Answer: D

Q506. What is the purpose of the medium-term scheduler?

- A. It schedules I/O operations for device driver code
- B. It manages the file system directory tree structure
- C. It assigns priorities to all newly created processes
- D. It swaps processes between main memory and the disk

Answer: D

Q507. How does a pipe work as an IPC mechanism in Unix?

- A. It provides unidirectional byte stream between procs
- B. It only works between processes on different machines
- C. It replaces the need for any process synchronization
- D. It provides bidirectional communication always here

Answer: A

Q508. What is a process address space composed of?

- A. Exclusively the operating system kernel code only
- B. Only the stack and no other memory segment data
- C. Text, data, heap, and stack segments combined
- D. Only the program code and nothing else at all

Answer: C

Q509. What is cascading termination in process management?

- A. Restarting a process multiple times before stopping
- B. Terminating all children when parent process exits
- C. Gradually slowing down a process before termination
- D. Saving the process state to disk before termination

Answer: B

Q510. What is the role of the dispatcher in process management?

- A. It gives CPU control to the process the scheduler chose
- B. It manages file system allocation tables on the disk
- C. It handles all network communication between hosts
- D. It creates new processes from executable binaries

Answer: A

Q511. What is the convoy effect in FCFS scheduling?

- A. All processes complete at exactly the same time
- B. Short processes wait behind a long CPU-bound one
- C. The CPU is idle while waiting for process arrival
- D. Processes are sorted by priority before execution

Answer: B

Q512. How does the Shortest Remaining Time First algorithm work?

- A. It preempts if a new process has shorter remaining time
- B. It always runs the longest process first for throughput
- C. It is identical to non-preemptive SJF in every way
- D. It uses Round Robin with variable time quantum sizes

Answer: A

Q513. What problem does aging solve in priority scheduling?

- A. It prevents context switching between processes now
- B. It increases the time quantum in Round Robin schemes
- C. It solves starvation for low-priority waiting processes
- D. It eliminates the need for any scheduling algorithm

Answer: C

Q514. What happens with a very small time quantum in Round Robin?

- A. It reduces context switches significantly overall
- B. It increases context switch overhead and degrades speed
- C. It eliminates the need for a ready queue in the system
- D. It converts Round Robin into FCFS scheduling behavior

Answer: B

Q515. How does multilevel queue scheduling organize processes?

- A. Each process gets its own dedicated scheduling queue
- B. Processes are divided into classes with separate queues
- C. All processes share a single common ready queue only
- D. Processes are randomly assigned to available CPU cores

Answer: B

Q516. What is dispatch latency in CPU scheduling?

- A. Time to transfer data from main memory to the CPU
- B. Time to stop one process and start running another
- C. Time for a process to complete its entire execution
- D. Time between submitting a job and its first output

Answer: B

Q517. What is response time and why is it important?

- A. It counts total number of context switches performed
- B. It is time from submission to first response produced
- C. It is the total time to complete the process entirely
- D. It measures amount of memory a process consumes now

Answer: B

Q518. How does SJF achieve optimal average waiting time?

- A. By using a large time quantum to minimize switching
- B. By assigning equal CPU time to every queued process
- C. By running the longest jobs first to clear the queue
- D. By placing shortest jobs first reducing total wait time

Answer: D

Q519. What distinguishes multilevel feedback queue from multilevel queue?

- A. Multilevel queues allow movement but feedback does not
- B. Feedback queues allow processes to move between queues
- C. Both scheduling algorithms are identical in all behavior
- D. Feedback queues do not allow preemption of processes

Answer: B

Q520. What is the main disadvantage of Shortest Job First?

- A. It needs CPU burst time which is hard to predict ahead
- B. It cannot work with more than two processes at a time
- C. It always has the worst average waiting time possible
- D. It causes excessive context switching between processes

Answer: A

Q521. What is the many-to-one threading model?

- A. Many user threads map to one kernel thread
- B. Each user thread maps to one kernel thread
- C. Many kernel threads map to one user thread
- D. Multiple kernel threads share one CPU core

Answer: A

Q522. What is the one-to-one threading model's main advantage?

- A. It eliminates the need for any synchronization at all
- B. It uses less memory than all other threading models
- C. It allows true concurrency on multiprocessor systems
- D. It does not need any operating system kernel support

Answer: C

Q523. What is the purpose of thread pools in multithreaded systems?

- A. To pre-create threads and reuse them for new requests
- B. To prevent any thread from being created in a system
- C. To merge all threads into a single execution context
- D. To permanently store thread objects on the hard disk

Answer: A

Q524. What is thread-local storage (TLS) used for?

- A. Storing thread data on a remote network file server
- B. Sharing data between all threads in a process
- C. Encrypting data that threads access in shared memory
- D. Giving each thread its own copy of specific data

Answer: D

Q525. How does the many-to-many threading model work?

- A. It eliminates both user and kernel threads entirely
- B. It maps one user thread to many kernel threads here
- C. It maps many kernel threads to one user thread now
- D. It maps many user threads to many kernel threads

Answer: D

Q526. What is the signal handling challenge in multithreaded programs?

- A. Signals are only relevant to single-threaded programs
- B. Deciding which thread should receive and handle signal
- C. Signals cannot be generated in multithreaded programs
- D. All signals are handled automatically by the OS kernel

Answer: B

Q527. What is the difference between implicit and explicit threading?

- A. Both approaches are identical in their implementation
- B. Implicit threading needs manual thread creation code
- C. Explicit threading is handled automatically by system
- D. Implicit threading is done by compilers and libraries

Answer: D

Q528. What happens during deferred thread cancellation?

- A. Thread cancellation is impossible in deferred mode here
- B. The target thread is terminated immediately on request
- C. Thread checks for cancellation at cancellation points
- D. The entire process is terminated along with all threads

Answer: C

Q529. Why is fork() complex in multithreaded programs?

- A. fork() terminates the calling thread before the child
- B. It must decide whether to duplicate all or one thread
- C. fork() cannot be called from multithreaded programs
- D. fork() always duplicates all threads without exception

Answer: B

Q530. What is OpenMP and how does it support threading?

- A. OpenMP is a hardware spec for multicore CPUs only
- B. OpenMP is a network protocol for distributed systems
- C. OpenMP provides compiler directives for parallel code
- D. OpenMP is an operating system for embedded controllers

Answer: C

Q531. What are the three requirements for a correct critical section solution?

- A. Speed, memory efficiency, and low power consumption
- B. Simplicity, readability, and backward compatibility now
- C. Atomicity, consistency, isolation, and full durability
- D. Mutual exclusion, progress, and bounded waiting time

Answer: D

Q532. What is the producer-consumer problem in synchronization?

- A. A technique for optimizing database query performance
- B. Coordinating producer adding and consumer removing
- C. A problem about consumer electronics device drivers
- D. A problem about manufacturing physical hardware

Answer: B

Q533. How does Peterson's solution achieve mutual exclusion?

- A. It uses a centralized server to manage all locks
- B. It uses two shared variables: turn and flag array
- C. It uses hardware test-and-set atomic instructions
- D. It relies on disabling all interrupts on processor

Answer: B

Q534. How do spinlocks differ from blocking locks?

- A. Both types always put waiting threads to sleep now
- B. Spinlocks sleep; blocking locks use busy waiting
- C. Both types always use busy waiting to check locks
- D. Spinlocks busy-wait; blocking locks put threads asleep

Answer: D

Q535. What is a monitor in concurrent programming?

- A. A display screen for viewing program output
- B. A network device monitoring all traffic on LAN
- C. A high-level synchronization construct with mutex
- D. A tool for monitoring CPU temperature and speed

Answer: C

Q536. What is the purpose of condition variables in monitors?

- A. They store values of conditional expressions only
- B. They replace the need for any mutual exclusion now
- C. They count threads inside the monitor at any time
- D. They let threads wait for specific conditions safely

Answer: D

Q537. What is the readers-writers problem in synchronization?

- A. A problem about reading user input from a keyboard
- B. Allowing concurrent reads but exclusive writes to data
- C. A technique for writing data to multiple disk drives
- D. A problem about reading and writing files in order

Answer: B

Q538. What is the test-and-set instruction used for?

- A. Testing network and setting bandwidth limits on it
- B. Setting CPU clock speed after testing the hardware
- C. Testing programs and setting breakpoints in them
- D. Atomically testing and modifying a word for locks

Answer: D

Q539. What is the compare-and-swap (CAS) instruction?

- A. A sorting algorithm comparing and swapping values
- B. A technique to compare files and swap if different
- C. A method to swap two processes in scheduling queue
- D. Atomic instruction conditionally updating memory word

Answer: D

Q540. What is a barrier synchronization mechanism?

- A. A way to permanently block a thread from running
- B. A point where all threads must arrive before any go
- C. A physical barrier between two system processors
- D. A mechanism preventing threads from being created

Answer: B

Q541. How does the Banker's algorithm determine if a state is safe?

- A. It finds a safe sequence where all processes complete
- B. It only checks if CPU utilization is above fifty percent
- C. It checks if total resources exceed process count
- D. It verifies no process has any resource allocated now

Answer: A

Q542. How can the hold-and-wait condition be prevented?

- A. By removing mutual exclusion from all shared resources
- B. By giving every process all existing system resources
- C. By requiring processes to request all resources at once
- D. By allowing processes to request at any time freely

Answer: C

Q543. How do deadlock prevention and avoidance differ?

- A. Prevention ignores deadlocks; avoidance terminates all tasks
- B. Prevention detects deadlocks; avoidance recovers from them
- C. Prevention constrains requests; avoidance checks each allocation
- D. They are exactly the same strategy with different names now

Answer: C

Q544. How does total ordering on resources prevent circular wait?

- A. It allows processes to request resources in any order
- B. It makes all resources shareable between all processes
- C. It eliminates the need for any resource allocation logic
- D. Processes must request resources in increasing order now

Answer: D

Q545. What is deadlock detection using a wait-for graph?

- A. A graph showing CPU utilization over time periods
- B. A diagram of physical network connections between PCs
- C. A chart showing memory usage of each running process
- D. A variant with only processes; a cycle means deadlock

Answer: D

Q546. What are the recovery options after detecting a deadlock?

- A. Only restarting the entire computer system works now
- B. Process termination or resource preemption can be used
- C. Deadlocks always resolve themselves automatically here
- D. Adding more physical memory always resolves all deadlock

Answer: B

Q547. What is the ostrich algorithm for handling deadlocks?

- A. A sophisticated algorithm detecting all deadlocks fast
- B. An algorithm preventing deadlock with resource ordering
- C. It ignores the problem assuming deadlocks rarely occur
- D. A technique recovering from deadlocks automatically now

Answer: C

Q548. What is a livelock and how does it differ from deadlock?

- A. Livelock means all processes are blocked and inactive
- B. In livelock processes are active but make no progress
- C. Livelock only occurs in single-threaded applications
- D. Livelock is identical to deadlock in every way here

Answer: B

Q549. What does the Banker's algorithm need from processes?

- A. The total disk space used by each process on system
- B. Only the current CPU usage of each active process
- C. Maximum resource needs declared by each process first
- D. Only the priority level assigned to each process now

Answer: C

Q550. Why might deadlock prevention lead to low resource utilization?

- A. Because conservative restrictions leave resources idle now
- B. Because it allocates all resources to one process always
- C. Because it detects deadlocks only after they have formed
- D. Because it allows processes to hold resources indefinitely

Answer: A

Q551. How does the LRU page replacement algorithm work?

- A. It replaces the page not used for the longest time
- B. It randomly selects any page for replacement now
- C. It replaces the page used furthest in the future
- D. It replaces pages in the order they were loaded in

Answer: A

Q552. What is the Translation Lookaside Buffer (TLB)?

- A. A register storing the base address of process
- B. A buffer for storing data being written to disk
- C. A queue for processes waiting for memory alloc
- D. A fast cache for recent page table entries only

Answer: D

Q553. What is Belady's anomaly in page replacement?

- A. Page faults are constant regardless of the frame count
- B. More frames always reduce the number of page faults
- C. Belady's anomaly only occurs with the optimal algorithm
- D. More frames can increase page faults with FIFO scheme

Answer: D

Q554. How does segmentation differ from paging?

- A. Neither technique uses any address translation now
- B. Both use exactly the same fixed-size memory blocks
- C. Segmentation uses fixed-size; paging uses variable
- D. Paging uses fixed-size; segmentation uses variable

Answer: D

Q555. What is demand paging in virtual memory?

- A. Loading all pages into memory at startup
- B. Requiring users to manually load needed pages
- C. Pre-loading all pages from disk before start
- D. Loading pages only when they are accessed now

Answer: D

Q556. What is the working set model in virtual memory?

- A. Pages a process actively uses in time window
- B. Set of all pages stored on the hard disk now
- C. Total physical memory available in computer
- D. Total number of processes in ready queue

Answer: A

Q557. What is thrashing in virtual memory systems?

- A. A process running very fast and finishing quickly
- B. The process of defragmenting virtual memory space
- C. A technique to improve memory utilization efficiency
- D. Excessive page faults causing most time spent swapping

Answer: D

Q558. How does the FIFO page replacement algorithm work?

- A. It replaces the page with fewest access counts
- B. It replaces pages by their physical address now
- C. It replaces the most recently loaded page here
- D. It replaces the oldest page that was loaded in

Answer: D

Q559. What is the dirty bit used for in paging?

- A. It marks pages containing errors or corrupted data
- B. It indicates whether a page was modified in RAM
- C. It shows whether a page is currently locked in RAM
- D. It counts the number of times a page was accessed

Answer: B

Q560. What is a multi-level page table and why is it used?

- A. A page table stored on multiple different disk drives
- B. A hierarchical page table reducing memory overhead
- C. A page table storing entries for multiple processes
- D. A table mapping pages to multiple physical frames

Answer: B

Q561. How does indexed allocation manage file disk blocks?

- A. Blocks are linked using pointers in each block
- B. An index block contains pointers to data blocks
- C. Blocks are allocated randomly without tracking
- D. All blocks are stored consecutively on disk

Answer: B

Q562. What differs between a hard link and a symbolic link?

- A. Hard links work across file systems but soft do not
- B. Hard link points to inode; soft link points to path
- C. Both hard and symbolic links are exactly identical
- D. Symbolic links point to inodes; hard links to paths

Answer: B

Q563. What is the inode structure in Unix file systems?

- A. A structure storing file metadata and block pointers
- B. A network node handling file transfer protocols
- C. A hardware component managing disk read operations
- D. A process monitoring file system integrity at boot

Answer: A

Q564. How does the FAT file system organize file allocation?

- A. Using a file allocation table chaining disk blocks
- B. Using B-tree indexes for each file on the disk now
- C. Using extent-based allocation with balanced trees
- D. Using inodes and indirect blocks like Unix systems

Answer: A

Q565. What is journaling in modern file systems?

- A. Recording user activity logs for security audit
- B. Writing metadata changes to a log before commit
- C. Storing journal entries for file content searching
- D. Maintaining daily backup schedule of all files now

Answer: B

Q566. What is the free-space management bitmap method?

- A. A method to compress free space for more storage
- B. A technique to visualize the directory tree layout
- C. Each bit represents a block allocation status bit
- D. A graphical representation of files on screen

Answer: C

Q567. What is direct access file organization?

- A. Any record can be accessed directly by position
- B. Files can only be read sequentially from start
- C. Files are accessed by searching all records first
- D. Files can only be accessed through symbolic links

Answer: A

Q568. What is the purpose of the Virtual File System layer?

- A. It provides uniform interface to file system types
- B. It creates virtual copies of files for backup
- C. It manages virtual memory not file system at all
- D. It encrypts all files stored on virtual disk drives

Answer: A

Q569. What is file system consistency checking used for?

- A. Ensuring all files have correct extensions set here
- B. Checking if files contain valid program source
- C. Verifying integrity and repairing corruption now
- D. Checking if file system has enough free space left

Answer: C

Q570. How does contiguous allocation organize file storage?

- A. Files are indexed using a multi-level tree structure
- B. Each file occupies contiguous disk blocks together
- C. Files are in random blocks scattered across the disk
- D. Files are stored using linked list of distant blocks

Answer: B

Q571. How does the SCAN disk scheduling algorithm work?

- A. Head moves one direction servicing then reverses
- B. It randomly selects the next request from queue
- C. It services requests in arrival order always
- D. It always jumps to the closest request first now

Answer: A

Q572. How does SSTF scheduling differ from FCFS?

- A. SSTF services requests in the exact arrival order
- B. SSTF always moves the head to outermost track first
- C. SSTF and FCFS produce identical scheduling results
- D. SSTF services the request nearest to current head

Answer: D

Q573. What is the difference between RAID 0 and RAID 1?

- A. RAID 0 provides redundancy; RAID 1 stripes only
- B. RAID 0 stripes for speed; RAID 1 mirrors for safety
- C. Both provide identical performance and safety here
- D. RAID 0 uses parity; RAID 1 uses error correction

Answer: B

Q574. What is the C-SCAN disk scheduling algorithm?

- A. It services the closest request to minimize seeking
- B. It processes requests in the order submitted always
- C. It scans in both directions alternately each time
- D. Head services one direction then jumps back to start

Answer: D

Q575. What is the purpose of disk defragmentation for HDDs?

- A. Encrypting all data stored on the hard disk drive
- B. Removing all deleted files permanently from disk
- C. Reorganizing fragmented files into contiguous blocks
- D. Increasing physical speed of disk platter rotation

Answer: C

Q576. How does RAID 5 provide fault tolerance?

- A. It keeps three copies of every data block on disk
- B. It distributes parity information across all drives
- C. It mirrors all data on two separate disk drives
- D. It uses error-correcting codes on a separate disk

Answer: B

Q577. Why is SSTF disk scheduling prone to starvation?

- A. Far requests may wait indefinitely for any service
- B. Because it services all requests equally in order
- C. It services farthest request first causing slow times
- D. SSTF scheduling never causes starvation of requests

Answer: A

Q578. What is the disk controller's role?

- A. It manages CPU scheduling for all running processes
- B. It handles network routing for file sharing on LAN
- C. It controls user interface for file management
- D. It translates logical addresses to physical locations

Answer: D

Q579. What is wear leveling in solid-state drives?

- A. Technique to physically level SSD circuit boards
- B. Distributing writes evenly to extend cell lifespan
- C. A process to cool down overheated memory chips now
- D. A method to reduce power consumption of SSD drive

Answer: B

Q580. What is the boot block and where is it stored?

- A. It stores the file system journal for crash recovery
- B. It stores user data in the first track of disk
- C. It contains bootstrap code in a fixed disk location
- D. It contains disk encryption keys for secure access

Answer: C

Q581. How do memory-mapped and port-mapped I/O differ?

- A. Memory-mapped requires special CPU instructions for access
- B. Port-mapped I/O is faster than memory-mapped in every case
- C. Both methods use exactly the same addressing mechanism now
- D. Memory-mapped uses address space; port-mapped uses separate

Answer: D

Q582. How does double buffering improve I/O performance?

- A. One buffer fills while other is being processed by CPU
- B. It eliminates the need for any buffering in the system
- C. It slows down I/O by requiring twice the memory space
- D. It doubles the speed of the physical I/O device hardware

Answer: A

Q583. What is device-independent I/O software?

- A. It handles only network device communication protocol
- B. It makes all devices behave like character devices
- C. It eliminates the need for any device drivers at all
- D. It provides uniform interfacing for diverse devices

Answer: D

Q584. What is an interrupt vector table used for?

- A. Storing data to be written to I/O devices later
- B. Tracking which I/O devices are powered on currently
- C. Mapping interrupt numbers to handler routines fast
- D. Counting total number of interrupts since boot time

Answer: C

Q585. What is the role of the I/O scheduler?

- A. It schedules manufacturing of I/O device hardware
- B. It orders and merges I/O requests for optimal access
- C. It schedules network packets for wire transmission
- D. It determines which user can log into the system now

Answer: B

Q586. How does spooling differ from buffering?

- A. Spooling uses disk as buffer for slow device queues
- B. Buffering uses disk while spooling uses only main memory
- C. Spooling is only used for input devices like keyboards
- D. Spooling and buffering are the same I/O technique here

Answer: A

Q587. What is the device status table?

- A. Storing serial numbers of all connected devices here
- B. Maintaining firmware update history for every device
- C. Displaying device information to end user on screen
- D. Tracking status and request queue for each device now

Answer: D

Q588. How do blocking and non-blocking I/O differ?

- A. Blocking suspends process; non-blocking returns immediately
- B. Both blocking and non-blocking I/O work the same way
- C. Blocking I/O is always faster than non-blocking I/O now
- D. Non-blocking suspends process until I/O completes fully

Answer: A

Q589. What is the DMA controller's role during transfer?

- A. It performs all CPU computations during the transfer
- B. It compiles programs while data is being transferred
- C. It encrypts all data before transferring it to memory
- D. It manages data transfer between device and memory now

Answer: D

Q590. How does asynchronous I/O differ from non-blocking?

- A. Asynchronous I/O is identical to non-blocking I/O now
- B. Non-blocking sends completion notification to caller
- C. Asynchronous notifies process upon I/O completion later
- D. Asynchronous blocks process until data is fully ready

Answer: C

Q591. What is a buffer overflow attack?

- A. It fills printer buffer with too many print jobs
- B. It fills the disk buffer causing file system crash
- C. It overwrites memory beyond buffer to inject code
- D. It overflows network buffer causing packet loss now

Answer: C

Q592. What is role-based access control (RBAC)?

- A. Assigning permissions to roles then roles to users
- B. Assigning permissions directly to individual users
- C. Assigning all permissions to every user in system
- D. Removing all access control from the OS entirely

Answer: A

Q593. How does the access matrix represent protection?

- A. Rows are resources and columns are users only now
- B. It is a physical matrix of hardware protection now
- C. Rows are domains, columns are objects with rights
- D. It only represents network access permissions here

Answer: C

Q594. What is a denial-of-service attack?

- A. Deleting all files from the target system forever
- B. Denying users permission to install software
- C. Encrypting data and demanding ransom for the key
- D. Overwhelming system with requests to make unavailable

Answer: D

Q595. What is a rootkit and why is it dangerous?

- A. Malware hiding itself providing persistent root access
- B. A security scanner checking for root vulnerabilities
- C. A toolkit for administrators to manage root access
- D. A legitimate tool for recovering forgotten passwords

Answer: A

Q596. How does sandboxing improve application security?

- A. It isolates apps in restricted execution environments
- B. It prevents applications from being installed at all
- C. It buries security threats deep in system storage
- D. It encrypts all data processed by sandboxed apps now

Answer: A

Q597. What is two-factor authentication (2FA)?

- A. Using same password on two different computers
- B. Logging into two different accounts at same time
- C. Using two different passwords for one account
- D. Requiring two independent verification for access

Answer: D

Q598. What is an intrusion detection system (IDS)?

- A. Installing security patches on system software now
- B. Managing user passwords and auth credentials only
- C. Monitoring system activity to detect malicious acts
- D. Detecting physical break-ins at office buildings

Answer: C

Q599. How do symmetric and asymmetric encryption differ?

- A. Symmetric uses two keys; asymmetric uses one shared
- B. Both encryption types use the same key mechanism now
- C. Symmetric encryption is always weaker than asymmetric
- D. Symmetric uses one shared key; asymmetric a key pair

Answer: D

Q600. What is privilege escalation in system security?

- A. Exploiting flaws to gain higher privileges than allowed
- B. Reducing user privileges for security enforcement now
- C. Escalating a security ticket to management team here
- D. Legitimately granting more permissions by an admin

Answer: A

Q601. What is the difference between a hard real-time system and a soft real-time system?

- A. Hard real-time guarantees deadlines while soft real-time allows occasional misses
- B. Hard real-time uses hardware timers while soft real-time uses software timers
- C. Hard real-time supports more users than soft real-time
- D. Hard real-time is faster than soft real-time in all scenarios

Answer: A

Q602. How does a multiprocessor system differ from a multicomputer system?

- A. Multiprocessor shares memory while multicomputer has distributed memory
- B. Multiprocessor uses one OS while multicomputer uses multiple keyboards
- C. Multiprocessor is slower than multicomputer in all workloads
- D. Multiprocessor only runs batch jobs while multicomputer handles interactive tasks

Answer: A

Q603. What is the role of a timer interrupt in operating system design?

- A. To prevent user processes from monopolizing the CPU indefinitely
- B. To speed up arithmetic calculations
- C. To increase the amount of available memory
- D. To manage network packet routing

Answer: A

Q604. What is the purpose of privileged instructions in a CPU?

- A. To restrict certain dangerous operations to kernel mode only
- B. To make programs execute faster in user mode
- C. To allow users to directly access I/O devices
- D. To enable parallel processing on multiple cores

Answer: A

Q605. How does symmetric multiprocessing (SMP) differ from asymmetric multiprocessing?

- A. SMP treats all processors equally while asymmetric assigns a master processor
- B. SMP uses one processor while asymmetric uses many
- C. SMP is only for real-time systems while asymmetric is for batch systems
- D. SMP requires identical software on each processor while asymmetric does not

Answer: A

Q606. What is the purpose of a system call in the operating system?

- A. To provide an interface for user programs to request OS kernel services
- B. To compile high-level code into machine language
- C. To physically connect hardware devices to the motherboard
- D. To partition the hard disk into volumes

Answer: A

Q607. What does Direct Memory Access (DMA) accomplish in a computer system?

- A. Allows devices to transfer data to memory without CPU intervention for each byte
- B. Directly increases the size of physical memory
- C. Enables memory to execute instructions without the CPU
- D. Provides encryption for data stored in memory

Answer: A

Q608. What is the memory hierarchy in a computer system?

- A. Arrangement of storage from fast/small registers to slow/large secondary storage
- B. A method for encrypting data in memory
- C. The process of allocating memory to user processes
- D. A technique for compressing files on disk

Answer: A

Q609. What is the purpose of an interrupt vector in an operating system?

- A. To store addresses of interrupt service routines for each interrupt type
- B. To count the number of interrupts that have occurred
- C. To prioritize user processes over system processes
- D. To buffer data during I/O transfers

Answer: A

Q610. What does it mean for an operating system to provide abstraction?

- A. It hides complex hardware details behind simpler interfaces
- B. It makes the hardware run at faster clock speeds
- C. It reduces the physical size of hardware components
- D. It eliminates the need for device drivers entirely

Answer: A

Q611. What is the main trade-off between monolithic and microkernel architectures?

- A. Monolithic has better performance but less modularity than microkernel
- B. Monolithic uses less memory than microkernel in all cases
- C. Microkernel is always faster because it has a smaller kernel
- D. Monolithic supports more hardware devices than microkernel

Answer: A

Q612. How are parameters passed to system calls via registers?

- A. Parameter values are placed directly in CPU registers before the system call
- B. Parameters are written to a file that the kernel reads
- C. Parameters are encoded in the system call number itself
- D. Parameters are passed through network sockets

Answer: A

Q613. What is the key benefit of loadable kernel modules over a static monolithic kernel?

- A. New functionality can be added at runtime without recompiling the kernel
- B. They eliminate the need for device drivers entirely
- C. They make the kernel run in user space
- D. They remove the need for system calls

Answer: A

Q614. What is the run-time environment (RTE) in the context of system calls?

- A. A software layer that intercepts API calls and invokes the correct system calls
- B. A special hardware unit that executes system calls
- C. A debugging tool for testing operating system code
- D. A network protocol for remote procedure calls

Answer: A

Q615. Why is inter-process communication slower in microkernel systems?

- A. Services communicate via message passing through the kernel rather than direct calls
- B. The microkernel uses slower processors
- C. User space runs at reduced clock speed
- D. Microkernel systems cannot use DMA for I/O

Answer: A

Q616. What is the purpose of the /proc file system in Linux?

- A. It provides a virtual file interface to kernel data structures and process info
- B. It stores user documents and personal files
- C. It contains compiled application programs
- D. It holds backup copies of the boot loader

Answer: A

Q617. What is the difference between a policy and a mechanism in OS design?

- A. Mechanism defines how to do something, policy decides what should be done
- B. Mechanism is software while policy is hardware
- C. Policy runs in kernel mode while mechanism runs in user mode
- D. There is no practical difference between the two

Answer: A

Q618. How does the stack-based method of passing system call parameters work?

- A. Parameters are pushed onto the program stack and the kernel pops them off
- B. Parameters are stored in a special CPU cache
- C. Parameters are passed as part of the instruction opcode
- D. Parameters are sent via interrupt signals

Answer: A

Q619. What are information maintenance system calls used for?

- A. Transferring information between the user program and the OS
- B. Creating new user accounts
- C. Formatting storage devices
- D. Establishing network connections

Answer: A

Q620. What advantage does a hybrid kernel offer over a pure microkernel?

- A. It keeps performance-critical services in kernel space while maintaining some modularity
- B. It completely eliminates context switches
- C. It runs all services in user space for maximum reliability
- D. It requires no device drivers

Answer: A

Q621. What is the difference between a process and a program?

- A. A process is an active instance of a program in execution with its own state
- B. A program runs on the CPU while a process is stored on disk
- C. A process is always larger in size than a program
- D. There is no difference between a process and a program

Answer: A

Q622. What is the purpose of the process address space?

- A. It defines the memory layout including text, data, heap, and stack sections
- B. It specifies the physical location of the process on the hard disk
- C. It determines the network address used by the process
- D. It sets the display resolution for the process window

Answer: A

Q623. How does message passing IPC differ from shared memory IPC in terms of synchronization?

- A. Message passing provides implicit synchronization while shared memory requires explicit synchronization
- B. Shared memory is always faster for large data transfers
- C. Message passing cannot be used between processes on the same machine
- D. Shared memory does not require any OS support

Answer: A

Q624. What is a message queue as an IPC mechanism?

- A. A linked list of messages stored in the kernel that processes can read and write
- B. A hardware buffer on the network card
- C. A queue of CPU instructions waiting to execute
- D. A list of print jobs waiting for the printer

Answer: A

Q625. What is the difference between direct and indirect inter-process communication?

- A. Direct IPC names the recipient process explicitly while indirect uses shared mailboxes
- B. Direct IPC is faster because it skips the kernel
- C. Indirect IPC can only be used in distributed systems
- D. Direct IPC requires shared memory while indirect does not

Answer: A

Q626. What information is saved during a context switch?

- A. The CPU registers, program counter, and process state of the outgoing process
- B. Only the process name and user ID
- C. The contents of the hard disk
- D. The screen display buffer

Answer: A

Q627. What is the role of the job queue in process scheduling?

- A. It contains all processes in the system regardless of their state
- B. It only holds processes currently executing on the CPU
- C. It stores terminated processes waiting for cleanup
- D. It manages disk I/O requests

Answer: A

Q628. How does the Unix kill() system call work?

- A. It sends a specified signal to a process identified by its PID
- B. It immediately destroys the process without any cleanup
- C. It only works on child processes of the calling process
- D. It deletes the executable file of the target process

Answer: A

Q629. What is the difference between I/O-bound and CPU-bound processes?

- A. I/O-bound processes spend more time on I/O operations while CPU-bound spend more time computing
- B. I/O-bound processes are faster than CPU-bound processes
- C. CPU-bound processes use more memory than I/O-bound processes
- D. There is no meaningful difference between them

Answer: A

Q630. What is swapping in the context of process management?

- A. Moving a process between main memory and a backing store to free memory
- B. Exchanging data between two running processes
- C. Switching the CPU between user mode and kernel mode
- D. Replacing one operating system with another

Answer: A

Q631. Why does Shortest Job First (SJF) scheduling produce the minimum average waiting time?

- A. Shorter jobs finish quickly, reducing the waiting time for all subsequent jobs
- B. It uses the fastest CPU clock speed for short jobs
- C. It skips I/O operations to save time
- D. It runs all processes simultaneously

Answer: A

Q632. What is the problem of starvation in priority scheduling?

- A. Low-priority processes may never execute because higher-priority processes keep arriving
- B. All processes starve for memory simultaneously
- C. The CPU runs out of power during execution
- D. Processes consume too much disk space

Answer: A

Q633. How does the aging technique prevent starvation?

- A. It gradually increases the priority of waiting processes over time
- B. It reduces the priority of all running processes
- C. It terminates processes that have waited too long
- D. It allocates more memory to starving processes

Answer: A

Q634. What is the effect of time quantum size on Round Robin performance?

- A. Too large behaves like FCFS; too small causes excessive context switching overhead
- B. Larger quanta always improve performance
- C. Smaller quanta always improve response time without any downside
- D. Time quantum size has no effect on system performance

Answer: A

Q635. In multilevel queue scheduling, how are processes assigned to queues?

- A. Based on process characteristics such as type, priority, or memory requirements
- B. Randomly distributed among available queues
- C. All placed in a single queue sorted by arrival time
- D. Assigned based on the day of the week they were created

Answer: A

Q636. What advantage does multilevel feedback queue scheduling have over multilevel queue?

- A. Processes can move between queues based on their behavior allowing dynamic adaptation
- B. It uses fewer CPU resources for scheduling decisions
- C. It eliminates the need for context switching
- D. It guarantees that all processes finish in the same amount of time

Answer: A

Q637. What is the difference between preemptive SJF and non-preemptive SJF?

- A. Preemptive SJF interrupts a running process if a shorter one arrives; non-preemptive does not
- B. Non-preemptive SJF is always faster than preemptive SJF
- C. Preemptive SJF does not require knowing burst times
- D. Non-preemptive SJF causes more context switches

Answer: A

Q638. What is the role of the medium-term scheduler in CPU scheduling?

- A. It swaps processes in and out of memory to control the degree of multiprogramming
- B. It selects which process runs on the CPU next
- C. It decides which jobs enter the system from the job pool
- D. It manages disk I/O scheduling

Answer: A

Q639. Why is predicting the next CPU burst length important for SJF scheduling?

- A. SJF requires knowing burst lengths to select the shortest job but future bursts are unknown
- B. Burst length determines how much memory a process needs
- C. Longer bursts indicate higher priority processes
- D. Burst prediction is only needed for real-time systems

Answer: A

Q640. What is the difference between throughput and turnaround time as scheduling metrics?

- A. Throughput measures processes completed per time unit while turnaround time measures total time for one process
- B. Throughput is always larger than turnaround time
- C. They measure the same thing using different units
- D. Turnaround time applies only to I/O-bound processes

Answer: A

Q641. What challenge does Amdahl's Law highlight for multicore systems?

- A. Adding more memory always improves performance linearly
- B. The serial portion of a program limits the maximum speedup achievable through parallelism
- C. All programs can be fully parallelized
- D. Multicore systems are slower than single-core systems

Answer: B

Q642. What is the key disadvantage of the one-to-one threading model?

- A. It does not support kernel-level threading
- B. Creating a user thread requires creating a corresponding kernel thread, adding overhead
- C. It cannot run on multiprocessor systems
- D. It merges all threads into a single execution context

Answer: B

Q643. What is the purpose of the pthread_join() function?

- A. To create a new thread
- B. To wait for a specific thread to terminate before continuing
- C. To send a signal to another thread
- D. To detach a thread from the process

Answer: B

Q644. What happens when a user-level thread makes a blocking system call in a many-to-one model?

- A. Only that thread blocks while others continue
- B. The entire process blocks because the single kernel thread is blocked
- C. The thread is automatically converted to a kernel thread
- D. The system call is ignored

Answer: B

Q645. What is the difference between task parallelism and data parallelism?

- A. Task parallelism distributes data across cores; data parallelism distributes tasks
- B. Data parallelism distributes subsets of data across cores performing the same operation; task parallelism distributes different tasks across cores
- C. They are different names for the same concept
- D. Data parallelism only works with databases

Answer: B

Q646. What is the purpose of pthread_cancel() in the Pthreads API?

- A. To create a cancelable thread
- B. To request termination of a target thread
- C. To pause a thread temporarily
- D. To increase a thread's priority

Answer: B

Q647. Why is asynchronous thread cancellation considered more dangerous than deferred cancellation?

- A. It uses more memory
- B. The target thread is terminated immediately, potentially leaving shared data in an inconsistent state
- C. It requires kernel mode exclusively
- D. It can only cancel one thread at a time

Answer: B

Q648. What advantage does a thread pool provide over creating threads on demand?

- A. Thread pools use more memory
- B. Pre-created threads reduce the overhead of thread creation and limit the total number of threads
- C. Thread pools eliminate the need for synchronization
- D. Thread pools allow only one thread at a time

Answer: B

Q649. In the context of threading, what is the fork-join model?

- A. A model where threads can only fork new processes
- B. A model where a parent thread creates child threads that execute tasks and then join back with the parent
- C. A model specific to database transactions
- D. A model that prevents any thread from terminating

Answer: B

Q650. What is the relationship between threads and signals in UNIX?

- A. Signals can only be sent to processes, never to individual threads
- B. A signal may be delivered to the specific thread to which it applies, to every thread, or to a designated thread
- C. Threads automatically ignore all signals
- D. Each thread has its own independent signal handler table

Answer: B

Q651. How does the test-and-set instruction help solve the critical section problem?

- A. It tests whether the CPU is available
- B. It atomically reads a variable and sets it to true, enabling mutual exclusion without interruption
- C. It sets all variables in memory to zero
- D. It tests the speed of the system bus

Answer: B

Q652. In the bounded buffer problem using semaphores, what are the three semaphores typically used?

- A. read, write, execute
- B. mutex (for mutual exclusion), full (counts filled slots), empty (counts empty slots)
- C. start, stop, pause
- D. lock, unlock, wait

Answer: B

Q653. What is the key challenge in the readers-writers problem?

- A. Ensuring that files can only be read once
- B. Allowing multiple readers simultaneous access while ensuring writers get exclusive access
- C. Preventing any process from reading data
- D. Synchronizing disk rotational speed

Answer: B

Q654. How does priority inversion occur in synchronization?

- A. A high-priority process runs before a low-priority process
- B. A high-priority process is blocked waiting for a lock held by a low-priority process, which is itself preempted by medium-priority processes
- C. All processes run with the same priority
- D. The scheduler inverts the order of the ready queue

Answer: B

Q655. What is the purpose of a condition variable in a monitor?

- A. To store the return value of a function
- B. To allow a thread to wait until a particular condition is met, and to be notified when it changes
- C. To count the number of active monitors
- D. To monitor CPU temperature conditions

Answer: B

Q656. What is the difference between wait() and signal() on a condition variable versus on a semaphore?

- A. They are identical in behavior
- B. Condition variable signal() has no effect if no thread is waiting, while semaphore signal() always increments the value
- C. Semaphore wait() never blocks
- D. Condition variables can only be used in Java

Answer: B

Q657. What problem can occur when semaphores are used incorrectly, such as swapping the order of wait() operations?

- A. Faster execution
- B. Deadlock, where two or more processes are each waiting on semaphores held by the other
- C. Automatic error correction
- D. Improved throughput

Answer: B

Q658. What is a reentrant lock and how does it differ from a standard mutex?

- A. A reentrant lock can only be acquired once
- B. A reentrant lock allows the same thread to acquire it multiple times without deadlocking
- C. A reentrant lock is slower than a standard mutex in all cases
- D. A reentrant lock provides no mutual exclusion

Answer: B

Q659. Why are spinlocks more efficient than blocking locks on multiprocessor systems for short critical sections?

- A. Spinlocks use less memory
- B. Spinning avoids the overhead of context switching, which would take longer than the short wait time
- C. Spinlocks automatically parallelize the critical section
- D. Blocking locks are not supported on multiprocessors

Answer: B

Q660. How does imposing a total ordering on resource types prevent circular wait?

- A. It requires processes to release all resources before requesting new ones
- B. Processes must request resources in increasing order of their assigned numbers, making circular dependencies impossible
- C. It limits the number of resources available
- D. It assigns equal priority to all resources

Answer: B

Q661. In the Banker's Algorithm, what does the 'Available' vector represent?

- A. The total number of resources in the system
- B. The number of instances of each resource type currently available for allocation
- C. The maximum resources any process can request
- D. The resources that have been permanently allocated

Answer: B

Q662. What factors should be considered when selecting a victim process for deadlock recovery?

- A. Only the process name
- B. Priority, computation time completed, resources held, remaining time, and number of rollbacks
- C. Only the process ID number
- D. The color of the user's terminal

Answer: B

Q663. What is the difference between deadlock prevention and deadlock avoidance?

- A. They are identical approaches
- B. Prevention ensures one of the four necessary conditions can never hold; avoidance dynamically checks each request to stay in a safe state
- C. Avoidance eliminates resources; prevention adds resources
- D. Prevention is used only in distributed systems

Answer: B

Q664. What is the safe sequence in the context of the Banker's Algorithm?

- A. A random ordering of all processes
- B. An ordering of processes such that each process can obtain its maximum required resources from currently available resources plus resources held by all preceding processes
- C. The order in which processes were created
- D. A sequence where no process ever requests resources

Answer: B

Q665. How can the hold-and-wait condition be prevented by requiring processes to request all resources at once?

- A. Processes request resources one at a time
- B. A process must request all needed resources before execution begins; it cannot hold some and wait for others
- C. Processes share all resources simultaneously
- D. The OS holds all resources and never allocates them

Answer: B

Q666. What is the difference between process termination and resource preemption as deadlock recovery methods?

- A. They are the same approach
- B. Process termination kills processes to break deadlock; resource preemption forcibly takes resources from processes and reassigns them
- C. Resource preemption always terminates all processes
- D. Process termination only pauses processes temporarily

Answer: B

Q667. Why is the Banker's Algorithm considered impractical for many real systems?

- A. It is too simple to implement
- B. It requires processes to declare their maximum resource needs in advance, which is often unknown
- C. It only works with one resource type
- D. It causes deadlock instead of preventing it

Answer: B

Q668. In deadlock detection with multiple resource instances, what algorithm is used?

- A. Dijkstra's shortest path algorithm
- B. A variant of the Banker's Algorithm that checks if the current state can complete all processes
- C. Binary search on resource allocation
- D. Depth-first search on a binary tree

Answer: B

Q669. What is starvation in the context of deadlock recovery, and how can it be prevented?

- A. Starvation is when the CPU runs out of power
- B. The same process is repeatedly selected as the victim for rollback; prevented by including rollback count in victim selection criteria
- C. Starvation means processes do not have enough memory
- D. It is a type of deadlock that cannot be prevented

Answer: B

Q670. How does a Translation Lookaside Buffer (TLB) improve memory access performance?

- A. By increasing the physical memory size
- B. By caching recently used page table entries to avoid the overhead of accessing the page table in memory for every address translation
- C. By compressing data in memory
- D. By reducing the CPU clock speed

Answer: B

Q671. What is the effective memory access time if the TLB hit ratio is 90%, TLB access time is 10ns, and memory access time is 100ns?

- A. 100ns
- B. 120ns
- C. 110ns
- D. 200ns

Answer: B

Q672. What is the advantage of a multi-level page table over a single-level page table?

- A. It is faster to look up
- B. It reduces the memory required for the page table by only allocating entries for used portions of the address space
- C. It eliminates the need for a TLB
- D. It increases the page size

Answer: B

Q673. How does the optimal (OPT) page replacement algorithm work?

- A. It replaces the most recently used page
- B. It replaces the page that will not be used for the longest period of time in the future
- C. It replaces pages in FIFO order
- D. It replaces the page with the lowest page number

Answer: B

Q674. Why does the FIFO page replacement algorithm suffer from Belady's anomaly?

- A. Because it uses too much memory
- B. Increasing the number of frames can lead to more page faults because FIFO does not consider page usage frequency
- C. Because it always replaces the most recently used page
- D. Because it requires future knowledge of page references

Answer: B

Q675. What is the working set of a process?

- A. The total number of pages in the process
- B. The set of pages that the process has referenced within a recent time window
- C. The set of all physical frames in the system
- D. The set of processes currently in the ready queue

Answer: B

Q676. How does segmentation differ from paging in memory management?

- A. Segmentation uses fixed-size blocks; paging uses variable-size blocks
- B. Segmentation divides memory into variable-size logical units (code, data, stack); paging divides into fixed-size physical blocks
- C. Paging is visible to the programmer; segmentation is not
- D. They are identical approaches with different names

Answer: B

Q677. What is the purpose of the dirty (modified) bit in a page table entry?

- A. To indicate the page contains errors
- B. To indicate the page has been modified since it was loaded, so it must be written back to disk before replacement
- C. To mark the page as deleted
- D. To count how many times the page was accessed

Answer: B

Q678. What causes thrashing and what is its primary symptom?

- A. Too many CPU cores causing overheating
- B. A process spends more time paging (swapping pages in and out) than executing, causing severe performance degradation
- C. The hard disk runs out of space
- D. Too many users are logged in simultaneously

Answer: B

Q679. What is the inverted page table and how does it save memory?

- A. A page table stored upside down in memory
- B. It has one entry per physical frame instead of one per virtual page, reducing table size for large address spaces
- C. It inverts the logical-to-physical mapping to physical-to-logical
- D. It is a page table that grows dynamically

Answer: B

Q680. How does linked allocation manage disk blocks for a file?

- A. All blocks are stored contiguously on disk
- B. Each block contains a pointer to the next block, forming a linked list of disk blocks
- C. A central index block stores pointers to all data blocks
- D. Blocks are stored in a hash table

Answer: B

Q681. What is the advantage of indexed allocation over linked allocation?

- A. It uses less disk space per file
- B. It supports direct (random) access by storing all block pointers in a single index block
- C. It never wastes any disk space
- D. It is simpler to implement

Answer: B

Q682. What is journaling in file systems and what problem does it solve?

- A. It keeps a human-readable log of user activity
- B. It records file system changes in a log before committing them, enabling recovery from crashes without full consistency checks
- C. It creates daily backups of all files
- D. It journals CPU usage for each file

Answer: B

Q683. How does the bitmap (bit vector) method manage free disk space?

- A. It stores free blocks in a linked list
- B. Each bit represents a disk block — 1 for free, 0 for allocated (or vice versa), allowing quick identification of free blocks
- C. It counts the total number of free blocks without tracking which ones
- D. It maps file names to free blocks

Answer: B

Q684. What is the difference between a hard link and a symbolic link in terms of inode behavior?

- A. Both create a new inode for the linked file
- B. A hard link creates another directory entry pointing to the same inode; a symbolic link creates a new inode containing the path to the target
- C. A symbolic link shares the same inode as the original file
- D. Hard links work across different file systems

Answer: B

Q685. What does the Virtual File System (VFS) layer provide?

- A. A virtual disk for storage
- B. A common interface that allows the OS to support multiple file system types transparently
- C. Virtual memory for file operations
- D. Encryption for all file systems

Answer: B

Q686. What is an Access Control List (ACL) in the context of file systems?

- A. A list of all files in a directory
- B. A per-file list specifying which users or groups have which permissions on that file
- C. A list of CPU access times for files
- D. A list of all mounted file systems

Answer: B

Q687. What is the purpose of the superblock in a Unix file system?

- A. To store user passwords
- B. To store metadata about the file system itself, including its size, block size, free blocks count, and inode information
- C. To store the largest file in the system
- D. To manage network connections

Answer: B

Q688. What is contiguous allocation's main advantage and disadvantage?

- A. Advantage: no fragmentation; Disadvantage: slow access
- B. Advantage: fast sequential and direct access; Disadvantage: external fragmentation and difficulty growing files
- C. Advantage: no wasted space; Disadvantage: complex implementation
- D. Advantage: supports journaling; Disadvantage: requires large inodes

Answer: B

Q689. What is the difference between ordered mode and writeback mode journaling?

- A. They are identical journaling modes
- B. Ordered mode writes data to disk before journaling metadata; writeback mode journals metadata without guaranteeing data order, risking stale data after crash
- C. Writeback mode is always slower than ordered mode
- D. Ordered mode only journals file names

Answer: B

Q690. How does the SCAN (elevator) algorithm work for disk scheduling?

- A. It randomly selects the next request to service
- B. The disk arm moves in one direction servicing requests until it reaches the end, then reverses direction and services requests going back
- C. It services only requests on the outermost tracks
- D. It services requests in alphabetical order of file names

Answer: B

Q691. What advantage does C-SCAN have over SCAN?

- A. C-SCAN is simpler to implement
- B. C-SCAN provides more uniform wait times by only servicing requests in one direction and returning to the beginning without servicing
- C. C-SCAN uses less disk space
- D. C-SCAN eliminates all seek time

Answer: B

Q692. How does RAID 5 distribute parity information?

- A. Parity is stored on a dedicated disk
- B. Parity blocks are distributed across all disks in the array, avoiding the bottleneck of a single parity disk
- C. Parity is not used in RAID 5
- D. Each disk stores its own parity only

Answer: B

Q693. What is wear leveling in SSDs?

- A. Evenly distributing weight on the drive housing
- B. Distributing write operations evenly across all flash memory cells to prevent some cells from wearing out faster than others
- C. Reducing the speed of write operations to extend drive life
- D. Leveling the surface of the flash memory chips

Answer: B

Q694. What is the LOOK variant of disk scheduling?

- A. The disk arm looks ahead one request at a time
- B. The arm moves in one direction only as far as the last pending request, then reverses, instead of going to the disk's end
- C. It looks at all requests simultaneously before choosing
- D. It skips every other request

Answer: B

Q695. What is the boot block on a disk?

- A. A block that prevents booting
- B. The disk block(s) containing the bootstrap loader program that initializes the system and loads the operating system
- C. A block reserved for backup data
- D. The largest block on the disk

Answer: B

Q696. What is disk defragmentation and when is it beneficial?

- A. It encrypts disk data for security
- B. It reorganizes scattered file fragments into contiguous blocks, beneficial for HDDs to reduce seek times but unnecessary for SSDs
- C. It deletes duplicate files from the disk
- D. It increases the disk's storage capacity

Answer: B

Q697. What is the purpose of a hot spare disk in a RAID configuration?

- A. A disk that stores temporary data
- B. An idle disk that automatically replaces a failed disk in the array, reducing the window of vulnerability
- C. A disk that runs at a higher temperature
- D. A disk used only for read operations

Answer: B

Q698. What is memory-mapped I/O and how does it differ from port-mapped I/O?

- A. Memory-mapped I/O is slower than port-mapped I/O in all cases
- B. Memory-mapped I/O maps device registers into the regular memory address space; port-mapped I/O uses separate I/O address space with special instructions
- C. Port-mapped I/O uses regular memory addresses
- D. Memory-mapped I/O requires dedicated I/O instructions

Answer: B

Q699. What is double buffering and why is it used?

- A. Using two CPUs for I/O operations
- B. Using two buffers so the device can fill one while the process reads from the other, overlapping I/O and computation
- C. Buffering data twice for error checking
- D. Using buffers of double the normal size

Answer: B

Q700. How does an interrupt vector table work?

- A. It stores all device drivers in a single table
- B. It is an array of pointers to interrupt handler routines, indexed by interrupt number, allowing quick dispatch to the correct handler
- C. It converts analog signals to digital interrupts
- D. It counts the number of interrupts per second

Answer: B

Q701. What is the role of the DMA controller during a data transfer?

- A. It replaces the CPU entirely during the transfer
- B. It manages the transfer of data between I/O devices and memory, handling addressing, counting, and bus arbitration while the CPU runs other tasks
- C. It only monitors the transfer without participating
- D. It encrypts data during transfer

Answer: B

Q702. How does asynchronous I/O differ from non-blocking I/O?

- A. They are identical concepts
- B. Non-blocking I/O returns immediately with available data; asynchronous I/O initiates the operation and notifies the process when it completes, fully decoupling the I/O from the process
- C. Asynchronous I/O blocks the process until completion
- D. Non-blocking I/O uses more memory than asynchronous I/O

Answer: B

Q703. What is the device status table maintained by the OS?

- A. A table listing all devices that need repair
- B. A table that tracks the type, address, status, and pending I/O requests for each device in the system
- C. A table of device prices for inventory management
- D. A table mapping device names to driver versions

Answer: B

Q704. What is device-independent I/O software responsible for?

- A. Manufacturing hardware devices
- B. Providing uniform interfaces, buffering, error reporting, and device allocation that work regardless of the specific device
- C. Installing device drivers automatically
- D. Converting device signals to audio

Answer: B

Q705. What is an interrupt controller and what does it do?

- A. A software program that generates interrupts
- B. Hardware that manages multiple interrupt lines, prioritizes interrupts, and routes them to the CPU
- C. A controller that disables all interrupts permanently
- D. A device that converts interrupts to I/O requests

Answer: B

Q706. What is the access matrix model and how is it used for protection?

- A. A matrix that stores encryption keys
- B. A conceptual model with rows for domains (subjects) and columns for objects, where each cell contains the set of operations the domain can perform on the object
- C. A physical matrix of hardware protection circuits
- D. A matrix that maps memory addresses

Answer: B

Q707. How does Role-Based Access Control (RBAC) simplify security management?

- A. By eliminating all access control
- B. By assigning permissions to roles instead of individual users, then assigning users to roles, reducing the complexity of managing per-user permissions
- C. By giving all users the same role
- D. By using biometrics exclusively

Answer: B

Q708. What is a buffer overflow attack and why is it dangerous?

- A. Filling a printer buffer with too much data
- B. Writing data beyond a buffer's allocated memory to overwrite adjacent memory, potentially hijacking program control flow to execute malicious code
- C. Downloading too many files at once
- D. Overflowing the CPU's instruction cache

Answer: B

Q709. What is sandboxing in operating system security?

- A. Running programs on beach-themed desktops
- B. Running a program in an isolated environment with restricted access to system resources, limiting the damage if the program is compromised
- C. Encrypting program data with sand-based algorithms
- D. A technique to speed up program execution

Answer: B

Q710. What is privilege escalation?

- A. A user requesting a password reset
- B. An attacker exploiting a vulnerability to gain higher access privileges than initially granted, such as obtaining root access from a regular user account
- C. The process of granting administrator access to new employees
- D. Upgrading the operating system to a newer version

Answer: B

Q711. How does the capability list approach implement the access matrix?

- A. It stores one list per object with authorized subjects
- B. Each process holds a list of capabilities (tokens) specifying objects it can access and the permitted operations
- C. It stores a single global list of all permissions
- D. It uses a hash table indexed by user names

Answer: B

Q712. What is a rootkit and why is it particularly dangerous?

- A. A toolkit for system administrators to manage root access
- B. Malware that hides its presence by modifying the OS or firmware, making it extremely difficult to detect while maintaining persistent unauthorized access
- C. A set of root vegetables used as a screen saver
- D. A backup tool for the root partition

Answer: B

Q713. What are protection rings and how do they enforce security?

- A. Physical rings placed around the CPU for protection
- B. Hierarchical privilege levels (Ring 0 being most privileged) enforced by hardware, where inner rings have more privileges and outer rings are restricted
- C. Software-only protection mechanisms in the firewall
- D. Network security zones for different departments

Answer: B

Q714. What is the purpose of a turnstile synchronization mechanism used in some kernels?

- A. To limit the number of threads in the system
- B. A queue structure where blocked threads waiting for a lock are placed, allowing priority inheritance and ordered wakeup
- C. To rotate CPU access among threads
- D. To count the number of active synchronization primitives

Answer: B

Q715. What is the C-LOOK disk scheduling algorithm?

- A. A variant of C-SCAN that reverses at the end of the disk
- B. A variant of C-SCAN where the arm only goes as far as the last pending request in each direction before wrapping around, avoiding unnecessary travel to disk edges
- C. A scheduling algorithm that looks at every other request
- D. An algorithm identical to FCFS but circular

Answer: B

Q716. What is the difference between low-level formatting and high-level formatting of a disk?

- A. They are the same process with different names
- B. Low-level formatting creates the physical sector structure on the disk surface; high-level formatting creates the file system data structures within a partition
- C. High-level formatting erases the physical platters
- D. Low-level formatting only applies to SSDs

Answer: B

Q717. What is the purpose of the I/O request queue in the OS?

- A. To store the output of completed I/O operations
- B. To hold pending I/O requests for a device, allowing the scheduler to reorder them for efficiency
- C. To count the total number of I/O operations performed
- D. To buffer all keyboard inputs

Answer: B

Q718. How does caching differ from buffering in the context of I/O?

- A. They are identical concepts with different names
- B. A buffer holds the only copy of data during transfer; a cache holds a faster duplicate copy of data that also exists elsewhere
- C. Caching is always slower than buffering
- D. Buffering uses CPU cache while caching uses RAM

Answer: B

Q719. What is the purpose of a digital certificate in security?

- A. To compress encrypted data
- B. To bind a public key to an entity's identity, verified by a trusted Certificate Authority, enabling secure key exchange
- C. To digitally sign physical documents
- D. To store all of a user's passwords

Answer: B

Q720. What is a man-in-the-middle (MITM) attack?

- A. A physical attack on a server's hardware
- B. An attacker secretly intercepts and potentially alters communication between two parties who believe they are communicating directly with each other
- C. A type of virus that hides in the middle of a file
- D. An attack that only targets the middle layer of the network stack

Answer: B

Operating Systems — Hard

360 questions

Q721. In the context of OS design, what is the key advantage of a microkernel architecture over a monolithic kernel?

- A. Better performance from fewer context switches in kernel
- B. Direct hardware access available for all system services
- C. Higher reliability since most services run in user space
- D. Simpler implementation compared to other kernel designs

Answer: C

Q722. What is the purpose of a hypervisor in virtualization?

- A. To serve as a real-time antivirus scanning tool
- B. To create and manage virtual machines on hardware
- C. To increase the total RAM capacity of a system
- D. To compile user programs at a much faster speed

Answer: B

Q723. What distinguishes a Type 1 hypervisor from a Type 2 hypervisor?

- A. Type 1 runs on top of host OS, Type 2 on hardware
- B. There is no real or meaningful difference between them
- C. Type 1 is inherently slower in performance than Type 2
- D. Type 1 runs directly on hardware, Type 2 on host OS

Answer: D

Q724. In a hard real-time system, what happens when a deadline is missed?

- A. The task priority gets increased
- B. The system gradually slows down
- C. The task is automatically retried
- D. The result is a total system failure

Answer: D

Q725. What is the main purpose of the interrupt vector table?

- A. To hold addresses of interrupt service routines
- B. To schedule and dispatch CPU tasks to run
- C. To manage the overall file system structure
- D. To permanently store user programs on disk

Answer: A

Q726. What is the concept of 'dual-mode operation' in operating systems and why is it essential?

- A. It separates user and kernel modes for protection
- B. It doubles the overall CPU processing speed rate
- C. It enables running two operating systems at once
- D. It allows two users to work at the same time

Answer: A

Q727. In clustered systems, what is the difference between asymmetric clustering and symmetric clustering?

- A. Asymmetric has standby node; symmetric all nodes share
- B. Asymmetric uses different OS, symmetric uses same OS
- C. There is no meaningful difference between these approaches
- D. Asymmetric clustering is inherently faster than symmetric

Answer: A

Q728. What mechanism does the OS use to prevent a user program from running indefinitely and never returning control?

- A. Timer interrupt
- B. Watchdog timer
- C. Busy waiting
- D. Device polling

Answer: A

Q729. What is the purpose of caching in the memory hierarchy of an operating system?

- A. To increase the size of main memory
- B. To store frequent data in faster memory
- C. To permanently store data on disk
- D. To compress data for efficient storage

Answer: B

Q730. What problem does cache coherency address in multiprocessor systems?

- A. Preventing the processor cache from overflowing
- B. Reducing the overall processor cache miss rate
- C. Ensuring all processor caches are the same size
- D. Ensuring shared data updates reflect in all caches

Answer: D

Q731. In the Mach microkernel, what are the primary abstractions provided?

- A. Files, directories, and named pipes
- B. Processes, semaphores, and mutexes
- C. Blocks, inodes, and superblocks
- D. Tasks, threads, ports, and messages

Answer: D

Q732. What is an exokernel?

- A. A kernel that runs outside the main CPU
- B. A minimal kernel giving apps direct hardware control
- C. A kernel designed only for external USB devices
- D. A kernel that runs entirely in user space only

Answer: B

Q733. What is the purpose of a policy/mechanism separation in OS design?

- A. To separate what is done from how it is done
- B. To divide the OS into two equal-sized halves
- C. To separate user programs from system programs
- D. To directly improve hardware processing speed

Answer: A

Q734. What is the main concept behind a unikernel?

- A. A kernel that runs on one processor core only
- B. A kernel that supports only one single user
- C. A kernel composed of one single code module
- D. A single-image OS compiled with the application

Answer: D

Q735. In OS debugging, what is a core dump?

- A. A memory snapshot of a process at crash time
- B. A network diagnostic and monitoring utility
- C. A listing of all currently running processes
- D. A disk formatting and partitioning operation

Answer: A

Q736. What is the strace command used for in Linux?

- A. To trace network packets on the wire
- B. To trace system calls made by a process
- C. To trace file system changes on the disk
- D. To trace memory allocations in the heap

Answer: B

Q737. What is the advantage of the modular kernel approach over a pure layered approach?

- A. It uses significantly less memory than layered design
- B. It is much simpler to implement and maintain
- C. Modules call any other module directly with flexibility
- D. It does not require loading any device drivers at all

Answer: C

Q738. In system generation (SYSGEN), the OS is configured for a specific hardware platform. Which of the following is NOT typically determined during SYSGEN?

- A. CPU type and count
- B. User access passwords
- C. Connected peripherals
- D. Available memory size

Answer: B

Q739. What is the role of the Hardware Abstraction Layer (HAL) in Windows?

- A. To manage and track user login sessions
- B. To provide a graphical user interface
- C. To hide hardware differences for portability
- D. To compile and link device driver programs

Answer: C

Q740. What distinguishes a library OS from a traditional OS design?

- A. Apps link directly with OS library code
- B. It manages library catalog structures
- C. It is a collection of shared libraries
- D. It only manages shared library files

Answer: A

Q741. In Chrome's multi-process architecture, what types of processes does it use?

- A. Only renderer display processes
- B. Background and foreground processes
- C. Only a single monolithic process
- D. Browser, renderer, and plug-in processes

Answer: D

Q742. What is the difference between direct and indirect communication in message passing?

- A. Direct names sender/receiver; indirect uses mailboxes
- B. Direct is synchronous only; indirect is asynchronous
- C. Direct uses mailboxes; indirect names each process
- D. There is no difference between the two

Answer: A

Q743. What is the rendezvous mechanism in synchronous message passing?

- A. A method to forcefully terminate processes
- B. Both sender and receiver block until ready
- C. A strategy for memory allocation
- D. A technique for CPU load balancing

Answer: B

Q744. In UNIX, how does the init process (PID 1) handle orphan processes?

- A. It adopts them and collects their exit status
- B. It moves them to a special waiting queue
- C. It terminates orphan processes immediately
- D. It ignores them and frees their resources

Answer: A

Q745. What is a socket in the context of IPC?

- A. A type of distributed file system
- B. A physical hardware port connector
- C. An endpoint defined by IP and port
- D. A special-purpose CPU register set

Answer: C

Q746. What is Remote Procedure Call (RPC) in the context of distributed process communication?

- A. A file transfer protocol for distributed systems
- B. Calling a remote procedure as if it were local
- C. A method to restart processes on remote machines
- D. A type of CPU scheduling algorithm for clusters

Answer: B

Q747. What is the purpose of the medium-term scheduler?

- A. To select the next process for CPU execution
- B. To create new processes from program images
- C. To manage file systems on storage devices
- D. To swap processes in and out of main memory

Answer: D

Q748. In Android, what is a Binder and what role does it play?

- A. A kernel memory allocation system
- B. An IPC framework using shared memory
- C. A CPU scheduler for Android apps
- D. A file management utility tool

Answer: B

Q749. What is the copy-on-write (COW) optimization used with fork()?

- A. Creating a complete full copy of the parent immediately
- B. Parent and child share pages; copy only on modification
- C. Writing all process data to disk before forking begins
- D. Preventing the child process from writing to any memory

Answer: B

Q750. What is the purpose of the vfork() system call?

- A. Child shares parent space; parent suspends until exec
- B. It creates a virtual process with no memory mapping
- C. It is identical to the standard fork() call
- D. It creates a process with higher priority than parent

Answer: A

Q751. In the Completely Fair Scheduler (CFS) used by Linux, how is CPU time allocated?

- A. Based only on arrival time of each process
- B. Based on vruntime, picking the smallest vruntime
- C. Using fixed time quanta for all processes equally
- D. Using strict static priority scheduling for all

Answer: B

Q752. What is the problem with using SJF in practice?

- A. Next burst length is unknown and must be estimated
- B. It always causes deadlock among the running tasks
- C. It is far too slow for practical use
- D. It does not support multitasking at all in practice

Answer: A

Q753. In exponential averaging for SJF burst prediction, the formula is $B_{t+1} = \alpha t(n) + (1-\alpha) \hat{A}(n)$. What happens when $\alpha = 0$?

- A. Only the most recent actual burst is considered here
- B. All previous burst lengths are weighted equally here
- C. Recent history has no effect; uses initial estimate only
- D. The prediction always becomes zero in all situations

Answer: C

Q754. In multiprocessor scheduling, what is processor affinity?

- A. Keeping a process on the same processor for cache
- B. The clock speed of a specific processor core
- C. The power consumption of a specific processor
- D. The total number of processors in the system

Answer: A

Q755. What is load balancing in multiprocessor scheduling?

- A. Dividing a single process into equal-sized parts
- B. Running all processes on a single CPU processor
- C. Reducing the CPU clock speed to save energy
- D. Distributing workload evenly across all processors

Answer: D

Q756. What is the difference between asymmetric and symmetric multiprocessing scheduling?

- A. Asymmetric uses more processors than symmetric
- B. They are identical in behavior and design
- C. Symmetric is always faster than asymmetric mode
- D. Asymmetric has one master; symmetric self-schedules

Answer: D

Q757. In real-time CPU scheduling, what is the difference between rate-monotonic and earliest-deadline-first (EDF) scheduling?

- A. Rate-monotonic is non-preemptive; EDF is preemptive
- B. Rate-monotonic uses fixed priority; EDF uses deadlines
- C. EDF uses fixed priority; rate-monotonic uses dynamic
- D. They are identical algorithms for real-time systems

Answer: B

Q758. What is the maximum CPU utilization bound for rate-monotonic scheduling with n processes?

- A. Always exactly 75% utilization
- B. Always 100% utilization
- C. Always exactly 50% utilization
- D. $n(2^{1/n}-1)$, approaches ~69.3%

Answer: D

Q759. What is NUMA-aware scheduling?

- A. Scheduling that ignores all memory placement
- B. Scheduling based on network usage patterns
- C. A scheduling algorithm for non-uniform CPUs
- D. Placing processes near their memory for speed

Answer: D

Q760. What is proportional share scheduling?

- A. Strict priority-based scheduling approach
- B. Scheduling based on memory usage amounts
- C. CPU time proportional to allocated shares
- D. Equal CPU time for all running processes

Answer: C

Q761. What is the many-to-many threading model and what advantage does it offer?

- A. It creates many processes for running threads
- B. It is the simplest threading model to implement
- C. It multiplexes user threads onto kernel threads
- D. It maps many threads to many individual CPUs

Answer: C

Q762. What is the two-level threading model?

- A. A model with exactly two priority levels only
- B. A model with exactly two scheduling queues
- C. Many-to-many plus binding user thread to kernel
- D. A model that uses exactly two processor CPUs

Answer: C

Q763. What is a Lightweight Process (LWP) in the context of user and kernel thread mapping?

- A. A process that runs and completes very quickly
- B. A type of user-level thread implementation
- C. An intermediate structure between user and kernel
- D. A process with very low memory usage footprint

Answer: C

Q764. How does signal handling work in a multithreaded program?

- A. Signals are ignored in multithreaded programs
- B. Only the main thread ever receives any signal
- C. Signals are always delivered to every thread
- D. Signals go to applicable, all, or designated thread

Answer: D

Q765. What is the scheduler activation mechanism?

- A. A method to start or initialize the operating system
- B. A timer-based scheduling technique for real-time use
- C. A way to activate the CPU scheduling component
- D. Kernel upcalls maintaining correct kernel thread count

Answer: D

Q766. What is Grand Central Dispatch (GCD)?

- A. A database system for concurrency
- B. Apple technology managing dispatch queues
- C. A network routing protocol for devices
- D. A Linux kernel module for scheduling

Answer: B

Q767. What is the fork-join parallelism pattern?

- A. A pattern for optimizing disk I/O performance
- B. A pattern for managing file system operations
- C. Parent forks child threads, then joins on completion
- D. A pattern for managing network communication tasks

Answer: C

Q768. What problem does the clone() system call solve in Linux that fork() doesn't?

- A. It creates child processes much faster than fork
- B. It allows more than 256 concurrent running processes
- C. It prevents zombie processes from accumulating in table
- D. It controls exactly which resources parent and child share

Answer: D

Q769. In the context of Intel Threading Building Blocks (TBB), what is a task?

- A. A fixed-size dedicated thread object
- B. A system call for thread management
- C. A work unit mapped to threads by runtime
- D. A hardware timer for task scheduling

Answer: C

Q770. Why have most modern operating systems moved away from the many-to-many threading model to the one-to-one model?

- A. Many-to-many has known security vulnerabilities
- B. Systems now efficiently support many kernel threads
- C. Many-to-many is more expensive to run overall
- D. One-to-one uses significantly less memory overall

Answer: B

Q771. What is the dining philosophers problem and why is it significant?

- A. A problem about memory allocation fragmentation
- B. A problem about restaurant management logistics
- C. A concurrency problem illustrating deadlock and starvation
- D. A problem about network packet routing efficiency

Answer: C

Q772. How can the dining philosophers problem be solved to prevent deadlock?

- A. Add more chopsticks than the total number of diners
- B. Give each philosopher two dedicated chopsticks to use
- C. Limit sitting philosophers, use asymmetric or monitors
- D. Remove one philosopher from the dining table entirely

Answer: C

Q773. What is a read-write lock and when is it preferred over a mutex?

- A. A lock used only for writing to shared data
- B. A lock only used for file read operations
- C. A lock that prevents all access to a resource
- D. Allows concurrent reads but requires exclusive writes

Answer: D

Q774. What is a memory barrier (memory fence)?

- A. A physical barrier inside memory chip hardware
- B. A limit on the total memory allocation size
- C. An instruction enforcing memory operation ordering
- D. A type of virtual memory address translation

Answer: C

Q775. What are lock-free algorithms and why are they important?

- A. Algorithms that use no synchronization at all
- B. Algorithms that run without any operating system
- C. Algorithms using atomic ops like CAS, no locks
- D. Algorithms that are never blocked by anything

Answer: C

Q776. In the readers-writers problem, what is the difference between the first and second variants?

- A. There is no difference between the two at all
- B. First is for single CPU; second for multiprocessor
- C. First uses semaphores; the second uses only monitors
- D. First favors readers no wait; second favors writers

Answer: D

Q777. What is the difference between Hoare-style and Mesa-style monitors?

- A. Hoare signal transfers control; Mesa is just a hint
- B. They use different programming languages entirely
- C. Mesa-style monitors are older than Hoare-style
- D. Hoare-style monitors are faster than Mesa-style

Answer: A

Q778. What is transactional memory?

- A. Memory transferred between running processes
- B. Atomic memory operations similar to databases
- C. A type of CPU cache for fast computations
- D. Memory used for financial transactions only

Answer: B

Q779. What is the ABA problem in lock-free programming?

- A. A deadlock scenario involving two blocked threads
- B. A naming convention issue in the source code
- C. A problem with kernel memory allocation routines
- D. CAS succeeds incorrectly due to A-to-B-to-A change

Answer: D

Q780. What is a futex (fast userspace mutex) in Linux?

- A. User-space mutex with kernel support on contention
- B. A fast file transfer utility for networks
- C. A type of file lock for exclusive access
- D. A network protocol for data synchronization

Answer: A

Q781. In the Banker's Algorithm safety check, what is the time complexity for n processes and m resource types?

- A. $O(n)$ linear
- B. $O(n!)$ factorial
- C. $O(n * m)$ time
- D. $O(n^2 * m)$ time

Answer: D

Q782. What is the problem with resource preemption as a deadlock recovery method?

- A. It uses too much memory for tracking state
- B. Selecting victim, rollback, preventing starvation
- C. It only works on single-processor systems
- D. It runs too fast and is hard to control

Answer: B

Q783. In a resource allocation graph with multiple instances per resource type, a cycle:

- A. Necessary but not sufficient
- B. Never indicates any deadlock
- C. Always indicates deadlock
- D. Neither necessary nor sufficient

Answer: A

Q784. What is a livelock and how does it differ from deadlock?

- A. There is no difference between livelock and deadlock
- B. Livelock only occurs in single-threaded programs only
- C. In livelock processes change state without any progress
- D. Livelock is simply a faster form of deadlock occurring

Answer: C

Q785. How does the 'no preemption' condition get addressed in deadlock prevention for resources like CPU registers and memory?

- A. All held resources are preempted if request fails
- B. The process is immediately terminated by the OS
- C. These resources can never be preempted at all
- D. The resources are duplicated for both processes

Answer: A

Q786. What is the main limitation of the Banker's Algorithm in practice?

- A. It runs too fast for real world use cases
- B. It only works with exactly two processes
- C. Processes rarely know max needs in advance
- D. It does not detect any resource cycles found

Answer: C

Q787. How frequently should a deadlock detection algorithm be invoked?

- A. Only when the system is shutting down
- B. Depends on frequency and tradeoff of cost
- C. Every single millisecond without exception
- D. Once at initial system startup only ever

Answer: B

Q788. In distributed systems, what additional challenges does deadlock detection face?

- A. Deadlocks cannot occur in distributed systems
- B. Only overall performance is affected here
- C. No additional challenges at all exist
- D. Delays, no global state, phantom deadlocks

Answer: D

Q789. What is a two-phase locking protocol and how does it relate to deadlocks?

- A. A protocol using only two shared resources
- B. A protocol with exactly two locks only
- C. Growing acquires, shrinking releases; can deadlock
- D. A protocol that is completely deadlock-free

Answer: C

Q790. What is the wound-wait scheme for deadlock prevention in database systems?

- A. Older wounds younger; younger waits for older
- B. A recovery technique for crashed transactions
- C. A method to wound and terminate processes
- D. A scheduling algorithm for query processing

Answer: A

Q791. What is the working set model and how does it relate to thrashing?

- A. It is a disk scheduling model for I/O requests
- B. It is a CPU scheduling model for processes
- C. It models CPU utilization across all processors
- D. Defines active pages; fewer frames causes thrashing

Answer: D

Q792. What is a multi-level page table and why is it used?

- A. A page table with multiple entries per page
- B. Hierarchical structure saving memory for sparse spaces
- C. A page table stored entirely on secondary disk
- D. A table shared by multiple running processes

Answer: B

Q793. What is an inverted page table?

- A. A page table stored in reverse order
- B. One entry per physical frame, reducing overhead
- C. A page table stored entirely on the disk drive
- D. A table that maps physical to logical addresses

Answer: B

Q794. What is the second-chance (clock) page replacement algorithm?

- A. Modified FIFO checking reference bit, gives second chance
- B. An algorithm that always replaces the second loaded page
- C. A two-pass algorithm scanning memory blocks twice each
- D. A modified version of the FIFO algorithm only

Answer: A

Q795. What is copy-on-write in the context of virtual memory?

- A. Copying all pages to disk during every write
- B. Writing data twice to provide data redundancy
- C. Sharing pages until a write, then making a copy
- D. Copying all pages before any read operation

Answer: C

Q796. What are huge pages (large pages) and when are they beneficial?

- A. Pages that span across multiple physical disk drives
- B. Pages assigned the highest priority access level
- C. Pages used to store very large files on disk
- D. Larger pages reducing TLB misses for big workloads

Answer: D

Q797. What is memory-mapped I/O?

- A. Mapping device registers into address space
- B. A technique for allocating memory to tasks
- C. An I/O scheduling algorithm for requests
- D. Storing I/O data in regular memory buffers

Answer: A

Q798. What is the page-fault frequency (PFF) approach to preventing thrashing?

- A. Setting a maximum number of page faults allowed
- B. Monitoring fault rate and adjusting frame allocation
- C. Counting total page faults across all processes
- D. Preventing all page faults from occurring ever

Answer: B

Q799. What is the buddy system for memory allocation?

- A. A system with two separate pools for allocation
- B. A system where two processes share memory pool
- C. A system for backing up memory to the disk
- D. Power-of-2 blocks, splitting and coalescing buddies

Answer: D

Q800. What is the slab allocator used in Linux kernel memory management?

- A. A page replacement algorithm for virtual memory
- B. A disk allocation method for file storage
- C. A virtual memory technique for address mapping
- D. Pre-allocating object caches to reduce overhead

Answer: D

Q801. What is a journaling file system and how does it improve reliability?

- A. Logs changes to journal before applying for crash recovery
- B. A read-only file system that never allows modifications
- C. A file system that keeps a diary of user activities
- D. A file system that journals all network activity on disk

Answer: A

Q802. What is a log-structured file system (LFS)?

- A. Writes all data sequentially to a log for write speed
- B. A file system that only stores system log files
- C. A file system with built-in logging capability
- D. A file system used only for system log storage

Answer: A

Q803. In UNIX, what is the purpose of the superblock?

- A. To store the largest file in the system
- B. To store file system metadata like size and counts
- C. To speed up file access through data caching
- D. To store user passwords and authentication info

Answer: B

Q804. How do UNIX file systems handle files larger than what direct block pointers in an inode can address?

- A. By splitting the file into multiple smaller separate files
- B. Using indirect, double indirect, and triple indirect pointers
- C. They cannot handle files larger than direct pointers allow
- D. By compressing the file data to reduce total block count

Answer: B

Q805. What is a copy-on-write file system like ZFS or Btrfs?

- A. Never overwrites data; writes to new locations always
- B. A file system that prevents all write operations
- C. A file system that duplicates all data for safety
- D. A file system that copies files when writing to disk

Answer: A

Q806. What is the Network File System (NFS)?

- A. A database for networked storage
- B. A firewall for file server protection
- C. A local file system for one machine
- D. A protocol for remote files as local

Answer: D

Q807. What are extents in modern file systems like ext4?

- A. Extra storage space added to disk
- B. External file links to other systems
- C. Contiguous block range by start and length
- D. Extended file attributes for metadata

Answer: C

Q808. What is file system defragmentation and why is it needed?

- A. Checking file system integrity and repairing errors
- B. Breaking files into smaller fragments for storage
- C. Deleting all fragmented files from the disk drive
- D. Reorganizing blocks to be contiguous for performance

Answer: D

Q809. What is the buffer cache in file system implementation?

- A. A buffer used for printer output spooling
- B. Memory caching disk blocks to reduce I/O ops
- C. A buffer used for storing network packet data
- D. A cache for graphical user interface buffers

Answer: B

Q810. What is a RAID system and what is its purpose?

- A. A debugging tool for disk diagnostics
- B. A memory management technique for allocation
- C. Multiple disks combined for performance or reliability
- D. A type of file system for special purposes

Answer: C

Q811. What is wear leveling in SSDs and why is it necessary?

- A. Equalizing read speeds across memory blocks
- B. Distributing physical wear on the drive casing
- C. Distributing write/erase cycles evenly on cells
- D. Leveling the drive in its mounting bracket

Answer: C

Q812. What is the TRIM command in the context of SSDs?

- A. A command to reduce overall file size used
- B. A command to trim long file names shorter
- C. Tells SSD which blocks are free for erasure
- D. A command to resize existing disk partitions

Answer: C

Q813. What is the write amplification problem in SSDs?

- A. Data being written too quickly to the drive
- B. Amplified noise during write operations on the drive
- C. Physical writes exceed logical due to garbage collection
- D. Writing same data multiple times for data redundancy

Answer: C

Q814. What is the difference between RAID 5 and RAID 6?

- A. RAID 6 uses mirroring instead of distributed parity
- B. There is no significant difference between them at all
- C. RAID 6 is faster in overall performance than RAID 5
- D. RAID 6 uses double parity, surviving two disk failures

Answer: D

Q815. What is the I/O scheduler's role in Linux and how do different schedulers (CFQ, deadline, noop) differ?

- A. They all work in an identical way overall
- B. CFQ ensures fairness; deadline prevents starvation; noop for SSDs
- C. They only differ in their names not in actual behavior
- D. They are all deprecated and no longer used in modern Linux

Answer: B

Q816. What is disk striping and how does it improve performance?

- A. Painting visual stripes on the disk surface
- B. Removing unused sectors from the disk drive
- C. Compressing data stored on the disk drive
- D. Distributing data across disks for parallel I/O

Answer: D

Q817. What is the purpose of a disk controller's command queue (NCQ/TCQ)?

- A. To queue commands issued by the user at terminal
- B. To encrypt all disk commands for data security
- C. To reorder pending I/O for reduced head movement
- D. To limit the number of concurrent disk requests

Answer: C

Q818. What is a hot spare disk in RAID configurations?

- A. A disk that runs at higher operating temperature
- B. An unused disk that auto-replaces a failed disk
- C. A backup disk stored off-site for recovery use
- D. A disk storing the most frequently accessed files

Answer: B

Q819. What is the difference between NVMe and SATA interfaces for SSDs?

- A. SATA is faster than NVMe in all standard benchmarks
- B. NVMe uses PCIe for higher bandwidth and lower latency
- C. NVMe only works with traditional hard disk drive units
- D. They are the exact same interface standard overall

Answer: B

Q820. What is the significance of the 4K sector size (Advanced Format) in modern disk drives?

- A. It slows down the disk read and write speed
- B. It reduces overall disk capacity significantly
- C. It is designed only for SSD drives and not HDDs
- D. Larger sectors improve error correction and efficiency

Answer: D

Q821. What is vectored I/O (scatter-gather I/O)?

- A. I/O operations on vector graphics rendering
- B. Broadcasting I/O to multiple devices at once
- C. Single I/O on multiple non-contiguous buffers
- D. Parallel I/O on vector processors for tasks

Answer: C

Q822. What is the purpose of I/O scheduling at the OS level?

- A. To encrypt I/O data for security and privacy
- B. To slow down all I/O operations for safety
- C. To prevent all I/O operations from executing
- D. To order and optimize I/O for throughput and fairness

Answer: D

Q823. What is the kernel I/O subsystem's role in device reservation?

- A. Updating device firmware and driver software
- B. Reserving devices for future hardware purchase
- C. Backing up all device data to secondary storage
- D. Granting exclusive device access to prevent conflicts

Answer: D

Q824. What is the life cycle of an I/O request from a user application to hardware?

- A. Application goes through network stack then to hardware
- B. Application directly accesses hardware with no intermediary
- C. App calls kernel, driver, controller, then hardware device
- D. Application goes through file system then to the hardware

Answer: C

Q825. What is asynchronous I/O and how does it differ from non-blocking I/O?

- A. Non-blocking uses interrupts while async does not
- B. They are the same thing in every single way
- C. Asynchronous I/O is actually a blocking I/O form
- D. Non-blocking returns available; async notifies on completion

Answer: D

Q826. What is IOCTL (I/O Control) used for?

- A. A syscall for device-specific operations beyond read/write
- B. Input and output data formatting utility
- C. I/O error correction and data recovery mechanism
- D. I/O traffic control and bandwidth management tool

Answer: A

Q827. What is zero-copy I/O and why is it important for performance?

- A. I/O that produces no output at all ever
- B. Eliminating unnecessary copies between kernel and user
- C. I/O that uses no disk space for data storage
- D. I/O with zero errors during the transfer process

Answer: B

Q828. What is the role of the select()/poll()/epoll() system calls?

- A. To monitor multiple file descriptors for I/O readiness
- B. To select which CPU scheduling algorithm to apply
- C. To select files to delete from the disk drive
- D. To poll system users for their preference settings

Answer: A

Q829. What is the difference between port-mapped I/O and memory-mapped I/O?

- A. Port-mapped I/O is always faster than memory-mapped I/O
- B. Port-mapped uses separate space; memory-mapped uses memory
- C. Memory-mapped requires special hardware not in modern CPUs
- D. They are identical in every respect and behavior

Answer: B

Q830. What is the transformer model in I/O subsystem layering?

- A. A machine learning model for I/O prediction
- B. A power supply model for device power management
- C. A database model for storing I/O request metadata
- D. Layered approach where each layer transforms requests

Answer: D

Q831. What is Address Space Layout Randomization (ASLR)?

- A. Randomizing data area positions to prevent exploits
- B. A network addressing scheme for distributed nodes
- C. A disk layout optimization for faster read access
- D. A memory allocation algorithm used by OS kernel

Answer: A

Q832. What is a rootkit?

- A. A set of root user access tools for admin
- B. A root user configuration file set used
- C. A system administration utility toolkit
- D. Malware providing hidden privileged access

Answer: D

Q833. What is the concept of security rings (protection rings) in OS architecture?

- A. Hierarchical privilege levels with inner having more
- B. Physical rings around the processor die chip
- C. A type of ring network topology for communication
- D. A form of data encryption using circular key bits

Answer: A

Q834. What is a side-channel attack?

- A. Exploiting physical info like timing or cache behavior
- B. An attack through a secondary network connection
- C. An attack on backup systems stored at off-site
- D. An attack on auxiliary devices connected to system

Answer: A

Q835. What are Spectre and Meltdown vulnerabilities?

- A. Software bugs found in major web browser apps
- B. Hardware flaws exploiting speculative execution to leak data
- C. Network protocol flaws in the TCP/IP stack implementation
- D. File system vulnerabilities found in modern operating systems

Answer: B

Q836. What is mandatory access control (MAC) and how does it differ from discretionary access control (DAC)?

- A. DAC is mandatory and MAC is discretionary
- B. They are the same access control model used
- C. MAC is system-enforced; DAC is owner-controlled
- D. MAC is weaker than DAC in all situations

Answer: C

Q837. What is Role-Based Access Control (RBAC)?

- A. Access control based on user physical location
- B. A type of encryption for access control data
- C. Controlling access based on time of day only
- D. Permissions assigned to roles; users gain via roles

Answer: D

Q838. What is a sandbox in operating system security?

- A. A debugging tool for code analysis testing
- B. A test database for development and staging
- C. Isolated environment restricting program access
- D. A type of malware infection on the system

Answer: C

Q839. What is the Bell-LaPadula security model?

- A. A network security protocol for data transfer
- B. A database security model for SQL prevention
- C. Confidentiality model: no read up, no write down
- D. A physical security model for server rooms

Answer: C

Q840. What is the Biba integrity model and how does it differ from Bell-LaPadula?

- A. Biba focuses on integrity: no read down, no write up
- B. They are the exact same model under different names
- C. Biba is a networking model for packet integrity checks
- D. Biba replaces Bell-LaPadula in all modern OS systems

Answer: A

Q841. In a hybrid kernel architecture, which services typically remain in kernel space?

- A. Only user applications remain inside the kernel space
- B. Networking stacks exclusively run in the kernel space
- C. All device drivers and file systems run in user space
- D. Core IPC and some drivers stay in kernel for speed

Answer: D

Q842. What security vulnerability does the Meltdown attack exploit in CPUs?

- A. It exploits buffer overflow in user application code
- B. It exploits speculative execution to read kernel data
- C. It exploits faulty device drivers in the OS subsystem
- D. It exploits weak encryption in network protocol sets

Answer: B

Q843. What is the key design trade-off in exokernel operating systems?

- A. Exokernels sacrifice all security for maximum speed
- B. They trade app portability for resource efficiency now
- C. Exokernels trade memory capacity for CPU performance
- D. They sacrifice networking for faster disk I/O throughput

Answer: B

Q844. How does a Type-1 hypervisor differ from a Type-2 hypervisor?

- A. Type-2 runs on bare metal while Type-1 needs a host
- B. Type-1 runs directly on bare metal without host OS
- C. Type-1 only supports Linux; Type-2 supports all OSes
- D. Both types require a host operating system to function

Answer: B

Q845. What problem does the UEFI boot process solve over legacy BIOS?

- A. UEFI only supports smaller disk sizes than BIOS can
- B. UEFI is slower but more compatible with older hardware
- C. UEFI eliminates the need for any operating system now
- D. UEFI removes the 2TB disk limit and adds secure boot

Answer: D

Q846. In capability-based OS design, what does a capability represent?

- A. A type of scheduling algorithm for real-time tasks
- B. A measure of CPU processing speed in megahertz
- C. A token granting specific access rights to objects
- D. A hardware register for storing interrupt addresses

Answer: C

Q847. What challenge does the OS face in managing NUMA architectures?

- A. Memory access times vary by processor-memory distance
- B. All memory accesses take the same time in NUMA setups
- C. NUMA systems cannot support more than one processor
- D. NUMA eliminates the need for cache memory in all CPUs

Answer: A

Q848. What is the fundamental principle behind separating mechanism and policy?

- A. It ensures the OS can never be modified or updated
- B. It prevents any user from customizing the OS at all
- C. It allows changing decisions without changing the code
- D. It requires all policies to be hard-coded in hardware

Answer: C

Q849. What is a unikernel and how does it differ from a traditional OS?

- A. A unikernel bundles app and OS in one address space
- B. A unikernel is a multi-user general-purpose OS now
- C. A unikernel requires a full OS installation underneath
- D. A unikernel runs many applications simultaneously here

Answer: A

Q850. Why is the halting problem relevant to operating system design?

- A. It guarantees all programs terminate in finite time span
- B. It proves the OS can always detect all infinite loops
- C. It shows no algorithm can decide if programs will halt
- D. It applies only to database management systems today

Answer: C

Q851. In the L4 microkernel family, what design decision improves IPC performance?

- A. L4 uses asynchronous message passing exclusively always
- B. L4 batches all IPC messages and processes them in bulk
- C. L4 implements synchronous IPC with register-based transfer
- D. L4 eliminates IPC entirely and uses shared memory only

Answer: C

Q852. What is the key challenge in defining layers for a layered OS?

- A. Finding hardware that supports the layered architecture
- B. Determining correct layer ordering with dependencies here
- C. Making sure each layer has the exact same code size now
- D. Ensuring every layer can communicate with all other ones

Answer: B

Q853. How does the Mach microkernel handle memory management?

- A. It requires only hardware-specific memory management
- B. It manages all memory entirely within the microkernel
- C. It does not support virtual memory in any form at all
- D. It uses external pagers in user space for page handling

Answer: D

Q854. What is a system generation (SYSGEN) process in OS deployment?

- A. It automatically writes new operating system source code
- B. It generates documentation for the operating system APIs
- C. It configures the OS for specific hardware at installation
- D. It creates backup copies of the OS kernel on other disk

Answer: C

Q855. Why do modern OS designs favor hybrid kernel over pure microkernel?

- A. Pure microkernels provide better performance in all cases
- B. Hybrid kernels balance modularity with better performance
- C. Pure microkernels cannot support any device drivers now
- D. Hybrid kernels are simpler to implement than microkernels

Answer: B

Q856. What is the role of the Hardware Abstraction Layer in Windows NT?

- A. HAL manages user interface themes and visual appearance
- B. HAL compiles C++ code into native machine instructions
- C. HAL hides hardware differences from upper OS layers now
- D. HAL provides a game rendering engine for DirectX apps

Answer: C

Q857. How does the Android architecture differ from standard Linux?

- A. Android adds middleware like ART runtime over Linux kernel
- B. Android does not use any Linux components in its design
- C. Android replaces the Linux kernel with a custom one here
- D. Android uses Linux only for networking and nothing else

Answer: A

Q858. What problem does eBPF solve in modern Linux kernels?

- A. It replaces the TCP/IP stack with a new protocol stack
- B. It allows safe programmable extensions in the kernel now
- C. It provides a graphical desktop environment for Linux
- D. It manages Bluetooth device connections in Linux only

Answer: B

Q859. What is the significance of MINIX 3 in operating system research?

- A. MINIX 3 eliminated the need for file systems completely
- B. MINIX 3 proved monolithic kernels are always superior
- C. MINIX 3 demonstrated a reliable self-healing microkernel
- D. MINIX 3 was the first OS to support graphical interfaces

Answer: C

Q860. How do C library wrappers simplify system call invocation?

- A. They bypass the kernel entirely for all OS operations
- B. They provide function interface hiding assembly details
- C. They convert system calls into network protocol packets
- D. They eliminate the need for privilege mode transitions

Answer: B

Q861. How does copy-on-write optimize the fork() system call?

- A. It eliminates the need for virtual memory addressing
- B. It copies the entire address space at fork instantly
- C. It prevents child processes from writing any memory
- D. It shares pages until a write then copies that page

Answer: D

Q862. What is vfork() and how does it differ from fork()?

- A. vfork() creates multiple child processes at same time
- B. vfork() bypasses the kernel for process creation now
- C. vfork() is identical to fork() in all design aspects
- D. vfork() shares address space and suspends the parent

Answer: D

Q863. How do process groups and sessions work in Unix systems?

- A. Sessions and process groups are the same exact concept
- B. Every process belongs to exactly one group and session
- C. Process groups exist only for root user processes now
- D. Process groups are only used in Windows and not Unix

Answer: B

Q864. How do preemptive and cooperative multitasking differ?

- A. Preemptive lets OS forcibly take CPU from a process
- B. Cooperative lets the OS forcibly interrupt any process
- C. Both approaches give unlimited CPU time to processes
- D. Preemptive requires processes to yield voluntarily now

Answer: A

Q865. What is the purpose of the clone() system call in Linux?

- A. It converts a user process into a kernel-level process
- B. It merges two existing processes into a single process
- C. It creates a thread or process with fine-grained sharing
- D. It only duplicates files on disk, not any processes

Answer: C

Q866. How does Chrome use process architecture for security?

- A. Chrome uses separate processes per tab for isolation
- B. Chrome runs all tabs in one single process for speed
- C. Chrome does not use processes; it uses threads only
- D. Chrome relies only on the OS kernel for tab isolation

Answer: A

Q867. What is the role of the init process (PID 1) in Unix?

- A. It only manages network interfaces during boot time
- B. It handles only file system mounting and nothing else
- C. It is temporary and exits after boot process completes
- D. It is ancestor of all processes and adopts all orphans

Answer: D

Q868. What challenges arise with process migration in distributed systems?

- A. Only the process ID needs to move between machines now
- B. Process migration is trivial with no challenges at all
- C. Open file handles and network state must be transferred
- D. Process migration eliminates the need for scheduling here

Answer: C

Q869. How does process creation differ between Windows and Unix?

- A. Windows maintains a strict parent-child tree like Unix
- B. Neither system tracks relationships between processes now
- C. Unix has parent-child trees; Windows uses handle tokens
- D. Both systems have identical process creation mechanisms

Answer: C

Q870. What is process checkpointing in fault-tolerant systems?

- A. It saves process state periodically for failure recovery
- B. It permanently deletes process state to free memory
- C. It checks if a process has any source code syntax errors
- D. It counts the number of processes running on the system

Answer: A

Q871. How does the Completely Fair Scheduler in Linux work?

- A. CFS maintains virtual runtime for fair CPU allocation
- B. CFS uses lottery scheduling for random CPU assignment
- C. CFS uses strict priority queues with fixed time slices
- D. CFS implements simple Round Robin with a fixed quantum

Answer: A

Q872. What is the exponential averaging formula for burst prediction?

- A. Next burst is always set to a fixed constant value here
- B. Next burst equals the exact length of the previous burst
- C. $\tau(n+1) = \alpha \cdot t(n) + (1-\alpha) \cdot \tau(n)$ using history
- D. Prediction uses only the average of all prior burst times

Answer: C

Q873. What is priority inversion and how can it be solved?

- A. Low-priority blocks high-priority; use priority inheritance
- B. High-priority tasks always run first without any exception
- C. Priority inversion occurs only in single-core CPU systems
- D. It is solved by removing all priorities from the system

Answer: A

Q874. How does the O(1) scheduler differ from CFS in Linux?

- A. O(1) is fairer than CFS for interactive desktop workloads
- B. O(1) uses active/expired arrays; CFS uses red-black tree
- C. Both schedulers are identical in design and implementation
- D. CFS uses fixed time slices while O(1) uses virtual runtime

Answer: B

Q875. What is gang scheduling in multiprocessor systems?

- A. It only works with single-threaded processes on one core
- B. It co-schedules related threads simultaneously on CPUs
- C. It randomly assigns processes to processors without order
- D. It schedules one process at a time across all CPUs now

Answer: B

Q876. How does processor affinity affect multiprocessor scheduling?

- A. It has no effect on scheduling in multiprocessor systems
- B. It forces processes to migrate between CPUs constantly
- C. It keeps a process on the same CPU to exploit warm cache
- D. It assigns all processes to the same single CPU core here

Answer: C

Q877. What is global vs. partitioned scheduling in multicore systems?

- A. Global and partitioned scheduling are the exact same thing
- B. Global scheduling assigns each process to a fixed core
- C. Partitioned scheduling uses a single queue for all cores
- D. Global uses one shared queue; partitioned uses per-core

Answer: D

Q878. What is rate-monotonic scheduling for real-time systems?

- A. It uses Round Robin for all periodic real-time task sets
- B. It assigns the same fixed priority to every task equally
- C. It assigns priorities randomly to all real-time task sets
- D. It assigns priorities inversely proportional to periods

Answer: D

Q879. How does Earliest Deadline First schedule real-time tasks?

- A. It only works with non-periodic tasks in batch systems
- B. It dynamically prioritizes tasks with nearest deadlines
- C. It schedules the task with the latest deadline first
- D. It ignores deadlines and uses burst time for scheduling

Answer: B

Q880. What is the schedulability test for rate-monotonic scheduling?

- A. All tasks must have priority higher than the OS kernel
- B. Each task must have the same exact period and burst time
- C. CPU utilization must be below 100 percent for all tasks
- D. Sum of C_i/T_i must be at most $n \cdot (2^{1/n} - 1)$ for guarantee

Answer: D

Q881. What is a lightweight process (LWP) in many-to-many threading?

- A. An LWP is a file storing thread state on the hard disk
- B. An LWP is intermediate between user and kernel threads
- C. An LWP is a network packet for inter-thread messaging
- D. An LWP is a physical CPU core in the processor chip

Answer: B

Q882. What is the scheduler activation mechanism in threading?

- A. Kernel notifies user library via upcalls about events
- B. It is a simple timer interrupt for thread scheduling
- C. It replaces the CPU scheduler with a user-space one
- D. It prevents communication between kernel and threads

Answer: A

Q883. How does Windows thread scheduling differ from Linux?

- A. Both systems only schedule processes, never any threads
- B. Windows schedules processes; Linux schedules threads
- C. Windows uses Round Robin; Linux uses SJF exclusively
- D. Windows schedules threads; Linux schedules tasks via CFS

Answer: D

Q884. What is the thundering herd problem in threaded servers?

- A. A single thread monopolizes the CPU preventing others
- B. Threads run too slowly due to excessive synchronization
- C. Too many threads cause total memory exhaustion now
- D. Multiple threads wake for one event but one handles it

Answer: D

Q885. What is the purpose of the futex mechanism in Linux?

- A. It provides a graphics rendering pipeline for threads
- B. It controls CPU frequency scaling for threaded workload
- C. It manages file transfers between threads over network
- D. It implements fast user-space locking with kernel fallback

Answer: D

Q886. How does hyperthreading affect OS thread scheduling?

- A. It eliminates the need for any software threading at all
- B. It reduces the number of CPUs visible to the OS kernel
- C. It has no effect on how the OS schedules threads at all
- D. OS sees additional logical CPUs and schedules on them now

Answer: D

Q887. What are the challenges of implementing user-level threads?

- A. User-level threads are always slower than kernel threads
- B. User-level threads cannot be created by any application
- C. User-level threads require special hardware support only
- D. A blocking syscall blocks all threads in the process now

Answer: D

Q888. What is the two-level model in thread implementation?

- A. It combines many-to-many with one-to-one mapping
- B. It requires two separate kernels for thread management
- C. It uses exactly two threads per process, no more here
- D. It maps all threads to exactly two kernel-level threads

Answer: A

Q889. How does Grand Central Dispatch handle threading on macOS?

- A. GCD only supports single-threaded application execution
- B. GCD requires programmers to manually create threads
- C. GCD uses blocks and dispatch queues managed by runtime
- D. GCD is a hardware threading mechanism in Apple chips

Answer: C

Q890. What is a fiber and how does it differ from a thread?

- A. Fibers are identical to threads in every way possible
- B. Fibers are hardware threads built into processor cores
- C. Fibers are cooperatively scheduled user-level threads
- D. Fibers are kernel-level threads with preemptive scheduling

Answer: C

Q891. What is the dining philosophers problem and its significance?

- A. It models network routing algorithms in large data centers
- B. It is about optimizing database query execution plans now
- C. It models resource allocation leading to potential deadlock
- D. It describes scheduling of philosophers teaching classes

Answer: C

Q892. How does Read-Copy-Update (RCU) achieve lock-free reads?

- A. RCU prevents any writes from occurring while reading
- B. RCU uses spinlocks internally for all read operations
- C. RCU locks all readers while writer updates the data
- D. Readers access old data while writers prepare new copy

Answer: D

Q893. What is the ABA problem in lock-free data structures?

- A. ABA is an algorithm for balanced binary tree building
- B. It describes automatic backup and archival of data
- C. It refers to alphabetical ordering of lock acquisition
- D. Value changes from A to B to A, hiding the updates

Answer: D

Q894. What is a memory barrier instruction used for?

- A. It ensures memory operations complete in proper order
- B. It prevents the CPU from accessing some memory regions
- C. It doubles available memory by compressing all data now
- D. It creates a physical barrier in RAM to separate data

Answer: A

Q895. What differs between Mesa and Hoare monitor semantics?

- A. Hoare uses signal-and-continue; Mesa signal-and-wait
- B. Mesa requires busy waiting; Hoare uses blocking only
- C. Mesa and Hoare semantics are completely identical here
- D. Mesa uses signal-and-continue; Hoare signal-and-wait

Answer: D

Q896. How does transactional memory simplify concurrent programming?

- A. It only works with single-threaded programs in practice
- B. It requires more locks than traditional synchronization
- C. It eliminates all shared memory between threads fully
- D. It lets code blocks execute atomically without locks now

Answer: D

Q897. What is the priority ceiling protocol and how does it work?

- A. Each mutex gets ceiling equal to highest priority user now
- B. It only lets highest priority thread acquire locks at all
- C. It lowers all thread priorities to zero to stop conflicts
- D. It eliminates all priorities making every thread equal here

Answer: A

Q898. What is lock-free vs. wait-free in concurrent algorithms?

- A. Wait-free ensures system progress but not per-thread
- B. Lock-free ensures system progress; wait-free per-thread
- C. Lock-free and wait-free algorithms are exactly the same
- D. Lock-free uses hidden locks but hides them from users

Answer: B

Q899. What does the sleeping barber problem model?

- A. It models network packet queuing in router memory now
- B. It describes file system journaling for crash recovery
- C. A scheduling algorithm for barber shop appointments
- D. It models bounded-buffer producer-consumer with sleep

Answer: D

Q900. How does Linux handle preemption within critical sections?

- A. Linux disables preemption using preemption counters now
- B. Linux never allows any kernel-level preemption at all
- C. Linux always allows preemption inside critical sections
- D. Linux uses hardware locks to prevent all preemption

Answer: A

Q901. What is the time complexity of the Banker's algorithm?

- A. $O(n \times n \times m)$ for determining safe sequence each time here
- B. $O(n)$ linear time complexity for each resource request
- C. $O(\log n)$ logarithmic time for each allocation decision
- D. $O(1)$ constant time regardless of process or resources

Answer: A

Q902. How does the Linux kernel handle deadlock in practice?

- A. Linux uses lockdep to detect potential deadlock patterns
- B. Linux ignores deadlocks and restarts the system if stuck
- C. Linux prevents all four deadlock conditions at all times
- D. Linux implements full Banker's algorithm at runtime

Answer: A

Q903. What is two-phase locking's relationship to deadlock?

- A. Two-phase locking completely eliminates all deadlocks
- B. Two-phase locking causes deadlock in every single case
- C. Two-phase locking ensures serializability allows deadlock
- D. Two-phase locking has no relationship to deadlock at all

Answer: C

Q904. What is a knot in a resource allocation graph?

- A. A knot is simply another name for any edge in graph
- B. A knot means the graph has no cycles present at all
- C. A cycle where no outside process can break the cycle
- D. A knot indicates that the system is in a safe state

Answer: C

Q905. How does wound-wait differ from wait-die for databases?

- A. Wait-die: older waits or dies; wound-wait wounds younger
- B. Both schemes are identical and behave the same always
- C. Wound-wait: older wounds younger; wait-die: older waits
- D. Wound-wait preempts younger; wait-die makes older wait

Answer: C

Q906. How are victim selection strategies used in deadlock recovery?

- A. Cost-based selection minimizes rollback overhead impact
- B. Victim selection only applies to file system operations
- C. All victims are always the newest process in the system
- D. Victim selection is random and cannot be optimized now

Answer: A

Q907. How can deadlock occur in distributed systems?

- A. Processes on different nodes can form distributed cycles
- B. Deadlock cannot occur across multiple distributed nodes
- C. Only single-node deadlocks are possible in any system
- D. Distributed systems automatically prevent all deadlocks

Answer: A

Q908. What is the phantom deadlock problem in distributed detection?

- A. It describes deadlocks that only occur during system startup
- B. It is a deadlock that is invisible to all detection methods
- C. It occurs when a detected deadlock does not actually exist
- D. It refers to deadlocks in virtual machine environments only

Answer: C

Q909. What is hierarchical deadlock prevention using lock ordering?

- A. It assigns random order to locks at runtime dynamically
- B. It groups locks into levels and enforces strict ordering
- C. It eliminates all locks from the system to prevent issues
- D. It uses only one global lock for the entire system here

Answer: B

Q910. How does the edge-chasing algorithm detect distributed deadlocks?

- A. It uses a centralized server to collect all wait-for info
- B. It prevents deadlock rather than detecting it after fact
- C. It broadcasts all lock info to every node all the time
- D. It propagates probe messages along wait-for edges across

Answer: D

Q911. How does the inverted page table reduce memory usage?

- A. It eliminates the need for any page table entirely
- B. It uses one entry per virtual page for each process
- C. It compresses page table entries to half their size
- D. It uses one entry per physical frame not per page

Answer: D

Q912. What is the clock (second-chance) page replacement algorithm?

- A. It gives each page a second chance via reference bit
- B. It always replaces the page with highest frame number
- C. It schedules page replacements at fixed clock intervals
- D. It replaces pages based on the actual wall clock time

Answer: A

Q913. What is copy-on-write in virtual memory management?

- A. Copying entire memory space when a process is created
- B. Sharing pages until write occurs then making private copy
- C. Writing all memory contents to disk after every instruction
- D. Preventing any process from writing to memory at all

Answer: B

Q914. How does ASLR improve security?

- A. It disables virtual memory to improve system performance
- B. It encrypts all data stored in process address space
- C. It randomizes code and data locations to prevent exploits
- D. It prevents all processes from accessing shared memory

Answer: C

Q915. What is the optimal page replacement algorithm's limitation?

- A. It does not support virtual memory in any implementation
- B. It causes more page faults than any other algorithm
- C. It can only work with a single page frame in system
- D. It requires future knowledge of page references to work

Answer: D

Q916. How does huge page support improve TLB performance?

- A. Huge pages reduce TLB size to improve lookup speed
- B. Huge pages reduce TLB miss frequency with fewer entries
- C. Huge pages eliminate the need for any TLB hardware now
- D. Huge pages make TLB slower but more accurate in lookup

Answer: B

Q917. What is the page-buffering algorithm used for?

- A. Buffering network data in page-sized blocks only
- B. Compressing pages to fit more data into memory now
- C. Preventing page faults by locking all pages in RAM
- D. Keeping a pool of free frames to speed replacement

Answer: D

Q918. What is memory-mapped I/O and how does it work?

- A. It stores all I/O data exclusively in the CPU registers
- B. It maps physical memory addresses to network addresses
- C. It maps I/O device registers into memory address space
- D. It eliminates the need for any I/O devices in system

Answer: C

Q919. What is kernel same-page merging (KSM) in Linux?

- A. It merges all kernel modules into a single binary
- B. It identifies and merges identical pages across procs
- C. It prevents any page sharing between virtual machines
- D. It splits each page into two smaller pages for speed

Answer: B

Q920. How does the buddy system manage memory allocation?

- A. It assigns memory randomly without any structure here
- B. It pairs every process with a buddy for backup now
- C. It splits memory into power-of-two blocks recursively
- D. It allocates memory in fixed blocks without splitting

Answer: C

Q921. How does ext4 use extents instead of block pointers?

- A. Extents are only used for files smaller than 4 KB
- B. An extent describes a contiguous run with one entry
- C. Extents eliminate the need for any metadata on disk
- D. Extents store each block address individually here

Answer: B

Q922. What is a copy-on-write file system and its advantage?

- A. It copies all data twice for redundancy on every write
- B. It writes data in place and copies only on deletion
- C. It never overwrites existing data ensuring consistency
- D. It only allows reads and prevents all write operations

Answer: C

Q923. How does the B+ tree structure benefit NTFS?

- A. It provides efficient $O(\log n)$ lookups and range scans
- B. It only works with files smaller than one megabyte now
- C. It stores file data directly inside B-tree leaf nodes
- D. It eliminates the need for any disk space management

Answer: A

Q924. What is the log-structured file system design philosophy?

- A. LFS stores data in traditional inode-based tree layout
- B. LFS writes all data and metadata sequentially to log
- C. LFS requires all data to be stored in main memory now
- D. LFS uses random writes to maximize disk head movement

Answer: B

Q925. How does ZFS ensure data integrity using checksums?

- A. ZFS checksums are stored alongside data in same block
- B. ZFS stores checksums in parent blocks enabling healing
- C. ZFS does not use any checksums for integrity checking
- D. ZFS only checksums metadata, not actual file data now

Answer: B

Q926. What is the TRIM command for SSDs in file systems?

- A. It trims the physical size of the SSD device now
- B. It informs SSD which blocks are no longer in use
- C. It compresses data on SSD to save storage space
- D. It increases read speed by defragmenting the SSD

Answer: B

Q927. How do deduplication techniques work in enterprise storage?

- A. They duplicate important files for safety purposes
- B. They compress each file individually to reduce size
- C. They identify and eliminate duplicate blocks to save
- D. They remove all files not accessed in recent months

Answer: C

Q928. What differs between ordered and writeback journaling?

- A. Ordered mode does not use a journal; writeback does
- B. Writeback writes data first; ordered metadata first now
- C. Both modes write data and metadata in the same order
- D. Ordered writes data before metadata; writeback either

Answer: D

Q929. What is the purpose of the superblock in Unix file systems?

- A. It stores the boot loader program for the OS kernel
- B. It contains critical file system metadata like size now
- C. It stores the contents of the largest file in system
- D. It is extra storage reserved for the root user only

Answer: B

Q930. How does FUSE work in Linux?

- A. FUSE moves all file system code into kernel space
- B. FUSE allows implementing file systems in user space
- C. FUSE replaces the VFS layer with a simpler version
- D. FUSE is a hardware device for connecting ext drives

Answer: B

Q931. How does LOOK improve upon the SCAN algorithm?

- A. LOOK eliminates the need for any head movement
- B. LOOK moves head to the physical end of disk
- C. LOOK reverses at the last request, not disk end
- D. LOOK processes requests in strict FCFS order now

Answer: C

Q932. What is the write amplification problem in SSDs?

- A. Writes are amplified to improve SSD performance
- B. SSDs amplify signals to write data faster on chip
- C. Writes are duplicated to multiple chips for safety
- D. More physical data is written than logical requested

Answer: D

Q933. How does RAID 6 improve on RAID 5 fault tolerance?

- A. RAID 6 uses triple mirroring of all data blocks
- B. RAID 6 uses dual parity allowing two disk failures
- C. RAID 6 stores four copies of parity on one drive
- D. RAID 6 and RAID 5 offer exactly the same safety

Answer: B

Q934. What is the FTL in solid-state drives?

- A. A network layer for transferring data between SSDs
- B. A physical layer connecting SSD to motherboard
- C. Firmware mapping logical addresses to flash pages
- D. A software tool for formatting flash drives on PC

Answer: C

Q935. What is shingled magnetic recording for HDDs?

- A. It uses circular tracks with no overlap at all
- B. It uses multiple read heads for faster read speed
- C. Tracks overlap like shingles for higher density now
- D. It eliminates platters using solid-state memory

Answer: C

Q936. What is NCQ in SATA drives?

- A. It prevents commands from executing out of order
- B. It queues user interface commands for the OS now
- C. It lets drives reorder commands for optimal execution
- D. It queues network commands for remote disk access

Answer: C

Q937. How does NVMe improve upon AHCI for SSDs?

- A. NVMe uses the same command set as legacy IDE chips
- B. NVMe and AHCI provide identical performance for SSDs
- C. NVMe uses deeper queues and lower latency than AHCI
- D. NVMe is designed for spinning disks limiting SSDs

Answer: C

Q938. What is the NOOP I/O scheduler and when is it used?

- A. NOOP completely eliminates all I/O scheduling here
- B. NOOP is the most advanced scheduler for disk drives
- C. NOOP uses simple FIFO queue with minimal ordering
- D. NOOP performs extensive sorting of I/O for HDDs

Answer: C

Q939. What is the RAID write hole problem?

- A. Power failure during write leaves parity inconsistent
- B. It prevents any write from completing on RAID now
- C. It is a physical hole in disk platter causing damage
- D. It only occurs when reading data from RAID array now

Answer: A

Q940. How does host-managed zoned storage work with ZNS SSDs?

- A. SSD firmware manages zones without any host input
- B. ZNS SSDs work identically to traditional block SSDs
- C. The host has no control over data placement here
- D. Host manages zones and writes sequentially in them

Answer: D

Q941. How does scatter-gather DMA improve I/O performance?

- A. It transfers data to non-contiguous memory regions now
- B. It eliminates DMA and uses programmed I/O instead
- C. It gathers all data into single buffer before transfer
- D. It scatters data randomly across memory for security

Answer: A

Q942. What is the IOCP model in Windows?

- A. A port number used for network socket communication
- B. A scalable model for handling many async I/O events
- C. A model that blocks all threads until I/O finishes
- D. A physical port for connecting I/O devices to PC

Answer: B

Q943. How does Linux epoll improve over select()?

- A. epoll uses O(1) notification instead of O(n) scanning
- B. epoll only works with network sockets not file I/O
- C. epoll and select have identical performance overall
- D. epoll monitors fewer file descriptors than select

Answer: A

Q944. What is IOMMU and how does it improve I/O security?

- A. It is a type of MMU used exclusively for memory mgmt
- B. It encrypts all data transferred between devices and CPU
- C. It translates device addresses providing memory isolation
- D. It is a memory unit storing I/O driver code only

Answer: C

Q945. How do edge-triggered and level-triggered I/O notifications differ?

- A. Edge-triggered notifications are always slower than level
- B. Both notification types trigger in the same situation here
- C. Level-triggered only works with sockets not with disk I/O
- D. Edge notifies on state transition; level while state holds

Answer: D

Q946. What is the io_uring interface in modern Linux?

- A. It provides high-performance async I/O via ring buffers
- B. It creates circular network connections between nodes
- C. It manages circular disk platters in HDD controllers
- D. It is a graphical interface for configuring I/O drivers

Answer: A

Q947. How does RDMA work?

- A. It requires CPU to copy all data for remote transfers
- B. It allows direct memory access between remote machines
- C. It only works within a single machine for local DMA
- D. It uses traditional TCP/IP for remote memory operations

Answer: B

Q948. What is interrupt coalescing and why is it used?

- A. It eliminates all interrupts using only polling for I/O
- B. It combines multiple events into fewer interrupt signals
- C. Each I/O event generates a separate interrupt always
- D. It splits one interrupt into multiple signals for detail

Answer: B

Q949. What is the SPDK approach to storage?

- A. It uses user-space drivers and polling for low latency
- B. It is a standard kernel-based storage driver framework
- C. It is a hardware kit for assembling storage arrays now
- D. It provides a graphical toolkit for storage management

Answer: A

Q950. How does virtio enable efficient I/O virtualization?

- A. It uses hardware passthrough without any abstraction
- B. It eliminates the need for any I/O drivers in the VM
- C. It provides standard paravirtual I/O interface for VMs
- D. It emulates physical hardware perfectly for each VM

Answer: C

Q951. How does return-oriented programming bypass NX protection?

- A. ROP disables the NX bit in CPU page table entries
- B. ROP chains existing code gadgets to execute payload
- C. ROP injects new executable code into stack directly
- D. ROP only works on systems without memory protection

Answer: B

Q952. What is the Trusted Platform Module and its security role?

- A. A hardware chip providing cryptographic security ops
- B. A kernel module managing user authentication only
- C. A software module scanning for viruses on system
- D. A network module filtering traffic like a firewall

Answer: A

Q953. How does mandatory access control differ from discretionary?

- A. MAC uses system-enforced labels; DAC lets owners control
- B. MAC and DAC are different names for the same mechanism
- C. Both give resource owners full control over all access
- D. MAC lets owners set permissions; DAC uses system policy

Answer: A

Q954. What is a side-channel attack and how does Spectre work?

- A. Spectre exploits speculative execution via cache timing
- B. Spectre exploits buffer overflows in browser apps only
- C. It attacks through unused network ports on system
- D. Side-channel attacks directly modify target source code

Answer: A

Q955. How does SELinux implement mandatory access control?

- A. SELinux assigns security labels to subjects and objects
- B. SELinux only encrypts file system data for privacy
- C. SELinux manages firewalls but not file access at all
- D. SELinux replaces Linux kernel with a secure version

Answer: A

Q956. What is a zero-day vulnerability?

- A. A flaw affecting zero users due to limited deployment
- B. A flaw existing only on the day software is released
- C. A flaw known for zero days and still unpatched now
- D. A flaw taking zero effort to exploit using any tool

Answer: C

Q957. How does control flow integrity protect against code-reuse?

- A. CFI encrypts all control flow instructions in binary
- B. CFI ensures execution follows predetermined control graph
- C. CFI only protects against buffer overflow not ROP now
- D. CFI prevents any branching instructions from executing

Answer: B

Q958. What is the confused deputy problem in security?

- A. A user confused about which password to use for login
- B. A privileged program tricked into misusing its authority
- C. An admin who misconfigures the security settings now
- D. A process confusing virtual and physical memory addrs

Answer: B

Q959. How does memory tagging (MTE) prevent memory safety bugs?

- A. MTE tags memory with metadata detecting out-of-bounds
- B. MTE increases the amount of physical RAM available here
- C. MTE encrypts all memory contents using hardware now
- D. MTE only works with interpreted languages not compiled

Answer: A

Q960. What is attestation in trusted computing?

- A. A technique for testing software under heavy load stress
- B. A legal document certifying software license compliance
- C. Cryptographic proof that system is in a known trusted state
- D. A user declaring identity through a sworn statement now

Answer: C

Q961. What is the key difference between a Type-0 and a Type-2 hypervisor in virtualization?

- A. Type-0 is firmware-based while Type-2 runs as an application on a host OS
- B. Type-0 is software while Type-2 is hardware
- C. Type-0 supports only Linux while Type-2 supports only Windows
- D. Type-0 is slower than Type-2 in all scenarios

Answer: A

Q962. What is paravirtualization and how does it improve VM performance?

- A. Guests are modified to make hypercalls instead of privileged instructions, reducing overhead
- B. Guests run unmodified but the hypervisor interprets all instructions
- C. The host OS is removed and guests run directly on hardware
- D. Multiple VMs share the same guest operating system image

Answer: A

Q963. What role does the IOMMU play in modern computer architectures?

- A. It translates device I/O addresses to physical memory addresses and provides isolation
- B. It manages CPU cache coherence across multiple cores
- C. It schedules interrupt handling among processors
- D. It encrypts all data transferred between CPU and memory

Answer: A

Q964. Why is the separation of user mode and kernel mode considered insufficient for modern security?

- A. Side-channel attacks like Spectre can leak kernel data even from user mode
- B. User mode programs cannot make system calls
- C. Kernel mode does not have access to hardware
- D. There are no privileged instructions in modern CPUs

Answer: A

Q965. What is the multikernel approach to OS design for many-core processors?

- A. It treats the machine as a network of independent cores communicating via messages
- B. It runs a single monolithic kernel replicated on each core
- C. It assigns one core to the kernel and all others to user processes
- D. It uses virtual machines to isolate each core

Answer: A

Q966. What is a container and how does it differ from a virtual machine?

- A. A container shares the host OS kernel while a VM runs its own full OS
- B. A container requires a hypervisor while a VM does not
- C. A container provides stronger isolation than a VM
- D. A container can only run Linux while a VM supports any OS

Answer: A

Q967. What is binary translation in the context of full virtualization?

- A. The hypervisor dynamically rewrites guest privileged instructions at runtime
- B. The compiler converts source code to a different CPU architecture
- C. The OS translates binary files between file formats
- D. The CPU converts binary to decimal during arithmetic operations

Answer: A

Q968. What design challenge does heterogeneous multiprocessing (big.LITTLE) introduce for operating systems?

- A. The scheduler must match task requirements to cores with different performance and power profiles
- B. All cores must run at the same clock speed
- C. The OS must use a separate kernel for each core type
- D. Applications must be compiled separately for each core type

Answer: A

Q969. What is the principle behind a library OS in the context of cloud computing?

- A. Application and OS are compiled together into a single-purpose image for minimal overhead
- B. The OS loads libraries dynamically from a central cloud repository
- C. All OS functions are implemented as shared libraries on a network
- D. Applications use library calls instead of system calls for I/O

Answer: A

Q970. What is the primary purpose of hardware-assisted virtualization extensions like Intel VT-x?

- A. To provide CPU hardware support for efficiently running virtual machines
- B. To increase the clock speed of the CPU
- C. To add more physical cores to the processor
- D. To enable GPUs to execute operating system code

Answer: A

Q971. How does the Darwin kernel used in macOS combine different architectural approaches?

- A. It uses a Mach microkernel core with BSD monolithic services in the same address space
- B. It runs entirely as a microkernel with all services in user space
- C. It uses a pure monolithic design identical to Linux
- D. It relies on a hypervisor to separate kernel components

Answer: A

Q972. What is the difference between a system call and a library call in terms of execution?

- A. A system call transitions to kernel mode while a library call stays in user mode
- B. A library call is always slower than a system call
- C. System calls cannot return values to the caller
- D. Library calls bypass the operating system entirely in all cases

Answer: A

Q973. What is the vDSO mechanism in Linux and why is it used?

- A. It maps kernel code into user space to avoid system call overhead for certain functions
- B. It provides virtual device drivers for emulated hardware
- C. It creates virtual disk storage from RAM
- D. It is a debugging tool for tracing system calls

Answer: A

Q974. What is the challenge of maintaining ABI compatibility in operating system development?

- A. Changes to system call interfaces or data structures can break existing compiled applications
- B. ABI compatibility only affects interpreted languages
- C. Maintaining ABI compatibility slows down hardware performance
- D. ABI compatibility is automatically handled by the CPU

Answer: A

Q975. How do system calls work on x86-64 Linux using the SYSCALL instruction?

- A. The syscall number is placed in RAX and SYSCALL transfers control to the kernel entry point
- B. The CPU automatically determines the system call from the program context
- C. System calls are made by writing to a special memory address
- D. The SYSCALL instruction is only available in kernel mode

Answer: A

Q976. What is the seccomp mechanism in Linux kernel architecture?

- A. A security facility that restricts the system calls a process can make
- B. A tool for compressing the kernel image during boot
- C. A scheduler for secondary storage devices
- D. A method for secure communication between microkernels

Answer: A

Q977. What problem does the Windows Subsystem for Linux (WSL2) solve architecturally?

- A. It runs a real Linux kernel in a lightweight VM to provide native Linux binary compatibility
- B. It translates Linux source code to Windows executables at compile time
- C. It emulates x86 Linux on ARM Windows devices
- D. It replaces the Windows kernel with the Linux kernel

Answer: A

Q978. What is the role of the init system (e.g., systemd) in modern Linux architecture?

- A. It is the first user-space process that initializes services and manages the system lifecycle
- B. It is part of the kernel that handles hardware interrupts
- C. It compiles the kernel from source code during boot
- D. It manages the BIOS firmware settings

Answer: A

Q979. What is the difference between a stable and unstable ABI in kernel module development?

- A. A stable ABI guarantees compatibility across versions while unstable ABI may change at any time
- B. Stable ABI is faster while unstable ABI is more secure
- C. Stable ABI runs in user mode while unstable ABI runs in kernel mode
- D. There is no practical difference in modern operating systems

Answer: A

Q980. How does the Fuchsia OS Zircon kernel differ from traditional Unix-like kernels?

- A. It uses a capability-based object system instead of Unix file descriptors for resource access
- B. It is a monolithic kernel identical to Linux in design
- C. It does not support user-space applications
- D. It runs exclusively on x86 architecture

Answer: A

Q981. What is the double fork technique in Unix and what problem does it solve?

- A. Forking twice makes the grandchild an orphan adopted by init to avoid zombies
- B. It creates two identical copies of a process for load balancing
- C. It forks a process on two different CPUs simultaneously
- D. It creates a backup copy of the process for fault tolerance

Answer: A

Q982. How does the Linux cgroup mechanism control process resource usage?

- A. It groups processes and enforces limits on CPU, memory, and I/O usage per group
- B. It encrypts process data for security
- C. It compresses process memory to save space
- D. It pins processes to specific CPU cores only

Answer: A

Q983. What is the difference between posix_spawn() and fork()+exec() for process creation?

- A. posix_spawn creates a process in a single call avoiding the overhead of copying the parent's address space
- B. posix_spawn only works on Windows systems
- C. fork()+exec() is always faster than posix_spawn
- D. posix_spawn cannot set up file descriptors for the child process

Answer: A

Q984. What are Linux namespaces and how do they relate to process isolation?

- A. They isolate system resources so processes see their own independent view of PIDs, network, and mounts
- B. They provide a naming convention for files on disk
- C. They organize kernel source code into modules
- D. They assign human-readable names to IP addresses

Answer: A

Q985. What is the thundering herd problem in process management?

- A. Multiple waiting processes are all woken up for an event but only one can handle it, wasting resources
- B. Too many processes run simultaneously causing CPU overheating
- C. Processes consume too much memory during startup
- D. Network packets arrive faster than processes can handle them

Answer: A

Q986. How does the Windows process creation model differ from the Unix fork/exec model?

- A. Windows uses CreateProcess() which creates a new process from scratch with a specified executable
- B. Windows uses fork() identically to Unix
- C. Windows cannot create child processes
- D. Windows processes do not have process IDs

Answer: A

Q987. What is process affinity in the context of NUMA architectures?

- A. Binding processes to specific NUMA nodes to keep memory accesses local and reduce latency
- B. Measuring how much a process likes its assigned CPU
- C. Preventing processes from accessing network resources
- D. Grouping processes by the user who created them

Answer: A

Q988. What is the OOM (Out-of-Memory) killer in Linux?

- A. A kernel mechanism that selects and terminates processes when the system runs out of memory
- B. A tool that prevents users from allocating too much disk space
- C. A hardware circuit that shuts down when RAM overheats
- D. A security feature that kills processes attempting buffer overflows

Answer: A

Q989. What is a process descriptor in the Linux kernel and what does it contain?

- A. A task_struct that holds all information the kernel needs about a process
- B. A text description of what the process does
- C. A file containing the process source code
- D. A log of all commands the process has executed

Answer: A

Q990. What is the seccomp-bpf mechanism used for in process sandboxing?

- A. It filters system calls using BPF programs to restrict what a process can do
- B. It encrypts process memory using Berkeley Packet Filters
- C. It monitors network packets sent by a process
- D. It compresses process data to reduce memory usage

Answer: A

Q991. How does the Linux CFS use a red-black tree for scheduling decisions?

- A. Processes are ordered by virtual runtime in the tree, and the leftmost node with smallest vruntime runs next
- B. The tree stores processes sorted by PID and the root node runs next
- C. Processes are randomly inserted and the tree auto-balances priorities
- D. The tree is used only for I/O scheduling, not CPU scheduling

Answer: A

Q992. What is the utilization bound test for rate-monotonic scheduling?

- A. The set of tasks is schedulable if total utilization does not exceed $n(2^{1/n} - 1)$
- B. Tasks are schedulable if each task's period is greater than its execution time
- C. The test checks if total memory usage is below the physical memory limit
- D. Tasks are schedulable only if they all have the same period

Answer: A

Q993. What is the priority inversion problem and how did it affect the Mars Pathfinder?

- A. A high-priority task was blocked by a low-priority task holding a shared resource, causing system resets
- B. The rover's CPU overheated due to excessive computation
- C. A software bug caused the scheduler to run processes in reverse priority order
- D. Network communication delays caused missed commands from Earth

Answer: A

Q994. What is the difference between global scheduling and partitioned scheduling on multicore systems?

- A. Global scheduling uses a single queue for all cores while partitioned assigns each task to a fixed core
- B. Global scheduling is always worse than partitioned scheduling
- C. Partitioned scheduling does not support priority-based algorithms
- D. Global scheduling can only be used with two cores

Answer: A

Q995. What is the BFS (Brain F* Scheduler) design philosophy compared to CFS?**

- A. BFS uses a single global run queue with an earliest eligible virtual deadline algorithm for simplicity
- B. BFS uses per-CPU run queues with work stealing for scalability
- C. BFS is designed only for real-time tasks on embedded systems
- D. BFS uses a multilevel feedback queue identical to traditional Unix schedulers

Answer: A

Q996. How does Earliest Deadline First (EDF) differ from rate-monotonic scheduling for real-time tasks?

- A. EDF assigns dynamic priorities based on deadlines achieving 100% utilization while rate-monotonic uses fixed priorities
- B. EDF only works with aperiodic tasks while rate-monotonic handles periodic tasks
- C. Rate-monotonic achieves higher utilization bounds than EDF
- D. EDF requires hardware support that rate-monotonic does not

Answer: A

Q997. What is work stealing in multiprocessor scheduling?

- A. Idle processors take tasks from the run queues of busy processors to balance load
- B. Processes steal CPU cycles from higher-priority processes
- C. The scheduler removes tasks from slow processors and discards them
- D. Memory is reallocated from one core's cache to another

Answer: A

Q998. What is the SCHED_DEADLINE scheduling class in Linux?

- A. An EDF-based scheduler that guarantees CPU bandwidth to tasks using runtime/deadline/period parameters
- B. A scheduler that assigns deadlines based on process creation time
- C. A file system scheduling class for managing disk deadlines
- D. A network scheduler for prioritizing packet delivery

Answer: A

Q999. What is the problem with using lottery scheduling in practice?

- A. Unpredictable short-term behavior due to randomness even though long-term fairness is achieved
- B. It requires specialized hardware random number generators
- C. It cannot handle more than ten processes simultaneously
- D. It always gives equal time to all processes regardless of priority

Answer: A

Q1000. How does the Energy Aware Scheduler (EAS) in Linux optimize for mobile devices?

- A. It uses CPU energy models to place tasks on the most energy-efficient core that meets performance needs
- B. It shuts down the CPU when battery is below 50%
- C. It reduces screen brightness to save power during computation
- D. It limits the number of processes to reduce energy consumption

Answer: A

Q1001. How does the Linux kernel implement threads differently from traditional UNIX thread implementations?

- A. Linux does not support threads at all
- B. Linux uses the clone() system call to create threads as tasks that share the address space, treating threads and processes uniformly
- C. Linux requires all threads to run in user mode only
- D. Linux threads cannot share file descriptors

Answer: B

Q1002. What is the N:M threading model's primary implementation challenge that led most OSes to abandon it?

- A. It uses too much disk space
- B. Coordinating user-level and kernel-level schedulers is complex and the performance benefits rarely justify the complexity
- C. It cannot support more than two threads
- D. It is incompatible with virtual memory

Answer: B

Q1003. What is thread affinity and why does it matter for performance?

- A. Thread affinity refers to how friendly threads are to each other
- B. It binds a thread to a specific CPU core to exploit warm caches and reduce cache migration overhead
- C. Thread affinity means threads must always run on different cores
- D. It is a security feature that isolates threads

Answer: B

Q1004. What problem does the NUMA-aware thread scheduling try to solve?

- A. Reducing the number of threads in the system
- B. Minimizing memory access latency by scheduling threads on cores close to the memory they access
- C. Preventing threads from accessing shared memory
- D. Converting kernel threads to user threads

Answer: B

Q1005. What is cooperative multithreading and what is its main drawback?

- A. Threads are scheduled by the kernel preemptively; the drawback is high overhead
- B. Threads voluntarily yield the CPU; a misbehaving thread can monopolize the CPU indefinitely
- C. Threads share all variables including the stack; the drawback is data corruption
- D. Only one thread can exist per process; the drawback is no parallelism

Answer: B

Q1006. How do green threads differ from native threads?

- A. Green threads use less electricity
- B. Green threads are scheduled by the runtime or virtual machine in user space, not by the OS kernel
- C. Green threads are always faster than native threads
- D. Green threads can only run on green computing hardware

Answer: B

Q1007. What is the purpose of thread-specific data (TSD) and how does it differ from regular global variables?

- A. TSD is stored on disk for persistence
- B. TSD provides each thread with its own copy of a variable, unlike global variables which are shared among all threads
- C. TSD makes variables immutable across all threads
- D. TSD encrypts thread data for security

Answer: B

Q1008. What are coroutines and how do they relate to threads?

- A. Coroutines are a type of hardware thread
- B. Coroutines are cooperatively scheduled lightweight execution units that can suspend and resume at specific points, often multiplexed over fewer OS threads
- C. Coroutines and threads are identical concepts
- D. Coroutines can only execute sequentially with no concurrency

Answer: B

Q1009. What is the thundering herd problem in the context of thread pools?

- A. Too many threads are created, exhausting memory
- B. Multiple threads are woken up to handle a single event, but only one can process it, wasting resources
- C. Threads run too slowly due to excessive synchronization
- D. All threads in the pool terminate simultaneously

Answer: B

Q1010. What is work stealing in the context of thread pool task scheduling?

- A. A malicious technique where threads steal CPU time
- B. An idle thread takes tasks from the queue of a busy thread to balance the workload dynamically
- C. A method to prevent threads from executing tasks
- D. A technique that forces all threads to execute the same task

Answer: B

Q1011. How does the priority ceiling protocol prevent both deadlock and priority inversion?

- A. By removing all locks from the system
- B. By assigning each lock a priority ceiling equal to the highest priority of any thread that may lock it, and only allowing a thread to acquire a lock if its priority is higher than the ceiling of all currently locked mutexes
- C. By running all threads at the same priority
- D. By disabling interrupts permanently

Answer: B

Q1012. What is sequence consistency (sequential consistency) in the context of concurrent memory operations?

- A. All memory operations execute in parallel without ordering
- B. The result of any execution is the same as if the operations of all processors were executed in some sequential order, preserving each processor's program order
- C. Memory is accessed only sequentially by one processor at a time
- D. It means data is stored in sorted sequence

Answer: B

Q1013. What is the difference between lock-free and wait-free algorithms?

- A. They are identical concepts
- B. Lock-free guarantees system-wide progress (at least one thread progresses); wait-free guarantees per-thread progress (every thread completes in bounded steps)
- C. Wait-free algorithms use more locks than lock-free algorithms
- D. Lock-free means no synchronization is needed

Answer: B

Q1014. How does Read-Copy-Update (RCU) allow readers to access shared data without acquiring locks?

- A. By encrypting the data so readers can safely access it
- B. Readers access the current version without locks; writers create a new copy, update it, and atomically switch the pointer, deferring reclamation of old data until all readers finish
- C. Readers must always copy the data before reading
- D. RCU prevents any concurrent writes

Answer: B

Q1015. What is the ABA problem and how is it typically solved?

- A. It is a problem with alphabetical sorting in concurrent programs
- B. A thread reads value A, another thread changes it to B then back to A; the first thread's compare-and-swap succeeds incorrectly; solved using version counters or hazard pointers
- C. It occurs when three threads simultaneously access the same variable
- D. It is a deadlock pattern involving three resources

Answer: B

Q1016. What is a memory barrier (fence) and why is it necessary on modern processors?

- A. A physical barrier in RAM chips that prevents electrical interference
- B. An instruction that enforces ordering constraints on memory operations, preventing the CPU and compiler from reordering reads and writes across the barrier
- C. A software firewall for memory protection
- D. A method to increase memory bandwidth

Answer: B

Q1017. How does transactional memory simplify concurrent programming compared to lock-based approaches?

- A. It eliminates the need for any concurrency control
- B. Programmers designate code regions as transactions that execute atomically; conflicts are detected automatically, eliminating manual lock management and reducing deadlock risk
- C. It makes all memory accesses sequential
- D. It converts concurrent programs into single-threaded programs

Answer: B

Q1018. In the context of Linux kernel synchronization, what are per-CPU variables and why are they efficient?

- A. Variables that count the number of CPUs in the system
- B. Each CPU has its own copy of the variable, eliminating the need for locking since no sharing occurs between CPUs
- C. Variables that are shared equally among all CPUs
- D. Variables that store CPU temperature readings

Answer: B

Q1019. What is the difference between optimistic and pessimistic concurrency control?

- A. Optimistic control is always faster
- B. Pessimistic control acquires locks before accessing data; optimistic control proceeds without locks and validates at commit time, aborting on conflict
- C. They produce different results for the same operations
- D. Optimistic control does not support concurrent access

Answer: B

Q1020. What is the sleeping barber problem and what synchronization challenge does it illustrate?

- A. A problem about scheduling CPU sleep states
- B. A barber sleeps when no customers are present and customers must wake the barber or wait; it illustrates coordination between producers and consumers with a bounded waiting area
- C. A deadlock scenario involving three barber threads
- D. A memory management problem involving page sleeping

Answer: B

Q1021. What is the wait-die scheme for deadlock prevention in database systems?

- A. Processes wait indefinitely until resources become available
- B. An older process waits for a younger one to release a resource, but a younger process requesting a resource held by an older one is aborted (dies)
- C. All processes die when a deadlock is detected
- D. Processes are assigned random wait times

Answer: B

Q1022. How does the edge-chasing algorithm detect deadlocks in distributed systems?

- A. By checking all resource allocation graphs simultaneously
- B. Probe messages are forwarded along edges of the distributed wait-for graph; if a probe returns to its initiator, a cycle (deadlock) exists
- C. By centralizing all resource information on one node
- D. By terminating all processes on all nodes periodically

Answer: B

Q1023. What is a phantom deadlock in distributed deadlock detection?

- A. A deadlock that occurs in virtual machines only
- B. A falsely detected deadlock caused by delays in propagating status information across nodes in a distributed system
- C. A deadlock involving phantom processes that do not exist
- D. A deadlock that occurs during system startup

Answer: B

Q1024. What is the relationship between deadlock and livelock in resource contention?

- A. Livelock is a more severe form of deadlock
- B. In deadlock, processes are blocked and make no progress; in livelock, processes continuously change state in response to each other but still make no progress
- C. Livelock is identical to deadlock
- D. Livelock occurs only with non-preemptive scheduling

Answer: B

Q1025. How does lock ordering (hierarchical locking) prevent deadlock in practice?

- A. By requiring all locks to be held for the same duration
- B. By defining a global order on all locks and requiring every thread to acquire locks only in that order, preventing cycles in the wait-for graph
- C. By limiting the number of locks in the system to one
- D. By making all locks recursive

Answer: B

Q1026. What is the knot in a resource allocation graph?

- A. A cycle involving exactly two processes
- B. A set of nodes such that every node in the set has a path to every other node in the set with no outgoing edges leaving the set
- C. A single node with no edges
- D. An edge that connects a resource to itself

Answer: B

Q1027. What is two-phase locking and how does it relate to deadlock in database systems?

- A. It prevents deadlock by ensuring locks are acquired in two distinct phases
- B. In the growing phase all needed locks are acquired and in the shrinking phase locks are released; it ensures serializability but does not prevent deadlock
- C. It acquires and releases each lock twice for safety
- D. It uses two separate lock managers to prevent deadlock

Answer: B

Q1028. How does the Linux kernel detect potential deadlocks using lockdep?

- A. By running the Banker's Algorithm at each lock acquisition
- B. By tracking lock acquisition order at runtime and checking for potential cycles in the lock dependency graph, even if the actual deadlock hasn't occurred
- C. By limiting the number of locks to 10
- D. By preventing any two threads from running simultaneously

Answer: B

Q1029. What is the convoy effect in the context of resource scheduling, and how does it relate to deadlock-like behavior?

- A. A high-speed scheduling algorithm
- B. Many processes queue behind a slow process holding a resource, causing a chain of delays similar to but distinct from deadlock
- C. All processes execute in parallel without any delays
- D. Processes are permanently blocked and never execute

Answer: B

Q1030. What is the difference between centralized and distributed deadlock detection, and what are the trade-offs?

- A. They are identical approaches applied to different operating systems
- B. Centralized detection maintains a global wait-for graph at one coordinator (simpler but single point of failure); distributed detection uses local algorithms with message passing (more resilient but may detect phantom deadlocks)
- C. Centralized detection is always faster and more accurate
- D. Distributed detection eliminates all false positives

Answer: B

Q1031. How does the clock (second-chance) algorithm approximate LRU replacement?

- A. It uses a hardware timer to track page usage
- B. Pages are arranged in a circular list with a reference bit; the algorithm scans for a page with reference bit 0, clearing bits as it goes, giving referenced pages a second chance
- C. It randomly selects a page for replacement
- D. It replaces the page closest to the clock's 12 o'clock position

Answer: B

Q1032. What is copy-on-write (COW) optimization in fork() and how does it work?

- A. It copies all pages immediately when fork() is called
- B. Parent and child initially share the same physical pages marked read-only; a page is copied only when either process writes to it, reducing unnecessary copying
- C. It prevents child processes from writing to any memory
- D. It copies memory from disk to RAM on write operations

Answer: B

Q1033. What is Address Space Layout Randomization (ASLR) and how does it improve security?

- A. It sorts addresses in alphabetical order
- B. It randomizes the memory layout of a process (stack, heap, libraries) at each execution, making buffer overflow exploits harder by unpredictable addresses
- C. It adds encryption to all memory addresses
- D. It assigns the same layout to all processes for consistency

Answer: B

Q1034. How does the buddy system allocator handle memory fragmentation?

- A. It eliminates fragmentation completely
- B. It splits memory blocks into power-of-two sized buddies and merges adjacent free buddies back together, reducing external fragmentation but causing internal fragmentation
- C. It uses a linked list of arbitrary block sizes
- D. It allocates memory in a single contiguous block

Answer: B

Q1035. What is the slab allocator and why is it efficient for kernel memory allocation?

- A. A disk allocation algorithm for solid-state drives
- B. It pre-allocates caches of objects of specific sizes from contiguous memory slabs, eliminating fragmentation and initialization overhead for frequently allocated kernel objects
- C. A memory compaction technique for user programs
- D. A page replacement algorithm for virtual memory

Answer: B

Q1036. What is page coloring and how does it improve cache performance?

- A. It assigns colors to pages for visual debugging
- B. It assigns physical frames to virtual pages such that pages mapping to the same cache set are distributed across frames, reducing cache conflicts
- C. It marks pages as read-only using color codes
- D. It groups pages by their access frequency

Answer: B

Q1037. How do huge pages (large pages) improve TLB performance?

- A. They reduce the size of each page
- B. Fewer TLB entries cover the same amount of memory, reducing TLB misses for applications with large memory footprints
- C. They increase the number of TLB entries available
- D. They bypass the TLB entirely

Answer: B

Q1038. What is memory-mapped file I/O and what advantage does it offer?

- A. A technique that stores files in CPU registers
- B. It maps a file's contents into a process's virtual address space, allowing file access through memory operations instead of read/write system calls, reducing system call overhead
- C. It encrypts files during I/O operations
- D. It stores all file metadata in physical memory

Answer: B

Q1039. What is the page-fault frequency (PFF) approach to thrashing prevention?

- A. It sets a minimum page fault rate for each process
- B. It monitors each process's page fault rate; if too high, more frames are allocated; if too low, frames are reclaimed, dynamically adjusting allocation
- C. It prevents all page faults by loading every page into memory
- D. It increases the swap space size when faults are frequent

Answer: B

Q1040. What is Kernel Same-page Merging (KSM) and where is it most beneficial?

- A. A technique to merge kernel code pages with user code pages
- B. It scans memory for identical pages across processes and merges them into a single shared copy (with COW), most beneficial in virtualization where VMs run similar OSes
- C. A method to compress kernel memory pages
- D. A page replacement algorithm for kernel pages

Answer: B

Q1041. How does the log-structured file system (LFS) approach differ from traditional file systems?

- A. LFS stores all files in a single log file
- B. LFS writes all changes (data and metadata) sequentially to a log, converting random writes to sequential writes for better write performance, using a cleaner for garbage collection
- C. LFS reads files from the end to the beginning
- D. LFS does not support directories

Answer: B

Q1042. How does ZFS ensure end-to-end data integrity?

- A. By using parity bits only
- B. By storing checksums in parent blocks (not with the data block itself), detecting silent data corruption, bit rot, and phantom writes
- C. By encrypting all data with AES
- D. By writing data twice to the same location

Answer: B

Q1043. What is FUSE and why is it significant for file system development?

- A. A hardware component for fast USB storage
- B. A framework that allows implementing file systems in user space without modifying the kernel, simplifying development and enabling novel file systems
- C. A file compression algorithm
- D. A network protocol for distributed file systems

Answer: B

Q1044. How do extents improve upon traditional block pointers in file systems like ext4?

- A. Extents store data in smaller units for precision
- B. An extent describes a contiguous range of blocks with a single start-block and length, dramatically reducing metadata overhead for large files
- C. Extents eliminate the need for inodes
- D. Extents only work with SSDs

Answer: B

Q1045. What is a copy-on-write file system and what advantages does it offer?

- A. A file system that copies files on every read operation
- B. Instead of overwriting data in place, new data is written to a new location and metadata is updated atomically, enabling snapshots, preventing partial writes, and maintaining consistency
- C. A file system that prevents all write operations
- D. A file system that duplicates the entire disk on each write

Answer: B

Q1046. How does the B+ tree structure benefit NTFS and other modern file systems?

- A. B+ trees are slower but use less memory
- B. B+ trees provide $O(\log n)$ lookup, insertion, and deletion for directory entries and file extents, with all data in leaf nodes for efficient range queries
- C. B+ trees only store file names, not their locations
- D. B+ trees are only used for binary files

Answer: B

Q1047. What is the TRIM command and why is it essential for SSD-backed file systems?

- A. It compresses files to save SSD space
- B. It informs the SSD which blocks are no longer in use, allowing the SSD's FTL to erase and reclaim those blocks proactively for better write performance
- C. It trims file names to save directory space
- D. It limits the number of files per directory

Answer: B

Q1048. What is deduplication in enterprise file systems and what are its trade-offs?

- A. It duplicates data for redundancy
- B. It identifies and eliminates duplicate data blocks, storing only unique blocks with references, saving storage but adding CPU and memory overhead for hash computation
- C. It removes all files older than 30 days
- D. It deletes duplicate file names only

Answer: B

Q1049. How does the Network File System (NFS) handle stateless server design and what are the implications?

- A. NFS requires the server to maintain all client state
- B. The NFS server does not track which clients have opened files; each request is self-contained, simplifying crash recovery but requiring idempotent operations
- C. NFS does not support any crash recovery
- D. NFS stores all state on the client side only

Answer: B

Q1050. What is the purpose of file system snapshots and how are they efficiently implemented in COW file systems?

- A. Snapshots are photographs of the server hardware
- B. Snapshots capture the file system state at a point in time; in COW file systems, they are nearly instant because only the root metadata block is copied, sharing unchanged blocks with the live file system
- C. Snapshots require copying the entire disk
- D. Snapshots delete all files created after a specific date

Answer: B

Q1051. What is write amplification in SSDs and why is it a problem?

- A. Writing louder signals to flash cells for reliability
- B. The actual amount of data written to flash exceeds the logical data written by the host due to garbage collection and wear leveling, reducing SSD lifespan and performance
- C. Writing data to multiple SSDs simultaneously
- D. Increasing the write speed beyond the SSD's rated capacity

Answer: B

Q1052. What is the Flash Translation Layer (FTL) in SSDs?

- A. A physical layer of insulation in the SSD
- B. Firmware that maps logical block addresses to physical flash locations, managing wear leveling, garbage collection, and bad block handling
- C. A network protocol for flash storage
- D. A file system designed specifically for flash memory

Answer: B

Q1053. How does NVMe improve upon the AHCI interface for SSDs?

- A. NVMe uses serial communication while AHCI uses parallel
- B. NVMe supports up to 65,535 I/O queues with 65,536 entries each and uses direct PCIe connection, dramatically reducing latency and increasing throughput compared to AHCI's single queue of 32 entries
- C. NVMe is designed for hard disk drives only
- D. AHCI is faster than NVMe for random access

Answer: B

Q1054. What is shingled magnetic recording (SMR) in HDDs?

- A. A technique using shingle-shaped disk platters
- B. Overlapping write tracks like roof shingles to increase data density, but requiring sequential writes within zones since writing a track partially overwrites adjacent tracks
- C. A method of reading data from multiple tracks simultaneously
- D. A technique to reduce disk noise

Answer: B

Q1055. What is NCQ (Native Command Queuing) in SATA drives?

- A. A method to queue network commands for remote drives
- B. A feature allowing the drive to internally reorder queued I/O commands to minimize seek and rotational delays, improving throughput
- C. A technique that queues commands in the OS driver only
- D. A command that queries the native format of the disk

Answer: B

Q1056. How does RAID 6 improve fault tolerance over RAID 5?

- A. RAID 6 uses triple mirroring
- B. RAID 6 uses two independent parity calculations (P and Q), tolerating two simultaneous disk failures instead of one
- C. RAID 6 has no parity overhead
- D. RAID 6 stripes data without any redundancy

Answer: B

Q1057. What is the NOOP (No Operation) I/O scheduler and when is it appropriate?

- A. It performs no I/O operations at all
- B. It implements a simple FIFO queue with request merging only, appropriate for SSDs and virtualized environments where the device or hypervisor handles scheduling
- C. It is a disk scheduling algorithm for maximum throughput on HDDs
- D. It disables the disk entirely

Answer: B

Q1058. What are Zoned Namespaces (ZNS) in NVMe SSDs and how do they differ from conventional SSDs?

- A. ZNS SSDs have different geographic zones for data storage
- B. ZNS exposes the SSD's internal zone structure to the host, requiring sequential writes within zones but eliminating the need for the FTL's garbage collection, reducing write amplification
- C. ZNS is a security zoning feature for data isolation
- D. ZNS SSDs have larger physical size than conventional SSDs

Answer: B

Q1059. What is the Advanced Format (4K sector) standard and why was it adopted?

- A. A format that stores data in 4KB RAM pages
- B. It increased the physical sector size from 512 bytes to 4096 bytes, improving error correction efficiency, format efficiency, and storage density on modern drives
- C. A new formatting standard that only applies to SSDs
- D. A technique that formats disks four times faster

Answer: B

Q1060. What is scatter-gather DMA and how does it improve I/O performance?

- A. It scatters data across multiple disks randomly
- B. It allows DMA to transfer data between non-contiguous memory regions and a device in a single operation using a list of memory descriptors, avoiding extra copy operations
- C. It gathers interrupts from multiple devices into one
- D. It distributes I/O requests across multiple CPUs

Answer: B

Q1061. How does Linux epoll improve over select() and poll() for I/O multiplexing?

- A. epoll uses more memory than select()
- B. epoll uses an event-driven model that only reports changes, avoids scanning all file descriptors, and scales O(1) with the number of monitored descriptors
- C. epoll works only with network sockets
- D. select() is always faster than epoll

Answer: B

Q1062. What is the IOMMU and how does it enhance I/O security and functionality?

- A. A memory unit for storing I/O device firmware
- B. Hardware that translates I/O device virtual addresses to physical addresses, preventing devices from accessing unauthorized memory regions and enabling DMA for virtualized guests
- C. A specialized I/O processor that replaces the CPU
- D. A memory management unit within the I/O device itself

Answer: B

Q1063. What is the difference between edge-triggered and level-triggered interrupt notifications?

- A. Edge-triggered uses higher voltage levels
- B. Edge-triggered fires on the transition (change) of the signal; level-triggered fires as long as the signal is asserted, requiring different handling strategies to avoid missed or spurious interrupts
- C. Level-triggered is always more efficient
- D. Edge-triggered is only used for software interrupts

Answer: B

Q1064. What is io_uring in modern Linux and why is it significant?

- A. A circular buffer for storing I/O errors
- B. An asynchronous I/O interface using shared ring buffers between user space and kernel, minimizing system call overhead and enabling high-performance I/O without context switches
- C. A debugging tool for I/O operations
- D. A type of network ring topology

Answer: B

Q1065. What is zero-copy I/O and how does sendfile() implement it?

- A. I/O where no data is actually transferred
- B. Data is transferred from disk to network socket directly through kernel buffers without being copied to user space, reducing CPU usage and memory bandwidth consumption
- C. A technique that compresses data to zero bytes during transfer
- D. I/O that creates zero backup copies

Answer: B

Q1066. What is interrupt coalescing and why is it used in high-speed network adapters?

- A. Combining multiple interrupt controllers into one
- B. Delaying and batching multiple interrupts into fewer interrupt notifications to reduce per-packet interrupt overhead at high data rates
- C. Converting interrupts into polling operations
- D. Encrypting interrupt signals for security

Answer: B

Q1067. What is RDMA (Remote Direct Memory Access) and how does it bypass the traditional I/O stack?

- A. A technique to access RAM on a remote machine through SSH
- B. It allows one computer to directly read from or write to another computer's memory without involving either CPU or OS, bypassing the kernel network stack entirely
- C. A remote debugging protocol for memory analysis
- D. A technique to access disk drives over the network

Answer: B

Q1068. What is the SPDK (Storage Performance Development Kit) approach to storage I/O?

- A. A kernel module for legacy storage devices
- B. It moves storage drivers into user space, uses polled mode instead of interrupts, and provides lockless designs to eliminate kernel overhead and achieve near-hardware-level NVMe performance
- C. A standard development kit for building storage hardware
- D. A graphical tool for monitoring storage performance

Answer: B

Q1069. How does virtio enable efficient I/O for virtual machines?

- A. By providing dedicated physical hardware to each VM
- B. It defines a standardized interface between VMs and the hypervisor using shared memory ring buffers (virtqueues), avoiding the overhead of emulating real hardware devices
- C. By running all VMs on the same physical I/O device
- D. By disabling I/O for virtual machines entirely

Answer: B

Q1070. How does return-oriented programming (ROP) bypass Data Execution Prevention (DEP/NX)?

- A. By disabling the CPU's NX bit
- B. By chaining together existing code sequences (gadgets) ending in return instructions from legitimate libraries, executing arbitrary computations without injecting new code
- C. By encrypting the malicious code so DEP cannot detect it
- D. By running code in kernel mode where DEP does not apply

Answer: B

Q1071. What is the Bell-LaPadula security model and what property does it enforce?

- A. A model that allows all users to read and write all data
- B. A mandatory access control model enforcing 'no read up, no write down' to prevent information flow from higher to lower security levels
- C. A model based on role-based access control
- D. A model that enforces data integrity but not confidentiality

Answer: B

Q1072. How does SELinux implement mandatory access control differently from traditional Unix permissions?

- A. SELinux replaces all file permissions with encryption
- B. SELinux assigns security labels to all subjects and objects and enforces policy rules for every access decision, regardless of traditional DAC permissions
- C. SELinux only adds network security controls
- D. SELinux uses the same permission model as standard Unix

Answer: B

Q1073. What is the confused deputy problem in computer security?

- A. When a system administrator is confused about access policies
- B. When a privileged program is tricked by a less-privileged entity into misusing its authority to perform unauthorized actions on the attacker's behalf
- C. When two processes have the same security level and confuse each other
- D. When encryption keys are mixed up between users

Answer: B

Q1074. What is control flow integrity (CFI) and how does it protect against code-reuse attacks?

- A. It controls the flow of network traffic
- B. It restricts the program's control flow transfers to only those targets determined at compile time, preventing ROP and JOP attacks from diverting execution
- C. It encrypts the program's control flow graph
- D. It monitors data flow but not control flow

Answer: B

Q1075. What is the Trusted Platform Module (TPM) and what security functions does it provide?

- A. A software-only security module for web browsers
- B. A dedicated hardware chip that provides secure key generation, storage, platform integrity measurement, and remote attestation capabilities
- C. A removable storage device for encrypted backups
- D. A network firewall appliance

Answer: B

Q1076. How does Memory Tagging Extension (MTE) help prevent memory safety vulnerabilities?

- A. It adds labels to memory for human readability
- B. It associates a 4-bit tag with each memory granule and each pointer; access is only permitted when the pointer's tag matches the memory's tag, detecting use-after-free and buffer overflows
- C. It encrypts all memory with unique tags
- D. It compresses memory to prevent overflow

Answer: B

Q1077. What is a zero-day vulnerability and why is it particularly dangerous?

- A. A vulnerability that takes zero days to fix
- B. A previously unknown vulnerability being exploited before the vendor has released a patch, leaving all systems defenseless
- C. A vulnerability that only exists for one day
- D. A vulnerability in programs that are zero days old

Answer: B

Q1078. What is attestation in the context of trusted computing?

- A. A user testifying in court about a security breach
- B. A process by which a system cryptographically proves its hardware and software configuration to a remote verifier, establishing trust in its integrity
- C. A method of authenticating users via attestation letters
- D. A technique for attesting to the speed of encryption

Answer: B

Q1079. How does the Biba integrity model differ from the Bell-LaPadula model?

- A. The Biba model is a more recent version of Bell-LaPadula
- B. Bell-LaPadula focuses on confidentiality (no read up, no write down); Biba focuses on integrity (no read down, no write up), preventing corruption of higher-integrity data
- C. Biba and Bell-LaPadula are identical models
- D. Biba allows unrestricted reading and writing

Answer: B

Q1080. What is over-provisioning in SSDs and why is it necessary?

- A. Providing more SSDs than needed as backups
- B. Reserving a percentage of flash capacity as spare blocks for garbage collection, wear leveling, and bad block replacement, improving sustained write performance and endurance
- C. Writing more data than the SSD can hold
- D. Providing extra power supply to the SSD

Answer: B

SUBJECT

Problem Solving & Analytical Skills

1,440 Multiple Choice Questions

Problem Solving & Analytical Skills — Easy

480 questions

Q1. What is the first step in problem solving?

- A. Testing the solution for correctness
- B. Understanding the problem thoroughly
- C. Deploying the application to production
- D. Writing code to implement a solution

Answer: B

Q2. Which best describes problem solving in CS?

- A. Memorizing algorithms from a textbook
- B. A systematic approach to finding solutions
- C. Copying solutions from existing projects
- D. Writing programs without any planning

Answer: B

Q3. What does decomposition mean in problem solving?

- A. Making a problem increasingly more complex
- B. Ignoring certain parts of the problem
- C. Combining multiple problems into one task
- D. Breaking a problem into smaller sub-problems

Answer: D

Q4. Which skill is most essential for a problem solver?

- A. Graphic design expertise
- B. Data entry proficiency
- C. Analytical thinking skills
- D. Speed typing on a keyboard

Answer: C

Q5. What is an algorithm?

- A. A database management system design
- B. A step-by-step procedure to solve a problem
- C. A specific programming language syntax
- D. A type of computer hardware component

Answer: B

Q6. Which is NOT a phase of problem solving?

- A. Devising a plan for the solution
- B. Procrastinating and delaying action
- C. Looking back and evaluating results
- D. Understanding the problem clearly

Answer: B

Q7. What is the purpose of brainstorming?

- A. To eliminate all ideas immediately
- B. To finalize the code right away
- C. To test the program for errors
- D. To generate multiple possible solutions

Answer: D

Q8. Who introduced the four-step problem solving process?

- A. George Polya
- B. Alan Turing
- C. Donald Knuth
- D. Ada Lovelace

Answer: A

Q9. What is a heuristic?

- A. A specific programming language tool
- B. A guaranteed optimal solution method
- C. A type of programming syntax error
- D. A practical approach that is sufficient

Answer: D

Q10. Which approach solves a simpler version first?

- A. Randomization approach
- B. Elimination technique
- C. Brute force method
- D. Simplification strategy

Answer: D

Q11. What should you first identify when analyzing a problem?

- A. The user interface color scheme
- B. The input and expected output
- C. The programming language to use
- D. The database engine to deploy

Answer: B

Q12. What is a problem statement?

- A. A set of test cases for validation
- B. The code implementation of the fix
- C. A clear description of what to solve
- D. The final solution to the problem

Answer: C

Q13. Which helps understand a problem better?

- A. Identifying examples and edge cases
- B. Skipping requirements gathering
- C. Ignoring constraints on the system
- D. Immediately coding a solution

Answer: A

Q14. What are requirements?

- A. Conditions the solution must satisfy
- B. Bugs found during the testing phase
- C. Test results from the final review
- D. Optional features to consider later

Answer: A

Q15. What is an edge case?

- A. Unusual input testing boundary limits
- B. The most common input scenario
- C. A syntax error in the source code
- D. A design pattern used in systems

Answer: A

Q16. Why identify constraints?

- A. They serve only as documentation notes
- B. Constraints are completely irrelevant
- C. They define limits the solution must meet
- D. They make the problem harder on purpose

Answer: C

Q17. What does scope mean?

- A. The boundaries of what the problem covers
- B. The programming language being used
- C. The speed of the algorithm execution
- D. The database size for the project

Answer: A

Q18. Most useful analysis question?

- A. What color theme should we apply
- B. What font should the UI display
- C. What are inputs and expected output
- D. How many lines of code are needed

Answer: C

Q19. What is a test case?

- A. A programming paradigm to follow
- B. A particular variable type definition
- C. A debugging tool in the compiler
- D. Scenario with specific input and output

Answer: D

Q20. What are functional requirements?

- A. Appearance and visual requirements
- B. Hardware specifications for the project
- C. Network requirements for deployment
- D. What the system should actually do

Answer: D

Q21. A=true, B=true. A AND B?

- A. True
- B. False
- C. Null
- D. Undefined

Answer: A

Q22. NOT True?

- A. Error
- B. True
- C. False
- D. Null

Answer: C

Q23. A=true, B=false. A OR B?

- A. True
- B. Neither
- C. Undefined
- D. False

Answer: A

Q24. General to specific reasoning?

- A. Abductive
- B. Inductive
- C. Analogical
- D. Deductive

Answer: D

Q25. Specific to general reasoning?

- A. Deductive
- B. Abductive
- C. Inductive
- D. Circular

Answer: C

Q26. Truth table with 2 variables has how many rows?

- A. 16
- B. 4
- C. 2
- D. 8

Answer: B

Q27. What is a logical fallacy?

- A. A correct logical argument
- B. An error making argument invalid
- C. A type of search algorithm
- D. A specific data structure

Answer: B

Q28. All cats are animals. Tom is a cat. Therefore?

- A. Tom is actually a dog
- B. Nothing can be concluded
- C. Tom is not an animal
- D. Tom is an animal too

Answer: D

Q29. What does XOR return?

- A. Always returns true as output
- B. True when exactly one is true
- C. Always returns false as output
- D. True when both inputs are true

Answer: B

Q30. What is a premise?

- A. A conclusion drawn from evidence
- B. A statement assumed true for reasoning
- C. A question posed to the audience
- D. An error found in the argument

Answer: B

Q31. What is a flowchart for?

- A. Creating user interface layouts
- B. Designing database table schemas
- C. Visually representing algorithm steps
- D. Writing executable source code

Answer: C

Q32. Which symbol is a decision?

- A. Diamond
- B. Parallelogram
- C. Rectangle
- D. Oval

Answer: A

Q33. Which symbol is a process?

- A. Arrow
- B. Oval
- C. Diamond
- D. Rectangle

Answer: D

Q34. What does an oval represent?

- A. Process
- B. Decision
- C. Start or End
- D. Input/Output

Answer: C

Q35. What is pseudocode?

- A. A specific programming language
- B. Informal high-level algorithm description
- C. Machine-readable binary code
- D. Directly executable source code

Answer: B

Q36. Three basic control structures?

- A. Start, Process, End
- B. Create, Read, Delete
- C. Sequence, Selection, Iteration
- D. Input, Output, Storage

Answer: C

Q37. What is sequence?

- A. Skipping steps entirely
- B. Repeating a set of steps
- C. Steps in random order
- D. Steps one after another in order

Answer: D

Q38. What does selection do?

- A. Skips all code entirely
- B. Executes all paths at once
- C. Chooses paths based on condition
- D. Repeats code multiple times

Answer: C

Q39. What does iteration do?

- A. Stops the program entirely
- B. Deletes all variable values
- C. Executes code only once
- D. Repeats while condition is true

Answer: D

Q40. Which symbol is input/output?

- A. Circle
- B. Parallelogram
- C. Rectangle
- D. Diamond

Answer: B

Q41. Binary of decimal 5?

- A. 110
- B. 111
- C. 101
- D. 100

Answer: C

Q42. What is abstraction in data?

- A. Making things increasingly complex
- B. Showing all implementation details
- C. Deleting all the stored data
- D. Hiding unnecessary, showing essential

Answer: D

Q43. Bits in a byte?

- A. 4
- B. 16
- C. 32
- D. 8

Answer: D

Q44. Data type for name?

- A. String
- B. Boolean
- C. Float
- D. Integer

Answer: A

Q45. What is an array?

- A. A specific type of loop construct
- B. A callable function definition
- C. A single variable only
- D. Same-type elements in contiguous memory

Answer: D

Q46. What does ASCII stand for?

- A. Automated Standard Code for Input Interfacing
- B. American Standard Code for Information Interchange
- C. American System for Computer Information Indexing
- D. Advanced System Code for Internet Integration

Answer: B

Q47. Decimal of binary 1010?

- A. 12
- B. 10
- C. 8
- D. 14

Answer: B

Q48. Which uses key-value pairs?

- A. Dictionary/Map
- B. Array structure
- C. Queue structure
- D. Stack structure

Answer: A

Q49. What is Boolean?

- A. String text type
- B. Decimal number type
- C. Only true or false
- D. Float number type

Answer: C

Q50. What is hexadecimal?

- A. Base-8 system
- B. Base-2 system
- C. Base-10 system
- D. Base-16 system

Answer: D

Q51. What is pattern recognition?

- A. Drawing visual pattern designs
- B. Copying solutions from others
- C. Identifying similarities and trends
- D. Guessing the answer randomly

Answer: C

Q52. Next in 2,4,6,8,?

- A. 9
- B. 10
- C. 12
- D. 14

Answer: B

Q53. Next in 1,2,4,8,?

- A. 16
- B. 32
- C. 12
- D. 10

Answer: A

Q54. What is generalization?

- A. Ignoring all recognized patterns
- B. Applying pattern to broader problems
- C. Making things more specific only
- D. Focusing on one instance alone

Answer: B

Q55. All sorting uses comparison identifies?

- A. A bug in the code
- B. A syntax error in logic
- C. A specific data type issue
- D. A common shared pattern

Answer: D

Q56. What is an analogy?

- A. A programming concept for loops
- B. Similarities between problems found
- C. A random guess at the answer
- D. An error type in the program

Answer: B

Q57. Next letter: A,C,E,G,?

- A. K
- B. J
- C. H
- D. I

Answer: D

Q58. What is Fibonacci?

- A. A random sequence with no pattern
- B. The sequence of even numbers 2,4,6,8
- C. Each equals sum of two preceding values
- D. The sequence of odd numbers 1,3,5,7

Answer: C

Q59. Which demonstrates pattern recognition?

- A. Ignoring existing working solutions
- B. Never reusing any solution pattern
- C. Noticing all searches scan collections
- D. Coding randomly without a plan

Answer: C

Q60. Why pattern recognition useful?

- A. It always produces longer code
- B. Identifies reusable solutions quickly
- C. It is not useful at all in CS
- D. It always introduces more bugs

Answer: B

Q61. 2^{10} ?

- A. 1024
- B. 2048
- C. 256
- D. 512

Answer: A

Q62. $5!$?

- A. 25
- B. 720
- C. 60
- D. 120

Answer: D

Q63. $17 \% 5$?

- A. 3
- B. 5
- C. 4
- D. 2

Answer: D

Q64. $\log_2(8)$?

- A. 4
- B. 8
- C. 3
- D. 2

Answer: C

Q65. Sum of first 10 naturals?

- A. 50
- B. 55
- C. 45
- D. 100

Answer: B

Q66. $C(n,2)$ represents?

- A. The product n times 2
- B. Ways to choose 2 from n
- C. The quotient n divided by 2
- D. The sum of n plus 2

Answer: B

Q67. $GCD(12,8)$?

- A. 6
- B. 2
- C. 4
- D. 8

Answer: C

Q68. $O(n)$, n from 10 to 100 scales?

- A. Stays the same
- B. About 100x slower
- C. About 10x slower
- D. About 2x slower

Answer: C

Q69. What is a prime?

- A. Any odd number in the range
- B. Divisible by any number at all
- C. Only 1 and itself as divisors
- D. Any even number in the range

Answer: C

Q70. $LCM(4,6)$?

- A. 2
- B. 10
- C. 24
- D. 12

Answer: D

Q71. What is algorithmic thinking?

- A. Memorizing algorithms from textbooks
- B. Avoiding any structured approach
- C. Defining clear steps to solve problems
- D. Thinking about hardware components

Answer: C

Q72. Simplest search?

- A. Hash lookup
- B. Jump search
- C. Linear search
- D. Binary search

Answer: C

Q73. Binary search requires?

- A. Only integer type values
- B. An odd length data array
- C. A sorted list of elements
- D. An empty list as input

Answer: C

Q74. Bubble sort idea?

- A. Insert each into a sorted tree
- B. Select the minimum each time
- C. Swap adjacent wrong-order elements
- D. Divide the array in half first

Answer: C

Q75. What is sorting?

- A. Copying data to a new place
- B. Deleting unwanted elements
- C. Searching for an element
- D. Arranging in a specific order

Answer: D

Q76. Linear search worst case?

- A. $O(n)$
- B. $O(1)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: A

Q77. What is greedy?

- A. Best choice at each step locally
- B. Always using recursive functions
- C. Using lots of memory resources
- D. Running very slowly on purpose

Answer: A

Q78. What is recursive algorithm?

- A. Calls itself with smaller instances
- B. An algorithm without any loops
- C. An algorithm that runs only once
- D. An algorithm that never repeats

Answer: A

Q79. BFS uses?

- A. Array structure
- B. Stack structure
- C. Hash table
- D. Queue structure

Answer: D

Q80. DFS uses?

- A. Heap structure
- B. Hash table lookup
- C. Queue structure
- D. Stack or recursion

Answer: D

Q81. What is critical thinking?

- A. Criticizing everything you see
- B. Objective analysis to form judgments
- C. Accepting all ideas without thought
- D. Ignoring evidence and data given

Answer: B

Q82. Why important in development?

- A. It is not important at all
- B. Only managers need this skill
- C. It slows everything down overall
- D. Evaluates solutions, identifies flaws

Answer: D

Q83. What is bias?

- A. A type of search algorithm
- B. A programming language name
- C. A systematic thinking error
- D. A specific data structure

Answer: C

Q84. Evidence-based decisions?

- A. Decisions made at random
- B. Blindly following authority
- C. Decisions from verified facts
- D. Decisions based on feelings

Answer: C

Q85. What is confirmation bias?

- A. Considering all viewpoints equally
- B. Seeking confirming evidence only
- C. Being fully objective about data
- D. Testing all hypotheses fairly

Answer: B

Q86. Role of questioning?

- A. It is entirely unnecessary
- B. It slows down the process
- C. It shows ignorance in the team
- D. Challenges assumptions, deepens understanding

Answer: D

Q87. What is a trade-off?

- A. Avoiding all decisions entirely
- B. Having no options to choose from
- C. Getting everything for free
- D. Sacrificing one quality for another

Answer: D

Q88. What is objectivity?

- A. Following the popular opinion only
- B. Evaluating without personal bias
- C. Relying on personal feelings only
- D. Ignoring all facts and evidence

Answer: B

Q89. What is an assumption?

- A. A proven and verified fact
- B. A specific test case to run
- C. An algorithm to implement now
- D. Taken for granted without proof

Answer: D

Q90. Evaluating alternatives?

- A. Choose one completely at random
- B. Always pick the first option
- C. Compare against criteria to select
- D. Ignore all the available options

Answer: C

Q91. What is debugging?

- A. Finding and fixing code errors
- B. Deleting all program files now
- C. Writing new source code files
- D. Compiling the program to binary

Answer: A

Q92. What is syntax error?

- A. A runtime exception in program
- B. A logic mistake in the code
- C. A violation of grammar rules
- D. A design flaw in architecture

Answer: C

Q93. What is runtime error?

- A. Error during code writing phase
- B. Error during code compilation
- C. Error during program execution
- D. Error in the syntax of code

Answer: C

Q94. What is logical error?

- A. A syntax mistake in the code
- B. A missing semicolon in the code
- C. An error during code compilation
- D. Runs fine but gives wrong results

Answer: D

Q95. What is a breakpoint?

- A. A syntax rule for statements
- B. A type of error in the code
- C. Execution pauses for inspection
- D. A point where code is broken

Answer: C

Q96. First debugging step?

- A. Reproduce the error consistently
- B. Rewrite all the code from scratch
- C. Ignore the error and move on
- D. Delete the problematic file now

Answer: A

Q97. What is print debugging?

- A. Printing the error log to a file
- B. Print statements to trace values
- C. Printing the source code on paper
- D. Printing the algorithm description

Answer: B

Q98. What is a stack trace?

- A. Function call sequence at error
- B. A variable type declaration
- C. A stack data structure diagram
- D. A sorting algorithm for stacks

Answer: A

Q99. What is an exception?

- A. A variable declaration statement
- B. A normal expected program flow
- C. Event disrupting flow, indicating error
- D. A design pattern for structure

Answer: C

Q100. Compiler errors identify?

- A. Syntax and type error locations
- B. Runtime errors only in code
- C. Performance bottlenecks found
- D. Logic errors in the algorithm

Answer: A

Q101. What does Big-O describe?

- A. The exact execution time needed
- B. The minimum time for the task
- C. The average case performance
- D. Upper bound of the growth rate

Answer: D

Q102. What is $O(1)$?

- A. Linear time growth
- B. Constant time always
- C. Quadratic time growth
- D. Logarithmic time growth

Answer: B

Q103. What is $O(n)$?

- A. Linear, proportional to input
- B. Quadratic time growth
- C. Constant time always
- D. Exponential time growth

Answer: A

Q104. $O(n)$ vs $O(n^2)$ for large inputs?

- A. They perform exactly equal
- B. $O(n^2)$ is faster overall
- C. $O(n)$ is faster overall
- D. Cannot tell the difference

Answer: C

Q105. Space complexity measures?

- A. Memory relative to input size
- B. Disk storage used by files
- C. Lines of code in the program
- D. Screen pixels for the display

Answer: A

Q106. Array access by index?

- A. $O(1)$
- B. $O(n^2)$
- C. $O(n)$
- D. $O(\log n)$

Answer: A

Q107. Single for loop through n ?

- A. $O(1)$
- B. $O(n)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: B

Q108. $O(\log n)$ typical of?

- A. Binary search method
- B. Bubble sort algorithm
- C. Linear search scan
- D. Array index access

Answer: A

Q109. Algorithm efficiency?

- A. How readable the code looks
- B. How fast you can type code
- C. Time and space usage vs input
- D. The number of lines of code

Answer: C

Q110. $O(n)$ vs $O(2^n)$?

- A. $O(2^n)$ grows faster than $O(n)$
- B. They grow at the same rate
- C. It depends on the input data
- D. $O(n)$ grows faster than $O(2^n)$

Answer: A

Q111. First step in programming problem?

- A. Choose the programming language
- B. Start coding right away now
- C. Understand requirements and constraints
- D. Open the IDE and create files

Answer: C

Q112. What is a variable?

- A. A constant that never changes
- B. A loop construct in the program
- C. A function definition in code
- D. Named storage with changeable value

Answer: D

Q113. What is a function?

- A. A data structure for storage
- B. Reusable block for a specific task
- C. A variable type declaration
- D. A file format for saving data

Answer: B

Q114. Purpose of return?

- A. Declare a new variable in scope
- B. Create a new loop construct
- C. Send value back, end the function
- D. Print output to the console

Answer: C

Q115. What is a parameter?

- A. An error in the program logic
- B. Variable receiving value when called
- C. A global variable in the program
- D. The return type of a function

Answer: B

Q116. == vs =?

- A. Both are comparison operators
- B. = compares, == assigns values
- C. = assigns, == compares values
- D. They are the same operator

Answer: C

Q117. What is a string?

- A. A numeric data type value
- B. A callable function reference
- C. A boolean true/false value
- D. A sequence of characters stored

Answer: D

Q118. What is if-else for?

- A. Looping through elements repeatedly
- B. Making decisions based on conditions
- C. Importing external code modules
- D. Declaring new variable bindings

Answer: B

Q119. What is list/array for?

- A. Performing math calculations only
- B. Displaying output on the screen
- C. Ordered collection of multiple values
- D. Storing a single value only

Answer: C

Q120. What does DRY mean?

- A. Don't Repeat Yourself ever
- B. Do Repeat Yourself always
- C. Dev Run Yield automation
- D. Do Run Yesterday's builds

Answer: A

Q121. What is data-driven problem solving?

- A. Guessing the answer without facts
- B. Solving problems without any data
- C. Using data to guide all decisions
- D. Relying only on gut intuition

Answer: C

Q122. Purpose of data collection?

- A. Filling databases with random entries
- B. Wasting time gathering useless info
- C. Creating charts for presentations only
- D. Gather info to understand the problem

Answer: D

Q123. What is a dataset?

- A. A programming language to learn
- B. Structured collection of related data
- C. A single data point value only
- D. A server hosting the application

Answer: B

Q124. Mean of 2,4,6,8,10?

- A. 6
- B. 5
- C. 8
- D. 4

Answer: A

Q125. Median of 1,3,5,7,9?

- A. 3
- B. 5
- C. 7
- D. 9

Answer: B

Q126. Bar chart for?

- A. Showing trends over time periods
- B. Comparing quantities across categories
- C. Displaying geographic location data
- D. Showing parts of a whole circle

Answer: B

Q127. What is filtering?

- A. Selecting data meeting criteria
- B. Changing existing data values
- C. Adding more data to the set
- D. Deleting all data from storage

Answer: A

Q128. Pie chart for?

- A. Showing trends over time periods
- B. Displaying individual data points
- C. Proportions of parts to a whole
- D. Comparing many different categories

Answer: C

Q129. Sorting data for?

- A. Organizing for analysis and search
- B. Deleting duplicate data entries
- C. Encrypting data for security
- D. Making data set size smaller

Answer: A

Q130. What is data visualization?

- A. Graphical representation of patterns
- B. An algorithm for data sorting
- C. Raw numbers in a spreadsheet
- D. A database query for records

Answer: A

Q131. What is creative thinking?

- A. Copying solutions from other work
- B. Avoiding anything new or different
- C. Generating novel innovative solutions
- D. Only using standard approaches

Answer: C

Q132. What is brainstorming?

- A. An algorithm for sorting data
- B. A debugging technique for errors
- C. Thinking during a storm outside
- D. Generating many ideas without judgment

Answer: D

Q133. Thinking outside the box?

- A. Following standard procedures strictly
- B. Unconventional angles, challenge assumptions
- C. Thinking about a literal box shape
- D. Only using proven existing methods

Answer: B

Q134. What is lateral thinking?

- A. Thinking very fast without analysis
- B. Indirect creative approaches to solve
- C. Avoiding all creative problem solving
- D. Thinking in a straight line only

Answer: B

Q135. Why creativity in development?

- A. It introduces more bugs in code
- B. Drives innovative solutions and ideas
- C. It makes code harder to maintain
- D. It is not important at all here

Answer: B

Q136. What is a mind map?

- A. A network topology layout diagram
- B. Visual diagram from central concept
- C. A GPS navigation system map
- D. A floor plan of an office building

Answer: B

Q137. What is prototyping?

- A. Building the final product fully
- B. Final testing before the release
- C. Writing documentation for the project
- D. Quick rough version to test ideas

Answer: D

Q138. What is divergent thinking?

- A. Only considering one single idea
- B. Narrowing down to one solution
- C. Making the final decision now
- D. Generating many different ideas

Answer: D

Q139. What is convergent thinking?

- A. Generating many diverse ideas
- B. Narrowing down to best solution
- C. Choosing a solution at random
- D. Avoiding all possible solutions

Answer: B

Q140. What is MVP?

- A. Just enough features to test core
- B. A complete fully finished product
- C. A testing framework for software
- D. Most Valuable Player in sports

Answer: A

Q141. What is a real-world CS problem?

- A. A mathematical proof to write down
- B. A textbook exercise for practice
- C. A purely theoretical proof exercise
- D. Practical problem addressable with tech

Answer: D

Q142. Example of CS real-world solution?

- A. Solving an algebra equation on paper
- B. Philosophical debate on abstract ideas
- C. Writing mathematical proofs by hand
- D. GPS navigation and routing systems

Answer: D

Q143. Real-world vs academic?

- A. Real-world always has exact solutions
- B. Messy data, unclear requirements exist
- C. They are exactly the same thing
- D. Academic problems are always harder

Answer: B

Q144. What is user-centered design?

- A. Ignoring all user feedback given
- B. Design focused on machines only
- C. End user needs as primary focus
- D. Design focused on developers only

Answer: C

Q145. Why requirements gathering?

- A. It is entirely unnecessary to do
- B. It is only for documentation needs
- C. Ensures understanding of what to solve
- D. It slows the project down greatly

Answer: C

Q146. What is scalability?

- A. Handling increasing work or users
- B. The size of the codebase files
- C. The database table size limit
- D. The number of developers hired

Answer: A

Q147. What is ethical consideration?

- A. A type of search algorithm used
- B. A coding standard to follow always
- C. A testing methodology for quality
- D. Moral implications and societal impact

Answer: D

Q148. Why user feedback?

- A. Checks if the solution meets needs
- B. It provides nothing of value here
- C. It is only for documentation uses
- D. It slows down the development work

Answer: A

Q149. What is maintenance?

- A. A one-time task done at launch
- B. Cleaning hardware equipment daily
- C. Ongoing updates, fixes, improvements
- D. Only fixing bugs that are found

Answer: C

Q150. What is accessibility?

- A. Having access to the internet
- B. Design for diverse abilities and needs
- C. Making the application run faster
- D. Securing the application from attacks

Answer: B

Q151. Why documentation important?

- A. It is completely unnecessary to do
- B. Only managers need to read the docs
- C. It wastes time that could be coding
- D. Records solutions for understanding/reuse

Answer: D

Q152. What is a code comment?

- A. A variable declaration in the code
- B. Social feedback on the project
- C. An error in the source code
- D. Text explaining code, compiler ignores

Answer: D

Q153. Good docs include?

- A. Only the final answer or result
- B. Problem, approach, usage, examples
- C. Only the raw source code itself
- D. Only variable names and types

Answer: B

Q154. What is a README?

- A. A personal diary for the developer
- B. A system log of all the events
- C. A configuration file for the app
- D. Introduces project with purpose/setup

Answer: D

Q155. Why clear communication?

- A. Alignment on problems and solutions
- B. It is only needed for presentations
- C. It is not important for the team
- D. It slows down the project progress

Answer: A

Q156. Why clear names?

- A. To confuse other developers reading
- B. They create self-documenting code
- C. To make the code look fancy
- D. Variable names do not matter at all

Answer: B

Q157. What is user manual?

- A. A tutorial for learning to code
- B. End-user software usage instructions
- C. Source code documentation for devs
- D. A developer guide for the APIs

Answer: B

Q158. What is changelog?

- A. A debug log of runtime errors seen
- B. Chronological notable changes per version
- C. An error log of system failures
- D. A log of all user passwords used

Answer: B

Q159. Why document approach?

- A. It is a waste of team time
- B. No one reads documentation anyway
- C. Review thinking, learn, and share
- D. It makes the project much harder

Answer: C

Q160. What is a bug report?

- A. Defect with repro steps and details
- B. A proposal for new feature ideas
- C. A financial report for the project
- D. A report about actual insects found

Answer: A

Q161. What does abstraction help us do in problem solving?

- A. Include every minor detail possible
- B. Focus on relevant details only
- C. Avoid thinking about the problem
- D. Copy solutions from other sources

Answer: B

Q162. Which is an example of a well-defined problem?

- A. Finding the meaning of life itself
- B. Creating the best art masterpiece
- C. Predicting future weather in detail
- D. Sorting a list of numbers in order

Answer: D

Q163. What is the main goal of problem solving?

- A. Memorizing every formula in math
- B. Finding a solution to a challenge
- C. Writing the longest code possible
- D. Avoiding all difficult situations

Answer: B

Q164. Which term means testing a solution works?

- A. Abstraction method
- B. Brainstorming phase
- C. Verification process
- D. Decomposition step

Answer: C

Q165. What do constraints in a problem define?

- A. The limitations and boundaries given
- B. The color scheme of the interface
- C. The number of team members needed
- D. The programming language to be used

Answer: A

Q166. Which of these is a problem-solving tool?

- A. Video streaming app
- B. Online gaming site
- C. Flowchart diagram
- D. Social media post

Answer: C

Q167. What does iteration mean in problem solving?

- A. Solving the problem only one time
- B. Deleting the solution permanently
- C. Ignoring all previous attempt results
- D. Repeating steps to improve results

Answer: D

Q168. Which best describes a systematic approach?

- A. Following an organized step-by-step plan
- B. Random guessing without any planning
- C. Solving only the easiest parts first
- D. Skipping analysis and writing code now

Answer: A

Q169. What is the output of a problem-solving process?

- A. A list of new unrelated problems
- B. A solution to the stated problem
- C. An increase in overall complexity
- D. A decrease in understanding gained

Answer: B

Q170. Why is planning important before solving?

- A. It makes the problem more confusing
- B. It wastes valuable time and effort
- C. It helps organize thoughts and steps
- D. It eliminates all possible solutions

Answer: C

Q171. What is the first step in analyzing a problem?

- A. Writing the solution code immediately now
- B. Identifying what the problem actually is
- C. Presenting findings to the whole team
- D. Choosing a programming language to start

Answer: B

Q172. What are problem requirements?

- A. Random features added without any reason
- B. Personal preferences of the developer only
- C. Conditions the solution must fully satisfy
- D. Optional suggestions that can be ignored

Answer: C

Q173. Which question helps clarify a problem best?

- A. What is the latest technology trend now?
- B. What is my favorite programming language?
- C. What did I eat for breakfast this morning?
- D. What is the expected output or result?

Answer: D

Q174. What does identifying inputs mean in analysis?

- A. Determining what data is given or available
- B. Selecting the server hosting provider to use
- C. Deciding on the color scheme for the design
- D. Choosing the best font for the user interface

Answer: A

Q175. Why is understanding context important in analysis?

- A. Context never affects the problem at all
- B. Context makes every problem harder to solve
- C. Context helps understand the bigger picture
- D. Context only matters in language translation

Answer: C

Q176. What is a problem statement?

- A. A summary of team member qualifications
- B. A budget report for the project finances
- C. A clear description of the issue to solve
- D. A list of all programming languages known

Answer: C

Q177. Which helps separate relevant from irrelevant info?

- A. Critical analysis of the available data
- B. Randomly guessing which facts to use here
- C. Ignoring all the data that was provided
- D. Including every piece of information given

Answer: A

Q178. What are boundary conditions in a problem?

- A. The average expected input values given
- B. The extreme or edge cases to consider
- C. The most common scenarios encountered
- D. The normal typical cases only to test

Answer: B

Q179. What does scope of a problem refer to?

- A. The physical size of the computer screen
- B. The extent and boundaries of the problem
- C. The speed of the internet connection used
- D. The number of developers on the team now

Answer: B

Q180. Why should assumptions be stated explicitly?

- A. To confuse team members with extra content
- B. To prevent misunderstandings about the problem
- C. To delay the start of the actual solution work
- D. To make the documentation longer than needed

Answer: B

Q181. What is deductive reasoning?

- A. Ignoring all available evidence and data given
- B. Drawing general conclusions from specific cases
- C. Making random guesses without any evidence here
- D. Reaching specific conclusions from general rules

Answer: D

Q182. What is inductive reasoning?

- A. Contradicting all evidence with random assertions
- B. Eliminating logical thinking from all processes
- C. Forming general rules from specific observations
- D. Applying general rules to get specific outcomes

Answer: C

Q183. What does a logical AND operation require?

- A. Both conditions must be true to return true
- B. Exactly one condition must always be false now
- C. Neither condition needs to be true at all here
- D. Only one condition needs to be true for this

Answer: A

Q184. What does a logical OR operation require?

- A. Neither condition can ever be true for result
- B. At least one condition must be true for true
- C. Both conditions must be false for result true
- D. Both conditions must always be true for true

Answer: B

Q185. What does the NOT operator do in logic?

- A. It combines two statements together as one
- B. It performs arithmetic addition on numbers
- C. It reverses the truth value of a statement
- D. It checks if two values are exactly equal

Answer: C

Q186. Which conclusion follows from All cats are animals?

- A. All animals are definitely cats themselves
- B. No cats can possibly be animals at all
- C. Animals and cats are completely unrelated
- D. My pet cat is therefore an animal here

Answer: D

Q187. What is a logical fallacy?

- A. A valid and sound logical argument made
- B. A mathematical formula for calculations
- C. A type of programming loop structure
- D. An error in reasoning that weakens logic

Answer: D

Q188. What is a truth table used for?

- A. Displaying data in a formatted spreadsheet view
- B. Organizing project tasks by their due dates
- C. Showing all possible outcomes of logic operations
- D. Storing user information in a database system

Answer: C

Q189. What is a premise in a logical argument?

- A. The final conclusion of the argument made
- B. A question asked at the end of reasoning
- C. An irrelevant fact added for more length
- D. A statement assumed true to support conclusion

Answer: D

Q190. What does if-then represent in logic?

- A. A conditional or implication statement here
- B. A mathematical multiplication operation only
- C. A statement that is always false by nature
- D. An unconditional always true statement only

Answer: A

Q191. What shape represents a decision in a flowchart?

- A. Diamond shape
- B. Rectangle shape
- C. Parallelogram
- D. Oval shape

Answer: A

Q192. What does a rectangle represent in a flowchart?

- A. An input or output operation needed
- B. The start or end point of the flow
- C. A decision that requires a yes or no
- D. A process or action step to perform

Answer: D

Q193. What does sequential flow mean in algorithms?

- A. Steps that skip over each other unpredictably
- B. Steps that execute in completely random order
- C. Steps that all execute at the same exact time
- D. Steps that execute one after another in order

Answer: D

Q194. What is a loop in algorithm flow control?

- A. A repeated execution of a set of steps here
- B. A section of code that never executes at all
- C. An error that crashes the running program now
- D. A single instruction that runs only one time

Answer: A

Q195. What does the oval shape represent in a flowchart?

- A. The start or end of the flow process
- B. A decision requiring a yes or no here
- C. A process or calculation step taken
- D. An input or output data operation now

Answer: A

Q196. What is a conditional statement in algorithms?

- A. A statement that executes based on a condition
- B. A statement that always executes regardless
- C. A statement that randomly decides to execute
- D. A statement that never executes at all here

Answer: A

Q197. What does the arrow in a flowchart indicate?

- A. The size of the data being processed
- B. The color of the interface elements
- C. The direction of the process flow
- D. The speed of program execution rate

Answer: C

Q198. What is a while loop used for?

- A. Executing steps exactly one time only here
- B. Skipping all steps in the given program
- C. Terminating the program immediately right now
- D. Repeating steps while a condition is true

Answer: D

Q199. What is pseudocode?

- A. A specific proprietary programming language
- B. An executable script ready for deployment
- C. An informal description of algorithm steps
- D. Compiled machine-level binary code output

Answer: C

Q200. What is a for loop typically used for?

- A. Iterating a known number of times through code
- B. Declaring variables at the start of program
- C. Defining a function for later use in program
- D. Running code only when an error occurs here

Answer: A

Q201. What is data representation in computer science?

- A. The color of the user interface elements
- B. The physical size of the computer hardware
- C. The speed of the internet connection used
- D. How data is formatted and stored in systems

Answer: D

Q202. What is the binary number system based on?

- A. Sixteen digits including some letters
- B. Ten digits from zero through nine
- C. Two digits which are zero and one
- D. Eight digits from zero through seven

Answer: C

Q203. What does abstraction mean in data representation?

- A. Including every detail about the data given
- B. Making data more complex than it needs to be
- C. Deleting all data from the storage systems
- D. Hiding unnecessary details to show essentials

Answer: D

Q204. What is an array as a data structure?

- A. A type of output display on a screen
- B. A collection of elements stored in order
- C. A random arrangement of unrelated data
- D. A single value stored in one location

Answer: B

Q205. What does ASCII stand for in data encoding?

- A. Advanced System Code for Internet Integration
- B. Automated Script Compiler for Integrated Interfaces
- C. American Standard Code for Information Interchange
- D. Applied Software Configuration for Input Interchange

Answer: C

Q206. What is a variable in programming?

- A. A hardware component inside the computer
- B. An output device like a monitor or screen
- C. A fixed constant that can never change
- D. A named storage location for data values

Answer: D

Q207. What is a string data type used to store?

- A. Only true or false Boolean values given
- B. A sequence of text characters in order
- C. Only numerical integer values and nothing else
- D. Only decimal floating point number values

Answer: B

Q208. What is a Boolean data type?

- A. A type that holds only true or false values
- B. A type that contains image data information
- C. A type that stores very large number values
- D. A type that stores audio or sound file data

Answer: A

Q209. What does a table represent in data organization?

- A. A random collection of unrelated numbers
- B. An algorithm for sorting data elements
- C. Data organized in rows and columns format
- D. A type of computer hardware components

Answer: C

Q210. What is the purpose of data types in programming?

- A. To eliminate variables from program source
- B. To make programs run slower than necessary
- C. To define what kind of data a variable holds
- D. To prevent any data from being stored here

Answer: C

Q211. What is pattern recognition in problem solving?

- A. Ignoring all similarities between problems
- B. Creating random solutions without analysis
- C. Identifying similarities and recurring trends
- D. Memorizing every detail without understanding

Answer: C

Q212. Which is an example of a pattern in numbers?

- A. Letters mixed randomly with the numbers
- B. Each number is double the previous one
- C. Numbers arranged in no particular order
- D. Random numbers with no relation at all

Answer: B

Q213. How does recognizing patterns help solve new problems?

- A. It makes every problem harder to understand
- B. It eliminates the need to think about them
- C. It provides no useful information at all
- D. It allows applying known solutions to cases

Answer: D

Q214. What is generalization in the context of patterns?

- A. Finding exceptions to every rule discovered
- B. Making a rule that only applies to one case
- C. Ignoring all examples and making no rules
- D. Creating a broad rule from specific examples

Answer: D

Q215. What pattern does the sequence 2 4 6 8 10 follow?

- A. Each number decreases by one every time
- B. Each number increases by two every time
- C. Each number is multiplied by two each time
- D. Each number increases by three every time

Answer: B

Q216. What is a template in pattern-based solving?

- A. A random approach with no defined structure
- B. A reusable solution structure for similar problems
- C. A one-time solution that cannot be reused again
- D. A problem that has never been solved before now

Answer: B

Q217. Which skill is essential for pattern recognition?

- A. Careful observation of details and relationships
- B. Avoiding comparison between different examples
- C. Ignoring all details in the data provided
- D. Refusing to look for any similarities at all

Answer: A

Q218. What is a repeating pattern?

- A. A pattern that changes its rule every single time
- B. A sequence that cycles through the same elements
- C. A random arrangement with no repetition at all
- D. A sequence that occurs once and never repeats

Answer: B

Q219. Why are patterns important in computing?

- A. They only matter in artistic design projects
- B. They are unrelated to computing in any way
- C. They make computing more complex and slower
- D. They enable efficient algorithms and solutions

Answer: D

Q220. What does classification mean in pattern recognition?

- A. Sorting items into groups based on features
- B. Deleting all items that look similar to others
- C. Ignoring all features of the items completely
- D. Randomly mixing all items together in a pile

Answer: A

Q221. What is the result of 15 modulo 4?

- A. 3
- B. 2
- C. 4
- D. 5

Answer: A

Q222. What does the factorial of a number represent?

- A. Product of all positive integers up to that number
- B. Difference between the number and its predecessor
- C. Quotient when the number is divided by two here
- D. Sum of all positive integers up to that number here

Answer: A

Q223. What is the base of the decimal number system?

- A. Ten
- B. Two
- C. Eight
- D. Sixteen

Answer: A

Q224. What is a prime number?

- A. Any even number greater than two in the sequence
- B. A number divisible by any integer greater than one
- C. A number divisible only by one and by itself here
- D. A number that is always negative in value given

Answer: C

Q225. What is the order of operations in mathematics?

- A. Parentheses, exponents, multiply, divide, add, subtract
- B. Random order depending on the solver preference
- C. Addition then multiplication then parentheses used
- D. Subtraction first then all other operations after

Answer: A

Q226. What does the term average typically mean?

- A. The middle value when data is sorted in any order
- B. The smallest value in a given set of numbers here
- C. The sum of values divided by their total count
- D. The largest value in a given set of numbers here

Answer: C

Q227. What is a ratio?

- A. A comparison of two quantities using division here
- B. The product of multiplying two numbers together
- C. The sum of two different numbers added together
- D. The difference between two numbers subtracted here

Answer: A

Q228. What does percentage literally mean?

- A. Per hundred units in the total population here
- B. Per ten units in the total population being used
- C. Per thousand units in the total population here
- D. Per million units in the total population given

Answer: A

Q229. What is the greatest common divisor of 12 and 18?

- A. 4
- B. 6
- C. 3
- D. 9

Answer: B

Q230. What is an integer?

- A. A number used only in advanced calculus problems
- B. A number that can only be positive never negative
- C. A number that always has a decimal point value
- D. A whole number without any decimal part given

Answer: D

Q231. What is algorithmic thinking?

- A. Writing code without any planning or design thoughts
- B. Avoiding any structured approach to solving problems
- C. Memorizing code without understanding any of its logic
- D. Thinking about algorithms as step-by-step processes

Answer: D

Q232. What is the first step in designing an algorithm?

- A. Understanding the problem and its requirements here
- B. Writing the final code in a programming language
- C. Testing the code with random input data values given
- D. Optimizing the solution for maximum speed of running

Answer: A

Q233. What is a sorting algorithm used for?

- A. Deleting elements from a given data collection
- B. Searching for a specific element in the given data
- C. Adding new elements to an existing data structure
- D. Arranging elements in a specific defined order

Answer: D

Q234. What is a searching algorithm used for?

- A. Finding a specific element within a data collection
- B. Creating new data elements from existing data given
- C. Removing duplicate elements from the data structure
- D. Organizing data into a sorted specific order here

Answer: A

Q235. What does efficiency mean for an algorithm?

- A. Producing incorrect results as quickly as possible
- B. Ignoring resource constraints during the execution
- C. Using minimal resources to achieve correct results
- D. Using the maximum amount of time and memory here

Answer: C

Q236. What is a greedy algorithm?

- A. An algorithm that explores all possible solutions
- B. An algorithm that makes the best choice at each step
- C. An algorithm that randomly selects the next action
- D. An algorithm that always picks the worst choice made

Answer: B

Q237. What does it mean for an algorithm to terminate?

- A. The algorithm runs indefinitely without stopping here
- B. The algorithm eventually stops and produces a result
- C. The algorithm crashes due to a runtime error found
- D. The algorithm restarts itself from the beginning now

Answer: B

Q238. What is a brute force algorithm?

- A. An algorithm that only checks the first possibility
- B. An efficient algorithm that skips unnecessary steps
- C. An algorithm that guesses the answer without checking
- D. An algorithm that tries all possibilities for answer

Answer: D

Q239. What is the input to an algorithm?

- A. The steps that make up the algorithm procedure
- B. The data provided for the algorithm to process
- C. The result that the algorithm produces as output
- D. The language used to write the algorithm code in

Answer: B

Q240. What is the output of an algorithm?

- A. The result produced after executing the algorithm
- B. The initial data given before processing starts
- C. The errors encountered during algorithm execution
- D. The code written to implement the algorithm here

Answer: A

Q241. What is critical thinking?

- A. Criticizing others without constructive feedback
- B. Accepting all information without any questioning
- C. Avoiding making any decisions under circumstances
- D. Analyzing and evaluating information objectively

Answer: D

Q242. Why is evidence important in decision making?

- A. Evidence supports informed and rational decisions
- B. Evidence makes decisions slower and more confusing
- C. Evidence should be ignored for faster decisions
- D. Evidence is irrelevant to any decision process

Answer: A

Q243. What does it mean to evaluate an argument?

- A. Assessing the strength and validity of reasoning
- B. Accepting the argument without any analysis here
- C. Ignoring the argument and its conclusions entirely
- D. Repeating the argument without understanding it

Answer: A

Q244. What is bias in thinking?

- A. A balanced and objective viewpoint on all issues
- B. A tendency to favor one perspective over others
- C. An approach that considers every possible angle
- D. A guarantee of accurate reasoning in all cases

Answer: B

Q245. What is the purpose of asking why questions?

- A. To avoid having to think about the problem here
- B. To delay making any progress on the decision
- C. To annoy others by questioning their decisions
- D. To understand the reasoning behind a statement

Answer: D

Q246. What is a fact versus an opinion?

- A. A fact is verifiable while an opinion is subjective
- B. Facts cannot be proven while opinions always can be
- C. An opinion is always more reliable than any fact
- D. Facts and opinions are exactly the same thing here

Answer: A

Q247. Why should multiple sources be consulted?

- A. Only the first source found should ever be used
- B. Multiple sources help verify and cross-check facts
- C. One source always provides complete information
- D. Consulting multiple sources wastes valuable time

Answer: B

Q248. What does objectivity mean in critical thinking?

- A. Judging based on facts without personal prejudice
- B. Ignoring all evidence and trusting only intuition
- C. Always agreeing with the majority group opinion
- D. Being influenced by personal feelings and biases

Answer: A

Q249. What is a conclusion in an argument?

- A. The starting assumptions of the argument given
- B. A random unrelated statement at the argument end
- C. The statement that follows from the given premises
- D. The evidence used to support the argument here

Answer: C

Q250. Why is open-mindedness important?

- A. It means accepting every claim without question
- B. It means rejecting all traditional knowledge given
- C. It prevents any evaluation of competing ideas here
- D. It allows considering alternative perspectives fairly

Answer: D

Q251. What is debugging in software development?

- A. The process of designing user interfaces for apps
- B. The process of writing new features from scratch
- C. The process of finding and fixing errors in code
- D. The process of deploying code to production server

Answer: C

Q252. What is a syntax error?

- A. An error that only occurs during program execution
- B. A violation of the programming language grammar rules
- C. A warning that does not affect program execution
- D. An error in the logic of the program algorithm

Answer: B

Q253. What is a runtime error?

- A. A warning shown during code compilation process here
- B. An error that occurs while the program is executing
- C. An error detected before the program runs at all
- D. A style issue found during code review by the team

Answer: B

Q254. What is a logical error?

- A. An error caused by missing semicolons in the code
- B. An error in the spelling of variable names in code
- C. An error that prevents the code from compiling here
- D. An error where code runs but produces wrong results

Answer: D

Q255. What is a breakpoint in debugging?

- A. A marked point where execution pauses for inspection
- B. A location where new code should be added to fix bug
- C. A section of code that should be deleted from source
- D. A point where the program permanently crashes here

Answer: A

Q256. What does a stack trace show?

- A. The number of lines of code in the entire program
- B. The amount of memory used by the entire program
- C. The sequence of function calls leading to an error
- D. The total execution time of the program in seconds

Answer: C

Q257. What is the simplest debugging technique?

- A. Using machine learning to find all the bugs here
- B. Adding print statements to trace program execution
- C. Deleting code randomly until the error disappears
- D. Rewriting the entire program from scratch every time

Answer: B

Q258. What is a bug in software?

- A. A standard part of every software design document
- B. An improvement suggestion from the user community
- C. A feature that works exactly as it was intended
- D. An error or flaw that causes unexpected behavior

Answer: D

Q259. Why is reproducing a bug important for debugging?

- A. It makes the bug worse and harder to fix in the code
- B. Bugs should never be reproduced only described aloud
- C. It helps understand the exact conditions causing the bug
- D. Reproducing bugs is unnecessary for fixing them here

Answer: C

Q260. What is a debugger tool?

- A. A tool that automatically writes new code features
- B. A tool that designs user interfaces for the program
- C. A tool that manages project timelines and schedules
- D. A tool that helps step through code to find errors

Answer: D

Q261. What does time complexity measure?

- A. How execution time grows with input size increase
- B. How long it takes to write the program code here
- C. How long the computer takes to boot up for work
- D. The calendar time to complete the whole project

Answer: A

Q262. What does space complexity measure?

- A. The disk space needed to store the source code here
- B. The number of monitors needed to display the output
- C. The physical size of the computer used for running
- D. How memory usage grows with the input size given

Answer: D

Q263. What does $O(1)$ mean in complexity notation?

- A. The algorithm takes constant time regardless of input
- B. The algorithm grows linearly with input size given
- C. The algorithm takes infinite time for all input sizes
- D. The algorithm cannot run with any input whatsoever

Answer: A

Q264. What does $O(n)$ mean in complexity notation?

- A. The time decreases as input size increases further
- B. The time grows proportionally with input size here
- C. The time grows exponentially with input size given
- D. The time remains constant for all input sizes given

Answer: B

Q265. Which is more efficient for large inputs: $O(n)$ or $O(n^2)$?

- A. Neither can handle any large input sizes effectively
- B. Both are equally efficient for all input sizes given
- C. $O(n^2)$ is always more efficient for large inputs
- D. $O(n)$ is more efficient because it grows more slowly

Answer: D

Q266. What is the complexity of accessing an array by index?

- A. $O(n^2)$ quadratic time
- B. $O(1)$ constant time
- C. $O(\log n)$ logarithmic
- D. $O(n)$ linear time

Answer: B

Q267. What does scalability mean for an algorithm?

- A. The algorithm requires manual intervention to run now
- B. The algorithm only works with very small inputs here
- C. How well the algorithm handles growing input sizes
- D. The algorithm cannot be modified or changed at all

Answer: C

Q268. What is the complexity of a simple for loop over n items?

- A. $O(n)$ linear time
- B. $O(n^2)$ quadratic time
- C. $O(1)$ constant time
- D. $O(\log n)$ logarithmic

Answer: A

Q269. Why do we ignore constants in Big-O notation?

- A. Constants are always exactly one in every algorithm
- B. Constants make Big-O notation too easy to calculate
- C. Constants become insignificant for large input sizes
- D. Constants matter more than the growth rate itself

Answer: C

Q270. What does $O(n^2)$ typically indicate?

- A. It has a nested loop iterating over the input data
- B. It accesses only one element of the input per run
- C. It requires no iterations through the data at all
- D. It has a single pass through the input data given

Answer: A

Q271. What is the purpose of a function in programming?

- A. To store data permanently on the hard disk drive
- B. To prevent any code from being executed by program
- C. To organize reusable blocks of code for tasks here
- D. To make code longer and more repetitive overall

Answer: C

Q272. What is a variable used for in problem solving?

- A. Displaying error messages on the computer screen
- B. Making the program run slower than it needs to run
- C. Storing data values that can change during execution
- D. Preventing any data from being stored in the program

Answer: C

Q273. What is a conditional statement used for?

- A. Making decisions based on whether conditions are true
- B. Defining a new function to be called later in code
- C. Repeating the same code block multiple times in row
- D. Importing external libraries for use in the program

Answer: A

Q274. What is an array used for in programs?

- A. Connecting to the internet for data downloading now
- B. Storing a single value at one memory location here
- C. Displaying graphics and images on the screen here
- D. Storing a collection of related values in structure

Answer: D

Q275. What does a return statement do in a function?

- A. It sends a value back to the code that called it
- B. It restarts the entire program from the beginning
- C. It permanently deletes the function from memory now
- D. It prints a message directly to the user screen

Answer: A

Q276. What is a string in programming?

- A. A physical wire connecting hardware parts together
- B. A numerical value used for math calculations here
- C. A Boolean value that is either true or false only
- D. A sequence of characters representing text data

Answer: D

Q277. Why are comments important in program code?

- A. Comments increase file size for better performance
- B. Comments make the program execute faster overall
- C. Comments are executed by the computer as commands
- D. Comments explain code purpose for human readers

Answer: D

Q278. What is an operator in programming?

- A. A file stored on the computer hard disk drive now
- B. A type of comment added for documentation purpose
- C. A symbol that performs an operation on values here
- D. A person who operates the computer hardware device

Answer: C

Q279. What is input in a programming context?

- A. The speed at which the program code is executed
- B. The visual appearance of the program user interface
- C. Data sent out by the program to external devices
- D. Data received by the program from external sources

Answer: D

Q280. What is output in a programming context?

- A. The errors found during compilation process of code
- B. The source code written by the programmer initially
- C. Data the program produces and sends to destination
- D. Data the program receives from the user or file

Answer: C

Q281. What is data-driven problem solving?

- A. Making decisions based on data and evidence collected
- B. Ignoring all available data when making any decisions
- C. Collecting data without ever using it for decisions
- D. Making decisions based on personal feelings and guesses

Answer: A

Q282. What is a dataset?

- A. A structured collection of related data records stored
- B. A single data point with no related information here
- C. A type of programming language used for data analysis
- D. A hardware device for storing physical paper documents

Answer: A

Q283. What is data collection?

- A. The process of ignoring available information sources
- B. The process of deleting all stored information here
- C. The process of randomizing existing information order
- D. The process of gathering relevant information needed

Answer: D

Q284. What is a chart used for in data analysis?

- A. Writing source code for a program application here
- B. Visually representing data to identify trends shown
- C. Encrypting data for secure network transmission now
- D. Storing raw data in a database management system

Answer: B

Q285. What does filtering data mean?

- A. Selecting data that meets specific criteria from set
- B. Adding fake data to increase the total dataset size
- C. Randomly removing data without any specific reason
- D. Including all data regardless of its relevance here

Answer: A

Q286. What is a spreadsheet commonly used for?

- A. Writing essays and long research documents only here
- B. Playing computer games and entertainment activities
- C. Organizing and analyzing data in rows and columns
- D. Creating animated videos and graphic design artwork

Answer: C

Q287. What is the mean of a dataset?

- A. The average calculated by sum divided by count here
- B. The range between the highest and lowest values
- C. The middle value when data is sorted in an order
- D. The most frequently occurring value in the data set

Answer: A

Q288. What is data cleaning?

- A. Fixing errors and removing inconsistencies in data
- B. Printing data on paper for physical storage needs
- C. Physically cleaning the computer hardware surfaces
- D. Adding more data to make the dataset larger in size

Answer: A

Q289. Why is sample size important in data analysis?

- A. Sample size only matters for qualitative research here
- B. Smaller samples always give the most accurate results
- C. Sample size has no effect on analysis reliability
- D. Larger samples generally give more reliable results

Answer: D

Q290. What is a survey used for in data collection?

- A. Writing computer programs for data processing tasks
- B. Gathering responses and opinions from participants
- C. Testing hardware components for defects and faults
- D. Designing user interfaces for software applications

Answer: B

Q291. What is creative thinking in problem solving?

- A. Avoiding all new ideas and sticking to tradition
- B. Following only established conventional methods here
- C. Generating novel and innovative solution approaches
- D. Copying solutions exactly from existing examples now

Answer: C

Q292. What is brainstorming?

- A. Avoiding all group discussion about the problem
- B. Selecting only the first idea that comes to mind
- C. Evaluating and criticizing every idea immediately
- D. Generating many ideas without initial judgment here

Answer: D

Q293. What is thinking outside the box?

- A. Considering unconventional approaches to problems
- B. Rejecting all ideas that are different or unusual
- C. Following the standard procedure without variation
- D. Staying within conventional boundaries and limits

Answer: A

Q294. What role does curiosity play in creative solving?

- A. Curiosity only matters in scientific research alone
- B. Curiosity drives exploration and new discoveries
- C. Curiosity has no effect on any problem solving work
- D. Curiosity hinders creative problem solving efforts

Answer: B

Q295. What is lateral thinking?

- A. Following the most obvious solution path directly
- B. Approaching problems from indirect creative angles
- C. Avoiding creative approaches to problem solving now
- D. Thinking in a straight linear logical sequence only

Answer: B

Q296. Why is it important to consider multiple solutions?

- A. The first solution found is always the best one here
- B. Considering options wastes time and adds confusion
- C. Multiple solutions provide options for best selection
- D. Only one solution can ever exist for any problem

Answer: C

Q297. What is an analogy in creative thinking?

- A. A mathematical formula for calculating precise values
- B. An exact copy of an existing solution without changes
- C. A list of rules that must be followed without question
- D. A comparison between two similar things for insight

Answer: D

Q298. What does innovation mean?

- A. Avoiding change and maintaining the current approach
- B. Copying competitors without adding any improvement
- C. Repeating the same old methods without any change
- D. Introducing new ideas or methods to solve problems

Answer: D

Q299. What is mind mapping used for?

- A. Performing complex mathematical calculations quickly
- B. Writing sequential linear text documents for reports
- C. Visually organizing ideas and their connections here
- D. Managing computer hardware and network connections

Answer: C

Q300. Why is failure important in the creative process?

- A. Failure provides learning opportunities for improvement
- B. Failure should be avoided at all costs in every case
- C. Failure indicates no more attempts should be tried now
- D. Failure means the creative process has ended forever

Answer: A

Q301. What makes real-world problems different from textbook?

- A. Textbook problems are always harder to solve properly
- B. Real-world problems are messy with multiple factors
- C. Real-world problems have one clear correct answer
- D. Real-world problems require no practical considerations

Answer: B

Q302. Why is stakeholder input important?

- A. Stakeholders have no interest in the solution at all
- B. Stakeholders provide requirements and perspective here
- C. Only developers should make all decisions on solutions
- D. Stakeholder input always complicates the solution work

Answer: B

Q303. What is a trade-off in real-world problem solving?

- A. A solution that satisfies every requirement completely
- B. An approach that has no disadvantages at all given
- C. Giving up something to gain something else of value
- D. A situation where all options are equally perfect here

Answer: C

Q304. Why is time management important in projects?

- A. Real-world projects have unlimited time for completion
- B. Time management only matters for personal life tasks
- C. Deadlines require efficient prioritization of tasks
- D. Time has no impact on real-world project outcomes

Answer: C

Q305. What is a prototype in real-world development?

- A. A financial budget plan for the entire project cost
- B. A document listing all project requirements in detail
- C. An early model built to test ideas and get feedback
- D. The final finished product ready for market launch

Answer: C

Q306. Why is user feedback important?

- A. User feedback is irrelevant to solution quality here
- B. Users never provide useful information about solutions
- C. Feedback should only be gathered after project ends now
- D. It ensures the solution meets actual user needs given

Answer: D

Q307. What is project scope?

- A. The boundaries of what the project will deliver here
- B. The budget allocated for team lunches and activities
- C. The number of meetings held during the project now
- D. The personal goals of the project team manager now

Answer: A

Q308. Why are deadlines important in real-world projects?

- A. Projects should never have any deadlines set for them
- B. Deadlines have no effect on project delivery at all
- C. They create urgency and help prioritize work efforts
- D. Deadlines always reduce the quality of work produced

Answer: C

Q309. What is teamwork in real-world problem solving?

- A. Working alone without any help from other people here
- B. Competing against team members for individual credit
- C. Avoiding all communication with colleagues on team
- D. Collaborating with others to achieve a shared goal now

Answer: D

Q310. What is a requirement in a real-world project?

- A. A personal preference of the lead developer on team
- B. A suggestion that has no impact on the final product
- C. A condition the solution must meet to be acceptable
- D. An optional nice-to-have feature that can be skipped

Answer: C

Q311. Why is clear communication important in solving?

- A. Communication has no role in problem solving at all
- B. It ensures everyone understands problem and solution
- C. Only technical people need to communicate solutions
- D. Clear communication slows down problem solving work

Answer: B

Q312. What is the purpose of documentation in a project?

- A. To waste time that could be spent writing more code
- B. To prevent anyone from understanding project work
- C. To make projects more complicated than they need be
- D. To record decisions and provide reference for team

Answer: D

Q313. What should a good bug report include?

- A. The entire source code of the application in report
- B. Steps to reproduce, expected and actual behavior
- C. Only the statement that something is broken wrong
- D. A complaint about the development team performance

Answer: B

Q314. What is a README file typically used for?

- A. Listing personal information about team members now
- B. Recording all meetings held during project lifetime
- C. Storing the database passwords for the application
- D. Providing overview and setup instructions for project

Answer: D

Q315. Why is audience awareness important in documenting?

- A. Audience does not matter when writing documentation
- B. Technical details should always be included for all
- C. Different audiences need different levels of detail
- D. All audiences need exactly the same level of detail

Answer: C

Q316. What is the purpose of code comments?

- A. To replace the need for well-named variables entirely
- B. To make the code file unnecessarily larger in size
- C. To explain the intent and reasoning behind the code
- D. To prevent the code from compiling and running here

Answer: C

Q317. What is a technical specification document?

- A. A list of cafes near office for team lunch options
- B. A detailed description of how a system should be built
- C. A personal diary of developer daily activities here
- D. A marketing brochure for selling product to users

Answer: B

Q318. Why is version history important in documentation?

- A. It makes documents harder to read and understand now
- B. Version history should be deleted before sharing files
- C. It tracks changes and evolution of document over time
- D. Version history is never useful for any purpose here

Answer: C

Q319. What is a user manual?

- A. A guide for developers to write source code for app
- B. A guide that explains how to use a product or system
- C. A financial report about company revenue numbers here
- D. A legal contract between two companies for services

Answer: B

Q320. What makes writing concise and effective?

- A. Repeating the same information multiple times through
- B. Conveying meaning clearly with minimal extra words
- C. Using as many words as possible for every point made
- D. Including every tangential thought in documentation

Answer: B

Q321. What is the role of defining a problem clearly before solving it?

- A. It wastes time
- B. It ensures effort is directed at the right issue
- C. It limits creative solutions
- D. It is only needed for simple problems

Answer: B

Q322. Which of these is a real-world example of problem solving?

- A. Memorizing a textbook
- B. Debugging a program that crashes on startup
- C. Copying someone else's solution
- D. Ignoring error messages

Answer: B

Q323. What does the term 'solution space' refer to?

- A. The room where you work
- B. The set of all possible solutions to a problem
- C. A specific programming language
- D. The final answer only

Answer: B

Q324. Why is breaking a problem into smaller parts helpful?

- A. It makes the problem more complex
- B. Smaller parts are easier to understand and solve individually
- C. It increases the number of problems
- D. It is only useful for math problems

Answer: B

Q325. What is a common first reaction when encountering a difficult problem?

- A. Immediately writing code
- B. Understanding and restating the problem
- C. Skipping it entirely
- D. Asking someone else to do it

Answer: B

Q326. Which of the following best describes a well-structured problem?

- A. A problem with no clear answer
- B. A problem with clear goals, initial state, and known operations
- C. A problem that changes over time
- D. A problem that requires guessing

Answer: B

Q327. What does 'trial and error' mean as a problem-solving approach?

- A. Giving up after one attempt
- B. Trying different solutions until one works
- C. Only using proven methods
- D. Avoiding all mistakes

Answer: B

Q328. Which quality is most important for effective problem solving?

- A. Speed only
- B. Persistence and patience
- C. Memorizing all formulas
- D. Working alone always

Answer: B

Q329. What is the purpose of verifying a solution after implementing it?

- A. To waste time
- B. To ensure the solution actually solves the original problem
- C. To make the problem harder
- D. Verification is unnecessary

Answer: B

Q330. Which term describes learning from solving one problem to solve another?

- A. Randomization
- B. Transfer of knowledge
- C. Avoidance
- D. Memorization

Answer: B

Q331. What is the purpose of gathering requirements before solving a problem?

- A. To delay the project
- B. To understand exactly what the solution must achieve
- C. To create more work
- D. Requirements are unnecessary

Answer: B

Q332. What is a constraint in problem analysis?

- A. A suggestion that can be ignored
- B. A limitation or restriction that the solution must respect
- C. A feature request
- D. A type of programming language

Answer: B

Q333. Why is identifying the expected output important during problem analysis?

- A. It is not important
- B. It defines what the solution should produce, guiding the design
- C. It makes problems harder
- D. Output is always obvious

Answer: B

Q334. What does it mean to identify stakeholders in problem analysis?

- A. Finding who will write the code
- B. Determining who is affected by or interested in the problem and its solution
- C. Counting team members
- D. Stakeholders are irrelevant

Answer: B

Q335. What is the difference between inputs and outputs in a problem?

- A. They are the same thing
- B. Inputs are data given to the solution; outputs are results produced by it
- C. Inputs are always numbers
- D. Outputs come before inputs

Answer: B

Q336. Why should you identify assumptions when analyzing a problem?

- A. Assumptions are always correct
- B. Unstated assumptions can lead to incorrect solutions if they prove false
- C. Assumptions make problems easier
- D. They are only for documentation

Answer: B

Q337. What is a use case in problem analysis?

- A. A storage container
- B. A description of how a user interacts with a system to achieve a goal
- C. A type of error
- D. A programming pattern

Answer: B

Q338. What role do examples play in understanding a problem?

- A. Examples are distracting
- B. They illustrate expected behavior and help clarify the problem
- C. They are only for beginners
- D. Examples always oversimplify

Answer: B

Q339. What is the benefit of restating a problem in your own words?

- A. It wastes time
- B. It helps verify understanding and can reveal misunderstandings
- C. It changes the problem
- D. It is only done in exams

Answer: B

Q340. What does prioritizing requirements mean in problem analysis?

- A. Ignoring some requirements
- B. Ranking requirements by importance to focus on the most critical ones first
- C. Making all requirements equal
- D. Removing constraints

Answer: B

Q341. What is a conclusion in a logical argument?

- A. The first statement
- B. A random guess
- C. The statement that follows logically from the premises
- D. An assumption without evidence

Answer: C

Q342. What does the logical implication 'If A then B' mean?

- A. A and B are the same
- B. Whenever A is true, B must also be true
- C. B causes A
- D. A is always false

Answer: B

Q343. Which logical operator returns true only when both inputs are true?

- A. OR
- B. NOT
- C. AND
- D. XOR

Answer: C

Q344. What is an argument in the context of logic?

- A. A heated disagreement
- B. A set of premises followed by a conclusion
- C. A programming variable
- D. A mathematical equation

Answer: B

Q345. If 'All dogs are mammals' and 'Rex is a dog,' what can we conclude?

- A. Rex is a cat
- B. Rex is a mammal
- C. Rex is not an animal
- D. No conclusion can be drawn

Answer: B

Q346. What is a valid argument in logic?

- A. An argument that is always wrong
- B. An argument where the conclusion necessarily follows from the premises
- C. An argument with true premises only
- D. An argument everyone agrees with

Answer: B

Q347. What does the OR operator do in Boolean logic?

- A. Returns true only when both inputs are true
- B. Returns true when at least one input is true
- C. Returns the opposite of the input
- D. Returns false always

Answer: B

Q348. What is a counterexample used for in reasoning?

- A. To prove a statement is always true
- B. To disprove a universal claim by showing one case where it fails
- C. To add confusion
- D. To support an argument

Answer: B

Q349. In a truth table, how many rows are needed for three variables?

- A. 3
- B. 6
- C. 8
- D. 12

Answer: C

Q350. What does it mean for two statements to be logically equivalent?

- A. They have the same words
- B. They have the same truth value in all possible situations
- C. They always contradict each other
- D. They are written in the same language

Answer: B

Q351. What does the parallelogram symbol represent in a flowchart?

- A. A decision
- B. An input or output operation
- C. The start of the program
- D. A loop

Answer: B

Q352. What is the purpose of an arrow in a flowchart?

- A. To decorate the chart
- B. To show the direction of flow from one step to the next
- C. To represent data storage
- D. To indicate an error

Answer: B

Q353. What happens when a condition in an if-statement is false?

- A. The program crashes
- B. The code in the else branch (if it exists) executes, or the if block is skipped
- C. The condition becomes true
- D. The program restarts

Answer: B

Q354. What is the difference between a flowchart and pseudocode?

- A. They are identical
- B. A flowchart uses visual symbols; pseudocode uses text resembling programming language
- C. Flowcharts are only for hardware
- D. Pseudocode requires a compiler

Answer: B

Q355. What is a counter variable commonly used for in loops?

- A. Storing user names
- B. Keeping track of how many times a loop has executed
- C. Measuring memory
- D. Defining functions

Answer: B

Q356. What is the result of executing a sequence of three assignment statements in order?

- A. Only the first one runs
- B. All three execute one after another in order
- C. They execute simultaneously
- D. Only the last one runs

Answer: B

Q357. What does a diamond shape represent in a flowchart?

- A. A process step
- B. An input operation
- C. A decision point with yes/no branches
- D. The end of the program

Answer: C

Q358. Why is indentation important in pseudocode?

- A. It is purely decorative
- B. It shows the structure and nesting level of control statements
- C. It affects execution speed
- D. Indentation is incorrect in pseudocode

Answer: B

Q359. What is the simplest type of control flow in programming?

- A. Recursion
- B. Sequential execution where statements run one after another
- C. Multi-threading
- D. Event-driven programming

Answer: B

Q360. What does a loop termination condition determine?

- A. How fast the loop runs
- B. When the loop should stop repeating
- C. The loop's color in a flowchart
- D. Which variables to declare

Answer: B

Q361. What is the purpose of a data type in programming?

- A. To make code longer
- B. To define what kind of values a variable can hold and what operations are valid
- C. To slow down execution
- D. Data types are optional

Answer: B

Q362. What is the difference between an integer and a floating-point number?

- A. They are the same
- B. An integer has no decimal part while a floating-point number can represent fractions
- C. Integers are always larger
- D. Floating-point is always exact

Answer: B

Q363. What does a character encoding like ASCII define?

- A. How to draw characters
- B. A mapping between numeric codes and text characters
- C. The speed of text processing
- D. The size of a monitor

Answer: B

Q364. What is a record or struct used for in data representation?

- A. Playing music
- B. Grouping related data of different types into a single unit
- C. Sorting numbers only
- D. Replacing arrays

Answer: B

Q365. Why is binary the fundamental number system for computers?

- A. It was chosen arbitrarily
- B. Computer hardware uses two states (on/off) which map directly to binary digits 0 and 1
- C. Binary is easier for humans
- D. Decimal does not exist

Answer: B

Q366. What is a list data structure?

- A. A type of database
- B. An ordered collection of elements that can grow or shrink in size
- C. A fixed-size array only
- D. A type of loop

Answer: B

Q367. What does the term 'bit' stand for?

- A. Big integer type
- B. Binary digit
- C. Byte in transfer
- D. Boolean input test

Answer: B

Q368. What is the difference between a constant and a variable?

- A. They are the same
- B. A constant's value cannot change after being set; a variable's value can be modified
- C. Constants are always zero
- D. Variables never hold numbers

Answer: B

Q369. How many values can a single byte represent?

- A. 8
- B. 16
- C. 256
- D. 1024

Answer: C

Q370. What is a dictionary or map data structure used for?

- A. Looking up words only
- B. Storing key-value pairs for efficient lookup by key
- C. Sequential processing only
- D. Replacing all other structures

Answer: B

Q371. What does it mean to identify a pattern in a sequence of numbers?

- A. Guessing randomly
- B. Finding a consistent rule that describes how the numbers relate to each other
- C. Memorizing all numbers
- D. It is not possible

Answer: B

Q372. Why is pattern recognition useful in everyday life?

- A. It is not useful
- B. It helps predict outcomes and make decisions based on past experiences
- C. It only works in computers
- D. It slows down thinking

Answer: B

Q373. What is an example of a visual pattern?

- A. A random arrangement of shapes
- B. A wallpaper design that repeats the same motif at regular intervals
- C. A single dot on a page
- D. An empty canvas

Answer: B

Q374. What is the next number in the pattern 3, 6, 9, 12, ...?

- A. 13
- B. 14
- C. 15
- D. 18

Answer: C

Q375. How does recognizing a pattern in code help a programmer?

- A. It does not help
- B. It allows reuse of known solutions and avoidance of reinventing approaches
- C. It makes coding harder
- D. It only helps with debugging

Answer: B

Q376. What is a growing pattern?

- A. A pattern that decreases
- B. A pattern where each element increases by a consistent amount or rule
- C. A pattern with no change
- D. A pattern that stops

Answer: B

Q377. What does sorting data help reveal?

- A. Nothing useful
- B. Patterns, duplicates, and outliers that are hidden in unsorted data
- C. Random errors
- D. The data's creation date

Answer: B

Q378. What type of pattern does alternating between two values represent?

- A. A growing pattern
- B. An alternating or cyclic pattern
- C. A random sequence
- D. No pattern at all

Answer: B

Q379. How can a table help in recognizing patterns in data?

- A. Tables hide patterns
- B. Tables organize data into rows and columns, making relationships and trends easier to see
- C. Tables only store text
- D. Tables are too complex to read

Answer: B

Q380. What is the value of finding similarities between two different problems?

- A. It has no value
- B. Similar problems often have similar solutions, saving time and effort
- C. It creates confusion
- D. It only works in mathematics

Answer: B

Q381. What is the result of 3 raised to the power of 4?

- A. 12
- B. 64
- C. 81
- D. 27

Answer: C

Q382. What does the modulo operation return?

- A. The quotient of division
- B. The remainder after integer division
- C. The product of two numbers
- D. The absolute value

Answer: B

Q383. What is the sum of the first 5 even numbers (2, 4, 6, 8, 10)?

- A. 20
- B. 25
- C. 30
- D. 35

Answer: C

Q384. What is the least common multiple (LCM) of 3 and 5?

- A. 8
- B. 10
- C. 15
- D. 30

Answer: C

Q385. What does 'n choose 2' or $C(n,2)$ count?

- A. The number of ways to arrange n items
- B. The number of ways to pick 2 items from n without regard to order
- C. The product of n and 2
- D. The square of n

Answer: B

Q386. What is the value of log base 10 of 1000?

- A. 2
- B. 3
- C. 10
- D. 100

Answer: B

Q387. What does it mean for a number to be composite?

- A. It has no factors
- B. It has factors other than 1 and itself
- C. It is always even
- D. It is the same as prime

Answer: B

Q388. What is the formula for the area of a rectangle?

- A. Length + Width
- B. Length x Width
- C. Length / Width
- D. $2 \times (\text{Length} + \text{Width})$

Answer: B

Q389. What is the result of 0 factorial (0!)?

- A. 0
- B. 1
- C. Undefined
- D. Infinity

Answer: B

Q390. If a set has 4 elements, how many subsets does it have?

- A. 4
- B. 8
- C. 16
- D. 24

Answer: C

Q391. Why is it important for an algorithm to have a clear stopping condition?

- A. It is not important
- B. Without a stopping condition, the algorithm may run forever and never produce a result
- C. It makes the algorithm slower
- D. Stopping conditions are only for loops

Answer: B

Q392. What does it mean to trace through an algorithm?

- A. Drawing the algorithm
- B. Manually following each step with specific input values to verify the result
- C. Deleting the algorithm
- D. Translating to a different language

Answer: B

Q393. What is the purpose of selection sort?

- A. To search for an element
- B. To sort by repeatedly finding the minimum element and placing it in its correct position
- C. To merge two arrays
- D. To compress data

Answer: B

Q394. What does it mean for an algorithm to be correct?

- A. It runs fast
- B. It produces the expected output for every valid input
- C. It uses the least memory
- D. It has no comments

Answer: B

Q395. What is a swap operation in sorting algorithms?

- A. Deleting two elements
- B. Exchanging the positions of two elements in a collection
- C. Adding new elements
- D. Comparing without moving

Answer: B

Q396. Why is it useful to consider the best, worst, and average cases of an algorithm?

- A. Only worst case matters
- B. Different cases reveal how the algorithm performs under various conditions, guiding practical decisions
- C. Best case is always the same as worst case
- D. Average case is meaningless

Answer: B

Q397. What is the key idea behind insertion sort?

- A. Dividing the array in half
- B. Building a sorted portion one element at a time by inserting each new element into its correct position
- C. Finding the maximum first
- D. Using recursion

Answer: B

Q398. What is a step-by-step procedure for solving a problem called?

- A. A guess
- B. An algorithm
- C. A hypothesis
- D. A theorem

Answer: B

Q399. What does 'divide and conquer' mean in algorithm design?

- A. Giving up on the problem
- B. Breaking a problem into smaller sub-problems, solving each, then combining the results
- C. Only solving half the problem
- D. Dividing the team into groups

Answer: B

Q400. Why is choosing the right data structure important for algorithm efficiency?

- A. Data structures do not affect efficiency
- B. The right data structure can dramatically reduce the time and space an algorithm requires
- C. All data structures perform the same
- D. It only matters for large companies

Answer: B

Q401. Why is it important to question assumptions in problem solving?

- A. Assumptions should never be questioned
- B. Unexamined assumptions may be wrong and lead to incorrect solutions
- C. Questioning slows down work
- D. Only experts question assumptions

Answer: B

Q402. What does it mean to think critically about a source of information?

- A. Believing everything you read
- B. Evaluating the credibility, bias, and evidence behind the information
- C. Ignoring all sources
- D. Only trusting one source

Answer: B

Q403. What is the difference between a fact and an opinion?

- A. They are the same
- B. A fact is verifiable and objective; an opinion is a personal judgment or interpretation
- C. Facts are always wrong
- D. Opinions are always right

Answer: B

Q404. Why should you consider alternative explanations when solving a problem?

- A. Alternatives waste time
- B. The first explanation may not be correct; considering alternatives helps find the true cause
- C. There is always only one explanation
- D. Alternatives create confusion

Answer: B

Q405. What is skepticism in the context of critical thinking?

- A. Rejecting everything
- B. A healthy questioning attitude that demands evidence before accepting claims
- C. Being negative about everything
- D. Never making decisions

Answer: B

Q406. Why is it important to consider the consequences of a decision?

- A. Consequences do not matter
- B. Understanding potential outcomes helps make better decisions and avoid unintended harm
- C. Only immediate results matter
- D. Consequences are unpredictable so should be ignored

Answer: B

Q407. What does it mean to evaluate the strength of an argument?

- A. Measuring physical strength
- B. Assessing whether the premises adequately support the conclusion
- C. Counting the number of words
- D. Checking the author's credentials only

Answer: B

Q408. Why is considering different perspectives valuable in critical thinking?

- A. Different perspectives are confusing
- B. They can reveal blind spots, biases, and aspects of the problem you might have missed
- C. Only one perspective is ever correct
- D. It wastes time

Answer: B

Q409. What role does evidence play in critical thinking?

- A. Evidence is unnecessary
- B. Evidence provides the factual basis for claims and helps distinguish justified beliefs from unjustified ones
- C. Only opinions matter
- D. Evidence always proves things completely

Answer: B

Q410. What is a hasty generalization?

- A. A well-supported conclusion
- B. Drawing a broad conclusion from too few examples or insufficient evidence
- C. A type of algorithm
- D. A fast way to solve problems

Answer: B

Q411. What is the first thing you should do when you encounter a bug?

- A. Rewrite the entire program
- B. Try to reproduce the bug consistently
- C. Ignore it and hope it goes away
- D. Delete the code

Answer: B

Q412. What information does an error message typically provide?

- A. Nothing useful
- B. The type of error, the location in code, and often a description of what went wrong
- C. The solution to the bug
- D. The name of the developer who caused it

Answer: B

Q413. Why is reading the error message carefully the best first step in debugging?

- A. Error messages are always misleading
- B. They often tell you exactly what went wrong and where, saving significant debugging time
- C. They are too technical to understand
- D. Only experts can read them

Answer: B

Q414. What is the difference between a compile-time error and a runtime error?

- A. They are the same
- B. Compile-time errors are caught before the program runs; runtime errors occur during execution
- C. Runtime errors are easier to find
- D. Compile-time errors are more dangerous

Answer: B

Q415. Why should you test your fix after correcting a bug?

- A. Testing is unnecessary
- B. To verify the fix actually resolves the bug without introducing new problems
- C. Testing wastes time
- D. The fix is always correct

Answer: B

Q416. What is the purpose of adding print statements for debugging?

- A. To make the program faster
- B. To display variable values and execution flow at specific points to understand program behavior
- C. To make the code permanent
- D. Print statements cannot help with debugging

Answer: B

Q417. What does 'isolating a bug' mean?

- A. Deleting the bug
- B. Narrowing down the specific section of code that causes the problem
- C. Moving the bug to another file
- D. Isolating the computer from the network

Answer: B

Q418. Why is version control helpful for debugging?

- A. It has nothing to do with debugging
- B. It lets you compare current code with working versions to identify what change introduced the bug
- C. It makes code slower
- D. It only helps with team coordination

Answer: B

Q419. What is a common cause of an 'undefined variable' error?

- A. Using too much memory
- B. Trying to use a variable that has not been declared or initialized before use
- C. The variable is too large
- D. The computer is too slow

Answer: B

Q420. Why is it helpful to simplify the test case when debugging?

- A. Simpler tests are meaningless
- B. A minimal test case removes irrelevant complexity, making it easier to identify the exact cause of the bug
- C. Complex tests always find more bugs
- D. Simplification hides bugs

Answer: B

Q421. Why is it important to understand how an algorithm's performance changes with larger inputs?

- A. It does not matter
- B. Poor scaling means an algorithm that works for small inputs may become impractically slow for large ones
- C. All algorithms scale the same
- D. Performance never changes with input size

Answer: B

Q422. What does $O(n)$ mean in simple terms?

- A. The algorithm is broken
- B. The running time grows proportionally to the input size
- C. The algorithm always takes n seconds
- D. It means the algorithm is optimal

Answer: B

Q423. Which is faster for large n : $O(n)$ or $O(n^2)$?

- A. $O(n^2)$
- B. $O(n)$
- C. They are equal
- D. It depends on the computer

Answer: B

Q424. What does it mean when an algorithm has $O(1)$ space complexity?

- A. It uses one byte
- B. It uses a fixed amount of memory regardless of input size
- C. It uses no memory
- D. It is the fastest algorithm

Answer: B

Q425. Why does doubling the input size quadruple the time for an $O(n^2)$ algorithm?

- A. It does not quadruple
- B. Because $(2n)^2 = 4n^2$, so doubling input leads to four times the operations
- C. All algorithms behave this way
- D. This only applies to sorting

Answer: B

Q426. What is the complexity of looking up a value in a hash table on average?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q427. What does it mean for an algorithm to be 'efficient'?

- A. It uses the most resources
- B. It solves the problem using reasonable time and space resources relative to the input size
- C. It always runs in $O(1)$
- D. Efficiency is subjective and unmeasurable

Answer: B

Q428. What is the time complexity of iterating through each element of an array once?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: C

Q429. Why does Big-O notation focus on the fastest-growing term?

- A. Other terms are incorrect
- B. For large inputs, the fastest-growing term dominates the running time and other terms become negligible
- C. It is just a convention with no meaning
- D. All terms are equally important

Answer: B

Q430. How many comparisons does binary search need in the worst case for n elements?

- A. n comparisons
- B. $n/2$ comparisons
- C. $\log_2(n)$ comparisons
- D. 1 comparison

Answer: C

Q431. Why is understanding the problem important before writing code?

- A. It wastes development time
- B. Writing code for a misunderstood problem leads to wrong solutions that must be rewritten
- C. Understanding is optional
- D. Code can always be fixed later easily

Answer: B

Q432. What is the purpose of a loop in solving programming problems?

- A. To make code longer
- B. To repeat a block of code a specific number of times or until a condition is met
- C. To define a function
- D. To declare variables

Answer: B

Q433. What is the benefit of breaking code into functions?

- A. It makes programs slower
- B. Functions make code reusable, readable, and easier to test and debug independently
- C. Functions are unnecessary
- D. They increase the file size

Answer: B

Q434. What does it mean to 'hardcode' a value in a program?

- A. To write code that is difficult to understand
- B. To embed a specific value directly in the code rather than using a variable or configuration
- C. To compress the code
- D. To encrypt the value

Answer: B

Q435. Why is choosing meaningful variable names important?

- A. It does not matter what names you use
- B. Meaningful names make the code self-documenting and easier for others to understand
- C. Short names are always better
- D. Only the computer reads variable names

Answer: B

Q436. What is the role of indentation in code readability?

- A. It affects program execution
- B. It visually shows the structure and nesting of code blocks, making logic easier to follow
- C. It is purely decorative
- D. Indentation slows down typing

Answer: B

Q437. What is the difference between = and == in most programming languages?

- A. They are the same
- B. = assigns a value to a variable; == compares two values for equality
- C. == assigns a value
- D. = compares values

Answer: B

Q438. What is an index in the context of arrays?

- A. A table of contents
- B. A number that specifies the position of an element in an array
- C. The size of the array
- D. The data type of the array

Answer: B

Q439. Why is testing code with different inputs important?

- A. Testing is unnecessary
- B. Different inputs may reveal bugs that only appear under specific conditions
- C. One test case is always sufficient
- D. Testing slows down development

Answer: B

Q440. What is a syntax error in programming?

- A. A logical mistake
- B. A violation of the programming language's grammar rules that prevents compilation or interpretation
- C. A runtime crash
- D. An incorrect algorithm

Answer: B

Q441. Why is data important for making good decisions?

- A. Data is always irrelevant
- B. Data provides objective evidence that helps make informed decisions rather than relying on guesswork
- C. Data only confuses people
- D. Intuition is always better than data

Answer: B

Q442. What is the difference between qualitative and quantitative data?

- A. They are the same
- B. Quantitative data is numerical and measurable; qualitative data describes qualities and characteristics
- C. Qualitative data is always better
- D. Quantitative data is not useful

Answer: B

Q443. What is the mode of a dataset?

- A. The average value
- B. The middle value
- C. The most frequently occurring value
- D. The range of values

Answer: C

Q444. What is a line chart typically used to show?

- A. Categorical comparisons
- B. Changes in data over time or continuous trends
- C. Part-to-whole relationships
- D. Frequency distributions

Answer: B

Q445. Why should you check data for errors before analyzing it?

- A. Errors do not affect analysis
- B. Errors in data can lead to incorrect conclusions and bad decisions
- C. Data never has errors
- D. Checking wastes time

Answer: B

Q446. What does 'range' mean in the context of a dataset?

- A. The number of data points
- B. The difference between the maximum and minimum values in the dataset
- C. The average of all values
- D. The most common value

Answer: B

Q447. What is a histogram used for?

- A. Showing relationships between two variables
- B. Showing the frequency distribution of a single continuous variable across intervals
- C. Displaying text data
- D. Showing part-to-whole relationships

Answer: B

Q448. What does it mean to aggregate data?

- A. To delete data
- B. To combine multiple data points into summary values like totals, averages, or counts
- C. To split data into individual records
- D. To encrypt data

Answer: B

Q449. Why is comparing data to a baseline useful?

- A. Baselines are meaningless
- B. A baseline provides a reference point to measure whether current performance is better, worse, or unchanged
- C. Baselines always change
- D. Comparison is not useful

Answer: B

Q450. What is the purpose of labeling axes on a chart?

- A. It is optional decoration
- B. Labels tell the reader what each axis represents and the units of measurement, making the chart interpretable
- C. Labels make charts look cluttered
- D. Only one axis needs a label

Answer: B

Q451. What does 'thinking outside the box' mean in problem solving?

- A. Literally stepping outside a box
- B. Approaching a problem from an unconventional or unexpected angle
- C. Ignoring the problem
- D. Only using standard methods

Answer: B

Q452. Why is asking 'what if' questions valuable in creative thinking?

- A. It wastes time
- B. It opens up new possibilities by imagining different scenarios and challenging current assumptions
- C. It creates confusion
- D. 'What if' questions have no answers

Answer: B

Q453. What is the benefit of generating many ideas before selecting one?

- A. More ideas means more confusion
- B. A larger pool of ideas increases the chance of finding a truly creative and effective solution
- C. Only one idea is ever worth considering
- D. Generating many ideas wastes time

Answer: B

Q454. How does looking at problems from different perspectives help creativity?

- A. It does not help
- B. Different viewpoints reveal aspects of the problem that a single perspective might miss
- C. Only one perspective is ever correct
- D. It complicates the problem

Answer: B

Q455. What is the role of experimentation in creative problem solving?

- A. Experimentation is always risky
- B. Trying out ideas and learning from both successes and failures leads to better solutions
- C. Only proven methods should be used
- D. Experimentation guarantees success

Answer: B

Q456. Why is collaboration important for creative thinking?

- A. Collaboration kills creativity
- B. Different people bring different experiences and ideas, leading to more diverse and innovative solutions
- C. Creativity only comes from working alone
- D. Collaboration slows down thinking

Answer: B

Q457. What does it mean to build on someone else's idea?

- A. Copying their idea exactly
- B. Taking an existing idea and extending, combining, or adapting it to create something new
- C. Stealing intellectual property
- D. Rejecting the idea

Answer: B

Q458. What is the value of sketching or drawing when solving problems creatively?

- A. Drawing is unrelated to problem solving
- B. Visual representations can reveal patterns and relationships that are hard to see in text or numbers alone
- C. Only artists should draw
- D. Sketching wastes time

Answer: B

Q459. Why should you avoid judging ideas too early during brainstorming?

- A. Judging is always helpful
- B. Premature criticism stops the flow of ideas and prevents creative possibilities from being explored
- C. All ideas should be judged immediately
- D. Only good ideas should be shared

Answer: B

Q460. What is an example of creative problem solving in everyday technology?

- A. Using a phone only for calls
- B. Using a smartphone's camera as a document scanner
- C. Using technology exactly as intended
- D. Avoiding all new technology

Answer: B

Q461. Why do real-world problems often have multiple valid solutions?

- A. Real-world problems always have one solution
- B. Different trade-offs between cost, time, quality, and other factors lead to different acceptable solutions
- C. Multiple solutions indicate a poorly defined problem
- D. Only textbook problems have multiple solutions

Answer: B

Q462. What is the importance of understanding the end user in real-world problem solving?

- A. End users are irrelevant
- B. Understanding who will use the solution ensures it meets their actual needs and abilities
- C. Only developers matter
- D. End users always want the same thing

Answer: B

Q463. Why is budget an important constraint in real-world projects?

- A. Budget does not affect projects
- B. Limited resources mean trade-offs must be made about what features and quality levels are feasible
- C. Budget is unlimited in real projects
- D. Only non-profit projects have budgets

Answer: B

Q464. What is the role of testing in real-world software projects?

- A. Testing is unnecessary in the real world
- B. Testing verifies that the software works correctly under various conditions before reaching users
- C. Only developers test software
- D. Testing guarantees zero bugs

Answer: B

Q465. Why is communication important in real-world problem-solving teams?

- A. Communication slows down work
- B. Clear communication ensures everyone understands the problem, plan, and their responsibilities
- C. Only managers need to communicate
- D. Written communication is unnecessary

Answer: B

Q466. What does the term 'deploy' mean in software development?

- A. To delete software
- B. To release and make the software available for actual use by end users
- C. To write documentation
- D. To start coding

Answer: B

Q467. Why might a simpler solution be preferred over a complex one in real-world projects?

- A. Complex solutions are always better
- B. Simpler solutions are easier to build, test, maintain, and less likely to contain bugs
- C. Simplicity means low quality
- D. Complex solutions are always more reliable

Answer: B

Q468. What is user acceptance testing?

- A. Testing by the development team
- B. Testing performed by actual end users to verify the solution meets their real-world needs
- C. Automatic testing by computers
- D. Testing only at the end of the project

Answer: B

Q469. Why is iterating on a solution important in real-world development?

- A. The first version is always perfect
- B. Real-world feedback reveals issues and improvements that cannot be anticipated in advance
- C. Iteration wastes resources
- D. Customers prefer first versions

Answer: B

Q470. What does 'backwards compatibility' mean in software?

- A. Software that runs backward
- B. New versions continue to work with data, interfaces, or systems from older versions
- C. All old features are removed
- D. Only backward-looking analysis

Answer: B

Q471. Why is it important to write clearly when documenting a solution?

- A. Clear writing is unnecessary
- B. Clear documentation helps others understand and maintain the solution without needing to ask the original author
- C. Only the author needs to understand the docs
- D. Documentation is never read

Answer: B

Q472. What should a good code comment explain?

- A. What the code does line by line
- B. Why the code exists or why a particular approach was chosen
- C. The author's name only
- D. Nothing; comments are unnecessary

Answer: B

Q473. What is the purpose of a project README file?

- A. To list all bugs
- B. To provide an overview of the project, how to set it up, and how to use it
- C. To store passwords
- D. READMEs have no purpose

Answer: B

Q474. Why should error messages be written in clear, plain language?

- A. Error messages do not matter
- B. Clear error messages help users understand what went wrong and what they can do to fix the issue
- C. Technical jargon is always better
- D. Error messages should be hidden

Answer: B

Q475. What is the benefit of using consistent formatting in documentation?

- A. Formatting is irrelevant
- B. Consistent formatting makes documents easier to scan, read, and navigate, helping readers find information quickly
- C. It makes documents longer
- D. Only printed documents need formatting

Answer: B

Q476. What should you include when reporting a bug to another developer?

- A. Just say 'it is broken'
- B. Steps to reproduce, expected behavior, actual behavior, and environment details
- C. Only the error message
- D. Your opinion about the code quality

Answer: B

Q477. Why is keeping documentation up to date important?

- A. Outdated docs are fine
- B. Outdated documentation is worse than no documentation because it can mislead users into incorrect actions
- C. Documentation never needs updating
- D. Only initial documentation matters

Answer: B

Q478. What is the difference between internal and external documentation?

- A. They are identical
- B. Internal docs are for the development team; external docs are for end users or clients
- C. Internal docs are secret
- D. External docs are optional

Answer: B

Q479. Why is using examples helpful in documentation?

- A. Examples make docs longer without benefit
- B. Examples show exactly how to use something, making abstract descriptions concrete and actionable
- C. Examples are always misleading
- D. Only API docs need examples

Answer: B

Q480. What is the value of documenting lessons learned from a project?

- A. Past lessons have no value
- B. Documented lessons help future projects avoid the same mistakes and apply successful strategies
- C. Only failures should be documented
- D. Lessons learned are always obvious

Answer: B

Problem Solving & Analytical Skills — Medium

480 questions

Q481. In Polya's method, what comes after devising a plan?

- A. Looking back at the work
- B. Understanding the problem
- C. Carrying out the plan
- D. Restating the problem

Answer: C

Q482. What is divide and conquer?

- A. Only solving the first half of the problem
- B. Solving the problem without breaking it down
- C. Ignoring the most difficult parts of a task
- D. Dividing into smaller independent sub-problems

Answer: D

Q483. Which strategy works backward from the goal?

- A. Trial and error method
- B. Forward chaining approach
- C. Brute force technique
- D. Working backward strategy

Answer: D

Q484. What distinguishes computational thinking?

- A. It cannot involve algorithmic processes
- B. It requires absolutely no human input
- C. It is applicable only to mathematics
- D. Formulating problems for computer solutions

Answer: D

Q485. What is abstraction in problem solving?

- A. Ignoring the problem entirely to move on
- B. Removing unnecessary details to focus
- C. Adding more details to the problem
- D. Making the problem significantly harder

Answer: B

Q486. Which uses previously learned solutions?

- A. Analogical reasoning method
- B. Brute force technique
- C. Random guessing approach
- D. Creative problem solving

Answer: A

Q487. What is a constraint?

- A. An algorithm type to implement
- B. A ready-made solution to use
- C. An optional feature to consider
- D. A limitation that must be satisfied

Answer: D

Q488. What role does evaluation play?

- A. Assesses whether the solution is correct
- B. It only checks for syntax errors
- C. It fully replaces all testing
- D. It is completely unnecessary

Answer: A

Q489. Which technique tries all possible solutions?

- A. Dynamic programming
- B. Greedy algorithm
- C. Heuristic approach
- D. Brute force search

Answer: D

Q490. What is iterative refinement?

- A. Repeatedly improving through cycles
- B. Copying work from other sources
- C. Deleting the solution entirely
- D. Solving the problem only once

Answer: A

Q491. Most important sorting constraint?

- A. Array variable name
- B. Output color format
- C. Input data set size
- D. Code indentation style

Answer: C

Q492. What is root cause analysis?

- A. Addressing surface symptoms only
- B. Ignoring all errors and warnings
- C. Guessing the source of the bug
- D. Identifying the fundamental cause

Answer: D

Q493. Maximum sum subarray is what type?

- A. Optimization problem type
- B. String matching problem
- C. Graph traversal problem
- D. Sorting algorithm problem

Answer: A

Q494. What is a precondition?

- A. Must be true before process begins
- B. An error message shown to users
- C. Checked only after the execution
- D. A specific type of loop construct

Answer: A

Q495. What is a postcondition?

- A. Checked before execution begins
- B. A particular variable type in code
- C. A syntax rule for the compiler
- D. Must be true after process completes

Answer: D

Q496. What does feasibility analysis determine?

- A. Whether a solution is practical and achievable
- B. The color scheme for the interface
- C. The marketing strategy to implement
- D. The number of programmers to hire

Answer: A

Q497. Functional vs non-functional requirements?

- A. Functional: what it does; non-functional: how well
- B. There is no meaningful difference
- C. Functional requirements are always optional
- D. Non-functional requirements are more important

Answer: A

Q498. What is stakeholder identification?

- A. Finding all parties affected by it
- B. Identifying who wrote the code
- C. Counting the team members involved
- D. Listing programming languages used

Answer: A

Q499. What is a use case?

- A. A user-system interaction for a goal
- B. A specific test case for the code
- C. A bug report filed by the team
- D. A comment added to source code

Answer: A

Q500. Role of domain knowledge?

- A. Helps understand context and terms
- B. It only serves for documentation
- C. It slows down the development
- D. It is completely irrelevant

Answer: A

Q501. Contrapositive of If P then Q?

- A. If P then not Q
- B. If not Q then not P
- C. If Q then P
- D. If not P then not Q

Answer: B

Q502. Which is De Morgan's Law?

- A. $\text{NOT } A = A$
- B. $\text{NOT}(A \text{ AND } B) = \text{NOT } A \text{ OR } \text{NOT } B$
- C. $A \text{ AND } B = A \text{ OR } B$
- D. $A \text{ XOR } B = A \text{ AND } B$

Answer: B

Q503. What is modus ponens?

- A. $P \rightarrow Q$, P false, therefore Q false
- B. $P \rightarrow Q$, Q false, therefore P false
- C. $P \rightarrow Q$, Q true, therefore P
- D. $P \rightarrow Q$, P true, therefore Q

Answer: D

Q504. What is modus tollens?

- A. $P \rightarrow Q$, P true, therefore Q
- B. $P \rightarrow Q$, Q true, therefore P
- C. $P \rightarrow Q$, Q false, therefore P false
- D. $P \rightarrow Q$, P false, therefore Q false

Answer: C

Q505. Truth table with 4 variables?

- A. 16 rows
- B. 32 rows
- C. 8 rows
- D. 4 rows

Answer: A

Q506. What is a tautology?

- A. Always true regardless of values
- B. A logical contradiction in reasoning
- C. A statement that is always false
- D. A statement that is sometimes true

Answer: A

Q507. What is a contradiction?

- A. Always false regardless of values
- B. A tautology under all conditions
- C. A valid argument with true premises
- D. A statement that is always true

Answer: A

Q508. What does $P \leftrightarrow Q$ mean?

- A. P implies Q in one direction only
- B. P is true if and only if Q is true
- C. Q implies P in one direction only
- D. Both P and Q are always true together

Answer: B

Q509. What is proof by contradiction?

- A. A type of mathematical induction
- B. Proving the statement is false
- C. A direct proof from axioms
- D. Assume opposite, show contradiction

Answer: D

Q510. Affirming the consequent fallacy?

- A. Rain $\rightarrow$ wet. No rain. Not wet.
- B. Rain $\rightarrow$ wet. Dry. No rain.
- C. Rain $\rightarrow$ wet. Wet. Therefore rained.
- D. Rain $\rightarrow$ wet. Rained. Wet.

Answer: C

Q511. While vs do-while?

- A. While only runs the loop body once
- B. Do-while never actually executes code
- C. While checks first; do-while runs once
- D. They are exactly the same construct

Answer: C

Q512. Connector symbol indicates?

- A. A terminal or endpoint state
- B. Continuation on another page
- C. A decision point in the flow
- D. An input or output operation

Answer: B

Q513. What is a nested loop?

- A. A loop inside another loop
- B. A loop that runs just once
- C. A loop with no condition
- D. A loop that never ends

Answer: A

Q514. for i=1 to 5 executes how many times?

- A. 5 times
- B. 6 times
- C. 0 times
- D. 4 times

Answer: A

Q515. What is an infinite loop?

- A. Condition never becomes false
- B. A very fast loop execution
- C. A loop that runs just twice
- D. A loop with an empty body

Answer: A

Q516. What is a sentinel value?

- A. A random value in the data
- B. Special value signaling end of input
- C. An error code returned by functions
- D. A variable name in the program

Answer: B

Q517. What does break do?

- A. Skips to the next iteration
- B. Restarts the loop from start
- C. Pauses the loop temporarily
- D. Immediately exits the loop

Answer: D

Q518. What does continue do?

- A. Breaks out of all nested loops
- B. Skips rest, goes to next iteration
- C. Restarts the entire program run
- D. Exits the loop entirely now

Answer: B

Q519. What is switch-case for?

- A. Handling errors and exceptions
- B. Selecting blocks based on a value
- C. Iterating through a collection
- D. Managing memory allocation tasks

Answer: B

Q520. $x=0$; while $x<3$: print x ; $x=x+1$. Output?

- A. 1 2 3
- B. 1 2
- C. 0 1 2 3
- D. 0 1 2

Answer: D

Q521. Hex of 255?

- A. 1F
- B. FE
- C. EF
- D. FF

Answer: D

Q522. Two's complement is for?

- A. Floating point values
- B. Signed integers in binary
- C. Data compression formats
- D. Text character encoding

Answer: B

Q523. 8-bit two's complement of -1?

- A. 00000001
- B. 10000001
- C. 11111110
- D. 11111111

Answer: D

Q524. Data abstraction in OOP?

- A. Hide implementation, expose interface
- B. Write longer and more verbose code
- C. Expose all internal details fully
- D. Avoid using functions or methods

Answer: A

Q525. ADT vs data structure?

- A. Data structure is always better to use
- B. ADT: interface; structure: implementation
- C. ADT can never be implemented in code
- D. They are exactly the same thing

Answer: B

Q526. IEEE 754 representation?

- A. Character encoding standard
- B. Sign, exponent, and mantissa
- C. Only the mantissa component
- D. Simple integer format only

Answer: B

Q527. Unicode vs ASCII?

- A. Unicode only supports English letters
- B. They are exactly the same standard
- C. ASCII has more characters than Unicode
- D. Unicode: all scripts; ASCII: 128 chars

Answer: D

Q528. What is a struct?

- A. Composite grouping different types
- B. A single primitive variable only
- C. A file format for data storage
- D. A database table definition format

Answer: A

Q529. What is serialization?

- A. Encrypting sensitive data
- B. Deleting data permanently
- C. Converting to storable format
- D. Sorting data in an order

Answer: C

Q530. Unsigned 8-bit range?

- A. 1-256
- B. 0-127
- C. -128 to 127
- D. 0-255

Answer: D

Q531. What are design patterns?

- A. Random unstructured coding practices
- B. User interface visual elements
- C. Reusable solutions to common problems
- D. Compiler-level code optimizations

Answer: C

Q532. Next: 1,1,2,3,5,8,13,?

- A. 20
- B. 18
- C. 26
- D. 21

Answer: D

Q533. BFS and DFS both being traversals is?

- A. A data entry verification task
- B. A debugging analysis approach
- C. Problem decomposition technique
- D. Pattern recognition and generalization

Answer: D

Q534. Merge sort, quicksort, binary search share?

- A. $O(n)$ time complexity bound
- B. Divide and conquer pattern
- C. Linked list usage only
- D. Hash table data structure

Answer: B

Q535. What is template method pattern?

- A. A C++ template for generics
- B. Base defines skeleton, subclasses override
- C. Writing documentation for the system
- D. Creating document templates for use

Answer: B

Q536. Stacks, queues, priority queues share?

- A. Array-based implementation only
- B. Specific insertion/removal ordering
- C. Random access to all elements
- D. Tree-based structure internally

Answer: B

Q537. What is observer pattern?

- A. Objects notified on state changes
- B. A debugging analysis approach
- C. A sorting algorithm technique
- D. A testing framework structure

Answer: A

Q538. Top-k problems commonly use?

- A. Full array sorting first
- B. Recursion-only based approach
- C. Linked list traversal method
- D. Heap or priority queue structure

Answer: D

Q539. What is sliding window?

- A. Moving window across data efficiently
- B. A sorting algorithm for arrays
- C. A database query optimization trick
- D. A graphical user interface widget

Answer: A

Q540. What is two-pointer technique?

- A. A linked list creation method only
- B. Using two mouse cursors at once
- C. Two references moving through data
- D. A memory management allocation tool

Answer: C

Q541. Euclidean GCD complexity?

- A. $O(a+b)$
- B. $O(a*b)$
- C. $O(\log(\min(a,b)))$
- D. $O(n^2)$

Answer: C

Q542. Subsets of n elements?

- A. 2^n
- B. n^2
- C. n
- D. $n!$

Answer: A

Q543. Pigeonhole Principle?

- A. n items in m slots ($n > m$): one has >1
- B. A specific data structure type
- C. A search algorithm for arrays
- D. A sorting algorithm technique

Answer: A

Q544. Geometric series sum?

- A. $a \cdot n$
- B. $a(r^n - 1)/(r - 1)$
- C. $n \cdot r$
- D. $a + r \cdot n$

Answer: B

Q545. Permutations of n distinct objects?

- A. 2^n
- B. $n!$
- C. n
- D. n^2

Answer: B

Q546. Modular arithmetic useful for?

- A. Only for division operations needed
- B. Cyclic ops, hashing, overflow prevention
- C. Only formatting output display
- D. It has no practical use in CS

Answer: B

Q547. P(heads) fair coin?

- A. 0.5
- B. 1
- C. 0
- D. 0.25

Answer: A

Q548. P(5,3)?

- A. 15
- B. 120
- C. 10
- D. 60

Answer: D

Q549. C(10,3)?

- A. 120
- B. 1000
- C. 720
- D. 30

Answer: A

Q550. Base case importance?

- A. Stops infinite recursion as a condition
- B. It is used only for display output
- C. It makes the formula longer overall
- D. It is optional and unneeded

Answer: A

Q551. Binary search complexity?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: B

Q552. Merge sort complexity?

- A. $O(n^2)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(\log n)$

Answer: B

Q553. Quicksort worst case?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(\log n)$
- D. $O(n)$

Answer: B

Q554. When greedy over DP?

- A. Always use greedy by default
- B. When the problem is NP-hard
- C. Never use greedy over DP
- D. Greedy-choice property plus optimal substructure

Answer: D

Q555. What is backtracking?

- A. A data compression approach
- B. Never going back on choices
- C. A sorting algorithm technique
- D. Try solutions, undo failed ones

Answer: D

Q556. N-Queens uses?

- A. Greedy approach
- B. Backtracking method
- C. Linear search scan
- D. Dynamic programming

Answer: B

Q557. Dijkstra's is for?

- A. String pattern matching
- B. Balancing binary trees
- C. Shortest paths, non-negative weights
- D. Sorting array elements

Answer: C

Q558. Hash function purpose?

- A. Compressing files for storage
- B. Mapping keys to indices for lookup
- C. Encrypting sensitive user data
- D. Sorting data in an array

Answer: B

Q559. What is stable sort?

- A. Maintains equal elements relative order
- B. A sort using constant space only
- C. A sort that never crashes at all
- D. The fastest sorting algorithm known

Answer: A

Q560. Which sort is not comparison-based?

- A. Heap sort
- B. Counting sort
- C. Quick sort
- D. Merge sort

Answer: B

Q561. What is premature optimization?

- A. Optimizing only after profiling done
- B. A good development practice overall
- C. Optimizing before knowing bottlenecks
- D. Never optimizing the code at all

Answer: C

Q562. What is sunk cost fallacy?

- A. Never investing resources into any project
- B. Continuing failed effort due to past investment
- C. A financial concept only used in accounting
- D. Stopping all projects at the first issue

Answer: B

Q563. What is decision matrix?

- A. A database query optimization method
- B. A matrix multiplication technique
- C. A compilation step in the process
- D. Options scored against weighted criteria

Answer: D

Q564. Root cause vs symptoms?

- A. Fixing symptoms is always better
- B. Root cause fixes underlying problem
- C. Distinguishing them is unnecessary
- D. They are essentially the same thing

Answer: B

Q565. What is cost-benefit analysis?

- A. Comparing expected costs and benefits
- B. A marketing strategy for products
- C. Ignoring all costs of the project
- D. Analyzing only the project costs

Answer: A

Q566. What is SWOT?

- A. Strengths, Weaknesses, Opportunities, Threats
- B. A testing framework for software
- C. A debugging technique for code
- D. A sorting algorithm for datasets

Answer: A

Q567. What is anchoring bias?

- A. Over-relying on first information
- B. An HTML anchor element tag
- C. Avoiding all first impressions
- D. A secure authentication method

Answer: A

Q568. What is risk assessment?

- A. Taking every risk available
- B. Identify, analyze, evaluate risks
- C. Ignoring all potential risks
- D. Avoiding all risks completely

Answer: B

Q569. Why worst cases?

- A. Prepare contingency plans for them
- B. Considering them wastes all time
- C. Just for pessimistic outlook
- D. They never actually happen at all

Answer: A

Q570. What is peer review?

- A. A formal software testing phase
- B. Colleagues examine work for quality
- C. A social media interaction type
- D. A completely unnecessary activity

Answer: B

Q571. What is rubber duck debugging?

- A. A rubber duck shaped mouse device
- B. A testing framework for web apps
- C. A waterfowl-based sorting algorithm
- D. Explaining code aloud to find errors

Answer: D

Q572. What is binary search debugging?

- A. The binary search algorithm itself
- B. Eliminate half the code each step
- C. Debugging binary executable files
- D. Searching binary number patterns

Answer: B

Q573. What is null pointer exception?

- A. Accessing a null reference value
- B. A logic error in computation
- C. A warning from the compiler
- D. A syntax error in the code

Answer: A

Q574. What is off-by-one error?

- A. Loop iterates one too many or few
- B. A network connectivity issue seen
- C. A rounding error in calculations
- D. A compilation error in the build

Answer: A

Q575. What is memory leak?

- A. Physical damage to memory chips
- B. Allocated memory that is never freed
- C. A security hack on the system
- D. Fast access to memory locations

Answer: B

Q576. What is regression testing?

- A. The first test ever written for code
- B. User interface design testing only
- C. Re-testing after changes are made
- D. Performance benchmark testing only

Answer: C

Q577. What is race condition?

- A. A type of loop in the code
- B. A competition between two programs
- C. A fast algorithm execution speed
- D. Depends on concurrent event timing

Answer: D

Q578. What is deadlock?

- A. A locked database table in use
- B. Processes waiting for each other
- C. A system crash due to hardware
- D. An infinite loop in the code

Answer: B

Q579. What is step-through debugging?

- A. Running the entire program at once
- B. Walking through the office halls
- C. One line at a time in debugger
- D. Deleting steps from the program

Answer: C

Q580. What is defensive programming?

- A. Being defensive about your code
- B. Avoiding writing any error handlers
- C. Anticipating and handling errors well
- D. Programming without any planning

Answer: C

Q581. Two nested n-loops?

- A. $O(n^2)$
- B. $O(n)$
- C. $O(2n)$
- D. $O(n \log n)$

Answer: A

Q582. Merge sort space?

- A. $O(n)$
- B. $O(1)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: A

Q583. Bubble sort best case?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(1)$
- D. $O(n \log n)$

Answer: A

Q584. Big-O vs Omega vs Theta?

- A. O describes the lower bound only
- B. Theta describes the upper bound
- C. They are all the same thing
- D. O: upper, Omega: lower, Theta: tight

Answer: D

Q585. Insert at array beginning?

- A. $O(n^2)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n)$

Answer: D

Q586. What is in-place?

- A. A very slow sorting algorithm
- B. $O(1)$ or $O(\log n)$ extra space only
- C. An algorithm that does not work
- D. Uses lots of extra memory space

Answer: B

Q587. Hash table average lookup?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(1)$
- D. $O(n^2)$

Answer: C

Q588. Heap insert/extract?

- A. $O(1)$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(n)$

Answer: C

Q589. Why $O(n \log n)$ efficient for sorting?

- A. It is slower than $O(n^2)$ sorting
- B. Theoretical lower bound for comparisons
- C. It is the slowest sort possible
- D. It only works on small inputs

Answer: B

Q590. Adjacency matrix space?

- A. $O(V^2)$
- B. $O(V+E)$
- C. $O(V)$
- D. $O(E)$

Answer: A

Q591. Modular code benefit?

- A. Smaller testable reusable pieces made
- B. It makes the program run slower
- C. It uses significantly more memory
- D. It makes code much longer overall

Answer: A

Q592. Find max in unsorted array?

- A. Use binary search on the array
- B. Sort the entire array first
- C. Iterate tracking the maximum value
- D. Use a hash table for lookup

Answer: C

Q593. What is variable scope?

- A. The data type of the variable
- B. The current value of the variable
- C. The name given to the variable
- D. The region where it is accessible

Answer: D

Q594. Recursion useful for?

- A. Self-similar sub-problem structures
- B. Replacing all loops in the code
- C. Only Fibonacci number computation
- D. It is always faster than loops

Answer: A

Q595. Count char frequency efficiently?

- A. Use nested loops over the string
- B. Use hash map in one single pass
- C. Sort the string first then count
- D. Use recursion to count each char

Answer: B

Q596. What is exception handling?

- A. A testing framework for the app
- B. Ignoring all errors in the code
- C. Handle runtime errors without crashing
- D. A design pattern for structure

Answer: C

Q597. Reverse linked list?

- A. Sort the list then reverse order
- B. Change next pointers to point back
- C. Copy all elements to an array first
- D. Delete and recreate the whole list

Answer: B

Q598. Check balanced parens?

- A. Hash table use
- B. Stack structure
- C. Array scanning
- D. Queue structure

Answer: B

Q599. Detect cycle in linked list?

- A. Count all the nodes in the list
- B. Sort the list nodes by value
- C. Check all pairs of nodes found
- D. Floyd's slow and fast pointers

Answer: D

Q600. What is memoization?

- A. A debugging technique for errors
- B. Writing memos about the code
- C. Caching results to avoid recomputation
- D. A type of loop construct used

Answer: C

Q601. Data preprocessing?

- A. It is entirely unnecessary to do
- B. Only formatting the output display
- C. Deleting data that is not needed
- D. Clean, transform, and prepare data

Answer: D

Q602. Standard deviation?

- A. The average of the dataset values
- B. The range of the data values
- C. Measure of spread from the mean
- D. The most common value in data

Answer: C

Q603. Outlier detection?

- A. Points significantly different from rest
- B. Sorting the data in ascending order
- C. Counting all the elements in data
- D. Finding the average of all values

Answer: A

Q604. Data normalization?

- A. Deleting abnormal data entries
- B. Making all values exactly equal
- C. Sorting data in a specific order
- D. Scaling values to standard range

Answer: D

Q605. Scatter plot for?

- A. Displaying hierarchical data structures
- B. Showing only time-based trend data
- C. Relationship between two numeric variables
- D. Comparing different categories shown

Answer: C

Q606. Hypothesis testing?

- A. Ignoring all evidence and results
- B. Making assumptions without any data
- C. Statistical method to check a claim
- D. Guessing the answer randomly given

Answer: C

Q607. Feature selection?

- A. Remove all features from the data
- B. Add random features to the dataset
- C. Choose the most relevant attributes
- D. Select all features without filtering

Answer: C

Q608. A/B testing?

- A. Alphabetical sorting of data values
- B. Compare two versions using real data
- C. A debugging technique for finding bugs
- D. Testing all possible combinations made

Answer: B

Q609. Data aggregation?

- A. Splitting data into smaller pieces
- B. Formatting data for the display
- C. Combining data into summary values
- D. Deleting data from the database

Answer: C

Q610. Cross-validation?

- A. Validating data only twice total
- B. Checking data types for correctness
- C. Removing all invalid data entries
- D. Multiple train/test splits for assessment

Answer: D

Q611. What is design thinking?

- A. Testing software for correctness
- B. Only visual design of interfaces
- C. Writing code without any planning
- D. Human-centered iterative problem process

Answer: D

Q612. What is SCAMPER?

- A. A debugging technique for code errors
- B. A testing methodology for the app
- C. Substitute, Combine, Adapt, Modify, etc.
- D. Running away from problems fast

Answer: C

Q613. What is reverse engineering?

- A. Manufacturing physical hardware parts
- B. Analyzing existing to understand it
- C. Destroying the existing system fully
- D. Writing code in reverse order now

Answer: B

Q614. Cross-pollination of ideas?

- A. Avoiding all ideas from other fields
- B. Copying solutions exactly from others
- C. A gardening technique for plants
- D. Applying concepts from one field to another

Answer: D

Q615. What is agile?

- A. Traditional waterfall development method
- B. Iterative cycles with feedback loops
- C. A one-time release without updates
- D. Quick development without any planning

Answer: B

Q616. Constraint-based creativity?

- A. Remove all constraints to create
- B. Limitations serve as creative catalysts
- C. Ignore all constraints in design
- D. Add unnecessary constraints to work

Answer: B

Q617. What is a hackathon?

- A. A security audit of the platform
- B. A hacking attack on the system
- C. A testing marathon for the app
- D. Time-limited creative solution event

Answer: D

Q618. What is biomimicry?

- A. Studying biology exclusively only
- B. Cloning organisms in a laboratory
- C. Medical research on human diseases
- D. Nature's designs for human problems

Answer: D

Q619. Six Thinking Hats?

- A. A fashion design methodology concept
- B. Different thinking perspectives via hats
- C. Wearing six physical hats at once
- D. Limiting team size to six people

Answer: B

Q620. What is rapid prototyping?

- A. Final development of the product
- B. A very slow development approach
- C. Quick rough models for fast testing
- D. Testing only without any building

Answer: C

Q621. What is load balancing?

- A. Managing the project budget funds
- B. Distributing traffic across servers
- C. Balancing items on a desk surface
- D. Reducing the size of source code

Answer: B

Q622. Cold start problem?

- A. Starting a server in cold weather
- B. Database initialization taking too long
- C. No history for new users or items
- D. A computer boot issue on startup

Answer: C

Q623. What is data privacy?

- A. Deleting all data after collection
- B. Only encrypting data at rest here
- C. Making all data publicly available
- D. Handling personal info per standards

Answer: D

Q624. What is fault tolerance?

- A. Ignoring all faults that occur
- B. Continuing operation despite failures
- C. Removing hardware that has faults
- D. Having no faults in the system

Answer: B

Q625. Technical feasibility?

- A. Whether the team is interested
- B. Can build with available resources
- C. Only the project budget matters
- D. Only the team size is relevant

Answer: B

Q626. Backward compatibility?

- A. Only old code is maintained still
- B. Only old hardware is supported now
- C. New version works with old systems
- D. Running programs in reverse order

Answer: C

Q627. MVP approach?

- A. Build all features before releasing
- B. Smallest core feature set to test
- C. Only planning without implementation
- D. Building nothing and just planning

Answer: B

Q628. What is interoperability?

- A. Avoiding all system integrations
- B. Systems operating independently only
- C. Only one system at a time runs
- D. Systems communicating and working together

Answer: D

Q629. What is CI/CD?

- A. A manual deployment process used
- B. Automate build, test, and deploy
- C. A programming language for web
- D. A database management system type

Answer: B

Q630. Disaster recovery?

- A. Only for natural disaster events
- B. Deleting all backups from storage
- C. Strategies to restore after disruption
- D. Ignoring all disruptions that occur

Answer: C

Q631. What is API documentation?

- A. A marketing brochure for the app
- B. Describes endpoints, params, examples
- C. Internal code comments only written
- D. A testing plan for quality checks

Answer: B

Q632. What is technical spec?

- A. A user guide for end-user features
- B. Detailed technical design and architecture
- C. A marketing brochure for clients
- D. A sales pitch for stakeholders

Answer: B

Q633. Inline vs block comments?

- A. Block comments are for single lines
- B. Inline: single line; block: section
- C. Inline comments are always longer
- D. They are exactly the same thing

Answer: B

Q634. What is RFC/design doc?

- A. Change proposal with rationale given
- B. A financial budget document for project
- C. A test plan for quality assurance
- D. A bug report filed by the team

Answer: A

Q635. Documentation-driven development?

- A. Only writing docs for bugs that are found
- B. Avoiding all documentation in the project
- C. Write docs before code to clarify design
- D. Writing docs only after the project ends

Answer: C

Q636. What is UML?

- A. Just drawing pictures for fun only
- B. Only for database schema diagrams
- C. Standardized software modeling notation
- D. Only for creating flowchart diagrams

Answer: C

Q637. Document the why not what?

- A. Never write any comments at all
- B. Comment every single line of code
- C. Explain reasoning, not restate code
- D. Only document variable names used

Answer: C

Q638. What is knowledge base?

- A. A collection of team passwords stored
- B. A textbook for learning to code
- C. A code repository on version control
- D. Repository of solutions for problems

Answer: D

Q639. Version control for docs?

- A. Track changes with revision history
- B. Deleting old versions of documents
- C. Counting the number of documents
- D. Numbering pages in the document

Answer: A

Q640. What is an ADR?

- A. A blueprint for building construction
- B. A server log of all system events
- C. Architectural decision with context noted
- D. A test result from quality checks

Answer: C

Q641. What distinguishes computational thinking from general problem solving?

- A. It focuses on solutions computers can execute
- B. It ignores data and pattern recognition
- C. It avoids using any logical reasoning skills
- D. It only applies to mathematical equations

Answer: A

Q642. In Polya's method, what does looking back involve?

- A. Reviewing and verifying the solution found
- B. Abandoning the solution without any check
- C. Forgetting all steps that were already taken
- D. Starting the entire problem over from scratch

Answer: A

Q643. How does analogical reasoning help in problem solving?

- A. By applying solutions from similar problems
- B. By avoiding any comparison between cases
- C. By creating entirely new unrelated methods
- D. By ignoring all previously solved problems

Answer: A

Q644. What is means-ends analysis in problem solving?

- A. Reducing difference between current and goal
- B. Randomly selecting any available next action
- C. Ignoring the goal and focusing on the start
- D. Solving unrelated problems simultaneously

Answer: A

Q645. Which best describes the role of feedback in solving?

- A. It replaces the need for initial planning
- B. It should always be completely ignored here
- C. It guides adjustments and improvements now
- D. It only matters after final deployment done

Answer: C

Q646. What happens when a problem is ill-defined?

- A. Every possible approach will definitely succeed
- B. The solution is immediately and easily obvious
- C. Goals and constraints are unclear or ambiguous
- D. No analysis or clarification is ever required

Answer: C

Q647. How does top-down design relate to problem solving?

- A. It starts with details then moves to overview
- B. It solves only the bottom-level sub-problems
- C. It avoids any form of hierarchical thinking
- D. It begins with overview then refines details

Answer: D

Q648. What is the benefit of using pseudocode in planning?

- A. It is only used for database query design
- B. It replaces the actual implementation fully
- C. It compiles and runs like real program code
- D. It describes logic without language specifics

Answer: D

Q649. Which cognitive bias can hinder effective problem solving?

- A. Confirmation bias limiting consideration
- B. Careful review of alternative approaches
- C. Systematic analysis of available evidence
- D. Open-minded evaluation of all options

Answer: A

Q650. What is the relationship between creativity and solving?

- A. Creativity replaces the need for all logic
- B. Creativity has no role in problem solving
- C. Creativity enables novel solution approaches
- D. Creativity only matters in artistic fields

Answer: C

Q651. How does stakeholder analysis contribute to understanding?

- A. It identifies who is affected and their needs
- B. It eliminates the need for requirements review
- C. It replaces technical analysis of the problem
- D. It only focuses on the developer preferences

Answer: A

Q652. What is the purpose of creating a problem taxonomy?

- A. Making problems more confusing to understand
- B. Classifying problems by type and characteristics
- C. Eliminating the need for any further analysis
- D. Reducing all problems to a single type only

Answer: B

Q653. Which technique uses 5 Whys for root cause analysis?

- A. Statistical regression analysis of the data
- B. Single question to find immediate surface cause
- C. Iterative questioning to find deeper causes
- D. Random hypothesis generation without any logic

Answer: C

Q654. What is a fishbone diagram used for in analysis?

- A. Mapping potential causes of a specific problem
- B. Displaying the project timeline and milestones
- C. Showing the organizational hierarchy structure
- D. Tracking daily progress of the development team

Answer: A

Q655. How does gap analysis help in problem understanding?

- A. It only measures the size of the code written
- B. It ignores differences between states entirely
- C. It focuses on past states and ignores the goal
- D. It compares current state to the desired state

Answer: D

Q656. What role do acceptance criteria play in analysis?

- A. They replace the need for testing the solution
- B. They are optional and can be safely left out
- C. They only apply to user interface design tasks
- D. They define when the solution is complete enough

Answer: D

Q657. Why distinguish symptoms from causes in analysis?

- A. Causes are never important in problem analysis
- B. Treating symptoms alone leads to recurring issues
- C. Symptoms and causes are always the same thing
- D. Symptoms always reveal the true root cause here

Answer: B

Q658. What is SWOT analysis in problem solving context?

- A. A method for encrypting sensitive user information
- B. Evaluating strengths, weaknesses, opportunities, threats
- C. A type of algorithm for sorting large data arrays
- D. A technique for compressing files to save space

Answer: B

Q659. How does domain knowledge affect analysis quality?

- A. Domain knowledge enables deeper issue understanding
- B. Domain knowledge only matters for simple problems
- C. Domain knowledge always leads to incorrect analysis
- D. Domain knowledge is irrelevant to analysis quality

Answer: A

Q660. What is the purpose of feasibility analysis?

- A. Determining if the proposed solution is achievable
- B. Skipping the analysis and starting implementation
- C. Eliminating all constraints from the problem scope
- D. Proving that every solution is equally feasible

Answer: A

Q661. What is the contrapositive of If it rains then the ground is wet?

- A. If it does not rain then ground is not wet
- B. If the ground is wet then it definitely rained
- C. If ground is not wet then it did not rain
- D. If the ground is wet then it did not rain

Answer: C

Q662. What is modus ponens as a rule of inference?

- A. If P implies Q and P is false then Q is true
- B. If P implies Q and P is true then Q is true
- C. If P implies Q and Q is false then P is true
- D. If P implies Q and Q is true then P is true

Answer: B

Q663. What is the difference between validity and soundness?

- A. Soundness only concerns form not actual truth
- B. Validity concerns form while soundness adds truth
- C. Neither concept is relevant to logical reasoning
- D. They mean exactly the same thing in all cases

Answer: B

Q664. Which logical equivalence is known as De Morgan's Law?

- A. $\text{NOT}(A \text{ OR } B)$ equals $(\text{NOT } A) \text{ OR } (\text{NOT } B)$
- B. $\text{NOT}(A \text{ AND } B)$ equals $(\text{NOT } A) \text{ OR } (\text{NOT } B)$
- C. $\text{NOT}(A \text{ AND } B)$ equals $(\text{NOT } A) \text{ AND } (\text{NOT } B)$
- D. $(A \text{ AND } B)$ equals $\text{NOT}(\text{NOT } A \text{ OR } \text{NOT } B \text{ AND } C)$

Answer: B

Q665. What is proof by contradiction?

- A. Providing a direct proof from given premises here
- B. Assuming opposite is true and showing a conflict
- C. Using examples to demonstrate the statement true
- D. Assuming the conclusion is true then verifying

Answer: B

Q666. What does the exclusive OR operation return?

- A. True only when both inputs are actually true
- B. True when both inputs have the same value
- C. True when exactly one input is true not both
- D. True only when both inputs are actually false

Answer: C

Q667. A valid argument with a false conclusion has what?

- A. At least one false premise in the reasoning
- B. An informal logical fallacy in the reasoning
- C. An inductive argument based on strong evidence
- D. A sound argument with reliable conclusions

Answer: A

Q668. How does propositional logic differ from predicate logic?

- A. Propositional logic uses quantifiers over domains
- B. Predicate logic adds quantifiers and predicates
- C. They are identical in expressive power and scope
- D. Propositional logic is more expressive than predicate

Answer: B

Q669. What is the law of excluded middle in classical logic?

- A. A statement is either true or false no third option
- B. Some statements have no truth value whatsoever
- C. A statement can be both true and false at once
- D. Logic only applies to mathematical statements made

Answer: A

Q670. What is a tautology in propositional logic?

- A. A statement that is always false for all values
- B. A statement that depends on context for truth
- C. A statement that is true for all possible values
- D. A statement that cannot be evaluated at all now

Answer: C

Q671. What is the key difference between while and do-while?

- A. A while loop always executes at least one time
- B. A do-while loop never executes the loop body
- C. A do-while executes body at least once first
- D. Both loops behave in exactly the same manner

Answer: C

Q672. What is a nested loop in algorithm design?

- A. A loop that runs exactly once then stops forever
- B. Two loops running in parallel at the same time
- C. A loop placed inside another loop structure here
- D. A loop that never terminates under any condition

Answer: C

Q673. What does a break statement do inside a loop?

- A. It pauses the loop for a specified time period
- B. It exits the loop immediately when it executes
- C. It restarts the loop from the very beginning
- D. It doubles the speed of the loop iterations

Answer: B

Q674. What is a sentinel value in loop control?

- A. A random value used to start the loop running
- B. A special value that signals end of input data
- C. An error value that crashes the program here
- D. The first value always processed in every loop

Answer: B

Q675. How does switch-case differ from if-else chains?

- A. If-else chains are never used in any programs
- B. Switch-case cannot handle any conditions at all
- C. Switch-case only supports two possible outcomes
- D. Switch-case matches a value against multiple cases

Answer: D

Q676. What is an infinite loop and when is it intentional?

- A. A loop that runs forever, used in event-driven code
- B. A loop that always runs exactly five times at most
- C. A loop that cannot be written in any programming code
- D. A compiler error that prevents program from running

Answer: A

Q677. What does the continue statement do in a loop?

- A. It stops the loop entirely and exits the code
- B. It reverses the direction of the loop execution
- C. It skips remaining body and goes to next iteration
- D. It duplicates the current iteration one extra time

Answer: C

Q678. What is a swim lane diagram used for in flowcharts?

- A. Showing which actor performs each process step
- B. Counting the number of variables in the program
- C. Displaying the color scheme of the user interface
- D. Measuring the execution speed of each algorithm

Answer: A

Q679. How does recursion relate to flow control?

- A. A function calling itself to solve smaller instances
- B. Recursion always runs faster than iterative loops
- C. Recursion never involves any function calls at all
- D. Recursion eliminates the need for base conditions

Answer: A

Q680. What is short-circuit evaluation in conditional flow?

- A. Randomly skipping some conditions during evaluation
- B. Evaluating all conditions regardless of early results
- C. Always evaluating every condition fully before acting
- D. Stopping evaluation when the outcome is determined

Answer: D

Q681. How does a hash table provide efficient data lookup?

- A. It stores data randomly without any structure
- B. It maps keys to indices using a hash function
- C. It searches through every element sequentially
- D. It sorts all data before every lookup operation

Answer: B

Q682. What is the difference between a stack and a queue?

- A. Stack is LIFO while queue follows the FIFO order
- B. Stack is FIFO while queue follows the LIFO order
- C. Both follow LIFO ordering for all their elements
- D. Both follow FIFO ordering for all their elements

Answer: A

Q683. Why is Unicode preferred over ASCII for text?

- A. Unicode only supports the English alphabet letters
- B. Unicode supports characters from all world languages
- C. ASCII already supports every language in the world
- D. Unicode uses fewer bytes than ASCII for every text

Answer: B

Q684. What is a linked list's advantage over an array?

- A. Linked lists use less memory for each stored item
- B. Linked lists provide faster random element access
- C. Linked lists allow efficient insertion and deletion
- D. Linked lists have better cache performance overall

Answer: C

Q685. How does floating-point handle decimal numbers?

- A. It converts all decimals to exact integer values
- B. It uses mantissa and exponent for approximation
- C. It stores decimals with exact infinite precision
- D. It only handles whole numbers with no decimals

Answer: B

Q686. What is data normalization in database design?

- A. Deleting all tables and recreating from scratch
- B. Making all data values uppercase text strings
- C. Organizing data to reduce redundancy and dependency
- D. Duplicating data across many tables for speed

Answer: C

Q687. What is the purpose of an abstract data type?

- A. To eliminate the need for any data structures here
- B. To expose all implementation details to the user
- C. To define behavior independently of implementation
- D. To force one specific implementation approach only

Answer: C

Q688. How does two's complement represent negative integers?

- A. By adding a minus sign before the binary number
- B. By inverting all bits and adding one to the result
- C. By storing the sign in a completely separate byte
- D. By using only positive numbers for all integers

Answer: B

Q689. What is a graph data structure used to represent?

- A. Relationships between entities as nodes and edges
- B. Only linear sequential data ordered by position
- C. A chart displayed on a computer monitor screen
- D. A single variable holding one value at a time

Answer: A

Q690. What is serialization in data representation?

- A. Running multiple processes at the exact same time
- B. Permanently deleting data from all storage systems
- C. Converting data to a format for storage or transfer
- D. Displaying data on a graphical user interface only

Answer: C

Q691. How do design patterns help software developers?

- A. They create unique solutions for every new problem
- B. They eliminate the need for any coding entirely
- C. They only apply to user interface design alone
- D. They provide tested reusable solution templates

Answer: D

Q692. What is the Observer pattern used for?

- A. Notifying multiple objects when a state changes
- B. Ensuring only one instance of a class exists
- C. Preventing any communication between components
- D. Sorting elements in a collection by value order

Answer: A

Q693. How does regular expression pattern matching work?

- A. It only works with numerical data not text at all
- B. It randomly selects text from a given document
- C. It matches text against a defined symbolic pattern
- D. It creates new text rather than matching existing

Answer: C

Q694. What distinguishes the Singleton from other patterns?

- A. It ensures a class has only one global instance
- B. It creates objects without specifying their class
- C. It creates unlimited instances of the given class
- D. It clones existing objects to create new instances

Answer: A

Q695. How does the Strategy pattern enable flexible algorithms?

- A. It hardcodes the algorithm directly into the client
- B. It encapsulates algorithms to make them swappable
- C. It prevents changing algorithms after initial setup
- D. It uses only one algorithm for all situations given

Answer: B

Q696. What role does feature extraction play in recognition?

- A. It adds noise to make pattern recognition more hard
- B. It removes all characteristics from the input data
- C. It identifies the most relevant characteristics used
- D. It ignores all features and uses random selection

Answer: C

Q697. How does MVC pattern separate concerns in design?

- A. It separates model, view, and controller components
- B. It only separates the database from the application
- C. It combines all code into one single monolithic file
- D. It merges user interface with business logic together

Answer: A

Q698. What is anomaly detection in pattern recognition?

- A. Deleting all data that follows expected patterns
- B. Finding patterns that match the expected baseline
- C. Ignoring unusual data to focus on common trends
- D. Identifying data points that deviate from normal

Answer: D

Q699. How does the Factory pattern help manage creation?

- A. It delegates creation to a method or subclass here
- B. It requires knowing the exact class to instantiate
- C. It only works with primitive data types not objects
- D. It prevents any new objects from being created now

Answer: A

Q700. What is clustering in pattern recognition?

- A. Assigning data to already known fixed categories here
- B. Deleting data points that are similar to each other
- C. Spreading data points as far apart as possible now
- D. Grouping similar data points without predefined labels

Answer: D

Q701. How is mathematical induction used to prove statements?

- A. By assuming the conclusion without any proof at all
- B. By testing every natural number one at a time here
- C. By using only examples without any formal reasoning
- D. By proving base case and that step k implies step $k+1$

Answer: D

Q702. What is the relationship between logarithms and exponents?

- A. Logarithms are the inverse operation of exponents
- B. Exponents are a special case of logarithm functions
- C. Logarithms and exponents give the same exact result
- D. They are completely unrelated math operations here

Answer: A

Q703. How does the pigeonhole principle apply to problem solving?

- A. It proves that distribution is always exactly even
- B. If items exceed containers at least one has two items
- C. It states every container will always remain empty
- D. It only applies to problems involving actual pigeons

Answer: B

Q704. What is the significance of base-2 logarithms in CS?

- A. They represent the halving steps in divide-and-conquer
- B. They are never used in algorithm time complexity work
- C. They measure the linear growth of algorithm runtime
- D. They only apply to algorithms with constant runtime

Answer: A

Q705. How do permutations differ from combinations in counting?

- A. Permutations ignore order while combinations respect it
- B. Permutations consider order while combinations do not
- C. Both permutations and combinations always ignore order
- D. Both permutations and combinations always respect order

Answer: B

Q706. What is the purpose of modular arithmetic in CS?

- A. It eliminates the need for division operations here
- B. It replaces all arithmetic with simpler string operations
- C. It handles cyclic computations like hashing and crypto
- D. It only works with even numbers in all calculations

Answer: C

Q707. How does a math function relate to a programming function?

- A. Programming functions never return any output values
- B. Math functions can only handle numerical input data
- C. Math functions have no relation to programming ones
- D. Both map inputs to outputs based on defined rules

Answer: D

Q708. What does Big-O notation describe mathematically?

- A. The minimum possible time any algorithm can achieve
- B. The average case performance of every algorithm run
- C. The exact running time of a given algorithm here
- D. The upper bound growth rate of a function or algorithm

Answer: D

Q709. How are sets useful for solving collection problems?

- A. Sets have no operations defined for them at all here
- B. Sets allow duplicate elements in the collection given
- C. Sets can only contain numerical values nothing more
- D. Sets model unique elements with union and intersection

Answer: D

Q710. What is the significance of Fibonacci in problem solving?

- A. It is a random sequence with no mathematical pattern
- B. It only appears in recreational math puzzles alone
- C. It has no application in computer science at all here
- D. It models growth patterns in nature and algorithms

Answer: D

Q711. How does binary search achieve $O(\log n)$ time?

- A. It halves the search space with each comparison made
- B. It checks every element in the array sequentially
- C. It uses extra memory to store all comparison results
- D. It sorts the array before performing the search here

Answer: A

Q712. What differs between stable and unstable sorting?

- A. Stable sorts are always faster than unstable ones here
- B. Unstable sorts always preserve order of equal elements
- C. Stable sorts preserve relative order of equal elements
- D. The distinction has no practical significance at all

Answer: C

Q713. Why is data structure choice important for efficiency?

- A. All data structures perform exactly the same in practice
- B. Data structures have no effect on algorithm performance
- C. The right structure optimizes time and space complexity
- D. Data structures only affect code readability not speed

Answer: C

Q714. What is the key idea behind dynamic programming?

- A. Storing solutions to subproblems to avoid recomputation
- B. Solving each subproblem repeatedly from scratch always
- C. Using random choices to find an approximate solution
- D. Solving the problem without breaking it into any parts

Answer: A

Q715. How does a hash function contribute to $O(1)$ lookup?

- A. It searches through all elements in sorted order here
- B. It uses binary search on the underlying array structure
- C. It maps keys directly to array indices for fast access
- D. It sorts all elements before every lookup operation run

Answer: C

Q716. What problem does the traveling salesman represent?

- A. Finding the shortest path between two specific nodes
- B. Sorting a list of city names in alphabetical order now
- C. Finding the minimum cost tour visiting all cities once
- D. Counting the number of cities in a given country here

Answer: C

Q717. What is backtracking in algorithmic problem solving?

- A. Always choosing the first available option and staying
- B. Exploring paths and reverting when they lead to failure
- C. Randomly jumping between different solution candidates
- D. Moving forward without ever reconsidering past choices

Answer: B

Q718. How does merge sort achieve guaranteed $O(n \log n)$?

- A. It divides the array and merges sorted halves repeatedly
- B. It randomly shuffles elements until they are sorted now
- C. It uses a single pass through the data without splitting
- D. It compares every pair of elements in the entire array

Answer: A

Q719. What is the purpose of a priority queue?

- A. Randomly selecting elements for processing each time
- B. Processing elements in the order they were inserted
- C. Always processing the highest priority element first
- D. Storing elements without any ordering consideration

Answer: C

Q720. What is the space-time tradeoff in algorithm design?

- A. Space and time always increase together simultaneously
- B. Using more space can reduce time and vice versa here
- C. Space and time are completely independent of each other
- D. Reducing space always also reduces the time required

Answer: B

Q721. How does the straw man fallacy misrepresent arguments?

- A. By distorting the argument to make it easier to attack
- B. By ignoring the argument and discussing another topic
- C. By accurately representing the original argument
- D. By strengthening the argument before responding to it

Answer: A

Q722. What is the appeal to authority fallacy?

- A. Consulting specialists before making important decisions
- B. Citing a relevant expert in the field of discussion
- C. Claiming truth because an authority said so not evidence
- D. Using evidence and data to support a logical argument

Answer: C

Q723. How does the sunk cost fallacy affect decisions?

- A. Past investments irrationally influence future choices
- B. It always leads to the most profitable decisions taken
- C. It encourages ignoring all previous investments made
- D. It helps make rational forward-looking decisions here

Answer: A

Q724. What differs between correlation and causation?

- A. Correlation and causation are the same concept exactly
- B. Correlation shows relationship while causation shows cause
- C. Correlation always proves one thing causes another
- D. Causation never requires any evidence to establish here

Answer: B

Q725. How does Occam's Razor guide critical thinking?

- A. It eliminates the need for any evidence or reasoning
- B. It says the most complex explanation is usually best
- C. The simplest adequate explanation is usually preferred
- D. It requires considering only one possible explanation

Answer: C

Q726. What is a false dilemma in argumentation?

- A. Offering too many options making the choice impossible
- B. Presenting all available options for fair evaluation
- C. Presenting only two options when more actually exist
- D. Accurately describing the limited available options here

Answer: C

Q727. How does the Dunning-Kruger effect impact solving?

- A. It ensures accurate self-assessment of all abilities
- B. It has no effect on problem solving or decision making
- C. Low ability individuals may overestimate their competence
- D. High ability individuals always overestimate their skills

Answer: C

Q728. What is the bandwagon fallacy?

- A. Rejecting an idea because too many people accept it
- B. Forming conclusions based on strong evidence and logic
- C. Assuming something is true because many people believe it
- D. Carefully evaluating popular opinions before acceptance

Answer: C

Q729. How does devil's advocate improve decision making?

- A. By deliberately arguing against to expose weaknesses
- B. By preventing any discussion of alternative viewpoints
- C. By always agreeing with the group without questioning
- D. By accepting the first proposed solution immediately

Answer: A

Q730. What differs between deductive and inductive strength?

- A. Deductive arguments are certain while inductive probable
- B. Inductive are always certain while deductive are not
- C. Neither type of argument provides any certainty at all
- D. Both provide the same level of certainty in all cases

Answer: A

Q731. What is rubber duck debugging?

- A. A proprietary tool made by a company called RubberDuck
- B. Randomly changing code until the error goes away now
- C. Using an actual rubber duck to fix code errors here
- D. Explaining code line-by-line to find errors by talking

Answer: D

Q732. How does binary search debugging help isolate a bug?

- A. It halves the suspicious code region with each test
- B. It only works when there is exactly one bug present
- C. It requires sorting the code alphabetically first here
- D. It tests every line of code one at a time in order

Answer: A

Q733. What is a regression bug?

- A. A bug that fixes itself without any developer action
- B. A bug introduced by changes that broke working features
- C. A bug that only appears on the first run of program
- D. A bug that exists in the very first version of code

Answer: B

Q734. What is the purpose of logging in error analysis?

- A. Logging replaces the need for any testing procedures
- B. Logging slows programs and provides no real value
- C. Logging is only useful during initial development here
- D. Logging records events and data for post-mortem analysis

Answer: D

Q735. How do assertions help catch bugs early?

- A. They only work in production not development environments
- B. Assertions have no effect on catching bugs at all here
- C. They validate assumptions and fail fast when violated
- D. Assertions slow the program without providing any value

Answer: C

Q736. What is a memory leak and how is it detected?

- A. A fast and efficient use of all available system memory
- B. Unreleased memory growing over time detected by profiling
- C. A type of syntax error caught during code compilation
- D. A physical leak of liquid from computer hardware here

Answer: B

Q737. How do unit and integration testing differ for bugs?

- A. Both test exactly the same scope of functionality here
- B. Unit tests are always more comprehensive than integration
- C. Unit tests check components while integration checks interactions
- D. Integration tests replace the need for any unit testing

Answer: C

Q738. How does version control help in debugging?

- A. Version control only stores the latest version of code
- B. It automatically fixes all bugs without developer action
- C. Version control has no relationship to debugging at all
- D. It allows comparing changes to identify when bugs appeared

Answer: D

Q739. What is a null pointer exception?

- A. A valid operation that always succeeds without any issue
- B. An error from accessing a reference that points to nothing
- C. An efficient way to manage memory in any program here
- D. A type of optimization that improves program performance

Answer: B

Q740. What role does code review play in preventing bugs?

- A. Reviews should only happen after bugs are found in code
- B. Code review only focuses on formatting not logic errors
- C. Peers examine code to catch errors before deployment now
- D. Code review is a waste of time and finds no bugs here

Answer: C

Q741. What is the time complexity of binary search?

- A. $O(1)$ constant time regardless of the array size
- B. $O(\log n)$ logarithmic time by halving search space
- C. $O(n)$ linear time for the search operation given
- D. $O(n^2)$ quadratic time for comparing element pairs

Answer: B

Q742. What is the best-case time complexity of quicksort?

- A. $O(1)$ when the array has only a single element in
- B. $O(n \log n)$ when pivots divide the array evenly
- C. $O(n^2)$ when the pivot is always the worst choice
- D. $O(n)$ when the array is already sorted in order

Answer: B

Q743. How do hash table operations degrade with many collisions?

- A. Collisions have no effect on the performance at all
- B. Performance improves significantly with collisions
- C. Hash tables never experience any collisions at all
- D. Operations degrade from $O(1)$ average to $O(n)$ worst

Answer: D

Q744. What is the space complexity of recursion with depth d ?

- A. Space complexity is unaffected by recursion depth
- B. $O(1)$ constant space regardless of recursion depth
- C. $O(d)$ due to the call stack frames stored in memory
- D. $O(n^2)$ quadratic space for all recursive algorithms

Answer: C

Q745. Why is $O(2^n)$ considered impractical for large inputs?

- A. $O(2^n)$ grows slower than $O(n)$ for all input sizes
- B. Exponential algorithms are the most efficient overall
- C. Exponential growth makes computation time infeasible
- D. It is actually faster than linear for large inputs

Answer: C

Q746. What is the complexity of inserting at linked list head?

- A. $O(n^2)$ because the entire list must be reorganized
- B. $O(n)$ because all elements must be shifted forward
- C. $O(\log n)$ because binary search finds insertion point
- D. $O(1)$ because only pointer adjustments are needed

Answer: D

Q747. How does matrix multiplication complexity impact design?

- A. Standard matrix multiplication is $O(n^3)$ which is costly
- B. Matrix multiplication has $O(1)$ constant time complexity
- C. Matrix multiplication complexity has no practical impact
- D. Standard matrix multiplication is always $O(n)$ time

Answer: A

Q748. What does amortized analysis tell us about operations?

- A. Every single operation has the exact same cost always
- B. The average cost per operation over many operations here
- C. Amortized analysis ignores all expensive operations now
- D. Only the most expensive operation matters for analysis

Answer: B

Q749. What is the relationship between $O(n \log n)$ and $O(n^2)$?

- A. $O(n^2)$ grows slower than $O(n \log n)$ for large inputs
- B. Both grow at exactly the same rate for all input sizes
- C. $O(n \log n)$ is always worse than $O(n^2)$ in every case
- D. $O(n \log n)$ grows slower than $O(n^2)$ for large inputs

Answer: D

Q750. How does choosing list versus set affect complexity?

- A. Lists always have better performance than sets entirely
- B. Sets offer $O(1)$ lookup while lists require $O(n)$ search
- C. Lists and sets have identical performance for all tasks
- D. The choice between list and set never affects performance

Answer: B

Q751. How does modular programming improve problem solving?

- A. It prevents any code reuse across different programs
- B. It puts all code in one file for simplicity of access
- C. It breaks solutions into independent reusable modules
- D. It eliminates the need for functions in the code base

Answer: C

Q752. What advantage does recursion have for tree problems?

- A. Recursion always uses less memory than iterative ways
- B. Tree structures naturally match recursive decomposition
- C. Recursion cannot handle any tree structure at all
- D. Trees can only be traversed using iterative approaches

Answer: B

Q753. How does exception handling improve robustness?

- A. It prevents all errors from occurring in the program
- B. It makes programs run faster by skipping error checks
- C. It gracefully manages errors without crashing program
- D. It eliminates the need for any input validation checks

Answer: C

Q754. What benefit do dictionaries provide for lookup problems?

- A. Dictionaries enable fast $O(1)$ average key-value lookups
- B. Dictionaries require sorting before any lookup is done
- C. Dictionaries can only store numerical data values now
- D. Dictionaries provide slow key-value pair access speed

Answer: A

Q755. How does the DRY principle improve maintainability?

- A. By making code as long and verbose as possible always
- B. By avoiding all abstraction to keep code very simple
- C. By duplicating code in many places for redundancy
- D. By eliminating repetition through abstraction and reuse

Answer: D

Q756. What role does algorithm selection play in solving?

- A. Any algorithm works equally well for every problem
- B. Choosing the right algorithm significantly impacts speed
- C. The fastest algorithm is the one with the most code
- D. Algorithm selection has no effect on execution at all

Answer: B

Q757. How does test-driven development improve quality?

- A. Writing tests first clarifies requirements before coding
- B. TDD eliminates the need for any code review process
- C. Tests are written after the code is fully complete
- D. TDD makes programs run faster than other approaches

Answer: A

Q758. What advantage do list comprehensions provide?

- A. They express transformations concisely and readably
- B. They prevent any filtering of data from the lists
- C. They make code longer and harder to understand here
- D. They always run slower than traditional loop methods

Answer: A

Q759. How do enumerations improve code clarity?

- A. They make code harder to understand and maintain now
- B. They define named constants for a set of related values
- C. They prevent any constants from being used in code
- D. They replace named constants with magic numbers here

Answer: B

Q760. What is the purpose of input validation?

- A. To accept all input without any checking whatsoever
- B. To reject all input regardless of its correctness here
- C. To slow down the program by adding unnecessary checks
- D. To ensure input meets expected format before processing

Answer: D

Q761. How does hypothesis testing help in data-driven solving?

- A. It replaces the need for any analysis of the data given
- B. It always confirms whatever hypothesis was proposed here
- C. It eliminates the need for any data collection at all
- D. It validates or rejects claims based on statistical evidence

Answer: D

Q762. What is the purpose of data visualization?

- A. To make data harder to understand and interpret here
- B. To store data more efficiently on the computer disk now
- C. To replace the need for any numerical analysis entirely
- D. To reveal patterns and insights through visual representation

Answer: D

Q763. What differs between qualitative and quantitative data?

- A. Quantitative data describes qualities not numerical values
- B. Qualitative describes qualities while quantitative measures
- C. Qualitative data can only be collected through surveys
- D. They are exactly the same type of data in all cases

Answer: B

Q764. How does A/B testing help in data-driven decisions?

- A. It eliminates the need for any control group in testing
- B. It compares two variants to determine which performs better
- C. It randomly assigns outcomes without measuring results
- D. It tests only one version without any comparison done

Answer: B

Q765. What is a key performance indicator used for?

- A. Tracking the number of emails received by the team
- B. Counting the number of lines of code written daily
- C. Measuring the physical weight of computer hardware
- D. Measuring progress toward specific business objectives

Answer: D

Q766. What is the purpose of exploratory data analysis?

- A. To skip all analysis and go directly to implementation
- B. To replace the need for any hypothesis testing process
- C. To discover patterns and anomalies before formal analysis
- D. To confirm predetermined conclusions without question

Answer: C

Q767. How does data normalization help when combining sources?

- A. It deletes data that does not match a specific format
- B. It scales data to a common range for fair comparison
- C. It prevents any data from multiple sources combined
- D. It makes data from different sources incompatible here

Answer: B

Q768. What role does statistical significance play in decisions?

- A. It has no bearing on the reliability of analysis results
- B. It guarantees the result will apply to all future cases
- C. It indicates results are likely due to chance variation
- D. It indicates results are unlikely due to chance alone

Answer: D

Q769. What is a data pipeline?

- A. A type of chart used for data visualization purposes
- B. A one-time manual data entry process for single use
- C. An automated flow for collecting and processing data
- D. A physical pipe that carries data through wires here

Answer: C

Q770. How does sampling bias affect conclusion validity?

- A. Sampling bias has no effect on conclusion validity here
- B. Sampling bias improves the accuracy of all conclusions
- C. Non-representative samples lead to misleading conclusions
- D. Only very large samples can have any sampling bias now

Answer: C

Q771. How does SCAMPER stimulate creative problem solving?

- A. It only works for product design not software solutions
- B. It provides a single fixed solution for every problem
- C. It uses prompts like substitute combine adapt to explore
- D. It eliminates the need for any creative thinking effort

Answer: C

Q772. What is design thinking's approach to creative solving?

- A. It skips understanding users and goes to building
- B. It eliminates the need for any user research or input
- C. It centers on empathy ideation prototyping and testing
- D. It follows a rigid linear process without iteration

Answer: C

Q773. How does cross-domain thinking enhance solutions?

- A. It only works when both domains are exactly identical
- B. It applies concepts from other fields to the problem
- C. It limits thinking to only one specific domain area
- D. It prevents any knowledge transfer between domains

Answer: B

Q774. What is rapid prototyping in creative problem solving?

- A. Avoiding prototypes and going to full production now
- B. Building a final polished product on the first attempt
- C. Spending years perfecting a prototype before testing
- D. Quickly creating a rough model to test ideas and learn

Answer: D

Q775. How does fail fast support creative innovation?

- A. Quick failures provide early learning to redirect effort
- B. Failing fast always results in permanent project failure
- C. It encourages building perfect solutions on first try
- D. It means giving up after the first minor setback here

Answer: A

Q776. What is divergent thinking and when is it most useful?

- A. It replaces the need for any convergent thinking here
- B. Narrowing down to a single solution immediately given
- C. Generating many different ideas during idea exploration
- D. It is only useful at the very end of problem solving

Answer: C

Q777. How does constraint-based creativity use limitations?

- A. Removing all constraints is the only path to creativity
- B. Constraints make every solution worse without exception
- C. Limitations force exploration of non-obvious solutions
- D. Constraints always prevent any creative thinking at all

Answer: C

Q778. What is the role of incubation in creative solving?

- A. It requires constant active focus without any breaks
- B. Incubation wastes time that should be spent working now
- C. Stepping away allows subconscious processing to happen
- D. It only works for artistic problems not technical ones

Answer: C

Q779. How does yes and from improv enhance creative collaboration?

- A. It requires saying no to all suggestions made by others
- B. It encourages rejecting every idea from team members
- C. It prevents any collaboration between team members now
- D. It builds on others ideas rather than dismissing them

Answer: D

Q780. What is reverse brainstorming?

- A. It prevents any new ideas from being generated at all
- B. It generates ideas in the usual forward direction only
- C. It asks how to cause the problem to find solutions
- D. It only works for problems that have been solved before

Answer: C

Q781. How does agile address uncertainty in projects?

- A. It eliminates all uncertainty through upfront planning
- B. It embraces change through iterative incremental delivery
- C. It prevents any changes once the project has started here
- D. It requires complete specifications before any work starts

Answer: B

Q782. What is technical debt and why does it matter?

- A. Shortcuts now that increase future maintenance effort
- B. It is a financial obligation to purchase new hardware
- C. Technical debt always improves long-term code quality
- D. It has no effect on future development speed at all

Answer: A

Q783. How does risk management improve project outcomes?

- A. It identifies and mitigates potential problems proactively
- B. It replaces the need for any contingency planning done
- C. Risk management is only needed for very large projects
- D. It eliminates all risks from the project completely

Answer: A

Q784. What is the minimum viable product approach?

- A. Launching with core features to validate and iterate
- B. Waiting until every feature is perfect before release
- C. Delivering a product with no features at all to users
- D. Building the most feature-complete product on first try

Answer: A

Q785. How does scope creep affect project delivery?

- A. Scope creep always improves project quality and timeline
- B. Adding features always speeds up project completion time
- C. Scope creep has no negative effects on any project work
- D. Uncontrolled additions can delay delivery and increase cost

Answer: D

Q786. Why is documentation important in projects?

- A. Documentation is never read by anyone on the team here
- B. Only large enterprise projects need any documentation now
- C. Documentation slows development without any benefits here
- D. It preserves knowledge and enables maintenance onboarding

Answer: D

Q787. How does continuous integration improve quality?

- A. By preventing any changes to the code after initial release
- B. By frequently merging and testing changes automatically
- C. By requiring manual testing of every change by the team
- D. By integrating code changes only at the end of project

Answer: B

Q788. What role does prioritization play in problem solving?

- A. Prioritization prevents any tasks from being completed
- B. All tasks are equally important and should be done at once
- C. It focuses resources on the most impactful tasks first
- D. Only the easiest tasks should be prioritized for completion

Answer: C

Q789. How does UX design relate to real-world problem solving?

- A. It replaces the need for any functional requirements here
- B. It ensures solutions are usable and meet user needs well
- C. UX design only matters for games not business applications
- D. User experience is unrelated to problem solving entirely

Answer: B

Q790. What is the purpose of a retrospective?

- A. To plan the next five years of the project in detail
- B. To assign blame for any mistakes made during sprint
- C. To celebrate success without identifying improvements
- D. To reflect on what worked and what needs improvement

Answer: D

Q791. How do architecture decision records improve decisions?

- A. They document context, decision, and consequences here
- B. They prevent any future decisions from being made
- C. They replace the need for any team discussions given
- D. They are only useful for very large enterprise projects

Answer: A

Q792. What is the benefit of diagrams in technical communication?

- A. They convey complex relationships visually and concisely
- B. Diagrams make documentation more confusing than text
- C. They replace the need for any written explanation text
- D. Diagrams are only useful for non-technical audiences

Answer: A

Q793. How does a runbook improve operational problem solving?

- A. It provides step-by-step procedures for common scenarios
- B. Runbooks are only needed for new team members starting
- C. It replaces the need for any operational knowledge
- D. It eliminates the possibility of any operational errors

Answer: A

Q794. What is the purpose of a project status report?

- A. To communicate progress, risks, and blockers transparently
- B. To replace all other forms of project communication
- C. To document only successes and never mention issues
- D. To hide problems from stakeholders and management

Answer: A

Q795. How does API documentation help developers?

- A. API documentation is only needed for internal use here
- B. They describe endpoints, parameters, and expected behaviors
- C. They replace the need for any testing of integrations
- D. API docs prevent any integration from being possible

Answer: B

Q796. What is the value of post-mortem documents?

- A. They are only required by policy not for any learning
- B. To capture lessons learned and prevent future recurrence
- C. Post-mortems have no value for improving reliability
- D. To assign blame to the person who caused incident

Answer: B

Q797. How does a changelog help track software evolution?

- A. It summarizes notable changes between software versions
- B. They only list bug fixes never mentioning new features
- C. It replaces the need for any version control system
- D. Changelogs make software harder to use and understand

Answer: A

Q798. What is the purpose of a design document?

- A. To propose and discuss a technical approach before building
- B. Design documents are never read by anyone on the team
- C. To record the final code implementation line by line
- D. To list all the technologies the developer knows well

Answer: A

Q799. How does structured commit formatting improve communication?

- A. It makes commit messages longer without adding value
- B. Only the first line of commit messages matters at all
- C. It enables automated changelog generation and tracking
- D. Commit format has no effect on project communication

Answer: C

Q800. What role does technical writing play for non-experts?

- A. It eliminates the need for any diagrams or visual aids
- B. Technical writing should only target expert audiences
- C. It translates complex concepts into accessible explanations
- D. Technical writing makes content harder to understand

Answer: C

Q801. How does the generate-and-test strategy work in problem solving?

- A. It avoids generating any solutions
- B. It creates possible solutions and tests each against the requirements
- C. It only uses the first solution found
- D. It eliminates testing entirely

Answer: B

Q802. What is the difference between a problem and a puzzle in computer science?

- A. They are identical concepts
- B. A problem has practical significance while a puzzle is typically recreational with a known solution
- C. Puzzles are harder than problems
- D. Problems have no solutions

Answer: B

Q803. Which problem-solving strategy involves starting from the desired outcome and working backward?

- A. Forward chaining
- B. Working backward
- C. Random search
- D. Brute force

Answer: B

Q804. How does collaboration improve the problem-solving process?

- A. It slows everything down
- B. Different perspectives and expertise can lead to better solutions
- C. It creates more problems
- D. Collaboration is never useful

Answer: B

Q805. What is the role of mental models in problem solving?

- A. They make thinking slower
- B. They provide simplified representations of how things work to guide reasoning
- C. They are only useful in psychology
- D. They prevent creative solutions

Answer: B

Q806. Why might simplifying assumptions be useful when solving complex problems?

- A. They always lead to wrong answers
- B. They reduce complexity to make the problem tractable while preserving key features
- C. They eliminate the need for analysis
- D. They are only used by beginners

Answer: B

Q807. What distinguishes algorithmic problem solving from heuristic problem solving?

- A. They are the same thing
- B. Algorithmic guarantees a correct solution; heuristic provides a good-enough solution faster
- C. Heuristic always gives the best answer
- D. Algorithmic is always faster

Answer: B

Q808. What is the importance of recognizing problem types in computer science?

- A. It has no importance
- B. Knowing the problem type helps select appropriate solving strategies and algorithms
- C. It only matters for exams
- D. It makes problems harder

Answer: B

Q809. How does the concept of incremental development relate to problem solving?

- A. It means solving the entire problem at once
- B. It involves building a solution step by step, testing at each stage
- C. It skips the planning phase
- D. It only applies to large teams

Answer: B

Q810. What is the relationship between problem representation and solution efficiency?

- A. Representation has no effect
- B. A good representation can make the solution much easier to find
- C. Only one representation exists for any problem
- D. Representation only affects readability

Answer: B

Q811. How does impact analysis help in understanding a proposed change?

- A. It has no value
- B. It identifies what parts of the system will be affected by a change and assesses the risks
- C. It only measures performance
- D. It replaces testing

Answer: B

Q812. What is the purpose of creating a problem decomposition tree?

- A. To make the problem look bigger
- B. To break a complex problem into a hierarchy of smaller, manageable sub-problems
- C. To avoid solving the problem
- D. It is only decorative

Answer: B

Q813. How do non-functional requirements differ from functional requirements in analysis?

- A. They are identical
- B. Functional requirements define what the system does; non-functional define how well it performs
- C. Non-functional requirements are optional
- D. Functional requirements are less important

Answer: B

Q814. What is the purpose of creating a context diagram during analysis?

- A. To draw pretty pictures
- B. To show the system boundary and its interactions with external entities
- C. To write code
- D. To replace all documentation

Answer: B

Q815. Why is it important to distinguish between causes and symptoms in problem analysis?

- A. They are always the same
- B. Fixing symptoms without addressing root causes leads to recurring problems
- C. Symptoms do not exist
- D. Causes are always obvious

Answer: B

Q816. How does benchmarking contribute to problem analysis?

- A. It has no contribution
- B. It provides reference points by comparing against known standards or competitors
- C. It slows down analysis
- D. It only applies to hardware

Answer: B

Q817. What is a decision table used for in problem analysis?

- A. Tracking expenses
- B. Mapping combinations of conditions to their corresponding actions systematically
- C. Storing data
- D. Scheduling tasks

Answer: B

Q818. How does Pareto analysis help prioritize problems?

- A. It solves all problems equally
- B. It identifies the vital few causes that produce the majority of effects
- C. It ignores important issues
- D. It only works for manufacturing

Answer: B

Q819. What is the role of traceability in requirements analysis?

- A. It is unnecessary overhead
- B. It links requirements to their sources, tests, and implementations for accountability
- C. It slows development
- D. It only matters for documentation

Answer: B

Q820. How does an affinity diagram help organize analysis findings?

- A. It replaces all other diagrams
- B. It groups related ideas and findings into clusters to reveal themes and patterns
- C. It is only for brainstorming
- D. It creates confusion

Answer: B

Q821. What is the law of contraposition and how is it applied?

- A. If P then Q is equivalent to If Q then P
- B. If P then Q is logically equivalent to If not Q then not P
- C. It reverses all logical operators
- D. It only applies to mathematics

Answer: B

Q822. What distinguishes deductive reasoning from abductive reasoning?

- A. They are identical
- B. Deductive derives certain conclusions from premises; abductive infers the best explanation from observations
- C. Abductive is always wrong
- D. Deductive is faster

Answer: B

Q823. What is the difference between necessary and sufficient conditions?

- A. They mean the same thing
- B. A necessary condition must be true for the conclusion; a sufficient condition guarantees the conclusion
- C. Necessary conditions are optional
- D. Sufficient conditions are always necessary

Answer: B

Q824. What is the fallacy of false cause (post hoc ergo propter hoc)?

- A. Correctly identifying causation
- B. Assuming that because one event followed another, the first caused the second
- C. A valid form of reasoning
- D. A mathematical proof technique

Answer: B

Q825. How does reductio ad absurdum work as a proof technique?

- A. It proves something by example
- B. It assumes the opposite of what you want to prove and shows this leads to a contradiction
- C. It avoids contradictions
- D. It only works for simple statements

Answer: B

Q826. What is the closed-world assumption in logical reasoning?

- A. The world is physically closed
- B. Anything not known or stated to be true is assumed to be false
- C. Everything is assumed to be true
- D. It applies only to databases

Answer: B

Q827. What is the difference between strong and weak inductive arguments?

- A. There is no difference
- B. A strong inductive argument makes the conclusion very probable; a weak one does not
- C. Strong arguments are always deductive
- D. Weak arguments are always fallacious

Answer: B

Q828. How does the principle of explosion apply in inconsistent logical systems?

- A. It prevents contradictions
- B. From a contradiction, any statement can be derived as true
- C. It destroys the computer
- D. It only applies to explosives

Answer: B

Q829. What is the relationship between logical equivalence and biconditional?

- A. They are unrelated
- B. Two statements are logically equivalent if and only if their biconditional is a tautology
- C. Biconditional is always false
- D. Equivalence means one implies the other

Answer: B

Q830. What is the difference between material and strict implication?

- A. They are identical
- B. Material implication is truth-functional; strict implication requires a necessary connection
- C. Strict implication is weaker
- D. Material implication requires causation

Answer: B

Q831. What is the difference between pre-test and post-test loops?

- A. There is no difference
- B. Pre-test loops check the condition before each iteration; post-test loops check after, guaranteeing at least one execution
- C. Pre-test loops are faster
- D. Post-test loops never terminate

Answer: B

Q832. How does a flag variable control flow in an algorithm?

- A. It draws a flag on screen
- B. It is a Boolean variable that signals when a specific condition has been met, altering subsequent flow
- C. It stores numerical data
- D. It replaces all loops

Answer: B

Q833. What is an accumulator pattern in algorithm design?

- A. A hardware component
- B. A variable that collects a running total or result through repeated updates in a loop
- C. A type of flowchart symbol
- D. A debugging technique

Answer: B

Q834. How does exception handling affect the normal flow of a program?

- A. It has no effect
- B. When an exception occurs, normal flow is interrupted and control transfers to an exception handler
- C. It speeds up execution
- D. It prevents all errors

Answer: B

Q835. What is the purpose of a guard clause in function flow?

- A. To protect against hackers
- B. To handle edge cases early by returning or throwing before the main logic executes
- C. To make code longer
- D. To add complexity

Answer: B

Q836. How does a state machine manage complex flow control?

- A. It uses random states
- B. It defines a finite set of states and transitions between them based on inputs or events
- C. It eliminates all states
- D. It only works for games

Answer: B

Q837. What is the difference between iteration and recursion for solving the same problem?

- A. They always produce different results
- B. Iteration uses loops while recursion uses self-calling functions; both can solve the same problems
- C. Recursion is always better
- D. Iteration cannot solve recursive problems

Answer: B

Q838. What is the role of an initialization step before a loop?

- A. It is unnecessary
- B. It sets up variables to their starting values so the loop operates correctly from the first iteration
- C. It makes loops slower
- D. It only applies to for loops

Answer: B

Q839. How does early termination improve algorithm efficiency?

- A. It does not help
- B. It stops processing as soon as the answer is found, avoiding unnecessary work on remaining data
- C. It makes algorithms incorrect
- D. It only works for sorting

Answer: B

Q840. What is a structured programming theorem and what does it guarantee?

- A. It is a math theorem only
- B. Any computable function can be implemented using only sequence, selection, and iteration
- C. It requires goto statements
- D. It is outdated and irrelevant

Answer: B

Q841. How does a priority queue differ from a regular queue?

- A. They are identical
- B. In a priority queue, elements are dequeued based on priority rather than insertion order
- C. Priority queues are always slower
- D. Regular queues use priorities too

Answer: B

Q842. What is the trade-off between using an array versus a linked list?

- A. There is no trade-off
- B. Arrays provide $O(1)$ random access but expensive insertion; linked lists provide $O(1)$ insertion but $O(n)$ access
- C. Arrays are always better
- D. Linked lists are always better

Answer: B

Q843. What problem does data compression solve?

- A. It makes data larger
- B. It reduces the size of data for efficient storage and transmission while preserving information
- C. It deletes data permanently
- D. It only works on images

Answer: B

Q844. How does a tree data structure organize hierarchical data?

- A. In a flat list
- B. With a root node and child nodes forming a branching hierarchy where each node has at most one parent
- C. In a circular pattern
- D. Randomly without structure

Answer: B

Q845. What is the purpose of a hash function in data representation?

- A. To encrypt data
- B. To map data of arbitrary size to fixed-size values for efficient lookup and comparison
- C. To sort data alphabetically
- D. To compress data

Answer: B

Q846. How does JSON represent structured data?

- A. In binary format
- B. As human-readable text using key-value pairs, arrays, and nested objects
- C. As machine code
- D. In XML format only

Answer: B

Q847. What is the difference between a set and a list as data structures?

- A. They are identical
- B. A set contains unique unordered elements while a list maintains order and allows duplicates
- C. Sets are always larger
- D. Lists cannot store numbers

Answer: B

Q848. Why might a circular buffer be preferred over a regular array for streaming data?

- A. It is always slower
- B. It efficiently reuses fixed memory by overwriting the oldest data when full, ideal for constant-size windows
- C. It uses infinite memory
- D. It cannot store data

Answer: B

Q849. How does an enum (enumeration) type improve data representation?

- A. It makes code slower
- B. It defines a fixed set of named values, making code more readable and preventing invalid values
- C. It replaces all data types
- D. It is only for numbers

Answer: B

Q850. What is the purpose of a schema in data representation?

- A. To make data larger
- B. To define the structure, types, and constraints of data, ensuring consistency and validation
- C. It is only decorative
- D. Schemas are unnecessary

Answer: B

Q851. How does the Decorator pattern extend object behavior without modifying existing code?

- A. It replaces the original class
- B. It wraps objects with additional functionality layers while maintaining the same interface
- C. It deletes existing behavior
- D. It only works with strings

Answer: B

Q852. What is the difference between structural and behavioral design patterns?

- A. There is no difference
- B. Structural patterns deal with object composition; behavioral patterns deal with communication between objects
- C. Structural patterns are always better
- D. Behavioral patterns are outdated

Answer: B

Q853. How does the sliding window pattern optimize problems involving contiguous subarrays?

- A. It processes all subarrays independently
- B. It maintains a window that slides through the data, updating results incrementally rather than recomputing from scratch
- C. It only works for sorting
- D. It makes problems slower

Answer: B

Q854. What common pattern connects depth-first search, backtracking, and recursive tree traversal?

- A. They all use queues
- B. They all explore paths fully before backtracking, using a stack-like mechanism
- C. They are unrelated algorithms
- D. They all require sorted data

Answer: B

Q855. How does the Iterator pattern decouple traversal from data structure implementation?

- A. It does not decouple anything
- B. It provides a uniform interface for accessing elements sequentially regardless of the underlying data structure
- C. It only works with arrays
- D. It replaces all loops

Answer: B

Q856. What pattern do problems like finding duplicates, counting frequencies, and grouping share?

- A. Sorting pattern
- B. Hash-based lookup pattern using dictionaries or hash maps
- C. Recursive pattern
- D. Divide and conquer

Answer: B

Q857. How does the Adapter pattern solve interface incompatibility?

- A. It deletes one interface
- B. It wraps an existing interface to make it compatible with a different expected interface
- C. It requires rewriting both interfaces
- D. It only works in Java

Answer: B

Q858. What is the two-pointer pattern and when is it typically applied?

- A. Using two mouse pointers
- B. Using two indices that traverse a sorted array from different positions to find pairs or subarrays
- C. It only works for strings
- D. It requires extra memory

Answer: B

Q859. How does the publish-subscribe pattern differ from the observer pattern?

- A. They are identical in every way
- B. Publish-subscribe uses a message broker for decoupling while observer has direct subject-observer coupling
- C. Observer is always better
- D. Publish-subscribe cannot handle events

Answer: B

Q860. What pattern connects binary search, bisection method, and git bisect?

- A. Linear search pattern
- B. Divide-and-eliminate pattern that halves the search space at each step
- C. Random search pattern
- D. Brute force pattern

Answer: B

Q861. How does the inclusion-exclusion principle count the size of a union of sets?

- A. It adds all set sizes
- B. It adds individual sizes, subtracts pairwise intersections, adds triple intersections, and so on
- C. It only counts the largest set
- D. It ignores overlaps

Answer: B

Q862. What is the sum formula for an arithmetic series with n terms, first term a and last term l ?

- A. $n * a$
- B. $n * (a + l) / 2$
- C. $a * l / n$
- D. $(a + l) * n$

Answer: B

Q863. Why is the floor function useful in algorithm analysis?

- A. It rounds numbers up
- B. It gives the largest integer less than or equal to a value, useful for integer division in index calculations
- C. It is only for architecture
- D. It has no use in CS

Answer: B

Q864. What does it mean for a function to grow exponentially?

- A. It grows by adding a constant
- B. Its growth rate is proportional to its current value, resulting in doubling over fixed intervals
- C. It stays the same
- D. It decreases over time

Answer: B

Q865. How is the binomial coefficient $C(n,k)$ computed using factorials?

- A. $n! / k!$
- B. $n! / (k! * (n-k)!)$
- C. $n * k$
- D. $(n+k)!$

Answer: B

Q866. What is the significance of the number e (Euler's number) in mathematics?

- A. It is just a random constant
- B. It is the base of natural logarithms and appears in growth, decay, probability, and calculus
- C. It equals exactly 3
- D. It is only used in physics

Answer: B

Q867. How does proof by strong induction differ from regular mathematical induction?

- A. They are identical
- B. Strong induction assumes the statement holds for all values up to k , not just k , when proving $k+1$
- C. Strong induction is weaker
- D. Regular induction is more powerful

Answer: B

Q868. What is the mathematical principle behind hashing with modular arithmetic?

- A. It has no mathematical basis
- B. Mapping keys to indices using $h(k) = k \bmod m$ distributes keys across m buckets, where prime m reduces clustering
- C. It requires floating-point math
- D. It only works for strings

Answer: B

Q869. Why are logarithms important in analyzing divide-and-conquer algorithms?

- A. They are not important
- B. Each halving of the problem adds one step, so algorithms that halve the input have $O(\log n)$ depth
- C. Logarithms make algorithms slower
- D. They only apply to sorting

Answer: B

Q870. What is a recurrence relation in algorithm analysis?

- A. A loop in code
- B. An equation that defines a function in terms of its value at smaller inputs, used to describe recursive algorithm complexity
- C. A fixed formula
- D. A type of data structure

Answer: B

Q871. How does memoization improve the performance of recursive algorithms?

- A. It makes recursion deeper
- B. It caches results of expensive function calls and returns the cached result when the same inputs recur
- C. It eliminates recursion
- D. It increases memory but not speed

Answer: B

Q872. What is the key difference between BFS and DFS in terms of the data structure used?

- A. Both use stacks
- B. BFS uses a queue (FIFO) while DFS uses a stack (LIFO)
- C. Both use queues
- D. They use the same structure

Answer: B

Q873. What makes a greedy algorithm 'greedy'?

- A. It uses the most memory
- B. It makes the locally optimal choice at each step without reconsidering previous choices
- C. It always finds the global optimum
- D. It tries every possibility

Answer: B

Q874. How does counting sort achieve $O(n)$ time complexity?

- A. It compares elements pairwise
- B. It counts occurrences of each value and uses the counts to place elements directly, avoiding comparisons
- C. It divides the array in half
- D. It is only $O(n)$ for small inputs

Answer: B

Q875. What is the advantage of using a heap for finding the k smallest elements in a stream?

- A. Heaps are slower than sorting
- B. A max-heap of size k maintains the k smallest elements seen so far with $O(\log k)$ per insertion
- C. Heaps require sorting first
- D. There is no advantage

Answer: B

Q876. What problem does Dijkstra's algorithm solve and what is its key limitation?

- A. It sorts arrays but is slow
- B. It finds shortest paths from a source vertex but requires all edge weights to be non-negative
- C. It works with negative weights
- D. It finds the longest path

Answer: B

Q877. How does the concept of invariants help prove algorithm correctness?

- A. Invariants are not useful
- B. An invariant is a condition that holds before and after each iteration; proving it holds throughout proves correctness
- C. They only apply to mathematics
- D. They make algorithms slower

Answer: B

Q878. What is the difference between a deterministic and a non-deterministic algorithm?

- A. They are the same
- B. A deterministic algorithm always produces the same output for the same input; a non-deterministic one may explore multiple paths simultaneously
- C. Non-deterministic is always wrong
- D. Deterministic is always faster

Answer: B

Q879. How does the two-phase approach of map-reduce enable distributed algorithm design?

- A. It only works on single machines
- B. Map distributes work by applying a function to each element; reduce aggregates results, enabling parallelism
- C. Map and reduce must be sequential
- D. It replaces all algorithms

Answer: B

Q880. What is the significance of algorithm stability in sorting?

- A. It means the algorithm never crashes
- B. A stable sort preserves the relative order of elements with equal keys, which matters when sorting by multiple criteria
- C. Stability is irrelevant
- D. All sorts are stable

Answer: B

Q881. How does the Socratic method promote critical thinking?

- A. It provides answers directly
- B. It uses systematic questioning to challenge assumptions, expose contradictions, and deepen understanding
- C. It avoids all questions
- D. It is only for philosophy

Answer: B

Q882. What is the difference between deductive and inductive reasoning in critical analysis?

- A. They are identical
- B. Deductive moves from general principles to specific conclusions with certainty; inductive moves from specific observations to general conclusions with probability
- C. Inductive is always correct
- D. Deductive is always wrong

Answer: B

Q883. What is the appeal to emotion fallacy?

- A. Using emotions to enhance understanding
- B. Manipulating emotional responses instead of providing logical arguments to support a claim
- C. All emotions are fallacious
- D. Emotions and logic are the same

Answer: B

Q884. How does steel-manning differ from straw-manning an argument?

- A. They are the same technique
- B. Steel-manning presents the strongest version of an opponent's argument; straw-manning misrepresents it as weaker
- C. Steel-manning is always wrong
- D. Straw-manning is more honest

Answer: B

Q885. Why is the distinction between correlation and causation important in data interpretation?

- A. They mean the same thing
- B. Two things occurring together (correlation) does not mean one causes the other; confusing them leads to false conclusions
- C. Correlation always implies causation
- D. Causation never involves correlation

Answer: B

Q886. What is the role of falsifiability in evaluating claims?

- A. It makes claims false
- B. A claim that cannot be tested or potentially disproven is not scientifically meaningful
- C. All claims are falsifiable
- D. Falsifiability weakens claims

Answer: B

Q887. How does the principle of charity improve critical discourse?

- A. It involves donating money
- B. It interprets others' arguments in the strongest reasonable way before critiquing, leading to more productive dialogue
- C. It weakens your position
- D. It is only for debates

Answer: B

Q888. What is the red herring fallacy in argumentation?

- A. A type of fish
- B. Introducing an irrelevant topic to divert attention from the original argument
- C. A strong counterargument
- D. A valid reasoning technique

Answer: B

Q889. How does systems thinking enhance critical analysis of complex problems?

- A. It simplifies everything to one cause
- B. It examines how components interact within a larger system, revealing feedback loops and unintended consequences
- C. It ignores relationships between parts
- D. It only applies to engineering

Answer: B

Q890. What is the difference between necessary and sufficient evidence?

- A. They are identical
- B. Necessary evidence must be present but may not be enough alone; sufficient evidence is enough to support the conclusion
- C. Necessary evidence is optional
- D. Sufficient evidence is always necessary

Answer: B

Q891. How does git bisect help locate the commit that introduced a bug?

- A. It searches every commit linearly
- B. It uses binary search through commit history, testing the midpoint to halve the search space each time
- C. It only works for merge conflicts
- D. It requires manual inspection of every commit

Answer: B

Q892. What is the difference between a bug caused by incorrect logic versus incorrect data?

- A. They are the same thing
- B. Logic bugs are errors in the algorithm or control flow; data bugs are caused by unexpected or corrupt input data
- C. Data bugs do not exist
- D. Logic bugs are always harder

Answer: B

Q893. How do assertions help catch bugs during development?

- A. They slow programs down without benefit
- B. They check that expected conditions hold at runtime, failing immediately with a clear message when violated
- C. They replace all testing
- D. They only work in production

Answer: B

Q894. What is the watchpoint feature in a debugger used for?

- A. Watching a clock
- B. It pauses execution when a specific variable's value changes, helping track unexpected modifications
- C. It watches network traffic
- D. It monitors CPU usage

Answer: B

Q895. Why is logging often preferred over print debugging in production systems?

- A. Logging is slower
- B. Logging provides structured, level-based output that can be filtered, persisted, and analyzed without code changes
- C. Print statements are always better
- D. Logging adds no value over print

Answer: B

Q896. What is a stack overflow error and what typically causes it?

- A. Too much data in an array
- B. Excessive recursion or very deep call chains that exhaust the available call stack memory
- C. Writing too many functions
- D. Using too many variables

Answer: B

Q897. How does defensive programming help prevent bugs?

- A. It makes code defensive against hackers only
- B. It validates inputs, checks preconditions, and handles edge cases explicitly, catching errors before they propagate
- C. It slows development without benefit
- D. It replaces all testing

Answer: B

Q898. What is the purpose of a core dump in debugging?

- A. To delete core files
- B. It captures the memory state of a program at the time of a crash, allowing post-mortem analysis
- C. To improve performance
- D. To backup the database

Answer: B

Q899. How does pair debugging improve bug-finding efficiency?

- A. It doubles the number of bugs
- B. Two people bring different perspectives and can catch errors that a single person might overlook due to familiarity
- C. It always slows things down
- D. It only works for beginners

Answer: B

Q900. What is the significance of boundary value analysis in testing and debugging?

- A. Boundaries are not important
- B. Bugs frequently occur at the edges of input ranges, so testing boundary values (0, max, min, empty) catches common errors
- C. It only applies to numerical data
- D. Boundary values are always correct

Answer: B

Q901. What is the difference between Big-O and Big-Theta notation?

- A. They are the same
- B. Big-O gives an upper bound; Big-Theta gives a tight bound that is both upper and lower
- C. Big-O is always tighter
- D. Big-Theta is less precise

Answer: B

Q902. Why is $O(n \log n)$ considered an efficient complexity class for sorting?

- A. It is the slowest possible
- B. It is the theoretical lower bound for comparison-based sorting, so no comparison sort can do better
- C. It is the same as $O(n)$
- D. It is worse than $O(n^2)$

Answer: B

Q903. How does space complexity differ from auxiliary space complexity?

- A. They are identical
- B. Space complexity includes input space; auxiliary space measures only the extra memory the algorithm uses beyond the input
- C. Auxiliary space is always larger
- D. They measure different things entirely

Answer: B

Q904. What is the time complexity of searching an unsorted array for a specific element?

- A. $O(1)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: C

Q905. How does the time complexity of building a heap compare to sorting?

- A. Building a heap is $O(n \log n)$
- B. Building a heap is $O(n)$ which is faster than the $O(n \log n)$ required for comparison-based sorting
- C. They are both $O(n)$
- D. Building a heap is slower than sorting

Answer: B

Q906. What is the worst-case complexity of a hash table lookup?

- A. $O(1)$ always
- B. $O(n)$ when all elements hash to the same bucket
- C. $O(\log n)$
- D. $O(n^2)$

Answer: B

Q907. Why is $O(2^n)$ considered intractable for even moderate input sizes?

- A. It is actually very fast
- B. Exponential growth means even $n=40$ requires over a trillion operations, far exceeding practical limits
- C. It only seems slow on old hardware
- D. It is the same as $O(n^2)$

Answer: B

Q908. How does memoization change the complexity of the naive recursive Fibonacci?

- A. It has no effect
- B. It reduces the complexity from $O(2^n)$ to $O(n)$ by caching previously computed results
- C. It increases complexity
- D. It only affects space, not time

Answer: B

Q909. What is the relationship between recursion depth and stack space complexity?

- A. They are unrelated
- B. Each recursive call adds a frame to the call stack, so space complexity is at least $O(\text{depth})$
- C. Recursion uses no stack space
- D. Stack depth is always $O(1)$

Answer: B

Q910. What is the time complexity of matrix multiplication for two $n \times n$ matrices using the standard algorithm?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(n^3)$
- D. $O(n \log n)$

Answer: C

Q911. How does the strategy of pre-sorting input data simplify certain programming problems?

- A. Pre-sorting always wastes time
- B. Sorted data enables binary search, simplifies duplicate detection, and allows efficient two-pointer techniques
- C. Sorting has no benefit for problem solving
- D. Pre-sorting makes problems harder

Answer: B

Q912. What is the advantage of using a stack for matching brackets in an expression?

- A. Stacks are the only data structure
- B. A stack naturally matches each opening bracket with its corresponding closing bracket in correct nesting order
- C. Arrays cannot solve this problem
- D. Stacks make the problem harder

Answer: B

Q913. How does the concept of 'separation of concerns' improve code quality?

- A. It has no effect
- B. Each module handles a single responsibility, making code easier to understand, test, modify, and reuse
- C. It makes code more complex
- D. It only applies to large projects

Answer: B

Q914. What is the benefit of using a hash map for counting frequency of elements?

- A. Hash maps are slower than arrays for counting
- B. Hash maps provide $O(1)$ average-time lookup and update, making frequency counting $O(n)$ for any hashable element type
- C. Arrays are always better for counting
- D. Hash maps cannot count frequencies

Answer: B

Q915. How does refactoring improve code without changing its behavior?

- A. Refactoring changes program output
- B. It restructures existing code for better readability, maintainability, or performance while preserving the same functionality
- C. It is the same as rewriting from scratch
- D. Refactoring introduces bugs

Answer: B

Q916. What is the purpose of edge case testing in programming?

- A. Edge cases are unimportant
- B. It tests boundary conditions and unusual inputs where bugs commonly hide, such as empty inputs, single elements, or maximum values
- C. It only tests happy paths
- D. Edge cases never cause bugs

Answer: B

Q917. How does the builder pattern solve the problem of complex object construction?

- A. It deletes complex objects
- B. It separates the construction of a complex object from its representation, allowing step-by-step construction with validation
- C. It only works for strings
- D. It makes construction harder

Answer: B

Q918. What advantage does recursion provide for tree and graph traversal?

- A. Recursion cannot traverse trees
- B. Recursion naturally maps to the hierarchical structure of trees and graphs, where each recursive call handles a subtree or neighbor
- C. It is always slower than iteration
- D. It only works for binary trees

Answer: B

Q919. How does using a set data structure help solve problems involving duplicates?

- A. Sets allow duplicates
- B. Sets automatically ensure uniqueness, making duplicate detection and removal trivially efficient
- C. Sets are slower than lists for this
- D. Sets cannot store data

Answer: B

Q920. What is the importance of writing clean code for future problem solving?

- A. Clean code is unnecessary
- B. Clean code is easier to understand, modify, and extend, reducing the time needed to solve future problems in the same codebase
- C. Only compilers care about code quality
- D. Clean code is slower

Answer: B

Q921. How does stratified sampling improve the representativeness of a sample?

- A. It uses random selection only
- B. It divides the population into subgroups and samples from each proportionally, ensuring all groups are represented
- C. It selects only from the largest group
- D. It eliminates sampling entirely

Answer: B

Q922. What is the purpose of a box plot (box and whisker diagram)?

- A. To show exact data values
- B. To visualize the distribution's center, spread, skewness, and outliers through quartiles
- C. To display trends over time
- D. To show part-to-whole relationships

Answer: B

Q923. How does the concept of standard deviation complement the mean?

- A. It replaces the mean
- B. The mean shows the center of data while standard deviation shows how spread out the data is around that center
- C. They measure the same thing
- D. Standard deviation is always larger than mean

Answer: B

Q924. What is selection bias and how does it affect data analysis?

- A. It is not a real problem
- B. It occurs when the sample is not representative of the population, leading to conclusions that do not generalize
- C. It only affects large datasets
- D. It improves data quality

Answer: B

Q925. How do dashboards help in data-driven problem solving?

- A. They are purely decorative
- B. They consolidate key metrics and visualizations in one place for quick monitoring, trend identification, and decision support
- C. They replace all data analysis
- D. They only show historical data

Answer: B

Q926. What is the purpose of a control group in an experiment?

- A. To control the experiment's cost
- B. To provide a baseline comparison by not receiving the treatment, allowing measurement of the treatment's true effect
- C. Control groups are unnecessary
- D. It receives all treatments simultaneously

Answer: B

Q927. How does data interpolation differ from data extrapolation?

- A. They are identical
- B. Interpolation estimates values within the range of known data; extrapolation estimates beyond it, with higher uncertainty
- C. Extrapolation is more reliable
- D. Interpolation ignores existing data

Answer: B

Q928. What is the difference between precision and recall in data-driven evaluation?

- A. They measure the same thing
- B. Precision measures accuracy of positive predictions; recall measures completeness of finding all actual positives
- C. Precision is always more important
- D. Recall is always more important

Answer: B

Q929. How does cohort analysis provide insights that aggregate analysis misses?

- A. It is identical to aggregate analysis
- B. It groups users by shared characteristics or time periods and tracks them separately, revealing patterns hidden in aggregate data
- C. It only works for medical data
- D. It requires larger samples

Answer: B

Q930. What role does data provenance play in trusting analysis results?

- A. It is irrelevant
- B. Knowing where data came from, how it was collected, and how it was transformed helps assess its reliability and potential biases
- C. Only the final result matters
- D. Provenance makes data less trustworthy

Answer: B

Q931. How does the technique of random stimulation promote creative thinking?

- A. It produces random solutions
- B. It introduces unrelated concepts or words as stimuli to force new associations and break fixation on familiar approaches
- C. It replaces structured thinking
- D. Random input always confuses

Answer: B

Q932. What is the concept of 'creative constraints' and how do they help?

- A. Constraints always limit creativity
- B. Deliberate limitations force innovative thinking by requiring novel approaches within boundaries
- C. Constraints eliminate all creativity
- D. They only apply to art

Answer: B

Q933. How does the concept of bisociation explain creative breakthroughs?

- A. It is about bicycle associations
- B. It describes creativity as connecting two previously unrelated frames of reference or mental matrices
- C. It only applies to science
- D. It prevents creative thinking

Answer: B

Q934. How does the 'worst possible idea' technique lead to creative solutions?

- A. It produces only bad ideas
- B. Deliberately generating terrible ideas removes the fear of failure and often reveals the inverse as a viable creative solution
- C. It wastes time
- D. It is never used in practice

Answer: B

Q935. What is the difference between incremental and radical innovation?

- A. They are identical
- B. Incremental innovation makes small improvements to existing solutions; radical innovation creates fundamentally new approaches
- C. Incremental is always better
- D. Radical innovation is impossible

Answer: B

Q936. How does role-playing or perspective-taking enhance creative problem solving?

- A. It is only for actors
- B. Adopting different roles forces you to see the problem from unfamiliar viewpoints, generating ideas you would not otherwise consider
- C. It has no cognitive benefit
- D. It always produces wrong answers

Answer: B

Q937. What is the purpose of an innovation sprint or design sprint?

- A. To run fast
- B. To compress the creative process into a short time-boxed period with structured activities for rapid prototyping and validation
- C. Sprints eliminate the need for planning
- D. They replace long-term development

Answer: B

Q938. How does the concept of serendipity contribute to creative discoveries?

- A. It is pure luck with no preparation
- B. Prepared minds recognize unexpected connections or accidental findings as opportunities for creative solutions
- C. It cannot be facilitated
- D. It only happens in laboratories

Answer: B

Q939. How does analogical reasoning across domains drive innovation?

- A. Analogies are always misleading
- B. Solutions from one domain can be adapted to solve problems in a completely different domain through structural similarity
- C. Analogies only work within the same field
- D. They always produce identical solutions

Answer: B

Q940. What is the role of constructive criticism in refining creative ideas?

- A. All criticism destroys creativity
- B. Constructive feedback identifies weaknesses and suggests improvements, helping transform raw creative ideas into viable solutions
- C. Criticism should always be avoided
- D. Only praise is productive

Answer: B

Q941. How does feature flagging help manage risk in real-world deployments?

- A. It adds unnecessary complexity
- B. It allows new features to be deployed but disabled by default, enabling gradual rollout and quick rollback without redeployment
- C. It prevents all deployments
- D. It only works for web applications

Answer: B

Q942. What is the significance of Service Level Agreements (SLAs) in real-world systems?

- A. They are just legal documents with no practical impact
- B. They define measurable commitments for availability, performance, and support, setting clear expectations between providers and consumers
- C. SLAs are only for large companies
- D. They guarantee perfect uptime

Answer: B

Q943. How does the concept of technical debt affect long-term project health?

- A. Technical debt has no long-term effect
- B. Shortcuts taken now accumulate and make future changes increasingly expensive and risky if not addressed
- C. It is always worth taking on
- D. It can be completely avoided

Answer: B

Q944. Why is monitoring important after deploying a solution to production?

- A. Monitoring is unnecessary after deployment
- B. It detects issues, performance degradation, and unexpected behavior before they significantly impact users
- C. Only broken systems need monitoring
- D. Monitoring slows down the system

Answer: B

Q945. How does the strangler pattern help modernize legacy systems?

- A. It shuts down the legacy system immediately
- B. It gradually replaces legacy components with new implementations while both coexist, reducing migration risk
- C. It requires a complete rewrite
- D. It only works for small systems

Answer: B

Q946. What role does capacity planning play in preventing real-world system failures?

- A. Capacity planning is unnecessary
- B. It forecasts future resource needs based on growth projections to ensure the system can handle expected load
- C. It only matters for new systems
- D. Current capacity is always sufficient

Answer: B

Q947. How does A/B testing help make better product decisions?

- A. It tests the alphabet
- B. It compares two versions with real users simultaneously, using statistical analysis to determine which performs better
- C. It requires two separate products
- D. It always gives clear answers

Answer: B

Q948. What is the purpose of an incident response plan?

- A. To assign blame for incidents
- B. To define clear procedures, roles, and communication channels for responding to production issues quickly and effectively
- C. Incidents do not need plans
- D. It replaces prevention measures

Answer: B

Q949. How does the concept of graceful degradation improve user experience during failures?

- A. It lets the system crash gracefully
- B. The system continues operating with reduced functionality rather than failing completely when components malfunction
- C. It prevents all failures
- D. It is the same as zero downtime

Answer: B

Q950. Why is stakeholder management important throughout a project lifecycle?

- A. Stakeholders are only relevant at the start
- B. Continuous stakeholder engagement ensures alignment, manages expectations, and prevents costly surprises from misaligned priorities
- C. Only technical stakeholders matter
- D. It creates unnecessary overhead

Answer: B

Q951. How do Architecture Decision Records (ADRs) improve long-term project understanding?

- A. They are unnecessary bureaucracy
- B. They document the context, options considered, and rationale behind architectural decisions, preserving decision-making context for future teams
- C. They replace all other documentation
- D. They only record final decisions

Answer: B

Q952. What is the difference between a tutorial, a how-to guide, and a reference document?

- A. They serve the same purpose
- B. Tutorials teach through examples; how-to guides provide steps for specific tasks; references provide comprehensive technical details
- C. Only references are needed
- D. Tutorials replace all other docs

Answer: B

Q953. How does the STAR method help communicate problem-solving achievements?

- A. It involves astronomy
- B. It structures communication as Situation, Task, Action, Result to clearly convey the context and impact of problem-solving work
- C. It is only for job interviews
- D. It replaces technical documentation

Answer: B

Q954. Why is audience awareness critical when writing technical documentation?

- A. All audiences need the same information
- B. Different audiences have different knowledge levels, needs, and goals requiring adapted content, depth, and terminology
- C. Technical writing has no audience
- D. Only experts read documentation

Answer: B

Q955. How do diagrams complement textual documentation?

- A. Diagrams are always unnecessary
- B. Diagrams convey relationships, architectures, and flows more clearly than text alone, especially for complex systems
- C. Text is always sufficient
- D. Diagrams replace all text

Answer: B

Q956. What is the purpose of semantic commit messages?

- A. They look more professional
- B. They categorize commits by type (feat, fix, docs, refactor) making history easier to search, understand, and automate changelog generation
- C. They are only for open-source projects
- D. They make commits longer for no reason

Answer: B

Q957. How does a glossary improve technical documentation for diverse audiences?

- A. Glossaries are outdated
- B. A glossary defines domain-specific terms in one place, ensuring consistent understanding across readers with different backgrounds
- C. Everyone knows all technical terms
- D. Glossaries make docs too long

Answer: B

Q958. What is the value of writing a pre-mortem document before starting a project?

- A. Pre-mortems are only for medical contexts
- B. It imagines the project has already failed and identifies potential causes, enabling proactive risk mitigation before problems occur
- C. It is too pessimistic
- D. Post-mortems are sufficient

Answer: B

Q959. How do inline code documentation tools like JSDoc or Javadoc improve developer productivity?

- A. They slow down development
- B. They generate navigable API documentation directly from annotated source code, keeping documentation close to the code it describes
- C. They are only for Java
- D. They replace all testing

Answer: B

Q960. Why is asynchronous communication important for distributed teams?

- A. Asynchronous communication is always inferior
- B. It allows team members in different time zones to contribute at their own pace, with documented discussions that anyone can reference later
- C. All communication must be synchronous
- D. It creates communication gaps

Answer: B

Problem Solving & Analytical Skills — Hard

480 questions

Q961. Shortest path with negative edges (no negative cycles)?

- A. Simple BFS traversal
- B. Bellman-Ford algorithm
- C. Dijkstra's algorithm
- D. DFS with backtracking

Answer: B

Q962. Which paradigm makes locally optimal choices at each step?

- A. Dynamic programming approach
- B. Backtracking technique
- C. Divide and conquer method
- D. Greedy algorithm approach

Answer: D

Q963. What is reduction in problem solving?

- A. Reducing the number of variables used
- B. Transforming into another known problem
- C. Simplifying the program output format
- D. Making smaller by removing input data

Answer: B

Q964. What characterizes an NP-hard problem?

- A. Has absolutely no solution at all
- B. At least as hard as hardest NP problems
- C. Solvable easily in polynomial time
- D. Always unsolvable by any algorithm

Answer: B

Q965. What is optimal substructure?

- A. Only greedy algorithms work on it
- B. Problem cannot be decomposed at all
- C. Sub-problems are fully independent
- D. Optimal solution uses optimal sub-solutions

Answer: D

Q966. Which concept stores sub-problem solutions?

- A. Iterative computation
- B. Memoization technique
- C. Simple recursion method
- D. Compilation process

Answer: B

Q967. Overlapping sub-problems + optimal substructure = which paradigm?

- A. Linear search method
- B. Brute force search
- C. Dynamic programming
- D. Simple recursion only

Answer: C

Q968. Decidable vs undecidable?

- A. An algorithm solves every decidable instance
- B. Decidable problems cannot use any recursion
- C. Undecidable problems have no instances at all
- D. Decidable problems are always harder to solve

Answer: A

Q969. What is state space search?

- A. Querying a database for records
- B. Allocating memory for data storage
- C. Searching through files on a disk
- D. Exploring all states to find a path

Answer: D

Q970. Which problem is undecidable?

- A. Binary search tree lookup
- B. Finding the shortest path
- C. Sorting a list of elements
- D. The Halting Problem itself

Answer: D

Q971. 10K concurrent users, <100ms response is what type?

- A. Usability requirement type
- B. Security requirement type
- C. Functional requirement type
- D. Performance non-functional type

Answer: D

Q972. Mapping to TSP implies?

- A. Likely NP-hard, needs heuristics
- B. Only sorting is required to solve
- C. It can be solved in linear time
- D. The problem is trivially solvable

Answer: A

Q973. Most critical real-time constraint?

- A. Deterministic response time guarantees
- B. Code readability standards
- C. Number of comments in code
- D. Descriptive variable naming style

Answer: A

Q974. Problem space vs solution space?

- A. They are exactly the same thing
- B. Neither concept is used in CS at all
- C. They refer to code versus documentation
- D. Problem: all states; solution: valid answers

Answer: D

Q975. Multiple conflicting constraints need?

- A. Multi-objective optimization approach
- B. Only brute force can work on them
- C. Ignoring some constraints entirely
- D. Removing all constraints from scope

Answer: A

Q976. Stream processing each element once?

- A. Static analysis technique
- B. Online streaming algorithm type
- C. Batch processing approach
- D. Compile-time optimization

Answer: B

Q977. What is invariant analysis?

- A. Measuring code coverage metrics
- B. Checking syntax for correctness
- C. Properties remaining true throughout
- D. Enforcing a code style guide

Answer: C

Q978. Scheduling with dependencies uses?

- A. Binary tree structure
- B. Linked list structure
- C. Hash table structure
- D. Directed acyclic graph

Answer: D

Q979. What is amortized analysis for?

- A. Measuring space complexity alone
- B. Analyzing the best case scenario
- C. Average cost per operation over time
- D. Analyzing single worst case only

Answer: C

Q980. Well-defined vs ill-defined problems?

- A. All CS problems are always well-defined
- B. Ill-defined problems have no solution at all
- C. Well-defined are always easier to solve
- D. Well-defined: clear states; ill-defined: ambiguous

Answer: D

Q981. Universal quantifier means?

- A. For exactly one element only
- B. For all elements in the domain
- C. For no elements in the domain
- D. There exists at least one element

Answer: B

Q982. Negation of forall x P(x)?

- A. exists x NOT P(x)
- B. forall x NOT P(x)
- C. NOT exists x P(x)
- D. forall x P(x) still

Answer: A

Q983. What is mathematical induction?

- A. Proving base case plus if n then n+1
- B. Testing all possible cases manually
- C. Guessing the answer to the problem
- D. Only proving the base case alone

Answer: A

Q984. What is a clause in resolution?

- A. A disjunction of logical literals
- B. A conjunction of several functions
- C. A complete executable program
- D. A variable assignment statement

Answer: A

Q985. Logical completeness means?

- A. The system runs very fast
- B. The system has no bugs at all
- C. Every valid formula is provable
- D. It uses all logical operators

Answer: C

Q986. Godel's first incompleteness theorem?

- A. All formal systems are complete
- B. All true statements are provable
- C. Consistent systems have unprovable truths
- D. Logic is unnecessary for proofs

Answer: C

Q987. What is satisfiability (SAT)?

- A. Whether an assignment makes it true
- B. A formula that is always true
- C. A formula with no variable bindings
- D. A formula that is always false

Answer: A

Q988. What is soundness?

- A. It uses auditory signal processing
- B. The system proves everything possible
- C. The system has zero error states
- D. Every provable statement is valid

Answer: D

Q989. SAT worst case?

- A. $O(n^2)$ quadratic time
- B. $O(n)$ linear time
- C. Exponential (NP-complete)
- D. $O(n \log n)$ linearithmic

Answer: C

Q990. What is semantic entailment?

- A. A programming concept for objects
- B. A specific data type for storage
- C. A syntax rule in formal languages
- D. Premises true implies conclusion true

Answer: D

Q991. for i=1..3, j=1..2: print(i*j). Output?

- A. 1 1 2 2 3 3
- B. 1 2 2 4 3 6
- C. 1 2 3 4 5 6
- D. 2 4 6 8 10 12

Answer: B

Q992. What is tail recursion?

- A. A recursion that never ends at all
- B. Last operation is the recursive call
- C. Recursion with multiple base cases
- D. A specific type of iterative loop

Answer: B

Q993. Recursion vs iteration relationship?

- A. They are completely unrelated concepts
- B. Only recursion works for any problem
- C. Every recursive can become iterative
- D. Iteration is always faster than recursion

Answer: C

Q994. Factorial base case?

- A. $n * \text{factorial}(n-1)$ recursive call
- B. $\text{factorial}(n)=n$ for all values
- C. $\text{factorial}(0)=1$ or $\text{factorial}(1)=1$
- D. No base case is ever needed

Answer: C

Q995. No base case means?

- A. The function runs much faster
- B. Stack overflow from infinite recursion
- C. The function gives correct results
- D. The function returns zero always

Answer: B

Q996. What is mutual recursion?

- A. A function calling only itself
- B. Functions calling each other cyclically
- C. A loop nested inside a function
- D. Recursion without any base case

Answer: B

Q997. Max depth for naive fibonacci(n)?

- A. $n/2$
- B. $\log n$
- C. 2^n
- D. n

Answer: D

Q998. What is a coroutine?

- A. A specific type of loop construct
- B. Can suspend and resume execution
- C. A normal sequential function call
- D. An error handler for exceptions

Answer: B

Q999. What is short-circuit evaluation?

- A. Evaluating expressions in reverse order
- B. A hardware electrical circuit fault
- C. Always evaluate all operands fully
- D. Stop evaluating when result is known

Answer: D

Q1000. What is a basic block?

- A. A class definition in a program
- B. A function definition in code
- C. One entry, one exit, no branches
- D. Any arbitrary piece of code

Answer: C

Q1001. Float problems vs integer?

- A. Rounding errors only
- B. Overflow errors only
- C. All of the above
- D. Underflow errors only

Answer: C

Q1002. What is endianness?

- A. A sorting algorithm technique
- B. A programming paradigm style
- C. A data compression approach
- D. Byte order stored in memory

Answer: D

Q1003. IEEE 754 single exponent bits?

- A. 32 bits
- B. 23 bits
- C. 8 bits
- D. 1 bit

Answer: C

Q1004. What is a tagged union?

- A. An array with mixed types
- B. A union with a type tag field
- C. A regular union without tags
- D. A sorting data structure type

Answer: B

Q1005. What is information hiding?

- A. Encrypting all data in storage
- B. Deleting data after processing
- C. Hiding files on the filesystem
- D. Restricting access, exposing interfaces

Answer: D

Q1006. What is data alignment?

- A. Alphabetical sorting of records
- B. Formatting text in a document
- C. Aligning elements on the screen
- D. Placing at boundaries for CPU access

Answer: D

Q1007. What is Liskov Substitution Principle?

- A. Subtypes substitutable for supertypes
- B. Making all class members public
- C. An encryption standard for data
- D. Functions without any parameters

Answer: A

Q1008. What is a phantom type?

- A. A null type with no useful value
- B. A runtime type for dynamic checks
- C. Type param with compile-time info only
- D. A type that does not exist at all

Answer: C

Q1009. IEEE 754 single max value?

- A. $3.4e38$
- B. 2^{64}
- C. $1.8e308$
- D. 2^{31}

Answer: A

Q1010. Structural vs nominal typing?

- A. They are exactly the same thing
- B. Nominal typing is not used in practice
- C. Structural is always better to use here
- D. Structural: shape match; nominal: name match

Answer: D

Q1011. LCS, edit distance, knapsack share?

- A. Linear search through all values
- B. Simple recursion without caching
- C. DP with optimal substructure pattern
- D. Greedy algorithm approach works

Answer: C

Q1012. Monotonic stack is for?

- A. Next greater/smaller element queries
- B. Graph traversal and pathfinding
- C. Sorting elements in an array
- D. String matching and searching

Answer: A

Q1013. Prefix sum is for?

- A. Searching for specific elements
- B. Sorting elements in an array
- C. Balancing a binary search tree
- D. Efficient range sum query answers

Answer: D

Q1014. Floyd's cycle detection?

- A. Two pointers at different speeds
- B. Graph coloring and partitioning
- C. Sorting elements in a list
- D. Tree traversal and path finding

Answer: A

Q1015. All permutations/combinations use?

- A. Hashing data structure
- B. Binary search technique
- C. Greedy algorithm approach
- D. Backtracking exploration

Answer: D

Q1016. What is meet in the middle?

- A. A compromise between two parties
- B. A social meeting of team members
- C. Split, process halves, then combine
- D. Finding the median of a dataset

Answer: C

Q1017. Topological sort is for?

- A. Sorting numbers in order
- B. Binary search in sorted data
- C. Sorting strings alphabetically
- D. Tasks ordered by dependencies

Answer: D

Q1018. Union-find is for?

- A. Sorting elements in arrays
- B. String matching and parsing
- C. Connected components and membership
- D. Queue operation management

Answer: C

Q1019. Binary lifting in trees?

- A. Sorting with binary comparisons
- B. Balancing a binary tree structure
- C. Ancestors and LCA in $O(\log n)$
- D. Binary search in an array

Answer: C

Q1020. Sweep line is for?

- A. Geometric event processing tasks
- B. Sorting points by coordinates
- C. Drawing shapes on screen
- D. Rendering graphics on display

Answer: A

Q1021. Master Theorem for?

- A. Finding prime numbers only
- B. Sorting arrays of elements
- C. Recurrences $T(n)=aT(n/b)+f(n)$
- D. Graph traversal algorithms

Answer: C

Q1022. $T(n)=2T(n/2)+n$?

- A. $O(n)$
- B. $O(\log n)$
- C. $O(n \log n)$
- D. $O(n^2)$

Answer: C

Q1023. Euler's totient $\phi(n)$?

- A. Count of numbers coprime with n
- B. The factorial of the number n
- C. The largest prime factor of n
- D. The sum of all divisors of n

Answer: A

Q1024. Catalan numbers count?

- A. Prime numbers in a range
- B. Greatest common divisor values
- C. Parenthesizations and binary trees
- D. Sorted permutations of arrays

Answer: C

Q1025. Fermat's Little Theorem?

- A. $a^p = a \pmod{p}$ for prime p
- B. All prime numbers are odd values
- C. $a^n = n^a$ for all values
- D. Every integer has unique factors

Answer: A

Q1026. Sieve of Eratosthenes complexity?

- A. $O(n \log n)$
- B. $O(n^2)$
- C. $O(n \log \log n)$
- D. $O(n)$

Answer: C

Q1027. Chinese Remainder Theorem for?

- A. Sorting elements in arrays
- B. Graph coloring and partitioning
- C. Factorization of large numbers
- D. Simultaneous modular congruences

Answer: D

Q1028. Stirling's approximation significance?

- A. Approximates $n!$ for growth analysis
- B. It sorts elements efficiently
- C. It finds prime numbers quickly
- D. It solves algebraic equations

Answer: A

Q1029. Handshaking Lemma?

- A. All vertices have even degree
- B. The graph is always fully connected
- C. Sum of degrees equals 2 times edges
- D. All edges have equal weight values

Answer: C

Q1030. Matrix exponentiation for?

- A. Sorting matrix rows and columns
- B. n th term of linear recurrences fast
- C. Displaying matrices on screen
- D. Reading matrix input from files

Answer: B

Q1031. Comparison sort lower bound?

- A. $O(\log n)$
- B. $O(n \log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: B

Q1032. What is approximation algorithm?

- A. Produces random unpredictable results
- B. Always gives exact solutions
- C. Near-optimal with provable guarantees
- D. Tries all solutions by brute force

Answer: C

Q1033. What is A*?

- A. A string matching technique
- B. A linear search method only
- C. Best-first search using heuristics
- D. A sorting algorithm for arrays

Answer: C

Q1034. What is branch and bound?

- A. A tree data structure type
- B. A sorting algorithm approach
- C. A compression technique used
- D. Prunes branches worse than best

Answer: D

Q1035. Floyd-Warshall complexity?

- A. $O(V^2)$
- B. $O(V^3)$
- C. $O(V \cdot E)$
- D. $O(E \log V)$

Answer: B

Q1036. What is randomized algorithm?

- A. An algorithm with no clear structure
- B. An algorithm that has bugs in it
- C. Uses random choices for performance
- D. An algorithm that is always wrong

Answer: C

Q1037. Las Vegas vs Monte Carlo?

- A. LV: always correct; MC: may err sometimes
- B. Monte Carlo is always correct output
- C. They are exactly the same algorithm
- D. Las Vegas is always faster in practice

Answer: A

Q1038. Amortized $O(1)$ dynamic array?

- A. The array never resizes at all
- B. Every single operation is $O(1)$
- C. Some $O(n)$ resizes, average $O(1)$
- D. All operations take $O(\log n)$

Answer: C

Q1039. Kruskal's key idea?

- A. Use DFS for tree construction
- B. Start from a single vertex first
- C. Sort edges, add non-cycle-forming
- D. Use BFS for tree construction

Answer: C

Q1040. KMP solves?

- A. Sorting array elements fast
- B. Pattern matching in $O(n+m)$
- C. Matrix multiplication task
- D. Graph traversal and search

Answer: B

Q1041. What is CAP theorem?

- A. A programming language feature
- B. At most 2 of C, A, P guaranteed
- C. All 3 properties always achievable
- D. A sorting algorithm for databases

Answer: B

Q1042. What is technical debt?

- A. Money owed to hardware vendors
- B. Software licensing fees to pay
- C. Future rework cost from shortcuts
- D. Physical hardware that is broken

Answer: C

Q1043. Pareto Principle in software?

- A. 80% of code should be comments
- B. All components contribute equally
- C. 80% of effects from 20% of causes
- D. 80% developers write 20% of code

Answer: C

Q1044. What is opportunity cost?

- A. The cost of running cloud servers
- B. The best alternative you gave up
- C. A pricing type for subscriptions
- D. The cost of buying software tools

Answer: B

Q1045. What is survivorship bias?

- A. A sorting algorithm technique used
- B. A programming paradigm approach
- C. A database concept for backups
- D. Focus on successes, ignore failures

Answer: D

Q1046. Correlation vs causation?

- A. Neither concept applies in CS work
- B. They are exactly the same concept
- C. Correlation: related; causation: causes
- D. Causation is weaker than correlation

Answer: C

Q1047. Conway's Law?

- A. A sorting algorithm for lists
- B. A complexity class in theory
- C. A data storage optimization law
- D. Systems mirror communication structure

Answer: D

Q1048. What is expected value?

- A. The maximum possible outcome
- B. The most common outcome seen
- C. Sum of outcome times probability
- D. The minimum possible outcome

Answer: C

Q1049. What is post-mortem?

- A. Structured review of what happened
- B. Only done after deployment phase
- C. Deleting all code from the project
- D. A security audit of the system

Answer: A

Q1050. Occam's Razor in software?

- A. All solutions are equally valid here
- B. Simplest adequate solution preferred
- C. Maximize complexity for robustness
- D. Complex solutions are always best

Answer: B

Q1051. What is a Heisenbug?

- A. A syntax error in the source code
- B. A bug that changes when observed
- C. A normal reproducible program bug
- D. A hardware component malfunction

Answer: B

Q1052. What is static analysis?

- A. Testing at runtime with real data
- B. Analyzing code without executing it
- C. User acceptance testing of the app
- D. Running the code to find bugs

Answer: B

Q1053. What is dynamic analysis?

- A. Code review by team members only
- B. Reading documentation about the code
- C. Analyzing behavior during execution
- D. Static code review without running

Answer: C

Q1054. What is buffer overflow?

- A. Writing beyond allocated memory area
- B. A database overflowing with data
- C. A network packet overflow error
- D. A full disk with no free space

Answer: A

Q1055. What is fault localization?

- A. Finding faulty hardware components
- B. Locating the server in a datacenter
- C. Finding the compiler installation path
- D. Automatically identifying bug locations

Answer: D

Q1056. What is delta debugging?

- A. Running multiple programs together
- B. Using version control for changes
- C. Minimizing failure-inducing input size
- D. Making small incremental changes

Answer: C

Q1057. What is a sanitizer?

- A. A cleaning product for hardware
- B. A code formatting utility tool
- C. An antivirus software application
- D. Runtime tool detecting memory errors

Answer: D

Q1058. What is symbolic execution?

- A. Using symbols in variable names
- B. Deploying to production environment
- C. Symbolic values exploring all paths
- D. Code review by senior developers

Answer: C

Q1059. What is a Mandelbug?

- A. A graphical rendering issue seen
- B. A simple reproducible error found
- C. A user interface display problem
- D. Complex chaotic causes, hard to fix

Answer: D

Q1060. What is time-travel debugging?

- A. Predicting future bugs in advance
- B. Record execution, step backward
- C. Debugging legacy system software
- D. Debugging very old legacy code

Answer: B

Q1061. Naive Fibonacci complexity?

- A. $O(n)$
- B. $O(n^2)$
- C. $O(2^n)$
- D. $O(n \log n)$

Answer: C

Q1062. Splay tree amortized?

- A. $O(n)$
- B. $O(n \log n)$
- C. $O(\log n)$
- D. $O(1)$

Answer: C

Q1063. Adjacency list vs matrix?

- A. No meaningful difference exists
- B. $O(V+E)$ vs $O(V^2)$, saves space sparse
- C. Matrix is always better to use here
- D. They use exactly the same space

Answer: B

Q1064. Dijkstra with binary heap?

- A. $O(V^3)$
- B. $O((V+E) \log V)$
- C. $O(V^2)$
- D. $O(E)$

Answer: B

Q1065. P=NP asks?

- A. Are primes equal to naturals
- B. Verifiable in poly time means solvable?
- C. Do programs always need parameters
- D. Are pointers always needed in code

Answer: B

Q1066. Naive matrix mult $n \times n$?

- A. $O(n^2)$
- B. $O(n^2 \log n)$
- C. $O(n^3)$
- D. $O(n)$

Answer: C

Q1067. Strassen significance?

- A. Same time as naive multiplication
- B. It is slower than naive approach
- C. Below $O(n^3)$ at about $O(n^{2.807})$
- D. It only works on 2×2 matrices

Answer: C

Q1068. What is NP-complete?

- A. An easy problem with fast solution
- B. In NP, all NP reduces to it in poly
- C. A problem with known $O(n)$ solution
- D. A problem that is unsolvable always

Answer: B

Q1069. Cache complexity?

- A. Same as hash table complexity analysis
- B. Cache misses affect real performance
- C. Only measures the cache memory size
- D. Same as space complexity of program

Answer: B

Q1070. PSPACE?

- A. Polynomial time class problems
- B. Only applies to sorting algorithms
- C. The simplest complexity class known
- D. Polynomial space, contains P and NP

Answer: D

Q1071. Find LCS?

- A. DP with a 2D table approach
- B. Hashing all subsequences found
- C. Brute force all subsequences
- D. Simple character matching scan

Answer: A

Q1072. 0/1 Knapsack optimal?

- A. Sort items by weight first
- B. DP over items and capacities
- C. Greedy algorithm approach
- D. Random selection of items

Answer: B

Q1073. LRU cache efficient implementation?

- A. Only an array data structure
- B. A stack-based data structure
- C. A binary search tree structure
- D. Hash map plus doubly linked list

Answer: D

Q1074. All connected components?

- A. BFS/DFS from unvisited vertices
- B. Use hash table for the lookup
- C. Check all pairs of vertex nodes
- D. Sort all the vertices first

Answer: A

Q1075. What is tree DP?

- A. Sorting the tree node values
- B. Balancing the tree structure
- C. Bottom-up from children results
- D. Simple tree traversal method

Answer: C

Q1076. Median in stream?

- A. Two heaps: max lower, min upper
- B. Use a single array for storage
- C. Sort the entire stream each time
- D. Use a linked list for ordering

Answer: A

Q1077. Bit manipulation for?

- A. Making code completely unreadable
- B. Graphics rendering operations only
- C. Low-level hardware drivers only
- D. Sets, flags, and $O(1)$ optimizations

Answer: D

Q1078. Shortest path unweighted?

- A. BFS from the source vertex
- B. Bellman-Ford algorithm approach
- C. Dijkstra's algorithm approach
- D. DFS from the source vertex

Answer: A

Q1079. What is segment tree?

- A. Sorting segments of an array
- B. String matching and pattern search
- C. Range queries and updates in $O(\log n)$
- D. Graph traversal and pathfinding

Answer: C

Q1080. Find articulation points?

- A. BFS from every vertex in the graph
- B. Sort the graph vertices by degree
- C. Tarjan's DFS with discovery/low values
- D. Check all vertices by removal

Answer: C

Q1081. Dimensionality reduction?

- A. Reduce features, preserve information
- B. Compressing files on the filesystem
- C. Deleting rows from the data table
- D. Reducing disk storage size used

Answer: A

Q1082. What is overfitting?

- A. Having too little training data
- B. A model achieving perfect accuracy
- C. Learns noise, fails on new data
- D. A model that is far too simple

Answer: C

Q1083. Bias-variance tradeoff?

- A. Balance simplicity and complexity
- B. A network optimization technique
- C. A database optimization approach
- D. A hiring process consideration

Answer: A

Q1084. What is MapReduce?

- A. A database type for storing data
- B. A visualization tool for charts
- C. Parallel map and reduce for big data
- D. A sorting algorithm for arrays

Answer: C

Q1085. Simpson's Paradox?

- A. Trend reverses when groups combined
- B. A sorting algorithm special case
- C. A code error in the implementation
- D. A normal expected statistical result

Answer: A

Q1086. Curse of dimensionality?

- A. Having too few data dimensions
- B. A graphics rendering limitation
- C. More features makes data sparser
- D. Simple linear scaling of the data

Answer: C

Q1087. Time series analysis?

- A. Sorting data by alphabetical name
- B. Counting occurrences in a dataset
- C. Analyzing static unchanging data only
- D. Temporal data for trends and forecasts

Answer: D

Q1088. Ensemble learning?

- A. A data cleaning preprocessing step
- B. Using a single model for predictions
- C. A database optimization technique used
- D. Combining multiple models for accuracy

Answer: D

Q1089. Data lineage?

- A. Formatting data for the display
- B. Deleting data after processing it
- C. The age of the data in storage
- D. Tracking origin and transformations

Answer: D

Q1090. Streaming vs batch?

- A. Streaming: real-time; batch: scheduled
- B. Streaming is always much slower
- C. They are exactly the same approach
- D. Batch processing is always real-time

Answer: A

Q1091. What is TRIZ?

- A. Systematic innovation from patents
- B. A testing framework for software
- C. A programming language for apps
- D. A database management system type

Answer: A

Q1092. What is first principles?

- A. Copying existing best practices always
- B. Following established procedures only
- C. Using templates without modification
- D. Reasoning up from fundamental truths

Answer: D

Q1093. Emergent vs planned design?

- A. Emergent evolves; planned defines upfront
- B. They are exactly the same approach
- C. Planned design never actually works
- D. Emergent design is always worse overall

Answer: A

Q1094. Innovator's dilemma?

- A. A database design issue to address
- B. A code problem in the application
- C. Established orgs struggle with disruption
- D. A sorting algorithm special case issue

Answer: C

Q1095. What is double diamond?

- A. A testing framework for the app
- B. A type of jewelry design pattern
- C. A data structure for binary trees
- D. Two diverge/converge phases in design

Answer: D

Q1096. What is technology transfer?

- A. Upgrading hardware on all machines
- B. Installing new software on systems
- C. Technology from one domain to another
- D. Moving servers to a new location

Answer: C

Q1097. What is morphological analysis?

- A. Analyzing word forms in linguistics
- B. All parameter variation combinations
- C. Parsing source code for syntax errors
- D. Static code analysis for quality

Answer: B

Q1098. Serendipity in innovation?

- A. It fully replaces structured research
- B. It always guarantees success achieved
- C. It plays no role in innovation
- D. Unexpected discoveries become breakthroughs

Answer: D

Q1099. What is disruptive innovation?

- A. Simpler solutions for overlooked segments
- B. Optimization of existing system performance
- C. Breaking things without any purpose
- D. Normal incremental improvement of product

Answer: A

Q1100. Platform thinking?

- A. Extensible platforms creating ecosystems
- B. Building stages for presentations
- C. Only using existing platforms given
- D. Targeting a specific operating system

Answer: A

Q1101. CAP for distributed DBs?

- A. Choose consistency or availability during partitions
- B. Only consistency matters in databases
- C. All 3 guarantees always achievable
- D. Only availability matters in databases

Answer: A

Q1102. Eventual consistency?

- A. System is never consistent at all
- B. Only works on very small systems
- C. Becomes consistent given enough time
- D. System is always immediately consistent

Answer: C

Q1103. Two generals problem?

- A. Reliable communication over unreliable channel
- B. A graph traversal algorithm technique
- C. A military history lesson studied
- D. A sorting algorithm for dual arrays

Answer: A

Q1104. Horizontal vs vertical scaling?

- A. Vertical is always the better choice
- B. They are exactly the same approach
- C. Horizontal: more machines; vertical: more power
- D. Horizontal is always the better choice

Answer: C

Q1105. Microservices?

- A. Very small source code files only
- B. Independent services communicating via APIs
- C. Micro-controller hardware programming
- D. A testing framework for small units

Answer: B

Q1106. Chaos engineering?

- A. Breaking systems permanently by intent
- B. General disorder in the codebase
- C. Creating chaos without any purpose
- D. Deliberate failures to test resilience

Answer: D

Q1107. Byzantine Generals?

- A. Consensus with faulty participants
- B. A graph coloring algorithm used
- C. A military strategy for battles
- D. A history lesson about generals

Answer: A

Q1108. GDPR compliance?

- A. A programming language standard
- B. Protecting EU personal data rights
- C. A database type for EU servers
- D. A testing methodology for quality

Answer: B

Q1109. Edge computing?

- A. A CSS styling technique for borders
- B. An optimization for rendering speed
- C. Processing near source for low latency
- D. Computing at the edge of a desk

Answer: C

Q1110. Zero-knowledge proof?

- A. A testing methodology for software
- B. An authentication method for users
- C. Knowing nothing about the subject
- D. Prove knowledge without revealing info

Answer: D

Q1111. What is literate programming?

- A. Adding many comments everywhere found
- B. Writing poetry about the algorithms
- C. Writing literary fiction about code
- D. Code embedded in documentation text

Answer: D

Q1112. What is docs-as-code?

- A. Using code tools to write docs
- B. Docs with version control and CI/CD
- C. Writing code inside documentation
- D. Replacing code with documentation

Answer: B

Q1113. What is C4 model?

- A. A C programming language standard
- B. A security classification framework
- C. Four levels: Context, Container, Component, Code
- D. A testing methodology for the app

Answer: C

Q1114. Technical writing for diverse audiences?

- A. Write only for experts in the field
- B. Always use maximum jargon in writing
- C. Adapt style and depth for audience
- D. Write the longest documents possible

Answer: C

Q1115. What are runbooks?

- A. Step-by-step operational procedure guides
- B. A marathon training plan document
- C. Code execution logs from the system
- D. Competitions between team members

Answer: A

Q1116. Diagramming in distributed systems?

- A. Designing logos for the application
- B. Diagrams for complex interactions shown
- C. Creating art for the office walls
- D. Drawing pictures for decoration only

Answer: B

Q1117. Retrospective documentation?

- A. Documenting very old legacy systems
- B. Record successes, failures, improvements
- C. Archiving old documents for storage
- D. Deleting outdated documentation files

Answer: B

Q1118. What is traceability?

- A. Link requirements to design and tests
- B. Numbering all the pages in documents
- C. Finding lost documentation on the server
- D. Tracking user access to the system

Answer: A

Q1119. What is communication debt?

- A. Outstanding phone bills to be paid
- B. Cost of poor communication accumulated
- C. Too many meetings in the schedule
- D. Email overload in the team inbox

Answer: B

Q1120. Post-incident review docs?

- A. Legal documents for court proceedings
- B. Documents assigning blame to someone
- C. Deleting all evidence of the incident
- D. Blameless timeline, root cause, actions

Answer: D

Q1121. A team repeatedly solves symptoms instead of root causes. Which problem-solving failure does this represent?

- A. Premature optimization of solution components
- B. Surface-level analysis without deep investigation
- C. Excessive decomposition of the original problem
- D. Functional fixedness limiting their perspective

Answer: B

Q1122. When solving a novel problem, which approach is most effective for generating initial solution ideas?

- A. Immediately coding the first idea that emerges
- B. Avoiding all brainstorming to save time needed
- C. Selecting the most popular known framework now
- D. Divergent thinking before convergent evaluation

Answer: D

Q1123. A developer uses only familiar tools despite better alternatives existing. What cognitive trap is this?

- A. The law of the instrument or Maslow's hammer
- B. The Dunning-Kruger effect on skill assessment
- C. Analysis paralysis from too many viable options
- D. Anchoring bias toward the first piece of data

Answer: A

Q1124. In complex system failures, why is linear cause-and-effect thinking often insufficient for analysis?

- A. Because complex problems only have single causes
- B. Because simple problems always have simple fixes
- C. Because linear thinking always finds root causes
- D. Because complex systems have interacting factors

Answer: D

Q1125. Which meta-cognitive strategy most improves problem-solving performance across different domains?

- A. Avoiding all unfamiliar problem types encountered
- B. Memorizing solutions to every known problem type
- C. Self-monitoring and reflective evaluation of approach
- D. Working faster without pausing to think or assess

Answer: C

Q1126. A problem has multiple valid solutions with different trade-offs. What is the best decision approach?

- A. Randomly select any solution since all are valid
- B. Always pick the solution with the lowest cost only
- C. Evaluate solutions against weighted criteria matrix
- D. Choose the first solution that seems acceptable

Answer: C

Q1127. How does the concept of problem space relate to search-based problem solving in AI research?

- A. It eliminates the need for any search algorithms
- B. It defines all possible states and transitions
- C. It only refers to physical workspace dimensions
- D. It is unrelated to state-based representations

Answer: B

Q1128. Why might an expert sometimes perform worse than a novice on certain restructured problems?

- A. Experts always think slower than beginners do
- B. Experts lack any knowledge of the problem domain
- C. Novices have inherently superior problem-solving skills
- D. Expert schemas can create fixation on known patterns

Answer: D

Q1129. In design thinking, why is reframing a problem often more valuable than directly solving it as stated?

- A. Because the original framing usually is always correct
- B. Because it eliminates the need for any user research
- C. Because reframing reveals hidden assumptions and needs
- D. Because it allows avoiding the problem entirely now

Answer: C

Q1130. Which approach best handles wicked problems that have no definitive formulation or stopping rule?

- A. Ignoring complexity and applying the simplest solution
- B. Applying a single fixed algorithm repeatedly here
- C. Iterative prototyping with stakeholder feedback loops
- D. Waiting until all information is completely available

Answer: C

Q1131. A system shows intermittent failures only under peak load. Which analysis approach best identifies the root cause?

- A. Reviewing the code during low traffic periods only
- B. Restarting the system each time a failure is noted
- C. Asking users to describe the error from their memory
- D. Load testing combined with systematic log analysis

Answer: D

Q1132. When requirements conflict with each other in a project, what is the most appropriate analysis strategy?

- A. Implementing all conflicting requirements simultaneously
- B. Ignoring the conflict and proceeding with work
- C. Prioritization and trade-off analysis with stakeholders
- D. Removing all conflicting requirements from the scope

Answer: C

Q1133. How does causal loop diagramming improve analysis of complex interdependent system problems?

- A. It focuses only on the most obvious direct causes
- B. It reveals feedback loops and systemic interactions
- C. It eliminates the need for any quantitative analysis
- D. It simplifies systems to single cause-effect chains

Answer: B

Q1134. A bug appears only when three specific modules interact simultaneously. What analysis type is most appropriate?

- A. Code style review of each module independently
- B. Performance benchmarking of individual module speed
- C. Unit testing each module in complete isolation
- D. Integration and interaction analysis across modules

Answer: D

Q1135. Why might quantitative data alone be insufficient for complete analysis in socio-technical systems?

- A. Statistical methods solve every analytical challenge
- B. Human factors require qualitative analysis as well
- C. Quantitative data always provides complete insights
- D. Numbers are always more important than any context

Answer: B

Q1136. When analyzing a legacy system for modernization, which approach best captures both explicit and tacit knowledge?

- A. Automated scanning without any human involvement
- B. Only reading the existing documentation available
- C. Code archaeology combined with expert interviews
- D. Rewriting everything from scratch without analysis

Answer: C

Q1137. How does Cynefin framework help classify problems for appropriate analysis strategies?

- A. It treats all problems as equally complex always
- B. It categorizes problems by their domain complexity
- C. It eliminates the need for any problem analysis
- D. It only works for simple and obvious problem types

Answer: B

Q1138. A data pipeline fails silently, producing incorrect results. What analysis method best detects this?

- A. Data validation with expected output range assertions
- B. Reviewing the pipeline code for syntax errors only
- C. Checking only if the pipeline completes without errors
- D. Monitoring only the system CPU and memory utilization

Answer: A

Q1139. When performing risk analysis for a critical system, why is fault tree analysis preferred over simple checklists?

- A. Fault trees are simpler to create than any checklist
- B. Fault trees model causal relationships between failures
- C. Checklists capture all possible failure combinations
- D. Checklists are always more thorough and comprehensive

Answer: B

Q1140. How does assumption mapping improve problem analysis in uncertain environments?

- A. It eliminates the need for any empirical validation
- B. It only works when all assumptions are already known
- C. It proves all assumptions are completely correct
- D. It identifies and ranks assumptions by risk and impact

Answer: D

Q1141. A programmer argues: The tests pass so the code is correct. What logical error is this?

- A. Affirming the consequent in conditional logic
- B. Correct use of biconditional logical equivalence
- C. Valid modus ponens application of the argument
- D. Denying the antecedent in conditional reasoning

Answer: A

Q1142. In formal verification, how does temporal logic extend propositional logic for system reasoning?

- A. It removes the need for any truth values used
- B. It only applies to static non-changing systems now
- C. It simplifies logic by removing all connectives
- D. It adds operators for reasoning about time states

Answer: D

Q1143. Why is the halting problem significant for the limits of logical reasoning in CS?

- A. It proves all programs can be verified completely
- B. It proves formal logic can solve every CS problem
- C. It demonstrates that all programs eventually halt
- D. It shows some properties are logically undecidable

Answer: D

Q1144. When building a logical argument for system requirements, why might closed-world assumption lead to errors?

- A. It ensures all possible scenarios are fully covered
- B. Unknown facts default to false which may be wrong
- C. It correctly handles all unknown facts in systems
- D. It makes reasoning more complete and more accurate

Answer: B

Q1145. How does non-monotonic reasoning differ from classical logic in practical problem solving?

- A. Both systems handle new evidence in the same way
- B. Classical logic allows retracting past conclusions
- C. Non-monotonic reasoning retracts with new evidence
- D. Non-monotonic reasoning never revises conclusions

Answer: C

Q1146. A spec states the system shall not fail more than once per year. What logical challenge arises in verification?

- A. It is trivially easy to verify this requirement
- B. Negative requirements need no special handling at all
- C. The requirement is too simple to need verification
- D. Proving a negative over time requires exhaustive testing

Answer: D

Q1147. In fuzzy logic, how is truth handled differently than in classical Boolean logic systems?

- A. Truth values range continuously between zero and one
- B. Truth values are restricted to only zero and one
- C. Fuzzy logic uses only three discrete truth values
- D. Fuzzy logic eliminates the concept of truth entirely

Answer: A

Q1148. Why is the principle of explosion problematic in inconsistent knowledge bases?

- A. It only affects mathematical proofs not software
- B. It makes consistent knowledge bases unreliable now
- C. From a contradiction any statement can be derived
- D. It prevents deriving any conclusions whatsoever

Answer: C

Q1149. How does abductive reasoning complement deductive and inductive reasoning in diagnostics?

- A. It provides mathematically certain proofs of causes
- B. It generates the best explanation for observations
- C. It replaces both deductive and inductive methods
- D. It ignores observed evidence during the reasoning

Answer: B

Q1150. When designing a rule-based system, why is the Rete algorithm important for efficient inference?

- A. It only works with exactly two rules at one time
- B. It optimizes pattern matching across many rules
- C. It eliminates the need for any rules in the system
- D. It replaces logical inference with random selection

Answer: B

Q1151. A recursive algorithm has overlapping subproblems. Which technique best optimizes its flow?

- A. Removing the base case to simplify the algorithm
- B. Adding more recursive calls to increase coverage
- C. Converting all recursion to deeply nested if-else
- D. Dynamic programming with memoization of results

Answer: D

Q1152. When converting recursive to iterative, which data structure commonly replaces the call stack?

- A. An explicit stack data structure for depth tracking
- B. A queue data structure for breadth-first processing
- C. A linked list for sequential data traversal only
- D. A hash table for random access to stored elements

Answer: A

Q1153. In concurrent programming, what flow control challenge does a race condition represent?

- A. Unpredictable behavior from unsynchronized shared access
- B. A guaranteed correct ordering of all operations
- C. A performance optimization technique for parallel code
- D. A standard debugging technique for multi-threaded code

Answer: A

Q1154. Why might tail-call optimization be important for recursive algorithms in functional programming?

- A. It increases the number of stack frames allocated
- B. It is only relevant to non-recursive function calls
- C. It prevents stack overflow by reusing stack frames
- D. It makes recursion slower but more memory intensive

Answer: C

Q1155. A state machine has unreachable states in its design. What does this indicate about algorithm flow?

- A. The design is optimal and completely correct here
- B. All states must be unreachable for a correct design
- C. Dead code or design flaws exist in the state model
- D. Unreachable states improve system fault tolerance

Answer: C

Q1156. How does coroutine-based flow control differ from traditional subroutine calls?

- A. Subroutines can pause execution at arbitrary points
- B. Coroutines cannot pause and resume their execution
- C. Coroutines and subroutines behave identically always
- D. Coroutines can suspend and resume at specific points

Answer: D

Q1157. What does cyclomatic complexity measure about code in a control flow graph?

- A. The number of independent paths through the program
- B. The execution speed of the algorithm in milliseconds
- C. The amount of memory the program needs to execute
- D. The total number of lines in the source code file

Answer: A

Q1158. In reactive programming, how does event-driven flow handle backpressure in data streams?

- A. By processing all events regardless of capacity now
- B. By shutting down the entire system under any load
- C. By dropping all incoming events without any notice
- D. By signaling the producer to slow down its rate

Answer: D

Q1159. Why are continuation-passing style transformations relevant to complex flow control?

- A. They make the flow of control explicit as a parameter
- B. They simplify all algorithms to a single instruction
- C. They eliminate the need for any function calls at all
- D. They only apply to algorithms with no branching logic

Answer: A

Q1160. In microservices, what flow pattern handles distributed transactions across services?

- A. Ignoring transaction failures across all the services
- B. Locking all services until one transaction completes
- C. The saga pattern with compensating transactions here
- D. Running all operations in a single local transaction

Answer: C

Q1161. For handling both structured and unstructured data, which representation provides the most flexibility?

- A. Schema-on-read approach using document-based storage
- B. Single flat file with comma separated value fields
- C. Rigid relational schema with strict type enforcement
- D. Fixed-width record format with no flexibility given

Answer: A

Q1162. Why might a trie be preferred over a hash table for storing a dictionary of words?

- A. Hash tables cannot store string data at all reliably
- B. Tries support efficient prefix-based search queries
- C. Tries have faster exact match lookup than hash tables
- D. Tries use less memory than hash tables for words

Answer: B

Q1163. In distributed systems, what challenge does the CAP theorem pose for data representation across nodes?

- A. The CAP theorem only applies to single-node systems
- B. Distributed systems never face any consistency issues
- C. All three properties can always be fully guaranteed
- D. Only two of consistency, availability, partition tolerance

Answer: D

Q1164. How does a bloom filter represent set membership differently from a traditional hash set?

- A. Bloom filters use more memory than standard hash sets
- B. Bloom filters guarantee no false positives ever occur
- C. Bloom filters store every element in full original form
- D. Bloom filters allow false positives never false negatives

Answer: D

Q1165. When representing time-series data, why might columnar storage outperform row-based storage?

- A. Columnar enables better compression and faster scans
- B. Columnar is worse for analytical aggregation queries
- C. Columnar storage cannot handle time-series data at all
- D. Row-based always compresses better than column based

Answer: A

Q1166. What is the significance of endianness in cross-platform data representation?

- A. Byte order differences can cause incorrect data reading
- B. Endianness has no effect on data interpretation ever
- C. All systems universally use the same byte ordering now
- D. Endianness only affects text data never numerical data

Answer: A

Q1167. Why might persistent data structures be preferred over mutable ones in concurrent programming?

- A. Persistent structures use less memory than mutable ones
- B. Mutable structures never cause concurrency problems here
- C. Persistent structures avoid race conditions by immutability
- D. Persistent structures are always faster to modify now

Answer: C

Q1168. How does a B-tree optimize data representation for disk-based storage systems?

- A. B-trees minimize disk reads with high branching factors
- B. B-trees cannot be used in any database system at all
- C. B-trees are binary trees optimized for memory only use
- D. B-trees store all data in memory avoiding disk reads

Answer: A

Q1169. When choosing between adjacency matrix and adjacency list for a sparse graph, what drives the decision?

- A. Adjacency matrices are always better for sparse graphs
- B. The choice has no impact on space or time performance
- C. Adjacency lists require more space than matrices always
- D. Adjacency lists use less space for graphs with few edges

Answer: D

Q1170. What challenge does IEEE 754 floating-point create for financial calculations?

- A. It represents all decimal values with perfect precision
- B. Rounding errors accumulate making exact comparison unsafe
- C. It is designed specifically for financial math operations
- D. Floating-point numbers never have any precision issues

Answer: B

Q1171. When applying CQRS, what does separating read and write models provide?

- A. It prevents any data from being written to the store
- B. It ensures read and write use the same model always
- C. It optimizes each model for its specific access pattern
- D. It eliminates the need for any database queries at all

Answer: C

Q1172. How does the circuit breaker pattern help in distributed systems?

- A. It stops calls to failing services preventing cascading
- B. It keeps retrying failed calls indefinitely always
- C. It ignores all failures and continues normal operation
- D. It speeds up calls to services that are already down

Answer: A

Q1173. In ML, why might overfitting be a failure of pattern generalization?

- A. The model learns general patterns that transfer well
- B. Overfitting and generalization are the same concept
- C. The model memorizes training data without generalizing
- D. Overfitting always improves performance on new data

Answer: C

Q1174. How does event sourcing differ from CRUD in representing state changes?

- A. It stores only the current state deleting all history
- B. It uses the same approach as traditional CRUD always
- C. It prevents any modification to the application state
- D. It stores all state changes as a sequence of events

Answer: D

Q1175. Why is the anti-corruption layer important when integrating with legacy systems?

- A. It translates between new and legacy domain models
- B. It forces legacy systems to adopt all new interfaces
- C. It eliminates the need for any integration testing
- D. It directly couples new code to the legacy interface

Answer: A

Q1176. How does hierarchical pattern recognition improve efficiency over flat matching?

- A. Hierarchical approaches ignore high-level pattern data
- B. It processes all patterns at the same level of detail
- C. Flat matching is always more efficient than hierarchical
- D. It recognizes patterns at multiple levels of abstraction

Answer: D

Q1177. When should the strangler fig pattern be used instead of a big-bang rewrite?

- A. When the system is small enough for instant rewrite
- B. When gradual incremental migration reduces overall risk
- C. When no part of the old system needs to keep running
- D. When all features must be replaced simultaneously now

Answer: B

Q1178. What challenge does concept drift pose for deployed recognition systems?

- A. Patterns remain perfectly stable over all time periods
- B. Concept drift improves model accuracy automatically
- C. Deployed models never need any retraining or updates
- D. Data distributions change making learned patterns stale

Answer: D

Q1179. How does the bulkhead pattern prevent total system failure?

- A. It shares all resources across every system component
- B. It eliminates redundancy to reduce system complexity
- C. It isolates components so failure in one stays contained
- D. It connects all components tightly for maximum speed

Answer: C

Q1180. Why is transfer learning effective when labeled data is scarce?

- A. It requires more labeled data than training from scratch
- B. It trains from scratch ignoring all prior knowledge
- C. It reuses patterns learned from related tasks or domains
- D. It only works when unlimited labeled data is available

Answer: C

Q1181. A problem requires counting paths in a grid. Which mathematical concept most efficiently solves this?

- A. Combinatorics using binomial coefficients for paths
- B. Simple addition of row and column dimensions here
- C. Subtraction of blocked cells from the total cell count
- D. Multiplication of the grid area by a constant factor

Answer: A

Q1182. Why is the master theorem important for analyzing divide-and-conquer complexity?

- A. It only applies to iterative non-recursive algorithms
- B. It provides closed-form solutions for recurrence relations
- C. It gives exact constant factors for algorithm run time
- D. It eliminates the need for any complexity analysis done

Answer: B

Q1183. How does probability theory help in analyzing randomized algorithms?

- A. Randomized algorithms are always worse than deterministic
- B. Probability is irrelevant to algorithm analysis work
- C. Expected value analysis predicts average case behavior
- D. Randomized algorithms always have fixed performance

Answer: C

Q1184. When solving optimization, why might linear programming be preferred over brute force?

- A. Brute force is always faster for optimization problems
- B. Linear programming efficiently handles continuous constraints
- C. Brute force uses less memory than linear programming does
- D. Linear programming cannot handle any constraints at all

Answer: B

Q1185. How does graph theory help model and solve network flow problems?

- A. Graph theory is unrelated to any network flow problems
- B. Graph theory only applies to social network analysis
- C. Network flows cannot be modeled using any graph theory
- D. Max-flow min-cut theorem optimizes network throughput

Answer: D

Q1186. Why is NP-completeness important for practical problem-solving decisions?

- A. NP-complete problems are always easy to solve quickly
- B. NP-completeness is only theoretical with no practical use
- C. It identifies problems unlikely to have efficient solutions
- D. All NP-complete problems have known polynomial solutions

Answer: C

Q1187. How does Bayes' theorem enable updating beliefs with new evidence?

- A. It updates posterior probability using prior and likelihood
- B. It ignores prior probabilities during all calculations
- C. It only works when all probabilities are exactly known
- D. It eliminates uncertainty from all decision-making tasks

Answer: A

Q1188. In cryptography, why is the discrete logarithm problem computationally significant?

- A. Computing discrete logarithms takes constant time only
- B. Its difficulty forms the basis for public key security
- C. Discrete logarithms are trivially easy to compute
- D. Discrete logarithms have no use in modern cryptography

Answer: B

Q1189. How does amortized analysis provide more accurate picture than worst-case analysis?

- A. It only applies to algorithms with constant time cost
- B. It always shows worse performance than worst-case does
- C. It ignores expensive operations in the total cost here
- D. It averages cost over a sequence of operations performed

Answer: D

Q1190. Why are Markov chains useful for modeling stochastic processes?

- A. They can only model deterministic non-random processes
- B. They require knowledge of entire history for prediction
- C. They model memoryless state transitions with probability
- D. They are unable to predict any future system states

Answer: C

Q1191. For real-time systems, why is worst-case complexity more critical than average-case?

- A. Average case guarantees meeting real-time deadlines
- B. Worst case determines if deadlines are always met here
- C. Real-time systems have no time constraints whatsoever
- D. Average and worst case are always the same value given

Answer: B

Q1192. How does A* search combine heuristic and actual cost for optimal paths?

- A. It always explores every node in the entire graph now
- B. It ignores heuristics and only uses actual path cost
- C. It uses $f(n) = g(n) + h(n)$ to guide the search path
- D. It randomly explores nodes without any cost function

Answer: C

Q1193. Why might approximation be preferred over exact for NP-hard problems?

- A. Approximation gives near-optimal results in polynomial time
- B. Approximation algorithms always find the exact best answer
- C. NP-hard problems are always easy to solve exactly in time
- D. Exact algorithms always run faster for NP-hard problems

Answer: A

Q1194. How does amortized $O(1)$ apply to dynamic array resizing?

- A. Every individual insertion takes $O(n)$ time to complete
- B. Resizing always takes constant time for every operation
- C. Expensive resizing is rare enough to average $O(1)$ cost
- D. Dynamic arrays never need to resize their storage space

Answer: C

Q1195. What advantage does randomized quicksort have over deterministic quicksort?

- A. Randomization makes the algorithm produce wrong results
- B. Deterministic quicksort handles all inputs optimally here
- C. It avoids worst-case $O(n^2)$ for adversarial input data
- D. Randomized quicksort is always slower in every case

Answer: C

Q1196. When should BFS be chosen over DFS for graph traversal?

- A. When finding any path regardless of its total length
- B. When memory usage must be minimized above all else
- C. When the shortest path in unweighted graph is required
- D. When the deepest node must be found first before rest

Answer: C

Q1197. How do algorithmic paradigms help select problem-solving strategies?

- A. They categorize problems to match with proven techniques
- B. They eliminate the need for understanding the problem
- C. Paradigms are only relevant for theoretical not practical
- D. Paradigms restrict thinking to only one possible approach

Answer: A

Q1198. Why is cache-oblivious algorithm design important for modern architectures?

- A. Modern computers have no memory hierarchy at all now
- B. It optimizes memory access patterns without cache knowledge
- C. Cache-oblivious algorithms are always slower in practice
- D. Memory hierarchy has no effect on algorithm performance

Answer: B

Q1199. How does minimax with alpha-beta pruning optimize game tree search?

- A. It prunes branches that cannot affect the final decision
- B. It only works for games with a single possible outcome
- C. It randomly selects moves without evaluating game state
- D. It explores every node in the entire game tree fully

Answer: A

Q1200. What is the significance of reduction in proving problem complexity?

- A. It proves all problems have polynomial-time solutions
- B. It shows one problem is at least as hard as another one
- C. Reduction makes all problems easier to solve quickly
- D. Reduction eliminates the need for complexity analysis

Answer: B

Q1201. A team unanimously agrees on a risky strategy without discussing alternatives. Which failure is this?

- A. Groupthink suppressing dissent and alternative views
- B. Effective consensus building through open discussion
- C. Healthy team alignment on a well-analyzed strategy
- D. Structured decision making with diverse perspectives

Answer: A

Q1202. How does survivorship bias distort analysis of success factors in startups?

- A. It equally considers both successful and failed startups
- B. It overweights successful cases ignoring failed examples
- C. It focuses specifically on understanding failure patterns
- D. It provides accurate insights by studying all startups

Answer: B

Q1203. Which critical thinking approach best reveals hidden assumptions in a technical proposal?

- A. Focusing only on cost without considering other factors
- B. Accepting the proposal based on presenter credentials
- C. Systematically questioning each premise and dependency
- D. Approving proposals that use the latest technology stack

Answer: C

Q1204. How does the availability heuristic lead to errors in risk assessment?

- A. It ensures accurate risk assessment in every situation
- B. It provides a mathematically rigorous probability model
- C. It eliminates all cognitive biases from risk assessment
- D. Recent or vivid events are overweighted in probability

Answer: D

Q1205. Why might a technically superior solution fail in practice despite logical analysis?

- A. Logical analysis always guarantees practical success here
- B. Technical superiority is the only factor that ever matters
- C. Organizational, cultural, or political factors override logic
- D. Rigorous analysis eliminates all implementation challenges

Answer: C

Q1206. How does the framing effect influence evaluation of equivalent options?

- A. People are immune to how information is framed and shown
- B. Presentation format changes perception of same information
- C. Statistically equivalent options always are seen the same
- D. Framing has no effect on rational decision making here

Answer: B

Q1207. In post-mortem analysis, why is just culture more effective than blame?

- A. Blame assignment encourages honest reporting of errors
- B. Just culture encourages reporting without fear of punishment
- C. Blame assignment always identifies the true root cause now
- D. Just culture prevents anyone from being held accountable

Answer: B

Q1208. How does confirmation bias affect the software testing process?

- A. It has no effect on how testers design their test cases
- B. It ensures all bugs are found during the testing phase
- C. Confirmation bias improves testing coverage automatically
- D. Testers may unconsciously write tests that confirm code works

Answer: D

Q1209. When stakeholders present competing priorities, which framework structures trade-off analysis best?

- A. Multi-criteria decision analysis with weighted scoring
- B. Ignoring all priorities and using developer intuition
- C. Choosing the priority of the most senior stakeholder
- D. Randomly selecting between the competing priorities here

Answer: A

Q1210. How does bounded rationality explain why optimal decisions are often impossible?

- A. Humans always make perfectly optimal rational decisions
- B. Cognitive limits and incomplete information constrain choices
- C. With enough time humans can always find optimal solutions
- D. Bounded rationality only applies to irrational individuals

Answer: B

Q1211. A distributed system produces inconsistent results but all services pass unit tests. What approach helps?

- A. Restarting all services simultaneously to clear the state
- B. Ignoring the inconsistency since all unit tests pass now
- C. Running more unit tests on each individual service here
- D. Distributed tracing to track requests across all services

Answer: D

Q1212. How does time-travel debugging improve analysis of intermittent bugs?

- A. It only works for bugs that occur at specific clock times
- B. It records execution history to replay and inspect states
- C. It speeds up program execution to find bugs more quickly
- D. It prevents bugs from ever occurring in the future here

Answer: B

Q1213. A heisenbug disappears under debugging conditions. What technique helps?

- A. Non-intrusive logging and statistical analysis of behavior
- B. Adding more breakpoints to catch the bug during debug
- C. Removing all error handling code to expose the real bug
- D. Attaching a debugger which will reliably reproduce the bug

Answer: A

Q1214. How does fuzzing complement traditional testing in discovering vulnerabilities?

- A. Fuzzing only tests the normal expected execution paths here
- B. It verifies that existing test cases are correctly written
- C. It provides random unexpected inputs to expose edge cases
- D. Fuzzing replaces the need for any traditional test cases

Answer: C

Q1215. Why might a bug be reproducible in dev but not staging?

- A. Development environments are always more strict than staging
- B. Bugs always behave identically across all environments here
- C. Environments are always identical in every possible way
- D. Configuration data or infrastructure differences mask bug

Answer: D

Q1216. How does static analysis complement dynamic testing?

- A. Static analysis replaces the need for runtime testing here
- B. Static finds code issues without running, dynamic tests behavior
- C. Dynamic testing makes static analysis completely unnecessary
- D. Both approaches find exactly the same types of bugs always

Answer: B

Q1217. Why is a data race in multi-threaded code hard to reproduce?

- A. Thread scheduling non-determinism changes execution order
- B. Data races are easily caught by standard unit testing here
- C. Data races always produce the same behavior every time
- D. Multi-threaded programs always execute in a fixed order

Answer: A

Q1218. How does chaos engineering improve reliability compared to reactive debugging?

- A. It deliberately injects failures to find weaknesses early
- B. It eliminates the need for any monitoring or logging here
- C. It waits for failures to occur then investigates cause
- D. It only applies to systems that have never had any bugs

Answer: A

Q1219. What is the significance of minimal reproducible examples for debugging?

- A. It should include the entire codebase for completeness now
- B. It is unnecessary when the full application code is given
- C. It includes as much code as possible for full context
- D. It isolates the essential conditions that trigger the bug

Answer: D

Q1220. How does observability differ from traditional monitoring for debugging?

- A. Observability and monitoring are exactly the same concept
- B. Observability enables exploring unknown unknowns from output
- C. Traditional monitoring covers all possible failure modes here
- D. Observability eliminates the need for any log collection now

Answer: B

Q1221. An algorithm has $O(n \log n)$ average but $O(n^2)$ worst case. What practical implications does this have?

- A. The algorithm should be rejected due to the worst case
- B. Average and worst case are always the same in practice
- C. The worst case never occurs in practice so ignore it
- D. Input distribution and adversarial scenarios must be considered

Answer: D

Q1222. How does the complexity class P differ from NP?

- A. P is solvable in polynomial time while NP is verifiable
- B. P problems are unsolvable while NP problems are solvable
- C. P and NP are exactly the same complexity class by definition
- D. All NP problems have been proven to be in P class now

Answer: A

Q1223. Why is the constant factor important despite Big-O ignoring it?

- A. For similar Big-O algorithms constants affect real performance
- B. The constant factor has no practical significance at all
- C. Big-O already accounts for all constant factors completely
- D. Constants only matter for theoretical analysis not practice

Answer: A

Q1224. How does the external memory model affect complexity analysis?

- A. Disk access patterns are irrelevant to algorithm performance
- B. I/O complexity measures disk accesses which dominate runtime
- C. Algorithms perform identically regardless of memory hierarchy
- D. External memory has no effect on algorithm running time now

Answer: B

Q1225. What implications does the preprocessing vs query time trade-off have?

- A. Heavy preprocessing can enable fast queries when many queries
- B. Preprocessing never provides any benefit for query speed
- C. The number of queries is irrelevant to this trade-off here
- D. Preprocessing always makes every query slower not faster

Answer: A

Q1226. How does parallel algorithm complexity differ from sequential?

- A. Parallel algorithms always achieve linear speedup exactly
- B. Parallel algorithms never provide any speedup over sequential
- C. Sequential algorithms are always faster than parallel versions
- D. Work and span define parallel complexity and potential speedup

Answer: D

Q1227. Why might worse theoretical complexity outperform better in practice?

- A. Input size never affects which algorithm performs better here
- B. Worse theoretical complexity always means worse real running
- C. Cache behavior and constants can dominate for real inputs
- D. Theoretical complexity perfectly predicts real performance

Answer: C

Q1228. How do output-sensitive algorithms challenge traditional analysis?

- A. Output-sensitive algorithms are always slower than others
- B. Output size is always the same as input size in all cases
- C. Traditional complexity already accounts for all output sizes
- D. Complexity depends on output size which may be much smaller

Answer: D

Q1229. What is the significance of time-space trade-off in constrained environments?

- A. Reducing memory may require more computation and vice versa
- B. Time and space requirements always decrease together here
- C. Memory constraints never affect algorithm design decisions
- D. More memory always means faster execution in every case

Answer: A

Q1230. How does parameterized complexity provide more nuanced analysis?

- A. It considers only input size for complexity analysis here
- B. It always gives the same result as worst-case analysis here
- C. It measures complexity in terms of problem-specific parameters
- D. It ignores all parameters except the total input size given

Answer: C

Q1231. For fast insertion and fast lookup, which data structure combination best addresses this?

- A. A singly linked list for all insertion and lookup tasks
- B. A balanced BST or hash table with appropriate trade-offs
- C. Using only an unsorted array for both operations here
- D. A stack that provides both fast insertion and fast lookup

Answer: B

Q1232. How does memoization transform the computational complexity of Fibonacci?

- A. It reduces complexity from $O(2^n)$ to $O(n)$ linear time
- B. It increases memory usage without any speed improvement
- C. It changes complexity from $O(n)$ to $O(2^n)$ exponential
- D. Memoization has no effect on Fibonacci computation time

Answer: A

Q1233. When should composition be chosen over inheritance for code reuse?

- A. Composition is preferred for flexible has-a relationships
- B. Inheritance and composition are the same thing entirely
- C. Composition prevents any code reuse between components
- D. Inheritance is always the better choice for code reuse

Answer: A

Q1234. How does lazy evaluation improve performance with potentially unused computations?

- A. It prevents any computation from ever being performed
- B. It defers computation until results are actually required
- C. Lazy evaluation always uses more memory than eager does
- D. It computes everything eagerly whether needed or not

Answer: B

Q1235. In concurrent solving, why might immutable structures be preferred?

- A. Mutable structures never cause any concurrency problems
- B. They eliminate synchronization issues between threads
- C. Immutable structures cannot be used in concurrent code
- D. Immutable structures are always slower to access here

Answer: B

Q1236. How does the sliding window technique optimize contiguous subarray problems?

- A. It maintains a window that moves incrementally through
- B. It requires sorting the array before any processing
- C. It examines every possible subarray from scratch each
- D. It only works on arrays with fewer than ten elements

Answer: A

Q1237. For complex state transitions, which programming paradigm best manages this?

- A. Unstructured code with global variables and goto jumps
- B. State machine pattern with explicit state and transitions
- C. Random conditional logic scattered throughout the codebase
- D. Ignoring state management and hoping for correct results

Answer: B

Q1238. How does the two-pointer technique improve efficiency for sorted arrays?

- A. It only works on unsorted arrays not on sorted ones
- B. It solves problems in $O(n)$ that naively require $O(n^2)$
- C. It always requires additional $O(n)$ extra memory to use
- D. It requires three passes through the array for queries

Answer: B

Q1239. Why is understanding constraints crucial before selecting an approach?

- A. Constraints should only be considered after implementing
- B. Constraints are irrelevant to the approach selection
- C. All approaches work regardless of any constraints given
- D. Constraints determine which approaches are feasible here

Answer: D

Q1240. How does Union-Find efficiently solve graph connectivity problems?

- A. It stores the entire adjacency matrix for the graph
- B. It tracks connected components with near-constant operations
- C. It requires $O(n^2)$ time for every connectivity query made
- D. It can only determine connectivity for two specific nodes

Answer: B

Q1241. When building a predictive model, why is train-test split essential?

- A. Training and testing on same data gives true accuracy
- B. Separate test data reveals how well the model generalizes
- C. Testing on training data always shows worst performance
- D. The split is unnecessary when the dataset is large enough

Answer: B

Q1242. How does Simpson's paradox challenge interpretation of aggregated data?

- A. Trends in subgroups can reverse when data is aggregated
- B. Aggregation always improves the accuracy of data trends
- C. Aggregated data always shows the same trend as subgroups
- D. Simpson's paradox only affects very small datasets here

Answer: A

Q1243. What challenges does multicollinearity pose for regression?

- A. Multicollinearity has no effect on regression analysis
- B. It improves reliability of all regression coefficients
- C. Correlated predictors make individual effects unreliable
- D. It always reduces the prediction error of the model now

Answer: C

Q1244. How does the curse of dimensionality affect high-dimensional data?

- A. Data becomes sparse making distance metrics less meaningful
- B. More dimensions always improve model accuracy and speed
- C. High-dimensional data is always easier to analyze than low
- D. The curse only affects two-dimensional data and nothing else

Answer: A

Q1245. Why are randomized controlled trials the gold standard for causal claims?

- A. Observational studies always provide stronger causal claims
- B. They are cheaper and faster than observational studies
- C. They require no statistical analysis of the results given
- D. Random assignment controls for confounding variables here

Answer: D

Q1246. How does feature engineering improve ML model performance?

- A. It only involves deleting features from the original data
- B. Feature engineering is unnecessary for all modern models
- C. It always reduces model accuracy by adding complexity
- D. It creates informative features that capture domain knowledge

Answer: D

Q1247. What ethical challenge does algorithmic bias present?

- A. Algorithmic bias only affects entertainment recommendations
- B. Algorithmic bias ensures perfectly fair decisions always
- C. Biased training data can perpetuate systemic discrimination
- D. Data-driven systems are always free from any human bias

Answer: C

Q1248. How does cross-validation provide more robust performance estimates?

- A. Cross-validation uses the same split every single time
- B. A single split always provides a more reliable estimate now
- C. It averages performance across multiple different data splits
- D. Cross-validation always uses more data for testing than training

Answer: C

Q1249. With imbalanced datasets, why might accuracy be misleading?

- A. Accuracy always reflects true model performance correctly
- B. A model predicting majority class gets high accuracy trivially
- C. Imbalanced datasets make accuracy harder to calculate here
- D. Accuracy is the only valid metric for classification tasks

Answer: B

Q1250. How does data lineage ensure trustworthiness of conclusions?

- A. Data lineage only matters for regulatory compliance now
- B. It eliminates the need for any data validation checks
- C. Data lineage is unrelated to data quality or trust here
- D. It tracks data origins transformations and dependencies

Answer: D

Q1251. How does biomimicry translate natural solutions to engineering challenges?

- A. Natural solutions never apply to technology or engineering
- B. It ignores nature and relies only on human engineering
- C. Biomimicry only applies to biological science research
- D. It studies natural systems to inspire engineered solutions

Answer: D

Q1252. When a team has creative block, which technique most likely generates breakthroughs?

- A. Restricting discussion to only the most obvious solutions
- B. Random stimulus technique introducing unrelated concepts
- C. Ending the creative process and accepting current results
- D. Repeating the same brainstorming approach more intensely

Answer: B

Q1253. How does TRIZ systematically approach creative problem solving unlike brainstorming?

- A. TRIZ relies on random idea generation without structure
- B. TRIZ uses patterns of invention from patent analysis here
- C. TRIZ only works for problems in mechanical engineering
- D. TRIZ eliminates the need for understanding the problem

Answer: B

Q1254. Why might psychological safety be more important than talent for team creativity?

- A. Safety enables risk-taking and sharing unconventional ideas
- B. Psychological safety has no effect on team creative output
- C. Teams perform best when members fear negative consequences
- D. Individual talent is always sufficient for team creativity

Answer: A

Q1255. How does creative destruction relate to innovative problem solving?

- A. It preserves all existing solutions without any changes
- B. Existing solutions should never be replaced or improved
- C. New innovations replace outdated approaches and systems
- D. Destruction of ideas always hinders creative progress now

Answer: C

Q1256. How does minimum viable product reduce innovation risk?

- A. MVP eliminates the need for any market validation work
- B. It tests core assumptions quickly with minimal investment
- C. It requires building the complete product before testing
- D. It always results in a product needing no improvements

Answer: B

Q1257. How does combinatorial creativity generate novel solutions?

- A. It requires discarding all prior knowledge before starting
- B. Combinatorial creativity only replicates existing solutions
- C. It creates ideas from nothing without any prior knowledge
- D. It connects existing concepts in unexpected combinations

Answer: D

Q1258. Why is the tension between exploitation and exploration important for innovation?

- A. Only exploration of new ideas matters for innovation now
- B. Exploitation and exploration are the same activity exactly
- C. Balancing refinement of known and exploration of new ideas
- D. Only exploitation of known solutions matters for success

Answer: C

Q1259. How does the adjacent possible explain emergence of innovations?

- A. Innovation builds incrementally on what currently exists
- B. The adjacent possible concept only applies to biology here
- C. All innovations appear randomly without any preconditions
- D. Innovation can jump to any possibility regardless of now

Answer: A

Q1260. What advantage does considering extreme scenarios provide in planning?

- A. They reveal vulnerabilities and opportunities others miss
- B. Extreme scenarios always lead to impractical solutions now
- C. Only the most likely scenario needs to be considered here
- D. Extreme scenarios are unrealistic and should be ignored

Answer: A

Q1261. When balancing reliability, performance, and cost, which approach best manages these concerns?

- A. Ignoring cost and focusing only on maximum performance
- B. Maximizing all three simultaneously without trade-off
- C. Service level objectives with explicit trade-off decisions
- D. Choosing the cheapest option regardless of reliability

Answer: C

Q1262. How does Conway's Law affect software architecture decisions?

- A. Organization structure has no effect on software design
- B. Conway's Law only applies to hardware not software design
- C. Small teams always produce more complex software systems
- D. System design tends to mirror organizational communication

Answer: D

Q1263. When migrating a legacy system, what approach minimizes business disruption?

- A. Shutting down old system before building new one from scratch
- B. Incremental strangler pattern migrating component by component
- C. Complete rewrite deployed all at once replacing old system
- D. Running both systems indefinitely without any migration plan

Answer: B

Q1264. How should a team handle deadline pressure versus code quality?

- A. Negotiate scope reduction while maintaining quality standards
- B. Ignore the deadline and deliver whenever team is ready now
- C. Always sacrifice quality to meet every deadline set here
- D. Deliver buggy code and fix it in a future release cycle

Answer: A

Q1265. In a production incident, what balances speed and thoroughness?

- A. Immediate mitigation followed by systematic root cause analysis
- B. Thorough root cause analysis before attempting any fix here
- C. Trying random fixes until something appears to work now
- D. Ignoring the incident until customers report it to support

Answer: A

Q1266. How does the build versus buy decision framework apply?

- A. Always buy commercial solutions and never build anything
- B. Evaluate total cost of ownership, fit, and strategic value
- C. Always build custom solutions for every requirement needed
- D. The decision has no long-term impact on the project here

Answer: B

Q1267. What challenge does data sovereignty present for global systems?

- A. Data sovereignty is only a concern for government systems
- B. All countries have identical data storage regulations here
- C. Data can be stored anywhere without any legal implications
- D. Local laws require data to remain within specific jurisdictions

Answer: D

Q1268. How does antifragility apply to designing resilient systems?

- A. Antifragile systems break under any stress or volatility
- B. Antifragile systems improve and strengthen under stress
- C. All systems should be designed to avoid all stressors now
- D. Antifragility means the system never changes or adapts

Answer: B

Q1269. When requirements evolve faster than development, which approach maintains alignment?

- A. Continuous discovery with short feedback loops and adaptation
- B. Freezing requirements at the start and never changing them
- C. Waiting for all requirements to stabilize before any coding
- D. Building features based on predicted future requirements only

Answer: A

Q1270. How does observability-driven development change problem solving?

- A. It eliminates the need for any pre-production testing here
- B. It replaces all monitoring with manual health checks only
- C. Observability is only useful for debugging not development
- D. It instruments systems to understand behavior in production

Answer: D

Q1271. How does documentation-as-code improve maintainability and accuracy?

- A. It keeps documentation separate from code in different repo
- B. It makes documentation harder to update than traditional
- C. It versions documentation alongside code using same workflow
- D. Documentation-as-code eliminates the need for any reviews

Answer: C

Q1272. When communicating architecture to mixed audiences, what approach is most effective?

- A. Layered communication with different detail levels per group
- B. Only communicating with the technical team and no one else
- C. Avoiding all diagrams and using only dense text paragraphs
- D. Using the same highly technical presentation for everyone

Answer: A

Q1273. How does the C4 model improve communication of software architecture?

- A. It describes architecture at only one level of detail here
- B. It replaces all other forms of technical documentation used
- C. The C4 model only works for microservices architecture now
- D. It provides context, container, component, and code views

Answer: D

Q1274. Why might a team adopt RFC documents for major technical decisions?

- A. RFCs prevent any discussion or debate about decisions
- B. RFCs are only used in internet standards not in companies
- C. They eliminate the need for any meetings about the decision
- D. RFCs enable structured async review and knowledge sharing

Answer: D

Q1275. How does living documentation address the problem of stale docs?

- A. Living docs are written once and never updated afterwards
- B. It eliminates the need for any human-written documentation
- C. Living docs are generated or verified from source of truth
- D. Living documentation is identical to traditional static docs

Answer: C

Q1276. When writing a post-mortem for a major outage, what balance must be struck?

- A. Only management should have access to post-mortem docs
- B. Post-mortems should avoid discussing what went wrong
- C. Focus entirely on blaming individuals who caused issue
- D. Blameless analysis focuses on systemic causes prevention

Answer: D

Q1277. How do structured communication frameworks like STAR help present work?

- A. Structured frameworks prevent any creative communication
- B. They make communication longer without adding clarity
- C. They organize information into situation task action result
- D. STAR only works for job interviews not project contexts

Answer: C

Q1278. What role do knowledge management systems play for problem-solving expertise?

- A. They capture and make searchable collective solving knowledge
- B. They replace the need for any experienced team members
- C. Knowledge management has no effect on team productivity
- D. They only store administrative documents not technical ones

Answer: A

Q1279. How does diagramming-as-code improve consistency and version control?

- A. It eliminates ability to include diagrams in any documents
- B. It generates diagrams from text making them versionable
- C. Diagramming-as-code produces lower quality diagrams always
- D. It requires manual drawing tools for all diagram creation

Answer: B

Q1280. When establishing documentation standards for cross-functional teams, how to reconcile competing needs?

- A. Eliminate all documentation standards let everyone decide
- B. Enforce one rigid format regardless of audience or purpose
- C. Create templates by documentation type with flexible sections
- D. Only the team lead should write all documentation for team

Answer: C

Q1281. How does the concept of computational irreducibility challenge traditional problem-solving approaches?

- A. It means all problems have shortcuts
- B. Some problems require running the full computation with no shortcut possible
- C. It only applies to simple problems
- D. It eliminates the need for algorithms

Answer: B

Q1282. When applying the Cynefin framework, how should a problem in the 'complex' domain be approached differently from one in the 'complicated' domain?

- A. Complex problems need expert analysis; complicated ones need experimentation
- B. Complex problems require probe-sense-respond; complicated ones require sense-analyze-respond
- C. Both domains use the same approach
- D. Complex problems are simpler than complicated ones

Answer: B

Q1283. Why is problem decomposition sometimes counterproductive for highly coupled systems?

- A. Decomposition always works perfectly
- B. Splitting tightly coupled components can obscure critical interactions between them
- C. Coupled systems are always simple
- D. Decomposition is only for hardware

Answer: B

Q1284. How does the concept of 'satisficing' differ from 'optimizing' in real-world problem solving?

- A. They are identical
- B. Satisficing seeks a good-enough solution that meets criteria; optimizing seeks the absolute best
- C. Satisficing always produces worse results
- D. Optimizing is always faster

Answer: B

Q1285. What role does epistemic humility play in effective problem solving?

- A. It has no role
- B. Recognizing the limits of one's knowledge prevents overconfidence and encourages seeking additional information
- C. It means never attempting difficult problems
- D. It only applies to beginners

Answer: B

Q1286. In systems thinking, why is understanding feedback loops essential for solving complex problems?

- A. Feedback loops only exist in electronics
- B. Feedback loops can amplify or dampen effects, creating non-linear behaviors that simple cause-effect analysis misses
- C. They make problems simpler
- D. They are irrelevant to software

Answer: B

Q1287. How does the 'no free lunch' theorem impact the selection of problem-solving strategies?

- A. One strategy works best for all problems
- B. No single strategy outperforms all others across every possible problem, so strategy must be matched to the problem
- C. It means all strategies are equally bad
- D. It only applies to machine learning

Answer: B

Q1288. What is the significance of problem isomorphism in problem solving?

- A. It means problems are always unique
- B. Two problems with the same underlying structure can be solved using the same approach despite different surface appearances
- C. It only applies to mathematics
- D. It makes problems harder

Answer: B

Q1289. Why is the frame problem significant in artificial intelligence and automated problem solving?

- A. It is about picture frames
- B. It concerns determining which aspects of a state change and which remain unchanged after an action
- C. It is a solved problem
- D. It only affects image processing

Answer: B

Q1290. How does emergence complicate reductionist problem-solving approaches?

- A. Emergence is not a real concept
- B. System-level behaviors can arise from component interactions that cannot be predicted by studying components in isolation
- C. It simplifies all problems
- D. It only applies to biology

Answer: B

Q1291. When analyzing a system with emergent behavior, why might traditional requirements gathering be insufficient?

- A. Traditional methods always work
- B. Emergent behaviors arise from component interactions and cannot be specified upfront from individual component analysis
- C. Emergent behavior does not exist
- D. Requirements gathering is never useful

Answer: B

Q1292. How does event storming improve problem analysis for complex business domains?

- A. It replaces all analysis techniques
- B. It maps domain events collaboratively, revealing process flows, boundaries, and hidden complexity
- C. It only applies to simple systems
- D. It eliminates the need for stakeholders

Answer: B

Q1293. Why is sensitivity analysis important when evaluating solutions to problems with uncertain parameters?

- A. It is only for finance
- B. It reveals which input variables most affect outcomes, guiding where to focus validation effort
- C. It adds unnecessary complexity
- D. It always gives definitive answers

Answer: B

Q1294. How does formal methods analysis differ from informal analysis in verifying system correctness?

- A. They are the same approach
- B. Formal methods use mathematical proofs to guarantee properties; informal methods rely on testing and review
- C. Informal methods are always better
- D. Formal methods are faster

Answer: B

Q1295. When a problem has multiple valid framings, how does frame analysis help select the most productive one?

- A. All framings are equally good
- B. Frame analysis evaluates how different perspectives highlight different aspects and solutions
- C. Only one framing ever exists
- D. Frame analysis is purely theoretical

Answer: B

Q1296. What is the significance of identifying invariants during problem analysis?

- A. Invariants are unimportant
- B. Invariants are properties that must always hold true, providing anchors for correctness verification
- C. They only apply to mathematics
- D. They change with every iteration

Answer: B

Q1297. How does theory of constraints analysis identify the most impactful improvement point?

- A. It improves everything simultaneously
- B. It identifies the single bottleneck that limits overall system throughput
- C. It only works for manufacturing
- D. It ignores system interactions

Answer: B

Q1298. Why might Bayesian analysis be preferred over frequentist analysis for problems with prior knowledge?

- A. It is always simpler
- B. Bayesian analysis formally incorporates prior knowledge and updates beliefs as new evidence is gathered
- C. It ignores prior knowledge
- D. Frequentist analysis is always wrong

Answer: B

Q1299. How does sociotechnical systems analysis improve over purely technical analysis?

- A. It ignores people
- B. It considers both human and technical factors, recognizing that system behavior depends on their interaction
- C. It replaces all technical analysis
- D. Social factors never matter in CS

Answer: B

Q1300. What challenge does Goodhart's Law pose when selecting metrics for problem analysis?

- A. It has no relevance
- B. When a measure becomes a target, it ceases to be a good measure because people optimize for it
- C. Metrics are always reliable
- D. It only applies to economics

Answer: B

Q1301. How does paraconsistent logic handle contradictions differently from classical logic?

- A. It ignores contradictions entirely
- B. It allows contradictions to exist without the entire system becoming trivially true
- C. It prevents all contradictions
- D. It is identical to classical logic

Answer: B

Q1302. What is the significance of the resolution inference rule in automated theorem proving?

- A. It is not used in practice
- B. It provides a single, complete inference rule for refutation-based proofs in propositional and first-order logic
- C. It replaces all other logic
- D. It only works for simple problems

Answer: B

Q1303. Why is the distinction between decidable and semi-decidable problems important for logical reasoning?

- A. It has no practical importance
- B. For decidable problems an algorithm always terminates with an answer; for semi-decidable it may run forever on false inputs
- C. All logical problems are decidable
- D. Semi-decidable problems cannot be computed at all

Answer: B

Q1304. How does intuitionistic logic differ from classical logic regarding the law of excluded middle?

- A. It accepts the law fully
- B. It rejects the law of excluded middle, requiring constructive proof of existence rather than proof by contradiction
- C. It is identical to classical logic
- D. It only applies to mathematics

Answer: B

Q1305. What is the role of Skolemization in converting first-order logic formulas for resolution?

- A. It adds more quantifiers
- B. It eliminates existential quantifiers by introducing Skolem functions, enabling clause-form conversion
- C. It removes all variables
- D. It simplifies propositional logic only

Answer: B

Q1306. How does model checking verify properties of finite-state systems?

- A. It checks physical models
- B. It exhaustively explores all possible states to verify whether a specification holds
- C. It only tests one scenario
- D. It replaces formal logic entirely

Answer: B

Q1307. What is the significance of Curry-Howard correspondence for logic and programming?

- A. It is a cooking technique
- B. It establishes that proofs in logic correspond to programs in computation, connecting these fields deeply
- C. It only applies to functional programming
- D. It has been disproven

Answer: B

Q1308. How do many-valued logics extend classical two-valued logic for practical reasoning?

- A. They reduce the number of truth values
- B. They introduce additional truth values beyond true and false to handle uncertainty or partial truth
- C. They eliminate true and false
- D. They are purely theoretical

Answer: B

Q1309. What is the frame problem in the context of logical reasoning about actions?

- A. It is about framing pictures
- B. It concerns efficiently representing what does not change when an action is performed in a logical formalism
- C. It has been fully solved
- D. It only affects visual computing

Answer: B

Q1310. Why is the compactness theorem important for first-order logic?

- A. It compresses files
- B. If every finite subset of a set of sentences is satisfiable, then the entire set is satisfiable
- C. It only applies to propositional logic
- D. It makes proofs shorter

Answer: B

Q1311. How does continuation-passing style transform the flow control of a program?

- A. It has no effect on flow
- B. Each function receives an explicit continuation (callback) representing the rest of the computation, making control flow explicit
- C. It removes all functions
- D. It only applies to web programming

Answer: B

Q1312. What problem does backpressure solve in reactive flow control?

- A. It increases data speed
- B. It prevents fast producers from overwhelming slow consumers by providing feedback to regulate flow
- C. It eliminates all data flow
- D. It only applies to plumbing

Answer: B

Q1313. Why is the halting problem relevant to understanding the limits of flow analysis?

- A. It is not relevant
- B. It proves that no general algorithm can determine whether an arbitrary program will terminate or loop forever
- C. It only affects old computers
- D. It has been solved

Answer: B

Q1314. How does the actor model handle concurrent flow control differently from shared-memory threading?

- A. They are identical
- B. Actors communicate through message passing with no shared state, eliminating data races by design
- C. Actors share all memory
- D. Actors are slower in every case

Answer: B

Q1315. What is the significance of control flow integrity in security?

- A. It has no security relevance
- B. It ensures program execution follows only legitimate paths, preventing attacks like return-oriented programming
- C. It makes programs slower
- D. It only applies to web apps

Answer: B

Q1316. How does algebraic effects provide a structured alternative to exceptions and monads for control flow?

- A. It eliminates all errors
- B. It separates the declaration of effects from their handling, allowing composable and resumable control flow
- C. It is identical to try-catch
- D. It only works in Haskell

Answer: B

Q1317. What is the role of Petri nets in modeling concurrent and distributed flow control?

- A. They are fishing nets
- B. They formally model concurrent processes with places, transitions, and tokens, capturing synchronization and conflict
- C. They only model sequential flow
- D. They are obsolete

Answer: B

Q1318. How does speculative execution affect the intended flow of an algorithm?

- A. It strictly follows the algorithm
- B. The processor executes instructions ahead of confirmed branches, potentially needing to discard results if the prediction was wrong
- C. It never makes predictions
- D. It only applies to interpreted languages

Answer: B

Q1319. What is the difference between structured concurrency and unstructured concurrency?

- A. There is no difference
- B. Structured concurrency ties the lifetime of concurrent tasks to a lexical scope, ensuring all complete before the scope exits
- C. Unstructured is always better
- D. Structured concurrency prevents all parallelism

Answer: B

Q1320. How does dataflow programming differ from traditional control flow programming?

- A. They are the same
- B. In dataflow, execution is driven by data availability rather than a prescribed sequence of instructions
- C. Dataflow is always slower
- D. Dataflow eliminates all parallelism

Answer: B

Q1321. How does a skip list achieve probabilistic $O(\log n)$ search while maintaining simplicity over balanced trees?

- A. It uses sorted arrays
- B. It maintains multiple layers of linked lists with probabilistic promotion, providing expected $O(\log n)$ without complex rotations
- C. It is always $O(n)$
- D. It requires more memory than any tree

Answer: B

Q1322. What trade-offs does a content-addressable storage system make compared to location-addressable storage?

- A. They have no differences
- B. Content-addressable enables deduplication and integrity verification but requires computing hashes and complicates updates
- C. Content-addressable is always faster
- D. Location-addressable cannot store files

Answer: B

Q1323. How do CRDTs (Conflict-free Replicated Data Types) enable eventual consistency without coordination?

- A. They prevent all conflicts
- B. They are designed so that concurrent updates can always be merged deterministically without conflicts
- C. They require a central server
- D. They only work for text

Answer: B

Q1324. Why might a rope data structure be preferred over a string for text editing applications?

- A. Ropes are simpler
- B. Ropes represent strings as balanced binary trees of shorter strings, enabling $O(\log n)$ insertion and deletion
- C. Ropes are always slower
- D. Strings are better for all uses

Answer: B

Q1325. How does a Merkle tree enable efficient verification of large data structures?

- A. It stores data linearly
- B. Each non-leaf node contains the hash of its children, so any change propagates up, allowing efficient verification by checking only the path from root
- C. It prevents all data changes
- D. It only works for blockchains

Answer: B

Q1326. What is the significance of algebraic data types in representing domain models?

- A. They are only for algebra
- B. They combine sum types (tagged unions) and product types (structs) to precisely model domain concepts and make illegal states unrepresentable
- C. They replace all databases
- D. They are slower than primitives

Answer: B

Q1327. How does column-oriented storage improve analytical query performance compared to row-oriented storage?

- A. It does not improve performance
- B. Storing data by columns enables better compression and allows reading only the columns needed for a query
- C. Columns are always slower
- D. Row storage is always better

Answer: B

Q1328. What challenge does the object-relational impedance mismatch present?

- A. There is no mismatch
- B. Object-oriented models use inheritance, encapsulation, and identity while relational models use tables and joins, creating a fundamental tension in data mapping
- C. They map perfectly
- D. It only affects old systems

Answer: B

Q1329. How do probabilistic data structures like HyperLogLog achieve extreme space efficiency?

- A. They store all data precisely
- B. They trade exactness for space by using randomization to provide approximate answers with bounded error
- C. They use more space than exact structures
- D. They cannot provide useful answers

Answer: B

Q1330. Why is the choice between normalized and denormalized data representation critical for system design?

- A. It makes no difference
- B. Normalization reduces redundancy and anomalies but requires joins; denormalization improves read performance but risks inconsistency
- C. Normalization is always best
- D. Denormalization eliminates all problems

Answer: B

Q1331. How does the saga pattern manage distributed transactions across microservices?

- A. It uses a single database transaction
- B. It breaks a distributed transaction into a sequence of local transactions with compensating actions for rollback
- C. It prevents all failures
- D. It only works for monoliths

Answer: B

Q1332. How does recognizing the monotonic stack pattern help solve next-greater-element problems efficiently?

- A. It does not help
- B. A monotonic stack maintains elements in sorted order, allowing $O(n)$ computation of next-greater-element for all positions
- C. It requires $O(n^2)$ time
- D. It only works for sorted arrays

Answer: B

Q1333. Why is recognizing the interval scheduling pattern important for resource allocation problems?

- A. It is not important
- B. Many resource allocation problems reduce to interval scheduling, where greedy algorithms by end time produce optimal solutions
- C. It only applies to calendars
- D. It requires exponential time

Answer: B

Q1334. How does the sidecar pattern extend service functionality in microservices architectures?

- A. It replaces the main service
- B. It deploys auxiliary functionality alongside a service in a separate process, sharing the lifecycle but not the runtime
- C. It merges all services
- D. It only handles logging

Answer: B

Q1335. How does the reservoir sampling pattern enable fair sampling from streams of unknown length?

- A. It requires knowing the stream length
- B. It maintains a fixed-size sample where each element has an equal probability of being included regardless of stream length
- C. It only works for small streams
- D. It produces biased samples

Answer: B

Q1336. What is the significance of recognizing the topological sort pattern in dependency resolution?

- A. It is only for sorting numbers
- B. It identifies that a problem requires ordering items subject to precedence constraints, enabling linear-time solutions via DAG processing
- C. It requires exponential time
- D. It only works for trees

Answer: B

Q1337. How does the outbox pattern ensure reliable event publishing in database-centric systems?

- A. It skips events during failures
- B. It writes events to a database table atomically with state changes, then publishes them asynchronously, ensuring at-least-once delivery
- C. It guarantees exactly-once delivery
- D. It replaces the database

Answer: B

Q1338. How does recognizing anti-patterns help improve software quality?

- A. Anti-patterns are always good
- B. Identifying common negative patterns allows teams to refactor toward known better solutions before problems worsen
- C. Anti-patterns are rare in practice
- D. They only matter for new projects

Answer: B

Q1339. How does the space-partitioning pattern (like quad-trees or k-d trees) optimize spatial queries?

- A. It makes spatial queries slower
- B. It recursively divides space into regions, enabling logarithmic-time range and nearest-neighbor queries by pruning irrelevant regions
- C. It only works in 2D
- D. It requires sorting all points

Answer: B

Q1340. What is the relationship between the visitor pattern and double dispatch in object-oriented design?

- A. They are unrelated
- B. The visitor pattern uses double dispatch to select the correct method based on both the visitor and element types at runtime
- C. Double dispatch is unnecessary
- D. Visitor replaces all other patterns

Answer: B

Q1341. How does generating function methodology help solve counting problems in combinatorics?

- A. It generates random numbers
- B. It encodes a sequence as coefficients of a formal power series, enabling algebraic manipulation to derive closed-form or recursive solutions
- C. It only works for simple sequences
- D. It replaces all counting techniques

Answer: B

Q1342. Why is the extended Euclidean algorithm important for computing modular inverses?

- A. It only computes GCD
- B. It finds integers x and y such that $ax + by = \gcd(a,b)$, which yields the modular inverse when $\gcd$ is 1
- C. It requires floating-point arithmetic
- D. It is slower than brute force

Answer: B

Q1343. How does the probabilistic method prove existence of structures without constructing them?

- A. It always constructs the structure
- B. It shows that a random construction has nonzero probability of having the desired property, proving existence
- C. It disproves existence
- D. It only applies to small sets

Answer: B

Q1344. What is the significance of the fast Fourier transform for polynomial multiplication?

- A. It has no computational benefit
- B. It reduces polynomial multiplication from $O(n^2)$ to $O(n \log n)$ by converting to and from frequency domain
- C. It only works for integers
- D. It increases the complexity

Answer: B

Q1345. How does Ramsey theory relate to the inevitability of patterns in large structures?

- A. It eliminates all patterns
- B. It proves that sufficiently large structures must contain certain ordered substructures regardless of arrangement
- C. It only applies to graphs
- D. It is a programming technique

Answer: B

Q1346. Why is the Akra-Bazzi method more general than the Master Theorem for solving recurrences?

- A. It is less general
- B. It handles non-uniform sub-problem sizes and more general cost functions that the Master Theorem cannot accommodate
- C. It only works for linear recurrences
- D. It gives less accurate results

Answer: B

Q1347. How does information theory quantify the minimum number of bits needed to represent data?

- A. It always uses 8 bits
- B. Shannon's entropy $H = -\sum(p \cdot \log_2(p))$ gives the theoretical lower bound on average bits per symbol
- C. It requires fixed-length encoding
- D. It ignores probability distributions

Answer: B

Q1348. What is the role of linear algebra in solving systems of equations computationally?

- A. It has no role
- B. Matrix representations enable efficient algorithms like Gaussian elimination and LU decomposition for solving large systems
- C. It only works for 2 equations
- D. It is slower than substitution

Answer: B

Q1349. How do Galois fields underpin error-correcting codes like Reed-Solomon?

- A. They are unrelated
- B. Galois fields provide finite arithmetic structures where polynomial operations enable systematic encoding and decoding for error detection and correction
- C. They are only theoretical
- D. They increase errors

Answer: B

Q1350. What is the mathematical foundation of public-key cryptography based on?

- A. Simple addition
- B. The computational asymmetry of certain mathematical problems: easy to compute in one direction but infeasible to reverse without a key
- C. It has no mathematical basis
- D. Only random number generation

Answer: B

Q1351. How does the minimax algorithm with alpha-beta pruning reduce game tree exploration?

- A. It explores every node
- B. It maintains alpha and beta bounds to skip branches that cannot influence the final decision, reducing exploration exponentially
- C. It only works for tic-tac-toe
- D. It eliminates all pruning

Answer: B

Q1352. Why is the distinction between online and offline algorithms important for system design?

- A. It has no importance
- B. Online algorithms must make decisions as data arrives without seeing future input, while offline algorithms have access to all data upfront
- C. Online means internet-based
- D. Offline is always better

Answer: B

Q1353. How does the concept of algorithm reduction help prove computational complexity?

- A. It makes algorithms simpler
- B. If problem A can be reduced to problem B in polynomial time, then B is at least as hard as A
- C. Reductions always make problems easier
- D. It only applies to NP problems

Answer: B

Q1354. What advantage do Las Vegas algorithms have over Monte Carlo algorithms?

- A. They are always faster
- B. Las Vegas algorithms always produce correct results but with variable runtime; Monte Carlo algorithms always terminate but may produce incorrect results
- C. They are identical
- D. Monte Carlo is always better

Answer: B

Q1355. How does the external memory model change algorithm design compared to the RAM model?

- A. It has no effect
- B. It accounts for the cost of transferring data blocks between disk and memory, favoring algorithms that minimize I/O operations
- C. It only affects storage capacity
- D. The RAM model is always sufficient

Answer: B

Q1356. What is the significance of fixed-parameter tractability for NP-hard problems?

- A. It makes all NP-hard problems easy
- B. It shows that some NP-hard problems can be solved efficiently when a specific parameter is small, even if input size is large
- C. It disproves $P \neq NP$
- D. It only applies to graph problems

Answer: B

Q1357. How does the concept of work-stealing improve parallel algorithm scheduling?

- A. It prevents parallelism
- B. Idle processors steal tasks from busy processors' queues, dynamically balancing load without centralized coordination
- C. It requires a central scheduler
- D. It increases total work

Answer: B

Q1358. Why is the competitive ratio important for evaluating online algorithms?

- A. It is not important
- B. It measures the worst-case ratio between the online algorithm's cost and the optimal offline solution's cost
- C. It measures average performance
- D. It only applies to sorting

Answer: B

Q1359. How does the concept of self-stabilization ensure algorithm robustness in distributed systems?

- A. It prevents all errors
- B. A self-stabilizing algorithm eventually reaches a correct state from any arbitrary initial state, recovering from transient faults automatically
- C. It requires manual restart
- D. It only works for single machines

Answer: B

Q1360. What is the significance of communication complexity for understanding distributed algorithm limits?

- A. It measures code length
- B. It quantifies the minimum amount of communication needed between parties to compute a function, establishing lower bounds
- C. It only measures network speed
- D. It is identical to time complexity

Answer: B

Q1361. How does Kahneman's System 1 and System 2 thinking framework explain decision-making errors?

- A. All thinking is the same
- B. System 1 is fast and intuitive but error-prone; System 2 is slow and analytical but often defers to System 1, leading to cognitive biases
- C. System 1 is always correct
- D. System 2 makes more errors

Answer: B

Q1362. Why is the ecological fallacy problematic in data-driven critical thinking?

- A. It is not a real fallacy
- B. It incorrectly infers individual characteristics from aggregate group data, leading to false conclusions about individuals
- C. It only affects ecology
- D. It strengthens conclusions

Answer: B

Q1363. How does the concept of epistemic closure affect critical evaluation of belief systems?

- A. It has no effect
- B. A closed system of beliefs can be internally consistent yet disconnected from reality, resisting disconfirming evidence
- C. It ensures beliefs are correct
- D. It only applies to formal logic

Answer: B

Q1364. What is the significance of Bayesian reasoning for updating beliefs in the face of new evidence?

- A. It has no significance
- B. It provides a formal framework for rationally updating the probability of a hypothesis as new evidence is observed
- C. It always gives absolute answers
- D. It replaces all other reasoning

Answer: B

Q1365. How does the concept of incommensurability challenge rational comparison of competing theories?

- A. All theories are easily comparable
- B. When theories use different concepts and standards, direct comparison may be impossible since there is no neutral ground
- C. It makes all theories equal
- D. It only affects science

Answer: B

Q1366. Why is the base rate fallacy particularly dangerous in medical and security screening?

- A. It is not dangerous
- B. Ignoring the base rate of a condition causes overestimation of positive results' reliability when the condition is rare
- C. Base rates are always known
- D. It only affects medical testing

Answer: B

Q1367. How does the veil of ignorance thought experiment promote fairness in decision-making?

- A. It promotes ignorance
- B. By imagining you do not know your position in society, you design rules that are fair to everyone since you might be anyone
- C. It ignores fairness
- D. It only applies to politics

Answer: B

Q1368. What is the Dunning-Kruger effect's impact on team decision-making in technical contexts?

- A. It has no impact
- B. Less skilled members may overestimate their competence while highly skilled members underestimate theirs, distorting group decisions
- C. It makes everyone equally confident
- D. It only affects individuals

Answer: B

Q1369. How does motivated reasoning differ from rational analysis?

- A. They are the same
- B. Motivated reasoning starts with a desired conclusion and selects evidence to support it, while rational analysis follows evidence to a conclusion
- C. Motivated reasoning is more objective
- D. Rational analysis ignores evidence

Answer: B

Q1370. Why is understanding second-order effects crucial for critical analysis of policy decisions?

- A. Only first-order effects matter
- B. Policies create cascading consequences where the indirect effects may be larger and opposite to the intended first-order effects
- C. Second-order effects are always positive
- D. They are too complex to consider

Answer: B

Q1371. How does differential debugging help identify the cause of a regression?

- A. It compares two debuggers
- B. It systematically compares a working version with a broken version, isolating the specific changes that caused the regression
- C. It only works for mathematics
- D. It requires two computers

Answer: B

Q1372. Why are race conditions particularly difficult to debug in concurrent systems?

- A. They are easy to find
- B. Their occurrence depends on precise timing of thread execution, making them non-deterministic and often unreproducible under debugger conditions
- C. They always produce the same error
- D. They are caught by compilers

Answer: B

Q1373. How does taint analysis help track the propagation of untrusted data through a program?

- A. It checks for stains on hardware
- B. It marks untrusted inputs and tracks their flow through computation, alerting when tainted data reaches sensitive operations
- C. It only works for web applications
- D. It replaces input validation

Answer: B

Q1374. What advantage does record-and-replay debugging provide for non-deterministic bugs?

- A. It has no advantage
- B. It captures the exact execution including all non-deterministic events, allowing deterministic replay for investigation
- C. It only records inputs
- D. It makes programs slower permanently

Answer: B

Q1375. How does property-based testing complement example-based testing in finding bugs?

- A. It is identical to example-based testing
- B. It generates many random inputs based on declared properties, often discovering edge cases that manually written tests miss
- C. It replaces all other testing
- D. It only works for simple functions

Answer: B

Q1376. What is the challenge of debugging in a microservices architecture compared to a monolith?

- A. Microservices are easier to debug
- B. Bugs may span multiple services, requiring correlation of distributed logs, understanding of network interactions, and tracing across service boundaries
- C. There is no difference
- D. Monoliths have more bugs

Answer: B

Q1377. How does mutation testing evaluate the quality of a test suite?

- A. It mutates the tests themselves
- B. It introduces small changes (mutations) to the source code and checks whether the test suite detects them; undetected mutations indicate weak tests
- C. It only tests performance
- D. It replaces all other testing metrics

Answer: B

Q1378. What is the significance of distributed tracing in debugging latency issues across services?

- A. It is unnecessary for performance issues
- B. It correlates request flows across services with timing data, revealing which service or operation is the bottleneck
- C. It only measures network speed
- D. It replaces all logging

Answer: B

Q1379. How does symbolic execution differ from concrete execution in bug finding?

- A. They are identical
- B. Symbolic execution uses symbolic inputs to explore all possible execution paths simultaneously, finding bugs that specific concrete inputs might miss
- C. It is always slower and less useful
- D. It only works for toy programs

Answer: B

Q1380. What role does canary deployment play in debugging production issues?

- A. It involves actual birds
- B. It gradually rolls out changes to a small subset of users first, allowing detection of issues before they affect the entire user base
- C. It is identical to blue-green deployment
- D. It prevents all production bugs

Answer: B

Q1381. How does amortized analysis using the potential method work?

- A. It averages over all algorithms
- B. It assigns a potential function to the data structure state, distributing the cost of expensive operations across many cheap ones
- C. It only works for arrays
- D. It ignores worst-case performance

Answer: B

Q1382. What is the significance of the Strassen algorithm for matrix multiplication?

- A. It is slower than standard multiplication
- B. It was the first to show matrix multiplication can be done in less than $O(n^3)$ time, opening research into faster algorithms
- C. It only works for 2×2 matrices
- D. It has no practical importance

Answer: B

Q1383. Why is the complexity class PSPACE significant in computational theory?

- A. It is the same as P
- B. It contains all problems solvable with polynomial space, and PSPACE-complete problems are believed to be harder than NP-complete ones
- C. It only contains easy problems
- D. It has been proven equal to NP

Answer: B

Q1384. How does the gap between theoretical complexity and practical performance arise?

- A. Theory and practice always agree
- B. Constant factors, cache behavior, branch prediction, and input distribution can make theoretically slower algorithms faster in practice
- C. Theory is always wrong
- D. Practice cannot be measured

Answer: B

Q1385. What is the complexity-theoretic significance of the Cook-Levin theorem?

- A. It proves P equals NP
- B. It proves SAT is NP-complete, establishing the first NP-complete problem and enabling reduction-based proofs for others
- C. It only applies to SAT solvers
- D. It has been disproven

Answer: B

Q1386. How do sublinear algorithms achieve better than $O(n)$ performance?

- A. They are impossible
- B. They sample or process only a portion of the input, providing approximate or probabilistic answers without reading all data
- C. They read all data faster
- D. They compress the input first

Answer: B

Q1387. What is the practical significance of the smoothed analysis framework?

- A. It replaces worst-case analysis entirely
- B. It analyzes algorithms under slight random perturbation of worst-case inputs, often explaining why algorithms like simplex work well in practice despite poor worst-case bounds
- C. It is identical to average-case analysis
- D. It only applies to the simplex method

Answer: B

Q1388. How does the concept of fine-grained complexity refine classical complexity theory?

- A. It makes complexity simpler
- B. It establishes conditional lower bounds within P, showing that improving certain polynomial-time algorithms would require breakthroughs in long-standing open problems
- C. It only classifies NP problems
- D. It eliminates Big-O notation

Answer: B

Q1389. What is the relationship between circuit complexity and algorithm design?

- A. They are unrelated
- B. Circuit complexity lower bounds prove minimum resources needed for computation, and strong enough bounds would resolve P vs NP
- C. Circuits are only for hardware
- D. All circuits are polynomial

Answer: B

Q1390. How does quantum computing potentially change the complexity landscape?

- A. It solves all NP problems
- B. It offers exponential speedup for specific problems like factoring (Shor's) and quadratic speedup for search (Grover's), but not for all problems
- C. Quantum computers are infinitely fast
- D. It makes all problems $O(1)$

Answer: B

Q1391. How does the technique of coordinate compression simplify problems with large value ranges?

- A. It converts all values to zero
- B. It maps sparse values to a compact range preserving relative order, enabling use of arrays instead of hash maps
- C. It only works for coordinates
- D. It increases space usage

Answer: B

Q1392. What is the advantage of using persistent data structures in functional programming?

- A. They save data to disk
- B. They preserve previous versions when modified, enabling safe sharing across threads and efficient undo operations
- C. They are always slower
- D. They are identical to mutable structures

Answer: B

Q1393. How does the technique of small-to-large merging achieve efficient set union operations?

- A. It merges sets randomly
- B. It always merges the smaller set into the larger one, ensuring each element is moved $O(\log n)$ times total
- C. It merges the larger into the smaller
- D. It has no efficiency benefit

Answer: B

Q1394. What problem does the flyweight pattern solve in memory-intensive applications?

- A. It makes objects heavier
- B. It shares common state among many objects to reduce memory usage when many similar objects exist
- C. It eliminates all objects
- D. It only works for graphics

Answer: B

Q1395. How does the technique of bit manipulation solve subset enumeration problems efficiently?

- A. Bits cannot represent subsets
- B. Each bitmask of n bits represents a subset where bit i indicates inclusion of element i , allowing $O(2^n)$ enumeration with $O(1)$ per subset operation
- C. It only works for sets of 8 elements
- D. Bit manipulation is always slower

Answer: B

Q1396. Why is understanding memory layout important for performance-critical programming?

- A. Memory layout has no effect on performance
- B. Cache-friendly data layout exploiting spatial and temporal locality can yield orders-of-magnitude speedup over cache-unfriendly access patterns
- C. It only matters for assembly language
- D. Modern compilers handle all optimization

Answer: B

Q1397. How does the technique of loop unrolling improve performance at the cost of code size?

- A. It makes loops shorter
- B. It processes multiple loop iterations in one pass, reducing branch overhead and enabling instruction-level parallelism
- C. It has no performance benefit
- D. It always causes bugs

Answer: B

Q1398. What is the advantage of event-driven architecture for handling high concurrency?

- A. It requires more threads
- B. A single thread handles many connections by reacting to events via callbacks or async IO, avoiding the overhead of thread-per-connection
- C. It is always slower
- D. It only works for web servers

Answer: B

Q1399. How does the concept of zero-copy optimize data transfer in systems programming?

- A. It copies data zero times per second
- B. It eliminates unnecessary data copying between kernel and user space, reducing CPU and memory bandwidth usage
- C. It always reduces reliability
- D. It only works on Linux

Answer: B

Q1400. Why is understanding instruction-level parallelism important for optimizing tight loops?

- A. Modern CPUs execute one instruction at a time
- B. Modern CPUs can execute multiple independent instructions simultaneously, and code that exposes this parallelism runs faster
- C. It only applies to GPUs
- D. Compilers always optimize this perfectly

Answer: B

Q1401. How does the bootstrap method enable statistical inference without distributional assumptions?

- A. It requires normal distribution
- B. It resamples the observed data with replacement many times, using the distribution of the statistic across resamples to estimate confidence intervals
- C. It only works for large samples
- D. It replaces all statistical tests

Answer: B

Q1402. What challenges does concept drift pose for deployed machine learning models?

- A. It has no effect
- B. The statistical properties of the target variable change over time, degrading model performance and requiring continuous monitoring and retraining
- C. It only affects unsupervised models
- D. It makes models more accurate

Answer: B

Q1403. How does causal inference differ from predictive modeling in data science?

- A. They are the same approach
- B. Causal inference aims to determine if X causes Y using techniques like instrumental variables; predictive modeling only needs correlations for accurate predictions
- C. Predictive modeling always finds causes
- D. Causal inference is less rigorous

Answer: B

Q1404. Why might accuracy be a misleading metric for imbalanced classification problems?

- A. Accuracy is always the best metric
- B. A classifier that always predicts the majority class achieves high accuracy while completely failing on the minority class
- C. Imbalanced datasets do not exist
- D. Accuracy accounts for class imbalance

Answer: B

Q1405. How does differential privacy protect individual information while enabling useful data analysis?

- A. It encrypts all data
- B. It adds carefully calibrated noise to query results so that individual records cannot be distinguished, with mathematically proven privacy guarantees
- C. It deletes sensitive data
- D. It only works for small datasets

Answer: B

Q1406. What is the significance of the bias-variance decomposition for understanding model error?

- A. It is purely theoretical
- B. It decomposes prediction error into bias (systematic error from model simplicity), variance (sensitivity to training data), and irreducible noise
- C. It only applies to linear models
- D. It eliminates all model error

Answer: B

Q1407. How does SHAP (SHapley Additive exPlanations) improve interpretability of complex models?

- A. It simplifies the model itself
- B. It uses game theory's Shapley values to assign each feature a contribution to each prediction, providing consistent and locally accurate explanations
- C. It only works for linear models
- D. It replaces the model

Answer: B

Q1408. Why is the multiple comparisons problem important when testing many hypotheses simultaneously?

- A. Testing many hypotheses is fine without correction
- B. Testing many hypotheses increases the chance of false positives, requiring corrections like Bonferroni or FDR control
- C. It only affects small datasets
- D. It makes all results significant

Answer: B

Q1409. How does survival analysis handle censored data that traditional methods cannot?

- A. It ignores incomplete data
- B. It models time-to-event data where some subjects have not yet experienced the event, using techniques like Kaplan-Meier and Cox regression
- C. It only applies to medical data
- D. Censored data should always be removed

Answer: B

Q1410. What is the significance of the reproducibility crisis for data-driven problem solving?

- A. It is not a real issue
- B. Many published findings fail to replicate, highlighting the importance of rigorous methodology, pre-registration, and transparent analysis for trustworthy results
- C. It only affects academic research
- D. It means all data analysis is wrong

Answer: B

Q1411. How does the theory of inventive problem solving (TRIZ) differ from unstructured creative techniques?

- A. It is identical to brainstorming
- B. TRIZ uses a systematic methodology based on patterns of invention derived from patent analysis, providing structured inventive principles
- C. It eliminates creativity
- D. It only works in engineering

Answer: B

Q1412. Why might diverse teams outperform homogeneous expert teams in creative problem solving?

- A. Diversity always causes conflict
- B. Diverse perspectives prevent groupthink and bring varied mental models that combine in novel ways, offsetting the efficiency of expert consensus
- C. Homogeneous teams are always better
- D. Diversity has no effect on creativity

Answer: B

Q1413. How does the concept of 'exaptation' explain how existing capabilities lead to novel innovations?

- A. It is a misspelling of adaptation
- B. A feature evolved for one purpose is co-opted for a different use, driving innovation through repurposing rather than invention
- C. It only applies to biology
- D. It prevents innovation

Answer: B

Q1414. How does the paradox of expertise affect creative thinking in specialist fields?

- A. Expertise always enhances creativity
- B. Deep expertise can create mental ruts and functional fixedness that prevent seeing novel solutions available to less specialized thinkers
- C. Expertise has no downsides
- D. Only non-experts are creative

Answer: B

Q1415. How does design fiction as a creative technique help explore future possibilities?

- A. It writes science fiction novels
- B. It creates tangible artifacts from an imagined future to provoke discussion about the implications and desirability of emerging technologies
- C. It predicts the future precisely
- D. It has no practical value

Answer: B

Q1416. What is the role of abductive reasoning in creative hypothesis generation?

- A. It replaces all other reasoning
- B. It infers the most likely explanation from incomplete observations, generating creative hypotheses that can then be tested deductively
- C. It is unreliable and useless
- D. It only works in medicine

Answer: B

Q1417. How does the concept of boundary objects facilitate creative collaboration across disciplines?

- A. They are physical walls
- B. They are shared artifacts flexible enough to be meaningful to different communities while maintaining enough structure for productive collaboration
- C. They prevent collaboration
- D. They only exist in museums

Answer: B

Q1418. Why is the incubation effect important for solving problems that resist conscious analytical effort?

- A. It is a myth
- B. Stepping away from a problem allows unconscious processing to continue, often producing insights that conscious effort could not achieve
- C. It only works for artistic problems
- D. Continuous work is always more productive

Answer: B

Q1419. How does the concept of bricolage describe innovation under resource constraints?

- A. It is a type of brick construction
- B. It involves creating solutions by combining whatever resources are available in novel ways rather than seeking purpose-built tools
- C. It requires unlimited resources
- D. It always produces inferior solutions

Answer: B

Q1420. What is the significance of psychological safety for fostering creative innovation in teams?

- A. It makes teams complacent
- B. It enables team members to take creative risks, share unconventional ideas, and learn from failures without fear of punishment
- C. It prevents all conflict
- D. It only matters for new teams

Answer: B

Q1421. How does the concept of antifragility go beyond resilience in system design?

- A. It is the same as resilience
- B. Antifragile systems actually improve and strengthen from stressors and disorder, unlike resilient systems that merely withstand them
- C. It makes systems fragile
- D. It only applies to financial systems

Answer: B

Q1422. How does the CAP theorem constrain distributed system design decisions in practice?

- A. It allows all three guarantees simultaneously
- B. Under network partitions, a system must choose between consistency and availability, with different choices suited to different use cases
- C. It is only theoretical
- D. It has been disproven

Answer: B

Q1423. What is the significance of the 'two pizza rule' for team structure in complex problem solving?

- A. It is about ordering pizza
- B. Small teams (fed by two pizzas) communicate more effectively and make faster decisions than large teams
- C. Larger teams are always better
- D. It only applies to Amazon

Answer: B

Q1424. How does the concept of reversible versus irreversible decisions affect real-world decision-making speed?

- A. All decisions are equally important
- B. Reversible decisions should be made quickly since they can be undone; irreversible decisions warrant more analysis and caution
- C. Irreversible decisions should be made faster
- D. Decision speed does not matter

Answer: B

Q1425. Why is the concept of eventual consistency important for globally distributed systems?

- A. All systems must be immediately consistent
- B. Eventual consistency allows better availability and performance across regions, accepting temporary inconsistency that resolves over time
- C. It means data is never consistent
- D. It only applies to social media

Answer: B

Q1426. How does Site Reliability Engineering (SRE) balance reliability with feature velocity?

- A. It prioritizes reliability over all else
- B. It uses error budgets where excess reliability budget allows more risky feature releases, and exhausted budgets prioritize stability
- C. It ignores reliability
- D. It only measures uptime

Answer: B

Q1427. What are the practical challenges of implementing zero-trust security architecture?

- A. It has no challenges
- B. It requires verifying every request regardless of network location, demanding identity management, micro-segmentation, and continuous validation infrastructure
- C. It is identical to perimeter security
- D. It eliminates all security threats

Answer: B

Q1428. How does the concept of blast radius minimization improve system reliability?

- A. It is about controlling explosions
- B. It limits the scope of potential failures through isolation, ensuring that a single component failure cannot cascade and take down the entire system
- C. It prevents all failures
- D. It only applies to physical systems

Answer: B

Q1429. Why is the build-versus-buy decision critical for real-world engineering organizations?

- A. Always build everything custom
- B. Building provides customization but costs more time and maintenance; buying saves time but creates dependencies, requiring analysis of strategic value
- C. Always buy off-the-shelf solutions
- D. The decision has no impact

Answer: B

Q1430. How does the concept of toil reduction from SRE improve engineering productivity?

- A. Toil is unavoidable and should be accepted
- B. Identifying and automating repetitive manual operational work frees engineers to focus on improvements that compound in value
- C. Automation is always too expensive
- D. Toil reduction only applies to large companies

Answer: B

Q1431. How does the concept of documentation as executable specifications bridge the gap between docs and tests?

- A. Documentation cannot be executable
- B. Tools like Cucumber or doctest embed testable examples in documentation, ensuring docs stay accurate because they are verified by automated testing
- C. It replaces all manual documentation
- D. It only works for simple functions

Answer: B

Q1432. How does the Divio documentation framework classify documentation into four types?

- A. It uses only two types
- B. It separates docs into tutorials (learning), how-to guides (goals), explanation (understanding), and reference (information), each serving a distinct need
- C. All documentation is the same type
- D. It only applies to APIs

Answer: B

Q1433. What is the significance of the bus factor for knowledge documentation in teams?

- A. It relates to public transportation
- B. A low bus factor means few people hold critical knowledge; documentation mitigates this risk by distributing knowledge across the team
- C. High bus factor is dangerous
- D. It only applies to open-source projects

Answer: B

Q1434. How does the concept of documentation debt parallel technical debt?

- A. Documentation debt does not exist
- B. Like technical debt, documentation debt accumulates when documentation is neglected, increasing the cost of onboarding, maintenance, and knowledge transfer over time
- C. Documentation is never a priority
- D. It resolves itself automatically

Answer: B

Q1435. Why is the distinction between prescriptive and descriptive documentation important?

- A. There is no meaningful distinction
- B. Prescriptive documentation tells how things should be done (standards, guidelines); descriptive documents how things currently work (architecture, behavior)
- C. They serve the same purpose
- D. Only prescriptive docs are needed

Answer: B

Q1436. How does the practice of writing RFCs (Request for Comments) improve technical decision-making?

- A. RFCs are outdated internet documents only
- B. RFCs provide structured proposals that invite feedback from stakeholders before implementation, improving decisions through diverse input and creating permanent records
- C. They slow down all decisions
- D. Only protocol designers use RFCs

Answer: B

Q1437. What role does information architecture play in making large documentation sets navigable?

- A. It is the same as document formatting
- B. It organizes content through meaningful categorization, hierarchies, and navigation paths so users can efficiently find what they need
- C. It only applies to websites
- D. It makes documentation harder to find

Answer: B

Q1438. How does Conway's Law influence the relationship between team communication and system architecture?

- A. It has no influence
- B. Organizations design systems that mirror their communication structures, so documentation and communication patterns directly shape system architecture
- C. It only affects hardware
- D. It has been disproven

Answer: B

Q1439. What is the value of decision logs versus meeting minutes for preserving institutional knowledge?

- A. They are identical
- B. Decision logs capture decisions with context and rationale in a searchable format; meeting minutes capture discussions but often bury decisions in narrative
- C. Meeting minutes are always sufficient
- D. Neither has value

Answer: B

Q1440. How does the concept of progressive disclosure improve documentation usability?

- A. It hides all information
- B. It presents essential information first and reveals additional detail on demand, reducing cognitive overload while keeping comprehensive information accessible
- C. It removes detailed content
- D. It only works for UI design

Answer: B

SUBJECT

Programming (C++, Java, Python)

1,440 Multiple Choice Questions

Programming (C++, Java, Python) — Easy

480 questions

Q1. What is a computer program?

- A. A set of instructions for a computer to execute
- B. A system that manages hardware resources
- C. A physical component inside the computer case
- D. A protocol for transmitting network data

Answer: A

Q2. Which of the following is a low-level programming language?

- A. JavaScript
- B. Kotlin
- C. Assembly
- D. Python

Answer: C

Q3. What does a compiler do?

- A. Allocates and manages runtime memory
- B. Converts entire source code to machine code
- C. Identifies and removes bugs from programs
- D. Executes source code one line at a time

Answer: B

Q4. Which is NOT a programming paradigm?

- A. Procedural Programming
- B. Functional Programming
- C. Structural Networking
- D. Object-Oriented Programming

Answer: C

Q5. What is the purpose of pseudocode?

- A. To plan program logic in plain language
- B. To write actual machine-executable code
- C. To compile a program into bytecode
- D. To debug errors in existing code

Answer: A

Q6. What is a syntax error?

- A. A failure in the underlying hardware
- B. A violation of the language grammar rules
- C. A mistake in the program logic flow
- D. A crash that occurs during runtime only

Answer: B

Q7. What is the difference between a compiler and an interpreter?

- A. An interpreter generates standalone machine code files for later execution
- B. They are functionally identical with no meaningful differences at all
- C. A compiler translates all code at once; an interpreter translates line by line
- D. A compiler always executes faster than an interpreter in every case

Answer: C

Q8. What is an algorithm?

- A. A step-by-step problem-solving procedure
- B. A high-level programming language
- C. A standalone software application
- D. A structured data storage format

Answer: A

Q9. Which of the following is a high-level language?

- A. Python
- B. Assembly
- C. FORTRAN
- D. Haskell

Answer: A

Q10. What does IDE stand for?

- A. Integrated Development Environment
- B. Internal Data Engine
- C. Indexed Database Engine
- D. Internet Development Extension

Answer: A

Q11. Which of the following is a primitive data type in most languages?

- A. List
- B. Integer
- C. Object
- D. Array

Answer: B

Q12. What data type is used to store true or false values?

- A. string
- B. float
- C. boolean
- D. integer

Answer: B

Q13. What is a variable?

- A. A fixed constant value in the program
- B. A reusable block of executable code
- C. A named storage location in memory
- D. A control structure for iteration

Answer: C

Q14. What is the default value of an integer variable in Java?

- A. 1
- B. -1
- C. 0
- D. null

Answer: C

Q15. Which data type would you use to store a single letter?

- A. String
- B. double
- C. boolean
- D. char

Answer: D

Q16. What is the difference between float and double?

- A. They are exactly the same data type
- B. double has more precision than float
- C. double is used for storing integers
- D. float has more precision than double

Answer: B

Q17. What does declaring a variable mean?

- A. Specifying its name and type
- B. Assigning it an initial value
- C. Printing its current value
- D. Removing it from the memory

Answer: A

Q18. Which keyword is used to declare a constant in Java?

- A. static
- B. fixed
- C. final
- D. const

Answer: C

Q19. What is a string?

- A. A boolean value
- B. A single character
- C. A sequence of characters
- D. A numeric data type

Answer: C

Q20. What is type casting?

- A. Removing a variable from program memory
- B. Declaring a variable with a specific name
- C. Converting a value from one type to another
- D. Defining a brand new composite data type

Answer: C

Q21. What does the + operator do with two integers?

- A. Concatenates them together
- B. Compares their values
- C. Multiplies them together
- D. Adds them arithmetically

Answer: D

Q22. What is the result of 10 % 3?

- A. 10
- B. 0
- C. 3
- D. 1

Answer: D

Q23. Which operator is used for assignment in most programming languages?

- A. :=
- B. !=
- C. =
- D. ==

Answer: C

Q24. What does the == operator do?

- A. Declares a new variable in scope
- B. Assigns a value to a variable
- C. Performs addition of two values
- D. Checks if two values are equal

Answer: D

Q25. What is the result of 5 > 3?

- A. true
- B. 3
- C. false
- D. 5

Answer: A

Q26. Which operator performs integer division in Python 3?

- A. //
- B. %
- C. **
- D. /

Answer: A

Q27. What does the NOT (!) operator do?

- A. Reverses a boolean value
- B. Adds two values together
- C. Multiplies two operands
- D. Assigns a new value

Answer: A

Q28. What is the result of true AND false?

- A. false
- B. error
- C. true
- D. null

Answer: A

Q29. What does the ++ operator do?

- A. Adds two variables
- B. Doubles the value
- C. Increments the value by 1
- D. Concatenates strings

Answer: C

Q30. Which operator is used for string concatenation in Java?

- A. +
- B. &
- C. .
- D. ,

Answer: A

Q31. What does an if statement do?

- A. Declares a new variable in the scope
- B. Defines a reusable function or method
- C. Executes code only if condition is true
- D. Repeats a block of code in a loop

Answer: C

Q32. What is a loop?

- A. A conditional branching statement
- B. A construct that repeats code blocks
- C. A syntax for declaring variables
- D. A mechanism for calling functions

Answer: B

Q33. What is the purpose of the 'else' clause?

- A. To terminate the entire program execution
- B. To execute code when if condition is false
- C. To define a reusable function or procedure
- D. To start a new loop iteration immediately

Answer: B

Q34. Which loop checks the condition before executing the body?

- A. both of them
- B. do-while loop
- C. neither of them
- D. while loop

Answer: D

Q35. What does the 'break' statement do in a loop?

- A. Restarts the loop from start
- B. Terminates the loop entirely
- C. Pauses the loop temporarily
- D. Skips the current iteration only

Answer: B

Q36. How many times does a for loop 'for(int i=0; i<5; i++)' execute?

- A. 4
- B. 0
- C. 5
- D. 6

Answer: C

Q37. What is a switch statement?

- A. A syntax for declaring new functions
- B. A type of iterative loop construct
- C. A multi-way branch on expression value
- D. A mechanism for handling exceptions

Answer: C

Q38. What does the 'continue' statement do?

- A. Restarts the loop from the very beginning
- B. Skips rest of iteration and moves to next
- C. Pauses execution until user gives input
- D. Exits and terminates the entire loop

Answer: B

Q39. What is a nested loop?

- A. A loop that has been terminated
- B. A loop without any condition set
- C. A loop that runs only one time
- D. A loop placed inside another loop

Answer: D

Q40. What is the output of: if(false) print('A'); else print('B');?

- A. BA
- B. AB
- C. A
- D. B

Answer: D

Q41. What is a function in programming?

- A. A reusable block performing a specific task
- B. A loop that iterates over a collection
- C. A named variable storing data values
- D. A primitive or composite data type name

Answer: A

Q42. What is a function parameter?

- A. A global variable accessible from anywhere
- B. A variable that receives a passed-in value
- C. The return value that a function produces
- D. The identifier name given to the function

Answer: B

Q43. What does the return statement do?

- A. Declares a variable in the function scope
- B. Sends a value back and exits the function
- C. Terminates the entire running program
- D. Starts a new loop inside the function

Answer: B

Q44. What is the difference between a parameter and an argument?

- A. A parameter is the actual value passed during the function call
- B. A parameter is in the definition; an argument is the passed value
- C. They are exactly the same thing with no differences at all
- D. An argument is defined in the function formal declaration only

Answer: B

Q45. What is a void function?

- A. A function that takes no input parameters
- B. A function with an empty body and no code
- C. A function that does not return any value
- D. A function that is syntactically invalid

Answer: C

Q46. What is a function call?

- A. Writing the definition of a function
- B. Invoking a function to execute its code
- C. Removing a function from the program
- D. Adding a comment above a function

Answer: B

Q47. Can a function call another function?

- A. Only void functions can call other ones
- B. Only if they are defined in the same class
- C. No, functions cannot call other functions
- D. Yes, functions can call other functions

Answer: D

Q48. What is a built-in function?

- A. A function provided by the language or library
- B. A function that you must always write yourself
- C. A function that calls itself recursively
- D. A function defined inside a loop construct

Answer: A

Q49. What is the main function?

- A. Any function found anywhere in the program source
- B. The last function that gets called before exiting
- C. The entry point of execution in languages like C/Java
- D. A mathematical function for numeric calculations

Answer: C

Q50. What happens if a function is defined but never called?

- A. It causes an error
- B. It runs at the end
- C. It runs automatically
- D. Its code is never executed

Answer: D

Q51. What does I/O stand for in programming?

- A. Integer or Object
- B. Index with Order
- C. Internal Operations
- D. Input and Output

Answer: D

Q52. Which function is used to display output in Python?

- A. echo()
- B. write()
- C. print()
- D. printf()

Answer: C

Q53. What is standard input (stdin)?

- A. A persistent network data connection
- B. The default input source like keyboard
- C. A database for storing program data
- D. A file stored on the hard disk drive

Answer: B

Q54. What is standard output (stdout)?

- A. The default output destination like console
- B. A database for persisting program output
- C. A connected printer device only
- D. A file stored on persistent disk storage

Answer: A

Q55. Which function reads a line of input from the user in Python?

- A. input()
- B. scanf()
- C. getLine()
- D. readLine()

Answer: A

Q56. What is a newline character?

- A. A whitespace character for horizontal spacing
- B. A tab character for indenting text in documents
- C. A special character that moves cursor to next line
- D. A backspace character that deletes previous input

Answer: C

Q57. What does printf() do in C?

- A. Closes an open file descriptor handle
- B. Formats and prints output to the console
- C. Reads input from standard input stream
- D. Allocates dynamic memory on the heap

Answer: B

Q58. What is a format specifier?

- A. A variable name in source code
- B. A placeholder defining value display format
- C. A counter used inside loop bodies
- D. A file type extension on disk

Answer: B

Q59. What is console output?

- A. Storing structured data in a database table
- B. Sending formatted data to a connected printer
- C. Displaying information on screen or terminal
- D. Writing data to a file on disk storage

Answer: C

Q60. What does Scanner class do in Java?

- A. Compiles Java source code into bytecode
- B. Reads input from various sources like keyboard
- C. Scans the system for viruses and malware
- D. Writes formatted output to the console

Answer: B

Q61. How are strings typically stored in memory?

- A. As boolean value sequences
- B. As integer values in memory
- C. As an array of characters
- D. As floating-point numbers

Answer: C

Q62. What does the length/len function return for a string?

- A. The index of the last character
- B. The memory size in bytes
- C. The number of characters in the string
- D. The ASCII value of the first character

Answer: C

Q63. What is string concatenation?

- A. Splitting a string into parts
- B. Reversing a string order
- C. Joining two or more strings
- D. Deleting a string entirely

Answer: C

Q64. What is the index of the first character in a string in most languages?

- A. -1
- B. 2
- C. 0
- D. 1

Answer: C

Q65. What does the toUpperCase() method do?

- A. Converts all characters to lowercase
- B. Converts all characters to uppercase
- C. Reverses the character order fully
- D. Removes all whitespace characters

Answer: B

Q66. What is a substring?

- A. The name of a string variable only
- B. A string that contains no characters
- C. A contiguous portion of the string
- D. A complete copy of the entire string

Answer: C

Q67. What is an empty string?

- A. A string with spaces only inside it
- B. An uninitialized variable with no type
- C. A null value with no reference set
- D. A string with zero characters in it

Answer: D

Q68. What does the trim() method do?

- A. Removes leading and trailing whitespace
- B. Converts all characters to lowercase form
- C. Removes every character from the string
- D. Splits the string at every space character

Answer: A

Q69. How do you compare strings in Java?

- A. Using the == operator directly
- B. Using the + concatenation operator
- C. Using the > comparison operator
- D. Using the equals() method call

Answer: D

Q70. What is a character in programming?

- A. A string of exactly two characters
- B. A numeric whole number data type
- C. A single symbol like a letter or digit
- D. A boolean true or false data value

Answer: C

Q71. What is an array?

- A. A loop construct that iterates over data elements
- B. A collection of same-type elements in contiguous memory
- C. A reusable function that performs a specific task
- D. A single variable holding one data value

Answer: B

Q72. What is the index of the first element in an array in C/Java?

- A. 0
- B. -1
- C. 2
- D. 1

Answer: A

Q73. What is an ArrayList in Java?

- A. A doubly linked list of elements
- B. A key-value pair mapping structure
- C. A fixed-size array that cannot change
- D. A dynamic array that grows and shrinks

Answer: D

Q74. What is a list in Python?

- A. A dictionary mapping keys to their associated values
- B. An immutable sequence that cannot be modified at all
- C. A fixed-size array of uniform typed elements
- D. An ordered mutable collection of any element types

Answer: D

Q75. What happens when you access an array index out of bounds?

- A. It returns zero as the default value for any position
- B. It returns null as the default value for the position
- C. It throws an exception or causes undefined behavior
- D. It automatically resizes the array to fit the index

Answer: C

Q76. What is a dictionary/map?

- A. An ordered array with indexed elements
- B. A list of words in alphabetical order
- C. A string type for storing text values
- D. A collection of key-value pair entries

Answer: D

Q77. What is a stack?

- A. A LIFO (Last-In First-Out) structure
- B. A sorted list of ordered elements
- C. A random access data structure
- D. A FIFO (First-In First-Out) structure

Answer: A

Q78. What is a queue?

- A. A LIFO (Last-In First-Out) structure
- B. A sorted array with indexed elements
- C. A FIFO (First-In First-Out) structure
- D. A hierarchical tree data structure

Answer: C

Q79. What is the difference between an array and a linked list?

- A. Arrays can dynamically grow and shrink in size without any overhead
- B. Arrays use contiguous memory with $O(1)$ access; linked lists use nodes
- C. They are functionally identical data structures with no differences
- D. Linked lists are always faster than arrays for every type of operation

Answer: B

Q80. What is a set in programming?

- A. A sorted array of ordered elements
- B. A specialized type of key-value map
- C. A collection with only unique elements
- D. An array that allows duplicate elements

Answer: C

Q81. What is a class in OOP?

- A. A variable type for storing data
- B. A blueprint for creating objects
- C. A loop construct for iteration
- D. A reusable function for operations

Answer: B

Q82. What is an object in OOP?

- A. A standalone function
- B. A class definition in code
- C. A primitive data type
- D. An instance of a class

Answer: D

Q83. What is encapsulation?

- A. Inheriting properties from a parent class definition
- B. A sorting method that orders elements in a collection
- C. A type of iterative loop control structure in code
- D. Bundling data and methods while restricting direct access

Answer: D

Q84. What is inheritance in OOP?

- A. Acquiring properties and methods from a parent class
- B. Creating a new object instance from a class
- C. A form of encapsulation that hides internal details
- D. A design pattern for structuring application code

Answer: A

Q85. What is a constructor?

- A. A static method belonging to the class itself
- B. A getter method that returns a field value
- C. A destructor that cleans up object state
- D. A special method called when creating an object

Answer: D

Q86. What is a method in OOP?

- A. A standalone function not tied to any class
- B. A function defined inside a class for objects
- C. A variable that stores data in the program
- D. A data type that defines value constraints

Answer: B

Q87. What does the 'this' keyword refer to?

- A. The current object instance
- B. A static method reference
- C. The class definition itself
- D. The parent class reference

Answer: A

Q88. What is an access modifier?

- A. A keyword controlling member visibility level
- B. A data type for storing numeric values only
- C. A type of loop construct in the language
- D. A constructor for initializing object state

Answer: A

Q89. What is the 'new' keyword used for?

- A. Deleting an existing object from memory
- B. Declaring a new variable in the scope
- C. Defining a new method in the class
- D. Creating a new instance of a class

Answer: D

Q90. What is polymorphism?

- A. A class relationship defined by inheritance hierarchy
- B. A type of encapsulation hiding internal data details
- C. Different objects responding differently to same method
- D. Having only one single form of behavior always

Answer: C

Q91. What is RAM?

- A. Random Access Memory, volatile memory for programs
- B. A programming language for system-level development
- C. A type of hard drive for persistent data storage
- D. Read-Access Module for hardware communication

Answer: A

Q92. What is the stack in memory?

- A. A memory region storing locals and call info in LIFO
- B. The hard drive used for persistent data storage
- C. A data structure only with no memory role
- D. A type of processor cache for fast data access

Answer: A

Q93. What is the heap in memory?

- A. Read-only memory that cannot be written to
- B. Identical to the stack memory region exactly
- C. A sorted data structure for priority access
- D. A memory region for dynamic memory allocation

Answer: D

Q94. What is a memory leak?

- A. A security vulnerability in network protocols
- B. A hardware failure in the memory modules
- C. A type of buffer overflow in array operations
- D. Allocated memory no longer used but not freed

Answer: D

Q95. What is garbage collection?

- A. A sorting algorithm for ordering data values
- B. Deleting files from the disk storage system
- C. Running disk cleanup utilities on the system
- D. Automatic reclamation of unused object memory

Answer: D

Q96. What is a pointer?

- A. A composite data type definition
- B. A variable storing a memory address
- C. A reusable block of executable code
- D. A variable holding a computed value

Answer: B

Q97. What is the difference between stack and heap allocation?

- A. Stack is automatic and fast with limited size; heap is larger but slower
- B. Heap allocation is always faster than stack allocation in all scenarios
- C. There is no meaningful difference between the two allocation methods
- D. Stack memory is unlimited while heap memory has a very strict size cap

Answer: A

Q98. What is a null pointer?

- A. A pointer to the memory address zero
- B. A pointer that has been deleted already
- C. A pointer to the stack memory region
- D. A pointer to no valid memory location

Answer: D

Q99. What does 'free()' do in C?

- A. Frees up disk space on the storage drive
- B. Deallocates previously allocated heap memory
- C. Resets a variable back to its default value
- D. Allocates new memory on the heap for use

Answer: B

Q100. What is a variable's lifetime?

- A. The duration the variable exists in memory
- B. Its declared data type in the program
- C. Its identifier name in the source program
- D. Its accessibility scope in the source code

Answer: A

Q101. What is an exception?

- A. A function call to a subroutine in the program
- B. An abnormal event disrupting normal program flow
- C. A normal expected program event during execution
- D. A variable type for storing error code values

Answer: B

Q102. What is a try-catch block?

- A. A function definition with parameters and body
- B. A looping construct for repeated iteration
- C. A construct attempting code and handling exceptions
- D. A conditional statement for branching logic

Answer: C

Q103. What is the purpose of the 'finally' block?

- A. To define a new function with a specific name
- B. To terminate the program execution immediately
- C. To execute code regardless of exception outcome
- D. To finalize a variable and prevent changes

Answer: C

Q104. What is a NullPointerException?

- A. A compile-time syntax error in the code
- B. A valid and expected operation result
- C. A warning generated by the code linter
- D. An exception from using a null reference

Answer: D

Q105. What does 'throw' do in exception handling?

- A. Ignores an exception and continues running
- B. Explicitly raises and creates an exception
- C. Logs an exception message to the console
- D. Catches an exception from the try block

Answer: B

Q106. What is an ArithmeticException?

- A. A type mismatch between two variable types
- B. A file not found error during I/O access
- C. An exception for illegal arithmetic operations
- D. A syntax error in the source code text

Answer: C

Q107. What is the difference between compile-time and runtime errors?

- A. Compile-time errors cause the running program to crash unexpectedly
- B. Runtime errors are detected and caught by the compiler before running
- C. Compile-time errors are caught before execution; runtime during it
- D. There is no meaningful difference between the two error types

Answer: C

Q108. What is an ArrayIndexOutOfBoundsException?

- A. A type error from wrong array element types
- B. An exception for accessing an invalid index
- C. A memory leak from unreleased array memory
- D. A valid and expected array access result

Answer: B

Q109. Can you have multiple catch blocks for one try?

- A. Yes, to handle different exception types differently
- B. No, only one catch block is allowed per try statement
- C. Only for a maximum of exactly two exception types total
- D. Only in Python, not in any other programming language

Answer: A

Q110. What is an error message?

- A. A variable name used for storing error data
- B. A text description about what went wrong
- C. A function output returned to calling code
- D. A comment written inside the source code

Answer: B

Q111. What is a module in programming?

- A. A data structure for storing elements
- B. A variable type for storing data values
- C. A self-contained unit of related code
- D. A type of iterative loop construct

Answer: C

Q112. What is the purpose of the import statement?

- A. To include functionality from another module
- B. To delete a module from the project files
- C. To compile code into executable binaries
- D. To export code to other modules or files

Answer: A

Q113. What is a package in Python?

- A. A single Python source code file only
- B. A Python class with methods and attributes
- C. A directory containing modules and `__init__.py`
- D. A standalone Python function definition

Answer: C

Q114. What is a library in programming?

- A. A collection of pre-written reusable code modules
- B. A place for storing reference books and manuals
- C. An integrated development environment application
- D. A single function defined in the source code file

Answer: A

Q115. What is the difference between a module and a package?

- A. They are exactly the same thing with different names
- B. A module is a single file; a package is a collection
- C. A package is smaller in size compared to a module
- D. A module contains multiple packages within itself

Answer: B

Q116. What is pip in Python?

- A. A general-purpose programming language for development
- B. A compiler that converts Python to machine code binary
- C. A debugger tool for finding errors in Python programs
- D. The package installer for Python that downloads packages

Answer: D

Q117. What is npm?

- A. A Python-specific development tool only
- B. A database for storing application data values
- C. A compiler for JavaScript source code files
- D. Node Package Manager for JavaScript packages

Answer: D

Q118. What is an API?

- A. A general-purpose programming language for development
- B. A relational database for storing structured data records
- C. A set of definitions and protocols for software integration
- D. A compiler that translates source code to machine language

Answer: C

Q119. What is a namespace?

- A. A string type for storing text data values in memory
- B. A file extension that identifies the programming language
- C. A container for identifiers to avoid naming conflicts
- D. A variable name in the source code program

Answer: C

Q120. What does 'from math import sqrt' do in Python?

- A. Creates a new sqrt function in the current file
- B. Imports only the sqrt function from math module
- C. Deletes the sqrt function from the math module
- D. Imports the entire math module with all functions

Answer: B

Q121. What is a design pattern?

- A. A reusable solution template for common software problems
- B. A type of algorithm for data processing
- C. A user interface visual design layout
- D. A programming language for building applications

Answer: A

Q122. What is recursion?

- A. A function calling itself to solve problems
- B. An error in the program source code
- C. A type of iterative loop construct
- D. A data structure for storing elements

Answer: A

Q123. What is a data structure?

- A. A way of organizing data for efficient access
- B. A programming language for writing software
- C. A function that performs a specific operation
- D. A database management system for storage

Answer: A

Q124. What is an event in event-driven programming?

- A. An action or occurrence that a program can respond to
- B. A function that performs a specific task when called
- C. A syntax error in the source code of the program
- D. A variable that stores data values during execution

Answer: A

Q125. What is a generic/template in programming?

- A. A design pattern for building complex object hierarchies
- B. Code that works with any type specified at compile time
- C. A default value assigned to variables automatically
- D. A runtime check that validates data types dynamically

Answer: B

Q126. What is the Singleton pattern?

- A. Ensuring a class has only one global instance
- B. Creating many instances of a class at once
- C. An error pattern for handling exceptions
- D. A function pattern for recursive operations

Answer: A

Q127. What is abstraction in programming?

- A. A primitive data type for storing numeric values only
- B. Making code unnecessarily complex and hard to follow
- C. Hiding details while exposing essential features only
- D. A type of error that occurs during program execution

Answer: C

Q128. What is an annotation/decorator?

- A. Metadata or wrapper adding behavior without modifying code
- B. A loop construct for iterating over collection elements
- C. A comment in the source code for documentation
- D. A variable that stores a single data value in memory

Answer: A

Q129. What is refactoring?

- A. Adding new features and functionality to the existing codebase
- B. Restructuring code to improve structure without changing behavior
- C. Deleting unused code and removing deprecated function calls
- D. Rewriting the entire codebase from scratch completely

Answer: B

Q130. What is the DRY principle?

- A. A testing principle for validating dry run output
- B. A moisture management rule for server rooms
- C. Avoid duplicating code by abstracting common logic
- D. A drying algorithm for removing duplicate data

Answer: C

Q131. What is concurrency in programming?

- A. Running only one task at a time sequentially
- B. Handling multiple tasks in overlapping time periods
- C. Exactly the same concept as true parallelism
- D. Strictly sequential execution of all operations

Answer: B

Q132. What is a thread?

- A. A reusable function definition block
- B. A type of string data structure
- C. The smallest unit of execution within a process
- D. A data structure for storing elements

Answer: C

Q133. What is a process?

- A. A function call that executes and then returns
- B. An independent program with its own memory space
- C. A variable that stores data during execution
- D. The same thing as a thread in all respects

Answer: B

Q134. What is the difference between concurrency and parallelism?

- A. Concurrency always requires multiple CPU cores to function properly
- B. Parallelism is always slower than concurrency in every scenario
- C. They are exactly the same concept with no differences at all
- D. Concurrency manages overlapping tasks; parallelism runs simultaneously

Answer: D

Q135. What is multithreading?

- A. A type of recursion with multiple recursive calls
- B. Using multiple programming languages in one project
- C. Using multiple processors in a distributed system
- D. Running multiple threads within a single process

Answer: D

Q136. What is a race condition?

- A. A debugging tool for analyzing multi-threaded applications
- B. A bug where outcome depends on non-deterministic thread timing
- C. A performance competition between different threads
- D. A type of exception thrown during concurrent data access

Answer: B

Q137. What is synchronization?

- A. A file operation for reading and writing data safely
- B. Running code statements in sequential order always
- C. A network protocol for data transfer between systems
- D. Coordinating shared resource access to prevent races

Answer: D

Q138. What is a mutex?

- A. An algorithm for sorting elements in a collection
- B. A primitive data type for storing values
- C. A lock ensuring exclusive resource access for one thread
- D. A function for performing calculations on data values

Answer: C

Q139. What is a deadlock?

- A. A memory leak from unreleased dynamically allocated data
- B. A type of infinite loop caused by incorrect conditions
- C. Threads blocked forever waiting for each other resources
- D. A program crash caused by a runtime error in code

Answer: C

Q140. What is the main benefit of concurrency?

- A. Improved performance and responsiveness of programs
- B. Simpler code that is easier to read and understand
- C. Smaller program binaries with reduced memory footprint
- D. Fewer bugs and errors during program execution overall

Answer: A

Q141. What is debugging?

- A. Compiling code into machine language
- B. Writing new source code from scratch
- C. Finding and fixing errors in a program
- D. Running automated tests on the code

Answer: C

Q142. What is a breakpoint?

- A. An error in the source code of the program
- B. A marker where the debugger pauses for inspection
- C. An exit point from a loop during execution flow
- D. The end of a function where control is returned

Answer: B

Q143. What is a unit test?

- A. A user acceptance test for final validation
- B. Testing the entire application end to end
- C. A test verifying a single isolated code unit
- D. A performance test measuring execution speed

Answer: C

Q144. What is a bug?

- A. A type of variable storing debug data
- B. A feature that works as intended
- C. A function used for error handling
- D. An error or flaw causing wrong behavior

Answer: D

Q145. What is print/console debugging?

- A. Using print statements to display values and flow
- B. An automated process for finding and fixing bugs
- C. A graphical user interface tool for visual debugging
- D. Professional debugging using specialized IDE tools

Answer: A

Q146. What is a test case?

- A. A debug tool for stepping through code line by line
- B. A set of inputs and expected results for verification
- C. A code review process performed by team members
- D. A programming language for writing test scripts

Answer: B

Q147. What does the term 'step over' mean in debugging?

- A. Execute current line and move to next without entering calls
- B. Skip the entire program execution completely
- C. Jump directly to the end of the current function body
- D. Restart the debugging session from the very beginning

Answer: A

Q148. What is a syntax error?

- A. A logic mistake producing incorrect program results
- B. A runtime error that occurs during program execution
- C. A design flaw in the overall application architecture
- D. A violation of language grammar rules at compile time

Answer: D

Q149. What is the purpose of an assertion?

- A. To create a new variable in the current scope of code
- B. To import a module from an external library into the file
- C. To define a new function with parameters and return type
- D. To verify a condition is true and fail with message if not

Answer: D

Q150. What is a logic error?

- A. An error where program runs but produces incorrect results
- B. A syntax mistake caught during code compilation by compiler
- C. A type error from assigning incompatible values to variables
- D. A compile error that prevents the program from being built

Answer: A

Q151. What is version control?

- A. Tracking and managing code changes over time
- B. Controlling which program version users access
- C. A testing tool for validating software behavior
- D. A deployment tool for releasing code to servers

Answer: A

Q152. What is Git?

- A. A distributed version control system for code
- B. A general-purpose programming language
- C. A database for storing application data
- D. A compiler for translating source to binaries

Answer: A

Q153. What is a code review?

- A. Deleting unused code from the codebase
- B. Having developers examine code before merging
- C. Writing documentation for the application
- D. Running automated tests on the source code

Answer: B

Q154. What is agile development?

- A. A programming language designed for rapid application development tasks
- B. An iterative approach emphasizing collaboration and short delivery cycles
- C. A testing method for validating software behavior against requirements
- D. Developing software as fast as possible without any planning at all

Answer: B

Q155. What is a commit in version control?

- A. A deployment to the production environment
- B. A branch created for feature development
- C. Deleting code from the shared repository
- D. A snapshot of changes saved with a message

Answer: D

Q156. What is a branch in Git?

- A. An independent line of development from main
- B. A variable used to store temporary values
- C. A copy of a file in the project directory
- D. A function defined in the source code file

Answer: A

Q157. What is a merge in Git?

- A. Creating a new commit in the repository
- B. Splitting code into separate source files
- C. Combining changes from one branch into another
- D. Deleting a branch from the repository

Answer: C

Q158. What is documentation in software development?

- A. Only code comments written inside source files
- B. Written descriptions of software design and usage
- C. A testing tool for validating software correctness
- D. A deployment process for releasing to production

Answer: B

Q159. What is the purpose of code comments?

- A. To define variables inside the source file
- B. To make the code execute faster at runtime
- C. To handle errors during program execution
- D. To explain the intent and reasoning in code

Answer: D

Q160. What is a pull request?

- A. A data request sent to a server for information
- B. A build request to compile and package the application
- C. Pulling code packages from the internet registry
- D. A request to merge changes with review and discussion

Answer: D

Q161. What is source code in programming?

- A. Human-readable instructions for a program
- B. The memory address of a running process
- C. A hardware signal sent to the processor
- D. The binary output after compilation

Answer: A

Q162. What does a linker do in program building?

- A. Checks source code for syntax errors
- B. Allocates memory for runtime variables
- C. Converts code into an intermediate format
- D. Combines object files into an executable

Answer: D

Q163. Which term describes a fixed value written directly in code?

- A. Keyword
- B. Operator
- C. Literal
- D. Variable

Answer: C

Q164. What is the main purpose of a flowchart?

- A. To encrypt data before transmission
- B. To allocate memory during execution
- C. To compile source code into bytecode
- D. To visually represent program logic flow

Answer: D

Q165. What does the term debugging mean?

- A. Designing the user interface layout
- B. Compiling code into machine language
- C. Writing new features for software
- D. Finding and fixing errors in code

Answer: D

Q166. Which of these is an example of a markup language?

- A. HTML
- B. Python
- C. Java
- D. Ruby

Answer: A

Q167. What is a runtime environment?

- A. A database for storing application data
- B. A text editor for writing source code files
- C. A network protocol for data transmission
- D. Software that provides execution support

Answer: D

Q168. What is machine code composed of?

- A. English keywords and symbols
- B. Flowchart diagram elements
- C. Pseudocode planning statements
- D. Binary digits zeros and ones

Answer: D

Q169. What is the purpose of comments in code?

- A. To speed up program execution time
- B. To declare variables automatically
- C. To handle errors during runtime
- D. To explain code for human readers

Answer: D

Q170. What does open source mean for software?

- A. Software that runs only on the internet
- B. Software with publicly available source code
- C. Software that requires no installation
- D. Software created by a single developer

Answer: B

Q171. What is a Boolean data type used to represent?

- A. Text strings
- B. Memory addresses
- C. Decimal numbers
- D. True or false

Answer: D

Q172. What is the default value of an uninitialized integer in Java?

- A. Undefined
- B. Null
- C. Zero
- D. One

Answer: C

Q173. Which data type stores a single character?

- A. char
- B. integer
- C. float
- D. string

Answer: A

Q174. What does the term type casting mean?

- A. Creating a new custom data type
- B. Assigning a name to a constant
- C. Deleting a variable from memory
- D. Converting a value to another type

Answer: D

Q175. Which data type is used for numbers with decimal points?

- A. char
- B. integer
- C. float
- D. boolean

Answer: C

Q176. What is the difference between a variable and a constant?

- A. A variable is global; a constant is always local
- B. A constant uses more memory than a variable
- C. A variable is faster than a constant in speed
- D. A variable can change; a constant cannot change

Answer: D

Q177. What does null represent in programming?

- A. A Boolean false state
- B. The absence of a value
- C. The number zero value
- D. An empty text string

Answer: B

Q178. Which keyword declares a constant in many languages?

- A. dim
- B. let
- C. const
- D. var

Answer: C

Q179. What is an unsigned integer?

- A. An integer with unlimited storage capacity
- B. An integer storing only non-negative values
- C. An integer stored as a floating-point value
- D. An integer that can hold negative values only

Answer: B

Q180. What is a string in programming?

- A. A sequence of characters
- B. A type of loop structure
- C. A memory address pointer
- D. A numeric calculation result

Answer: A

Q181. What does the modulus operator (%) return?

- A. The quotient of division
- B. The remainder of division
- C. The absolute difference
- D. The product of two values

Answer: B

Q182. Which operator is used for logical AND in most languages?

- A. ||
- B. ^^
- C. &&
- D. !!

Answer: C

Q183. What does the increment operator (++) do?

- A. Multiplies a value by two
- B. Divides a value by one
- C. Decreases a value by two
- D. Increases a value by one

Answer: D

Q184. What is the assignment operator in most programming languages?

- A. ==
- B. =
- C. !=
- D. <=

Answer: B

Q185. Which operator checks if two values are NOT equal?

- A. ==
- B. >=
- C. <=
- D. !=

Answer: D

Q186. What does the logical OR operator (||) return?

- A. True if at least one operand is true
- B. False only when first operand is false
- C. The sum of two Boolean operand values
- D. True only if both operands are true

Answer: A

Q187. What type of operator is the greater-than sign (>)?

- A. Comparison
- B. Logical
- C. Assignment
- D. Arithmetic

Answer: A

Q188. What does the NOT operator (!) do to a Boolean value?

- A. Doubles the value
- B. Deletes the value
- C. Inverts the value
- D. Converts to string

Answer: C

Q189. Which symbol represents the multiplication operator?

- A. asterisk
- B. forward slash
- C. minus sign
- D. plus sign

Answer: A

Q190. What is the result of 10 / 3 in integer division?

- A. 0
- B. 3.33
- C. 4
- D. 3

Answer: D

Q191. What does a while loop do in programming?

- A. Executes code a fixed number of times
- B. Skips code blocks based on values
- C. Repeats code while condition remains true
- D. Runs code exactly once then stops

Answer: C

Q192. What is the purpose of the break statement?

- A. It restarts the loop from beginning
- B. It pauses execution for specified time
- C. It skips to the next function in code
- D. It exits the current loop or switch

Answer: D

Q193. Which control structure selects between multiple code paths?

- A. for loop
- B. while loop
- C. if-else statement
- D. do-while loop

Answer: C

Q194. What does the continue statement do in a loop?

- A. Ends the loop entirely and exits immediately
- B. Skips the rest of current iteration only
- C. Restarts the loop counter to initial value
- D. Pauses the loop until user provides input

Answer: B

Q195. What is a do-while loop?

- A. A loop needing no ending condition at all
- B. A loop that checks condition after executing
- C. A loop that runs exactly twice every time
- D. A loop that might never execute its body

Answer: B

Q196. What does a switch statement do?

- A. Switches between two different program files
- B. Transfers control to another function call
- C. Toggles a Boolean variable between states
- D. Compares a value against multiple case labels

Answer: D

Q197. What is an infinite loop?

- A. A loop whose condition never becomes false
- B. A loop that processes infinite data items
- C. A loop iterating exactly one million times
- D. A loop that runs fast but eventually stops

Answer: A

Q198. What is the purpose of the else clause?

- A. It always executes regardless of condition
- B. It executes when the if condition is false
- C. It executes when the if condition is true
- D. It ends the program after the if statement

Answer: B

Q199. What are the three parts of a standard for loop?

- A. Try, catch, and finally block sections
- B. Input, process, and output statements
- C. Initialization, condition, and update
- D. Declaration, assignment, and return

Answer: C

Q200. What is nesting in control structures?

- A. Converting loops into conditional checks
- B. Placing one structure inside another one
- C. Removing unused code from the program
- D. Connecting two programs externally together

Answer: B

Q201. What is a function in programming?

- A. A variable that holds numeric values
- B. A data type that stores text values
- C. A reusable block of code with a name
- D. A control structure for looping code

Answer: C

Q202. What is a parameter in a function?

- A. A variable that receives input to function
- B. The name given to the function itself
- C. The data type of the function output
- D. The return value of the function call

Answer: A

Q203. What does the return statement do?

- A. It repeats the function from the start
- B. It sends a value back to the caller
- C. It declares a new variable in the scope
- D. It prints output to the screen display

Answer: B

Q204. What is a function call?

- A. Defining a new function in the program
- B. Renaming a function to a new identifier
- C. Executing a function by using its name
- D. Deleting a function from the program

Answer: C

Q205. What is the difference between an argument and a parameter?

- A. Arguments are types; parameters are values only
- B. They are the same thing with no difference
- C. Arguments are in definition; parameters in calls
- D. Parameters are in definition; arguments in calls

Answer: D

Q206. What is a void function?

- A. A function that cannot be called by others
- B. A function that takes no parameters at all
- C. A function that returns no value to caller
- D. A function that runs only one time ever

Answer: C

Q207. What does the term function signature mean?

- A. The comments written above function body
- B. The digital signature used to secure code
- C. The total number of lines in the function
- D. The name, parameters, and return type info

Answer: D

Q208. What is a built-in function?

- A. A function that cannot be modified at all
- B. A function that runs before main function
- C. A function provided by the language itself
- D. A function written by the programmer only

Answer: C

Q209. What is a recursive function?

- A. A function that takes no arguments at all
- B. A function that runs in parallel threads
- C. A function that calls itself to solve tasks
- D. A function that never returns any values

Answer: C

Q210. What is the scope of a local variable inside a function?

- A. It is shared across all program functions
- B. It is accessible from anywhere in program
- C. It persists after the function has ended
- D. It exists only within that function body

Answer: D

Q211. What does standard input (stdin) refer to?

- A. The file system storage on disk
- B. The network connection to internet
- C. The default input source like keyboard
- D. The screen display output device

Answer: C

Q212. What does standard output (stdout) refer to?

- A. The printer attached to the computer
- B. The default output destination like screen
- C. The database server for data storage
- D. The keyboard input device

Answer: B

Q213. What is a file in the context of I/O?

- A. A temporary variable in program memory
- B. A named collection of data stored on disk
- C. A network connection between two machines
- D. A function that handles user inputs

Answer: B

Q214. What does reading from a file mean?

- A. Renaming the file to a new file name
- B. Retrieving data from a file into program
- C. Deleting the file from the file system
- D. Writing new data to the file on disk

Answer: B

Q215. What is the purpose of the print function?

- A. To create a new variable in the program
- B. To display output to the screen or console
- C. To save data permanently to a file on disk
- D. To read input from the keyboard device

Answer: B

Q216. What is a file path?

- A. The content stored inside a file itself
- B. The location address of a file on system
- C. The date when a file was last modified
- D. The size of a file measured in bytes

Answer: B

Q217. What does writing to a file mean?

- A. Storing data from program into a file
- B. Deleting all contents of the file only
- C. Moving a file to a different directory
- D. Reading data from the file into memory

Answer: A

Q218. What is a console in programming?

- A. A database management system for data
- B. A text-based interface for program I/O
- C. A gaming device for entertainment use
- D. A graphical design tool for layouts

Answer: B

Q219. What does the input function do in Python?

- A. It writes data to a file on the disk
- B. It creates a new variable in the code
- C. It displays formatted output on screen
- D. It reads a line of text from the user

Answer: D

Q220. What is the difference between text and binary file modes?

- A. Text mode is faster; binary mode is slower always
- B. Text mode is for images; binary mode is for documents
- C. Text mode is read only; binary mode is write only
- D. Text mode handles characters; binary handles raw bytes

Answer: D

Q221. What is string concatenation?

- A. Converting string to number
- B. Joining two strings together
- C. Splitting a string into parts
- D. Reversing a string backward

Answer: B

Q222. What does the length property of a string return?

- A. The number of words inside
- B. The index of last character
- C. The memory size in bytes
- D. The number of characters

Answer: D

Q223. What is a substring?

- A. A string used as a variable
- B. A string with no characters
- C. A portion of another string
- D. A string stored in memory

Answer: C

Q224. What is an empty string?

- A. A string that equals null
- B. A string with zero characters
- C. A string containing spaces only
- D. A string holding the digit zero

Answer: B

Q225. What does converting a string to uppercase mean?

- A. Removing all spaces from the string text
- B. Adding exclamation marks after each word
- C. Changing all letters to capital letters
- D. Increasing the font size of the string

Answer: C

Q226. What is a character index in a string?

- A. The total count of characters in string
- B. The numeric position of a character
- C. The ASCII value of the character
- D. The memory address of the character

Answer: B

Q227. What does the trim function do to a string?

- A. Converts the string to lowercase only
- B. Removes leading and trailing whitespace
- C. Shortens the string to ten characters
- D. Removes all characters from the string

Answer: B

Q228. What is an escape character in a string?

- A. A character that exits the program when found
- B. A character that deletes the previous character
- C. A character that converts text into numeric data
- D. A character starting a special sequence in text

Answer: D

Q229. What does string comparison do?

- A. Counts how many strings exist in program
- B. Joins two strings into one combined string
- C. Converts strings into integer numeric values
- D. Checks if two strings are equal or ordered

Answer: D

Q230. What is the newline character used for?

- A. To add a space between two words
- B. To underline the current text line
- C. To delete the current line of text
- D. To move text to the next line down

Answer: D

Q231. What is an array in programming?

- A. A collection of elements stored in order
- B. A function that processes numeric data
- C. A single variable that holds one value
- D. A loop that iterates over user input

Answer: A

Q232. What is an array index?

- A. The data type of array elements
- B. The position number of an element
- C. The memory size of the full array
- D. The total number of elements in array

Answer: B

Q233. What does it mean to traverse an array?

- A. To delete all elements from the array
- B. To visit each element of the array once
- C. To sort the array in ascending order
- D. To copy the array to another variable

Answer: B

Q234. What is a two-dimensional array?

- A. An array organized in rows and columns
- B. An array that stores only two elements
- C. An array with two different index types
- D. An array that can hold two data types

Answer: A

Q235. What is a list in Python?

- A. A read-only sequence of characters
- B. A function that returns multiple values
- C. A fixed-size array of integers only
- D. An ordered mutable collection of items

Answer: D

Q236. What does the push operation do on a stack?

- A. Searches for an element in the stack
- B. Adds an element to the top of stack
- C. Sorts all elements within the stack
- D. Removes the top element from stack

Answer: B

Q237. What is the difference between a stack and a queue?

- A. Both use the same ordering of elements
- B. Stack is LIFO; queue is FIFO ordering
- C. Stack stores numbers; queue stores text
- D. Stack is FIFO; queue is LIFO ordering

Answer: B

Q238. What is the purpose of a dictionary or map?

- A. To store data as key-value pair entries
- B. To count the number of elements in list
- C. To sort data in alphabetical order always
- D. To convert arrays into string format

Answer: A

Q239. What happens when you access an array out of bounds?

- A. The array automatically grows in size
- B. An error or undefined behavior occurs
- C. The array resets to its initial state
- D. The first element is returned instead

Answer: B

Q240. What is a set in programming?

- A. A collection of unique elements only
- B. A sorted sequence of text characters
- C. A fixed-size array of numeric values
- D. An ordered list allowing duplicate values

Answer: A

Q241. What is a class in object-oriented programming?

- A. A function that processes data values
- B. A loop structure for iteration
- C. A variable storing numeric data
- D. A blueprint for creating objects

Answer: D

Q242. What is an object in programming?

- A. A type of loop control structure
- B. A keyword reserved by the language
- C. An instance of a class in memory
- D. A comment in the source code text

Answer: C

Q243. What is inheritance in OOP?

- A. Copying code from one file to another
- B. A class acquiring properties from parent
- C. Renaming a class to a new identifier
- D. Deleting unused classes from program

Answer: B

Q244. What is encapsulation?

- A. Running multiple objects at the same time
- B. Converting objects into primitive data type values
- C. Splitting a class into multiple smaller classes
- D. Bundling data and methods while restricting access

Answer: D

Q245. What is a constructor in a class?

- A. A function that converts objects to strings
- B. A variable that stores the class name text
- C. A special method called when object is created
- D. A method that deletes the object from memory

Answer: C

Q246. What is a method in OOP?

- A. A comment describing the class purpose
- B. A variable declared inside a class body
- C. A function defined within a class body
- D. A data type used only in class files

Answer: C

Q247. What does the keyword 'this' refer to in a class?

- A. The first parameter of any method
- B. The current object instance itself
- C. The main method of the application
- D. The parent class of the current class

Answer: B

Q248. What is polymorphism in OOP?

- A. Creating multiple constructors in a class
- B. Deleting objects after they are used once
- C. Storing different data types in one array
- D. Objects taking many forms via shared interface

Answer: D

Q249. What is an attribute or property of a class?

- A. A variable that holds data within a class
- B. A method that performs calculations on data
- C. A class that inherits from another class
- D. A keyword that defines the class access

Answer: A

Q250. What is an interface in OOP?

- A. A tool for debugging object-oriented programs
- B. A type of variable used in class constructors
- C. A contract specifying methods a class must implement
- D. A graphical user interface for the application

Answer: C

Q251. What is RAM in a computer?

- A. Volatile memory for temporary data storage
- B. A processor that executes program instructions
- C. A permanent storage device like hard drive
- D. A network component for internet connection

Answer: A

Q252. What is the stack in memory management?

- A. A region for storing program source code
- B. A region for network data buffering use
- C. A region for dynamically allocated objects
- D. A region for function calls and local vars

Answer: D

Q253. What is the heap in memory management?

- A. Memory for dynamic allocation at runtime
- B. Memory for function call stack frames
- C. Memory for operating system kernel data
- D. Memory for storing constant values only

Answer: A

Q254. What is garbage collection?

- A. Deleting old files from the file system
- B. Defragmenting the hard drive storage
- C. Automatic reclamation of unused memory
- D. Manually freeing unused memory in code

Answer: C

Q255. What is a memory leak?

- A. When a program uses too much CPU power
- B. When a program writes to read-only memory
- C. When data is lost during a power outage
- D. When allocated memory is never freed up

Answer: D

Q256. What does memory allocation mean?

- A. Reserving a block of memory for program use
- B. Compressing data to use less memory space
- C. Transferring memory between two computers
- D. Deleting data from computer memory entirely

Answer: A

Q257. What is a pointer in programming?

- A. A variable storing a memory address value
- B. A function that points to another function
- C. A graphical cursor on the screen display
- D. A keyword used to create new variables

Answer: A

Q258. What is the difference between static and dynamic memory allocation?

- A. Static is for objects; dynamic is for integers
- B. Static is at compile time; dynamic is at runtime
- C. Static is slower; dynamic is faster always
- D. Static uses the heap; dynamic uses the stack

Answer: B

Q259. What happens when a program runs out of memory?

- A. The program automatically frees old memory up
- B. The program switches to using the CPU cache only
- C. The operating system adds more physical RAM chips
- D. The program crashes or throws an out-of-memory error

Answer: D

Q260. What is a null pointer?

- A. A pointer that stores a numeric zero value
- B. A pointer to the largest memory address
- C. A pointer that does not point to anything
- D. A pointer to the first element of array

Answer: C

Q261. What is an exception in programming?

- A. A normal expected program execution result
- B. An event disrupting normal program flow
- C. A type of variable for storing text
- D. A function for mathematical calculation

Answer: B

Q262. What does the try block do?

- A. It tests the program for performance speed
- B. It retries failed operations multiple times
- C. It wraps code that might throw exceptions
- D. It attempts to fix errors automatically

Answer: C

Q263. What does the catch block do?

- A. It prevents all exceptions from occurring
- B. It handles a specific type of exception
- C. It catches user input from the keyboard
- D. It stops the program from running further

Answer: B

Q264. What does the finally block do?

- A. It runs only when no exception was thrown
- B. It finalizes variable values permanently
- C. It ends the program after error handling
- D. It executes code regardless of exceptions

Answer: D

Q265. What does throwing an exception mean?

- A. Preventing the program from starting at all
- B. Deleting an error from the program memory
- C. Signaling that an error condition has occurred
- D. Converting an error into a warning message

Answer: C

Q266. What is a NullPointerException?

- A. An error from dividing a number by zero
- B. An error from accessing a null reference
- C. An error from invalid string formatting
- D. An error from array index being negative

Answer: B

Q267. What is an ArrayIndexOutOfBoundsException?

- A. Deleting an element from an empty array
- B. Creating an array with too many elements
- C. Accessing an array with invalid index value
- D. Accessing an array with valid index number

Answer: C

Q268. What is error handling?

- A. The process of creating custom error messages
- B. The process of hiding errors from the user
- C. The process of writing error-free code always
- D. The process of managing and responding to errors

Answer: D

Q269. What is the difference between an error and an exception?

- A. Errors are recoverable; exceptions are not recoverable
- B. Errors are serious system issues; exceptions are recoverable
- C. Both errors and exceptions are exactly the same thing
- D. Exceptions are more serious than errors in all cases

Answer: B

Q270. What is a stack trace?

- A. A list of variables currently stored on stack
- B. A report showing the sequence of method calls
- C. A diagram of the program memory layout
- D. A log of all user inputs during execution

Answer: B

Q271. What is a module in programming?

- A. A type of variable for storing numbers
- B. A comment explaining program functionality
- C. A self-contained unit of reusable code
- D. A single line of executable source code

Answer: C

Q272. What is a package in programming?

- A. A collection of related modules grouped together
- B. A compressed file containing program source code
- C. A user interface component for displaying data
- D. A single function within a larger program

Answer: A

Q273. What does the import statement do?

- A. It exports code to another program file
- B. It deletes unused variables from memory
- C. It compiles the program into machine code
- D. It brings external code into current scope

Answer: D

Q274. What is a library in programming?

- A. A network protocol for data communication
- B. A tool for designing graphical user interfaces
- C. A database for storing user information data
- D. A collection of pre-written reusable code

Answer: D

Q275. What is a namespace?

- A. A file that lists all variables in the program
- B. A container preventing naming conflicts in code
- C. A variable that stores the program name string
- D. A function that generates random names for vars

Answer: B

Q276. What is a dependency in software?

- A. A function that runs only in debug build mode
- B. A bug that depends on specific input to occur
- C. A variable that depends on user input value
- D. An external library that a program requires

Answer: D

Q277. What is the purpose of a package manager?

- A. To test programs for bugs and performance
- B. To compile source code into executable files
- C. To install and manage software dependencies
- D. To write new code automatically for developers

Answer: C

Q278. What is an API in the context of libraries?

- A. The documentation website for the library only
- B. The internal source code of the library files
- C. The set of functions and rules for using library
- D. The version number assigned to the library code

Answer: C

Q279. What does exporting a function from a module mean?

- A. Copying the function into a separate backup file
- B. Deleting the function from the current module
- C. Making the function available to other modules
- D. Converting the function into a different language

Answer: C

Q280. What is a framework in programming?

- A. A testing tool for verifying program correctness
- B. A type of database for storing application data
- C. A single function for processing data values
- D. A structure providing foundation for building apps

Answer: D

Q281. What is recursion in programming?

- A. A function that calls itself to solve tasks
- B. A variable that stores multiple data values
- C. A loop that runs a fixed number of times
- D. A technique for sorting array elements fast

Answer: A

Q282. What is a data structure?

- A. A way to organize and store data efficiently
- B. A network protocol for transmitting data
- C. A programming language for data analysis
- D. A tool for designing user interface layouts

Answer: A

Q283. What is a generic type in programming?

- A. A type that can only store integer values
- B. A type that cannot be used in functions
- C. A type specific to one programming language
- D. A type parameterized to work with any type

Answer: D

Q284. What is a design pattern?

- A. A reusable solution to a common coding problem
- B. A database schema for storing application data
- C. A testing method for finding software bugs
- D. A visual design for user interface screens

Answer: A

Q285. What is an iterator?

- A. A counter variable used inside for loops
- B. A class that stores a collection of objects
- C. A function that sorts elements in an array
- D. An object that traverses elements one by one

Answer: D

Q286. What is a linked list?

- A. A sorted array with binary search capability
- B. An array stored in non-contiguous memory blocks
- C. A list of all links on a web page document
- D. A sequence of nodes connected by pointers

Answer: D

Q287. What is a binary tree?

- A. A tree with exactly two levels of depth total
- B. A tree where each node has at most two children
- C. A tree that stores only binary data zero and one
- D. A tree that can only be traversed in one way

Answer: B

Q288. What is Big O notation used for?

- A. Counting the number of lines in source code
- B. Describing algorithm efficiency and scalability
- C. Determining the memory size of data types used
- D. Measuring the exact runtime in milliseconds

Answer: B

Q289. What is a graph data structure?

- A. A set of nodes connected by edges or links
- B. A chart displaying numerical data visually
- C. A database table with rows and column fields
- D. A type of array with two dimensions in it

Answer: A

Q290. What is an abstract class?

- A. A class that cannot be instantiated directly
- B. A class with no methods or properties defined
- C. A class that exists only in pseudocode form
- D. A class that is automatically garbage collected

Answer: A

Q291. What is concurrency in programming?

- A. Using multiple monitors for one computer
- B. Running one task at a time in sequence
- C. Managing multiple tasks overlapping in time
- D. Connecting multiple computers on a network

Answer: C

Q292. What is a thread in programming?

- A. A connection between client and server
- B. A lightweight unit of execution in process
- C. A complete independent running program
- D. A sequence of characters in a string

Answer: B

Q293. What is parallelism?

- A. Writing code in two programming languages
- B. Executing multiple tasks simultaneously on CPUs
- C. Connecting computers in a parallel network
- D. Running tasks one after another in order

Answer: B

Q294. What is a process in operating systems?

- A. A single instruction executed by the CPU
- B. An independent program instance in execution
- C. A file stored on the hard drive disk
- D. A connection between two network devices

Answer: B

Q295. What is a race condition?

- A. A competition between programmers writing code
- B. A performance test comparing two algorithms speed
- C. An error when threads access shared data unsafely
- D. A condition that causes programs to run too fast

Answer: C

Q296. What is a deadlock?

- A. When a program produces incorrect output data
- B. When the CPU overheats from excessive usage
- C. When threads wait for each other indefinitely
- D. When a program runs too slowly for the user

Answer: C

Q297. What is multithreading?

- A. Running multiple threads within one process
- B. Using multiple monitors for programming work
- C. Writing code in multiple languages at once
- D. Storing data in multiple databases together

Answer: A

Q298. What does synchronization mean in concurrent programming?

- A. Coordinating thread access to shared resources
- B. Converting synchronous code to asynchronous
- C. Copying data between two different computers
- D. Keeping system clocks at the same exact time

Answer: A

Q299. What is a mutex?

- A. A lock ensuring only one thread accesses resource
- B. A function for mathematical calculations only
- C. A type of data structure for sorting elements
- D. A variable that stores multiple values at once

Answer: A

Q300. What is the difference between concurrency and parallelism?

- A. Concurrency is faster than parallelism in all execution scenarios
- B. Concurrency runs tasks simultaneously; parallelism overlaps them
- C. Both terms mean exactly the same thing in all programming contexts
- D. Concurrency manages overlapping tasks; parallelism runs them at once

Answer: D

Q301. What is a unit test?

- A. A test of the entire application system
- B. A test of network connectivity speed
- C. A test of a single small code component
- D. A test of the user interface design layout

Answer: C

Q302. What is a breakpoint in debugging?

- A. A marker indicating the end of a code block
- B. A point where the code has a syntax error
- C. A point where the program terminates normally
- D. A marker where execution pauses for inspection

Answer: D

Q303. What is a bug in software?

- A. An error causing unexpected program behavior
- B. A security update for the application code
- C. A comment left in the source code text
- D. A feature that works exactly as intended

Answer: A

Q304. What does a debugger tool do?

- A. It compiles source code into machine language
- B. It designs the user interface for applications
- C. It helps find and fix errors in program code
- D. It automatically writes code for the developer

Answer: C

Q305. What is a test case?

- A. The outer casing of a testing hardware device
- B. A folder containing all source code files used
- C. A specific scenario to verify expected behavior
- D. A function that generates random test data sets

Answer: C

Q306. What is a syntax error?

- A. A violation of programming language grammar rules
- B. An error caused by network connection failure
- C. A mistake in the user interface visual design
- D. An error in the logic of the program algorithm

Answer: A

Q307. What does stepping through code mean?

- A. Executing code one line at a time to inspect flow
- B. Deleting unused lines of code from the program
- C. Running the entire program as fast as possible
- D. Skipping over sections of code during execution

Answer: A

Q308. What is a test suite?

- A. A software tool for writing source code files
- B. A single test case for one specific function
- C. A room where testing equipment is kept stored
- D. A collection of related test cases grouped together

Answer: D

Q309. What is a runtime error?

- A. An error that occurs while the program is running
- B. An error that prevents the IDE from opening up
- C. An error in the project configuration file text
- D. An error detected during code compilation phase

Answer: A

Q310. What is the purpose of print debugging?

- A. To print the source code on paper for review
- B. To display the final output to the end user
- C. To print test results in a formatted report doc
- D. To add print statements to trace program values

Answer: D

Q311. What is version control?

- A. Limiting the number of code files in project
- B. Controlling access permissions to the server
- C. Controlling which version of language is used
- D. Tracking and managing changes to source code

Answer: D

Q312. What is a code review?

- A. Examining code by peers for quality and issues
- B. An automated test that runs on every commit
- C. A process of deleting unused code from files
- D. A tool that formats source code automatically

Answer: A

Q313. What does DRY stand for in programming?

- A. Deploy Run Yield in application lifecycle
- B. Do Repeat Yourself for code clarity
- C. Debug Review Yell in team collaboration
- D. Don't Repeat Yourself in code writing

Answer: D

Q314. What is a branch in version control?

- A. A copy of the main code for independent work
- B. A tool for merging two programs into one
- C. A comment added to track code change history
- D. A permanent deletion of code from repository

Answer: A

Q315. What is refactoring?

- A. Adding new features to existing program code
- B. Restructuring code without changing its behavior
- C. Removing all comments from the source code
- D. Converting code to a different language entirely

Answer: B

Q316. What is a commit in version control?

- A. Running the program to check for any errors
- B. Deleting a file from the code repository
- C. A request to merge code into main branch
- D. A saved snapshot of changes to the codebase

Answer: D

Q317. What is agile software development?

- A. A single long development phase with no feedback
- B. An iterative approach with frequent delivery cycles
- C. A technique for debugging code more efficiently
- D. A method of writing code as fast as possible

Answer: B

Q318. What is documentation in software development?

- A. The user interface of the application system
- B. Written explanations of code and system design
- C. The compiled binary output of the program
- D. The source code of the program itself only

Answer: B

Q319. What is a pull request?

- A. A request to review and merge code into a branch
- B. A request to compile the code into executable
- C. A request to delete code from the repository
- D. A request to pull data from a database server

Answer: A

Q320. What is the purpose of coding standards?

- A. To limit the number of lines per source file
- B. To make all code run faster on every machine
- C. To prevent any bugs from occurring in programs
- D. To ensure consistent readable code across team

Answer: D

Q321. What is a variable in programming?

- A. A named storage location in memory
- B. A hardware component
- C. A type of loop
- D. A function that returns nothing

Answer: A

Q322. What is the purpose of indentation in Python?

- A. It improves readability only
- B. It defines code blocks and scope
- C. It is used for commenting
- D. It speeds up execution

Answer: B

Q323. Which of the following is an example of an interpreted language?

- A. Assembly
- B. Rust
- C. C
- D. Python

Answer: D

Q324. What is the output of a program?

- A. The compiler error messages
- B. The result produced by executing the program
- C. The input given by the user
- D. The source code written by the programmer

Answer: B

Q325. What does the term 'syntax' refer to in programming?

- A. The rules governing the structure of code
- B. The speed of program execution
- C. The process of finding bugs
- D. The meaning behind the code logic

Answer: A

Q326. What is a binary number system?

- A. A system that uses hexadecimal digits
- B. A system based on the number 8
- C. A system that uses digits 0 through 9
- D. A system that uses only 0 and 1

Answer: D

Q327. What is a logic error in a program?

- A. An error that crashes the program immediately
- B. An error caught by the compiler
- C. An error where the program runs but produces wrong results
- D. An error caused by missing semicolons

Answer: C

Q328. What is the role of an operating system for running programs?

- A. It designs the user interface of programs
- B. It writes the source code automatically
- C. It compiles all programs into machine code
- D. It manages hardware resources and provides services to programs

Answer: D

Q329. What is a keyword in a programming language?

- A. Any word used as a variable name
- B. A reserved word with a special meaning in the language
- C. A comment in the source code
- D. A user-defined function name

Answer: B

Q330. What does the term 'execute' mean in programming?

- A. To delete a program from memory
- B. To save a file to disk
- C. To run a program and carry out its instructions
- D. To write source code in an editor

Answer: C

Q331. What is an integer data type used for?

- A. Storing true or false values
- B. Storing whole numbers without decimal points
- C. Storing text values
- D. Storing images and multimedia

Answer: B

Q332. What is a floating-point number?

- A. A number used only for counting
- B. A number stored as text
- C. A number that is always positive
- D. A number that includes a decimal point

Answer: D

Q333. What is the byte data type typically used for?

- A. Storing long text strings
- B. Storing very large decimal numbers
- C. Storing date and time values
- D. Storing small integer values in the range 0 to 255

Answer: D

Q334. What does initializing a variable mean?

- A. Deleting the variable from memory
- B. Assigning a value to a variable for the first time
- C. Changing the data type of a variable
- D. Declaring the variable without a value

Answer: B

Q335. What is a long data type?

- A. A type used exclusively for loop counters
- B. An integer type with a larger range than int
- C. A type that stores only positive numbers
- D. A data type for storing very short strings

Answer: B

Q336. What is the difference between a literal and a variable?

- A. A variable cannot change its value while a literal can
- B. Variables are only used in loops
- C. A literal is a fixed value written directly in code while a variable is a named storage location
- D. Literals are only used for strings

Answer: C

Q337. What is an array data type?

- A. A collection of elements of the same type stored in contiguous memory
- B. A single value stored in memory
- C. A type that stores only Boolean values
- D. A special type of function

Answer: A

Q338. What does the short data type represent?

- A. A text string with few characters
- B. A fractional number with limited precision
- C. An integer type with a smaller range than int
- D. A Boolean value that is always false

Answer: C

Q339. What is a double data type?

- A. An integer type with twice the range of long
- B. A type that doubles the value stored automatically
- C. A type that stores two variables at once
- D. A floating-point type with double the precision of float

Answer: D

Q340. What is a reference type in programming?

- A. A type that can only hold numeric values
- B. A type used only in functional programming
- C. A type that references external files
- D. A type that stores the memory address of data rather than the data itself

Answer: D

Q341. What is an arithmetic operator?

- A. An operator that combines Boolean values
- B. An operator that assigns values to variables
- C. An operator that performs mathematical calculations like addition and subtraction
- D. An operator that compares two values

Answer: C

Q342. What is the result of 15 / 4 in integer arithmetic?

- A. 3
- B. 3.75
- C. 4
- D. 15

Answer: A

Q343. What does the less-than-or-equal operator (<=) check?

- A. Whether two values are exactly equal
- B. Whether the left value is less than or equal to the right value
- C. Whether the left value is greater than the right value
- D. Whether the left value is strictly less than the right value

Answer: B

Q344. What does the subtraction operator (-) do?

- A. It adds two numbers together
- B. It multiplies two numbers
- C. It divides one number by another
- D. It calculates the difference between two numbers

Answer: D

Q345. What is the decrement operator (--) used for?

- A. Increasing a variable's value by one
- B. Decreasing a variable's value by one
- C. Setting a variable to zero
- D. Doubling a variable's value

Answer: B

Q346. What is a comparison operator?

- A. An operator that performs string concatenation
- B. An operator that allocates memory
- C. An operator that compares two values and returns a Boolean result
- D. An operator that modifies the value of a variable

Answer: C

Q347. What does the division operator (/) do?

- A. It compares two numbers
- B. It finds the remainder of division
- C. It divides the left operand by the right operand
- D. It multiplies two numbers together

Answer: C

Q348. What is the compound assignment operator += used for?

- A. Comparing whether two values are equal
- B. Adding a value to a variable and storing the result back
- C. Creating a new variable with an initial value
- D. Concatenating two strings permanently

Answer: B

Q349. What does the equality operator (==) return?

- A. A new variable with the combined value
- B. True if two values are equal, false otherwise
- C. The sum of two values
- D. The larger of two values

Answer: B

Q350. What is the logical AND operator (&&) used for?

- A. Returning true only when both operands are true
- B. Negating a Boolean value
- C. Adding two numbers together
- D. Returning true when at least one operand is true

Answer: A

Q351. What is a conditional statement?

- A. A statement that repeats code multiple times
- B. A statement that terminates the program
- C. A statement that executes code based on whether a condition is true or false
- D. A statement that always executes regardless of conditions

Answer: C

Q352. What is the purpose of the 'elif' or 'else if' clause?

- A. To define a new function
- B. To declare a new variable
- C. To check an additional condition when the previous if condition was false
- D. To end a loop immediately

Answer: C

Q353. How many times does a for loop 'for(int i=1; i<=10; i++)' execute its body?

- A. 11 times
- B. 10 times
- C. 9 times
- D. 1 time

Answer: B

Q354. What is the default behavior when no break is used in a switch case?

- A. The program terminates immediately
- B. Execution falls through to the next case
- C. Only the matched case executes
- D. An error is thrown

Answer: B

Q355. What is a counter variable in a loop?

- A. A variable that stores the exit code
- B. A variable that holds the loop condition
- C. A variable that stores the loop result
- D. A variable that keeps track of how many iterations have occurred

Answer: D

Q356. What happens when a while loop condition is false from the start?

- A. The loop body never executes
- B. The loop body executes once before stopping
- C. The loop runs infinitely
- D. The program crashes with an error

Answer: A

Q357. What is the difference between a for loop and a while loop?

- A. A for loop is used when the number of iterations is known while a while loop is used when it depends on a condition
- B. A for loop cannot use counter variables
- C. A for loop can only iterate 10 times
- D. A while loop always runs at least once

Answer: A

Q358. What is a Boolean condition in an if statement?

- A. A string that names the condition
- B. A numeric value used for calculation
- C. An expression that evaluates to true or false
- D. A reference to another function

Answer: C

Q359. What does the 'return' statement do inside a loop?

- A. It exits only the current loop
- B. It skips to the next iteration of the loop
- C. It restarts the loop from the beginning
- D. It exits the entire function, ending the loop as well

Answer: D

Q360. What is the purpose of curly braces {} in control structures in languages like Java?

- A. They are used for arithmetic grouping
- B. They declare new variables
- C. They define the block of code that belongs to the control structure
- D. They indicate comments in the code

Answer: C

Q361. What is the purpose of a return value in a function?

- A. To end the program immediately
- B. To send a result back to the code that called the function
- C. To declare a new variable
- D. To print output to the console

Answer: B

Q362. What is a function prototype or declaration?

- A. A comment describing what the function does
- B. A statement that specifies the function name, return type, and parameters without providing the body
- C. The complete implementation of a function
- D. A test case for the function

Answer: B

Q363. What is the difference between a local variable and a global variable?

- A. A local variable is accessible only within its function while a global variable is accessible throughout the program
- B. Global variables can only store numbers
- C. Local variables are always faster than global variables
- D. Local variables persist longer than global variables

Answer: A

Q364. Can a function have multiple parameters?

- A. Functions cannot have any parameters
- B. No, functions can only have one parameter
- C. Only built-in functions can have multiple parameters
- D. Yes, functions can have multiple parameters separated by commas

Answer: D

Q365. What happens when a function calls itself?

- A. It creates a new copy of the function in memory permanently
- B. It creates an infinite loop that always runs forever
- C. It performs recursion, which requires a base case to stop
- D. The program crashes immediately

Answer: C

Q366. What is a method in the context of object-oriented programming?

- A. A variable that stores a function reference
- B. A module that contains multiple functions
- C. A function that is defined inside a class and operates on its data
- D. A standalone function not associated with any class

Answer: C

Q367. What is the difference between calling and defining a function?

- A. Calling creates the function while defining runs it
- B. Defining executes the function while calling creates it
- C. There is no difference between them
- D. Defining specifies what the function does while calling executes it

Answer: D

Q368. What is a nested function?

- A. A function that never returns a value
- B. A function defined inside another function
- C. A function that only calls built-in functions
- D. A function that takes no parameters

Answer: B

Q369. What is the purpose of the 'def' keyword in Python?

- A. It deletes a variable from memory
- B. It defines a new function
- C. It defers execution to another thread
- D. It declares a constant value

Answer: B

Q370. What is function reusability?

- A. Copying a function from one language to another
- B. Writing the same code in multiple places
- C. Restarting the program to run functions again
- D. Writing a function once and calling it from multiple places in the program

Answer: D

Q371. What is a file extension used for?

- A. To encrypt the file contents
- B. To increase the file size
- C. To indicate the type or format of a file
- D. To compress the file automatically

Answer: C

Q372. What does opening a file in write mode do?

- A. It creates a new file or overwrites the existing file with new data
- B. It locks the file from other users
- C. It reads the contents of the file
- D. It appends data to the end of the file

Answer: A

Q373. What does opening a file in append mode do?

- A. It adds new data to the end of the file without removing existing content
- B. It opens the file in read-only mode
- C. It deletes all existing content before writing
- D. It creates a backup of the file first

Answer: A

Q374. What is the purpose of closing a file after reading or writing?

- A. To delete the file from disk
- B. To convert the file to a different format
- C. To encrypt the file contents
- D. To release system resources and ensure all data is written

Answer: D

Q375. What is the difference between reading and writing a file?

- A. Writing can only handle text files
- B. Reading retrieves data from a file while writing sends data to a file
- C. Reading modifies the file while writing preserves it
- D. Reading is faster than writing in all cases

Answer: B

Q376. What is the `System.out.println()` method used for in Java?

- A. Printing a line of text to the console with a newline at the end
- B. Reading input from the keyboard
- C. Creating a new string variable
- D. Opening a file for writing

Answer: A

Q377. What is user input in programming?

- A. The source code written by the programmer
- B. The output displayed on the screen
- C. Data provided by the user to the program during execution
- D. Data that the program generates internally

Answer: C

Q378. What is the difference between `stdout` and `stderr`?

- A. `stdout` handles errors while `stderr` handles normal output
- B. `stdout` is for normal program output while `stderr` is for error messages
- C. `stderr` is faster than `stdout`
- D. They are the same output stream with different names

Answer: B

Q379. What does the `readline()` method do?

- A. It deletes a line from a file
- B. It counts the number of lines in a file
- C. It reads a single line of text from input
- D. It reads all lines from a file at once

Answer: C

Q380. What is a file handle or file descriptor?

- A. A reference that the program uses to access an open file
- B. The name of the file on disk
- C. The size of the file in bytes
- D. A physical part of the hard drive

Answer: A

Q381. What is a string literal?

- A. A sequence of characters enclosed in quotation marks written directly in code
- B. A variable that holds text
- C. A number converted to text
- D. A function that returns text

Answer: A

Q382. What does the replace() method do on a string?

- A. It deletes the entire string
- B. It converts the string to a number
- C. It substitutes occurrences of a specified substring with another substring
- D. It reverses the order of characters

Answer: C

Q383. What is the null terminator in C strings?

- A. The character '\0' that marks the end of a string in C
- B. A special character that marks the beginning of a string
- C. A method that deletes a string from memory
- D. A character used to separate words in a string

Answer: A

Q384. What does the indexOf() or find() method do on a string?

- A. It removes a character at a specified position
- B. It counts the total characters in the string
- C. It inserts a character at a specified position
- D. It returns the position of the first occurrence of a substring

Answer: D

Q385. What is the difference between single quotes and double quotes for strings?

- A. Single quotes create mutable strings and double quotes create immutable strings
- B. There is no difference in any programming language
- C. Single quotes are for characters and double quotes for strings in languages like Java and C
- D. Single quotes are faster to process than double quotes

Answer: C

Q386. What does the toLowerCase() method do?

- A. It converts all characters in a string to lowercase letters
- B. It counts the number of lowercase letters
- C. It removes all lowercase letters from the string
- D. It moves lowercase letters to the end of the string

Answer: A

Q387. What does string slicing allow you to do?

- A. Extract a portion of a string by specifying start and end indices
- B. Convert a string to an array
- C. Delete parts of a string permanently
- D. Join two strings together

Answer: A

Q388. What is the startsWith() method used for?

- A. It starts the execution of a string function
- B. It moves the first character to the end of the string
- C. It creates a new string starting with a given character
- D. It checks whether a string begins with a specified prefix

Answer: D

Q389. What does the contains() method check on a string?

- A. Whether the string is empty
- B. Whether the string is stored in memory
- C. Whether the string contains a specified substring anywhere within it
- D. Whether the string contains only numbers

Answer: C

Q390. What is string reversal?

- A. Moving the first character to the end
- B. Creating a new string with characters in reverse order
- C. Deleting the last character of a string
- D. Converting a string to uppercase

Answer: B

Q391. What is the length or size of an array?

- A. The number of elements it contains
- B. The amount of memory it uses in bytes
- C. The maximum value stored in the array
- D. The index of the last element

Answer: A

Q392. What is a dynamic array?

- A. An array that sorts itself automatically
- B. An array that changes its data type automatically
- C. An array that only holds dynamic data
- D. An array that can grow or shrink in size as elements are added or removed

Answer: D

Q393. What does the pop operation do on a stack?

- A. It removes and returns the element from the top of the stack
- B. It adds an element to the top of the stack
- C. It clears all elements from the stack
- D. It returns the bottom element without removing it

Answer: A

Q394. What is the enqueue operation in a queue?

- A. Checking if the queue is empty
- B. Adding an element to the back of the queue
- C. Removing an element from the front
- D. Sorting the elements in the queue

Answer: B

Q395. What is the dequeue operation in a queue?

- A. Removing and returning the element from the front of the queue
- B. Doubling the size of the queue
- C. Adding an element to the front
- D. Reversing the order of elements

Answer: A

Q396. What is a key-value pair?

- A. A data structure that associates a unique key with a corresponding value
- B. Two arrays linked together
- C. Two functions that call each other
- D. A pair of variables with the same data type

Answer: A

Q397. What is the difference between a sorted array and an unsorted array?

- A. Sorted arrays use more memory than unsorted arrays
- B. Sorted arrays can only store numbers
- C. Unsorted arrays cannot be searched
- D. A sorted array has elements arranged in order while an unsorted array has elements in arbitrary order

Answer: D

Q398. What is an empty collection?

- A. A collection that only holds null values
- B. A collection that has not been initialized
- C. A collection that contains no elements
- D. A collection that has been deleted from memory

Answer: C

Q399. What is the difference between a list and a set?

- A. A list cannot be sorted
- B. A set maintains insertion order while a list does not
- C. A set can hold more elements than a list
- D. A list allows duplicate elements and maintains order while a set contains only unique elements

Answer: D

Q400. What is the peek operation on a stack or queue?

- A. It counts the number of elements
- B. It adds a new element to the collection
- C. It returns the top or front element without removing it
- D. It removes the top or front element

Answer: C

Q401. What is a destructor in OOP?

- A. A method that copies one object to another
- B. A method that modifies all object properties
- C. A special method called when an object is being destroyed to clean up resources
- D. A method that creates new objects

Answer: C

Q402. What is an instance variable?

- A. A variable that belongs to a specific object instance of a class
- B. A variable shared by all objects of a class
- C. A variable that cannot change its value
- D. A variable declared outside any class

Answer: A

Q403. What is method invocation in OOP?

- A. Calling a method on an object to execute its code
- B. Deleting a method from a class
- C. Defining a new method inside a class
- D. Copying a method from one class to another

Answer: A

Q404. What is a subclass or child class?

- A. A class that cannot be instantiated
- B. A class that contains only static methods
- C. A class that inherits properties and methods from another class
- D. A class that has no methods

Answer: C

Q405. What is the 'private' access modifier?

- A. It restricts access to only within the same class
- B. It makes the member accessible from the same package
- C. It allows access from any class in the program
- D. It allows access from subclasses only

Answer: A

Q406. What is an abstract method?

- A. A method declared without implementation that must be overridden by subclasses
- B. A method that cannot be called
- C. A method that returns abstract data types
- D. A method with a complete implementation

Answer: A

Q407. What is object instantiation?

- A. Defining a class in source code
- B. Creating a new object from a class using a constructor
- C. Deleting an object from memory
- D. Copying all methods from one class to another

Answer: B

Q408. What is a getter method?

- A. A method that retrieves the value of a private field
- B. A method that sets the value of a private field
- C. A method that creates a new field in the class
- D. A method that deletes a field from the object

Answer: A

Q409. What is a setter method?

- A. A method that sets or updates the value of a private field with optional validation
- B. A method that removes a field from the object
- C. A method that creates a new class
- D. A method that returns the value of a field

Answer: A

Q410. What is the 'public' access modifier?

- A. It allows access only from subclasses
- B. It restricts access to the same class only
- C. It makes the member read-only
- D. It allows access from any class in the program

Answer: D

Q411. What is memory deallocation?

- A. Allocating additional memory for a program
- B. Compressing memory to save space
- C. Moving data from RAM to the hard drive
- D. Releasing memory that is no longer needed back to the system

Answer: D

Q412. What is the stack used for in program execution?

- A. Storing function call information, local variables, and return addresses
- B. Storing all program files on disk
- C. Running the operating system
- D. Permanently storing user data

Answer: A

Q413. Why is the heap used for dynamic memory allocation?

- A. Because it automatically cleans up all allocations
- B. Because it is the only available memory region
- C. Because it allows allocating memory of any size at runtime that persists until explicitly freed
- D. Because it is faster than the stack

Answer: C

Q414. What is a stack overflow?

- A. When the heap runs out of space
- B. When the stack exceeds its maximum size, typically due to deep or infinite recursion
- C. When a variable stores a value that is too large
- D. When the CPU overheats

Answer: B

Q415. What does the 'new' keyword do in languages like Java and C++?

- A. It allocates memory on the heap and creates a new object
- B. It deletes an existing object from memory
- C. It declares a new variable on the stack
- D. It opens a new file for writing

Answer: A

Q416. What is automatic memory management?

- A. Memory that never needs to be allocated
- B. A system where the runtime environment automatically handles memory allocation and deallocation
- C. Memory that is managed by an external program
- D. A tool for manually tracking memory usage

Answer: B

Q417. What is a reference in memory management?

- A. A copy of an object stored in a different location
- B. A comment in the source code
- C. A value that points to or identifies the location of an object in memory
- D. A backup of the original memory

Answer: C

Q418. What happens to local variables when a function returns?

- A. They are moved to the heap
- B. Their memory on the stack is automatically reclaimed
- C. They become global variables
- D. They are saved to disk permanently

Answer: B

Q419. What is the difference between manual and automatic memory management?

- A. Manual is always faster than automatic
- B. Automatic management cannot handle large programs
- C. Manual requires the programmer to allocate and free memory while automatic uses garbage collection
- D. Manual management is only used in interpreted languages

Answer: C

Q420. What is the purpose of the delete keyword in C++?

- A. It deletes an entry from a database
- B. It removes a variable declaration from the code
- C. It frees memory that was allocated with new and calls the destructor
- D. It deletes a source code file

Answer: C

Q421. What is the purpose of error handling in programming?

- A. To speed up program execution
- B. To detect and respond to errors gracefully without crashing the program
- C. To prevent users from running the program
- D. To add more features to the program

Answer: B

Q422. What is a FileNotFoundException?

- A. An exception thrown when a program tries to access a file that does not exist
- B. An error when the file has the wrong extension
- C. An exception when the file system is full
- D. An error when a file is too large to open

Answer: A

Q423. What is an IllegalArgumentException?

- A. An exception when the compiler finds syntax errors
- B. An error when the program has too many arguments
- C. An error when the program runs out of memory
- D. An exception thrown when a method receives an argument that is not valid

Answer: D

Q424. What happens if an exception is not caught?

- A. The exception is saved to a file for later review
- B. The exception is automatically fixed
- C. The program terminates abnormally and typically displays an error message
- D. The exception is ignored and the program continues

Answer: C

Q425. What is a ClassCastException?

- A. An error when a class has too many methods
- B. An exception when a class has duplicate names
- C. An error when a class cannot be loaded
- D. An exception thrown when trying to cast an object to a type it is not an instance of

Answer: D

Q426. Can a try block have no catch block?

- A. Yes, a try block can exist alone without catch or finally
- B. No, it must have both catch and finally
- C. Yes, if it has a finally block instead
- D. No, every try must have at least one catch

Answer: C

Q427. What is a NumberFormatException?

- A. An exception when arithmetic operations fail
- B. An exception thrown when trying to convert a non-numeric string to a number
- C. An error when numbers exceed the integer range
- D. An error when formatting numbers for display

Answer: B

Q428. What is the purpose of the 'catch' keyword?

- A. It throws a new exception
- B. It defines a block that handles a specific type of exception
- C. It stops the program from running
- D. It creates a new error object

Answer: B

Q429. What is an IndexOutOfBoundsException?

- A. An exception when too many indices are created
- B. An exception thrown when accessing a collection with an invalid index
- C. An error when the file index is corrupted
- D. An error when a database index is missing

Answer: B

Q430. What is the purpose of the 'raise' keyword in Python?

- A. It raises the value of a variable
- B. It increases the stack size
- C. It throws or raises an exception manually
- D. It increases the priority of a process

Answer: C

Q431. What is the purpose of importing a module?

- A. To compile the module into machine code
- B. To delete the module from the system
- C. To make the functions and classes defined in the module available in the current file
- D. To create a backup copy of the module

Answer: C

Q432. What is the `__init__.py` file used for in Python packages?

- A. It creates a backup of the package
- B. It stores initialization data for the program
- C. It marks a directory as a Python package and can contain initialization code
- D. It initializes all variables to zero

Answer: C

Q433. What is a third-party library?

- A. A library created by someone other than the language developers or the project team
- B. A library that requires three imports
- C. A library stored in a third location
- D. A library built into the programming language

Answer: A

Q434. What is the purpose of the 'export' keyword in JavaScript modules?

- A. It sends data to an external server
- B. It removes a variable from the module
- C. It converts the module to a different format
- D. It makes functions, classes, or variables available for other modules to import

Answer: D

Q435. What is a standard library?

- A. A collection of modules and packages included with the programming language by default
- B. A library that can only store standard data types
- C. A physical library where programmers study
- D. A library that follows a specific coding standard

Answer: A

Q436. What is a Maven repository in Java development?

- A. A version control system for Java code
- B. A storage location for Java libraries and dependencies that Maven can download automatically
- C. A testing framework for Java modules
- D. A database for storing Java application data

Answer: B

Q437. What does the 'require' function do in Node.js?

- A. It imports and loads a module, returning its exported functionality
- B. It checks if a condition is true
- C. It validates that a file exists
- D. It requires user authentication

Answer: A

Q438. What is the purpose of a .gitignore file in relation to packages?

- A. It ignores all errors in the package
- B. It specifies files and directories (like node_modules) that should not be tracked by version control
- C. It hides packages from other developers
- D. It imports Git-related packages

Answer: B

Q439. What is a framework in software development?

- A. A single function imported from a library
- B. A debugging tool for tracing program execution
- C. A comprehensive package that provides a structure and set of tools for building applications
- D. A physical frame used to hold a computer

Answer: C

Q440. What is the difference between a default export and a named export in JavaScript?

- A. Named exports can only export functions
- B. Default exports are faster than named exports
- C. A default export allows importing without curly braces while named exports require them
- D. Default exports must be constants

Answer: C

Q441. What is the Observer pattern used for?

- A. Notifying multiple objects when the state of another object changes
- B. Watching for syntax errors in code
- C. Monitoring memory usage in real time
- D. Observing CPU performance metrics

Answer: A

Q442. What is a hash function?

- A. A function that validates user passwords
- B. A function that maps input data to a fixed-size output value used for efficient data lookup
- C. A function that encrypts all data permanently
- D. A function that removes duplicate data

Answer: B

Q443. What is an event listener?

- A. A hardware device that detects sound
- B. A tool that monitors network events
- C. A function that waits for and responds to a specific event in event-driven programming
- D. A log file that records all system events

Answer: C

Q444. What is the MVC pattern?

- A. A method of compressing video files
- B. A security protocol for web applications
- C. A version control system for managing code
- D. A pattern that separates an application into Model (data), View (presentation), and Controller (logic)

Answer: D

Q445. What is time complexity?

- A. The time needed to compile the program
- B. A measure of how the running time of an algorithm grows relative to input size
- C. The time a program takes to load from disk
- D. The time taken to write the code

Answer: B

Q446. What is the main advantage of concurrent programming?

- A. It reduces the amount of memory needed
- B. It makes source code shorter
- C. It allows programs to perform multiple tasks simultaneously, improving responsiveness and throughput
- D. It eliminates all bugs from the program

Answer: C

Q447. What is a thread-safe data structure?

- A. A data structure that can be safely accessed by multiple threads concurrently without data corruption
- B. A data structure stored in thread-local memory
- C. A data structure that can only be used in single-threaded programs
- D. A data structure that is locked permanently

Answer: A

Q448. What does the 'join' method do on a thread?

- A. It makes the calling thread wait until the target thread finishes execution
- B. It joins the thread to a thread pool
- C. It combines two threads into one
- D. It creates a connection between two threads

Answer: A

Q449. What is a shared resource in concurrent programming?

- A. A library used by multiple projects
- B. A file that is shared on a network drive
- C. A CPU core shared between programs
- D. Data or resource that can be accessed by multiple threads or processes simultaneously

Answer: D

Q450. What is the start() method used for with threads?

- A. It restarts a completed thread
- B. It initializes thread-local variables
- C. It starts the main program execution
- D. It begins the execution of a new thread by calling its run method in a separate thread of execution

Answer: D

Q451. What is starvation in concurrent programming?

- A. When a thread is perpetually denied access to a resource because other threads keep acquiring it first
- B. When a program runs out of memory
- C. When a CPU has no tasks to execute
- D. When a thread pool runs out of threads

Answer: A

Q452. What is the run() method in a thread?

- A. It contains the code that the thread will execute when started
- B. It measures the thread's execution speed
- C. It runs the entire program from the beginning
- D. It runs diagnostics on the thread

Answer: A

Q453. What is a critical section in concurrent programming?

- A. The most important part of the source code
- B. A section of code that accesses shared resources and must not be executed by more than one thread at a time
- C. A section of code that runs with highest priority
- D. A code section that handles critical errors

Answer: B

Q454. What is the difference between a daemon thread and a user thread?

- A. User threads cannot access shared resources
- B. Daemon threads have higher priority than user threads
- C. Daemon threads run faster than user threads
- D. Daemon threads are background threads that do not prevent the program from exiting, while user threads keep the program alive

Answer: D

Q455. What is the sleep() method used for with threads?

- A. It releases all thread resources
- B. It pauses the thread for a specified duration before it resumes execution
- C. It permanently stops the thread
- D. It puts the entire program to sleep

Answer: B

Q456. What is the purpose of a test framework?

- A. A physical frame for holding test devices
- B. A tool that provides structure and utilities for writing and running automated tests
- C. A framework for testing hardware components
- D. A document that describes test procedures

Answer: B

Q457. What is the difference between a bug and an error?

- A. Errors are more severe than bugs
- B. A bug is a flaw in the code that causes incorrect behavior while an error is a mistake made by the programmer
- C. They are exactly the same thing
- D. Bugs only occur in production while errors occur in development

Answer: B

Q458. What does the 'step into' command do in a debugger?

- A. It executes the current line and enters the called function to debug it line by line
- B. It skips all remaining code in the function
- C. It restarts the debugging session
- D. It steps over the current line

Answer: A

Q459. What is a test assertion?

- A. A legal assertion about software ownership
- B. A claim that the software is bug-free
- C. A statement that checks whether an expected condition is true, failing the test if it is not
- D. A developer's confidence in their code

Answer: C

Q460. What is a watch expression in a debugger?

- A. A log message that watches for errors
- B. A timer that measures code execution speed
- C. A scheduled check that runs periodically
- D. An expression whose value is continuously monitored and displayed as you step through code

Answer: D

Q461. What is a test fixture?

- A. A fixture that holds test equipment
- B. A fixed baseline state or set of conditions set up before running tests
- C. A hardware device used for testing
- D. A test that runs automatically every day

Answer: B

Q462. What is the call stack in a debugger?

- A. A list of all breakpoints set in the program
- B. A display showing the chain of function calls that led to the current point of execution
- C. A list of all variables in the program
- D. A stack of error messages

Answer: B

Q463. What does a test pass or fail indicate?

- A. A pass means the code compiled successfully, a fail means it did not
- B. A pass means the code behaves as expected, a fail means the actual result differs from expected
- C. A pass means the test ran quickly, a fail means it was too slow
- D. A pass means no exceptions occurred regardless of correctness

Answer: B

Q464. What is the purpose of logging in debugging?

- A. Recording program events, state, and data flow to help diagnose issues without using a debugger
- B. Creating log files for regulatory compliance
- C. Recording user login attempts
- D. Logging the time spent on each function

Answer: A

Q465. What is a test runner?

- A. A thread dedicated to running tests in the background
- B. A tool that automatically discovers, executes, and reports the results of test cases
- C. A person who manually runs all tests
- D. A script that runs the program in test mode

Answer: B

Q466. What is a merge in version control?

- A. Reverting all changes to the original state
- B. Creating a new repository from scratch
- C. Deleting a branch permanently
- D. Combining changes from one branch into another

Answer: D

Q467. What is the purpose of code commenting?

- A. To make the code run faster
- B. To increase the file size for storage
- C. To prevent code from being compiled
- D. To add explanations that help developers understand the code's purpose and logic

Answer: D

Q468. What is a repository in version control?

- A. A physical location where servers are stored
- B. A collection of programming tutorials
- C. A database for user information
- D. A storage location containing the project files and their complete change history

Answer: D

Q469. What is the purpose of a README file?

- A. To list all errors found in the code
- B. To provide project documentation including description, setup instructions, and usage information
- C. To read data from a file at runtime
- D. To mark files as read-only

Answer: B

Q470. What is a coding convention?

- A. A conference about programming
- B. A legal contract for software development
- C. An agreed-upon set of guidelines for writing code consistently within a team or project
- D. A mathematical formula used in algorithms

Answer: C

Q471. What does 'git clone' do?

- A. It creates a new empty repository
- B. It copies a remote repository to the local machine including all history
- C. It merges two repositories together
- D. It deletes a remote repository

Answer: B

Q472. What is the purpose of an issue tracker?

- A. Recording and managing bugs, feature requests, and tasks for a software project
- B. Tracking performance issues in the CPU
- C. Monitoring server uptime issues
- D. Tracking internet connectivity issues

Answer: A

Q473. What is a deployment in software development?

- A. The process of making a software application available for use in a specific environment
- B. The process of hiring new developers
- C. The process of designing the user interface
- D. The process of writing new code

Answer: A

Q474. What is a staging environment?

- A. An environment that mirrors production, used for final testing before releasing to users
- B. A temporary development environment for writing code
- C. An environment used exclusively for database operations
- D. A backup environment for disaster recovery

Answer: A

Q475. What is the purpose of a .env file?

- A. Configuring the text editor environment
- B. Storing user session data
- C. Encrypting the entire project
- D. Storing environment-specific configuration variables like API keys and database URLs separately from code

Answer: D

Q476. What is the difference between a stack and a heap data structure?

- A. A heap follows First-In-First-Out order
- B. A heap is always faster than a stack
- C. A stack can hold more elements than a heap
- D. A stack follows Last-In-First-Out order while a heap is a tree-based structure that maintains a priority order

Answer: D

Q477. What is a queue data structure used for?

- A. Randomly accessing elements by index
- B. Processing elements in First-In-First-Out order where the first added element is removed first
- C. Storing elements in sorted order
- D. Storing elements in reverse order

Answer: B

Q478. What is the difference between linear search and binary search?

- A. Binary search works on unsorted data while linear search requires sorted data
- B. Linear search is always faster than binary search
- C. Linear search checks each element sequentially while binary search repeatedly divides a sorted collection in half
- D. Binary search checks every element one by one

Answer: C

Q479. What is a sorting algorithm?

- A. An algorithm that arranges elements in a specific order such as ascending or descending
- B. An algorithm that searches for a specific element
- C. An algorithm that deletes duplicate elements
- D. An algorithm that compresses data for storage

Answer: A

Q480. What is a callback function in event-driven programming?

- A. A function passed as an argument to be executed when an event or operation completes
- B. A function that always returns to the caller immediately
- C. A function that calls the main function repeatedly
- D. A function that calls back the operating system

Answer: A

Programming (C++, Java, Python) — Medium

480 questions

Q481. What is the difference between compilation and interpretation in terms of error detection?

- A. Compilation detects syntax errors before execution; interpretation at runtime
- B. Interpretation detects every error before execution even begins
- C. There is no practical difference between the two in error detection
- D. Compilation detects all errors only at runtime during execution

Answer: A

Q482. Which generation of programming languages includes languages like C and Java?

- A. First generation
- B. Second generation
- C. Fifth generation
- D. Third generation

Answer: D

Q483. What is Just-In-Time (JIT) compilation?

- A. Compiling code during execution for performance
- B. Handling runtime errors through catch blocks
- C. Compiling all code before shipping to users
- D. Writing source code at the very last minute

Answer: A

Q484. What is the role of a linker in program compilation?

- A. It combines object files into an executable
- B. It interprets bytecode during execution
- C. It validates syntax in the source code
- D. It manages runtime memory allocation

Answer: A

Q485. What is the difference between strongly typed and weakly typed languages?

- A. There is no real difference between the two type systems
- B. Strongly typed languages allow implicit type conversions freely
- C. Strongly typed enforces strict rules and restricts conversions
- D. Weakly typed languages enforce very strict type conversion rules

Answer: C

Q486. What is bytecode?

- A. Source code that is written using bytes
- B. Encrypted form of the original source
- C. Intermediate code run on a virtual machine
- D. Binary code identical to machine code

Answer: C

Q487. What is the purpose of a preprocessor in C/C++?

- A. To optimize generated machine code output
- B. To process directives like `#include` and `#define`
- C. To execute the compiled program directly
- D. To link external libraries to the binary

Answer: B

Q488. Which of the following best describes a runtime error?

- A. An error detected during the compilation phase
- B. An error that occurs while the program executes
- C. A syntax mistake caught before program runs
- D. A warning generated by the development IDE

Answer: B

Q489. What is type inference?

- A. A runtime error caused by wrong type assignment
- B. The compiler automatically determining variable type
- C. A debugging technique to inspect type values
- D. Manually specifying every variable data type

Answer: B

Q490. What is the call stack used for in program execution?

- A. Tracking function calls and local variables
- B. Handling incoming network data requests
- C. Storing all global variables and constants
- D. Managing all file input/output operations

Answer: A

Q491. What is the difference between implicit and explicit type casting?

- A. Implicit casting always causes errors while explicit casting never does
- B. Implicit is done automatically by the compiler; explicit is done manually
- C. Explicit casting executes much faster than implicit casting at runtime
- D. They are exactly the same type conversion process with no differences

Answer: B

Q492. What is the size of an int in Java?

- A. 32 bits
- B. 16 bits
- C. 8 bits
- D. 64 bits

Answer: A

Q493. What is the difference between value types and reference types?

- A. Value types store data directly; reference types store a memory address
- B. They are completely identical in behavior and memory representation
- C. Value types are immutable and cannot be modified after creation
- D. Reference types always execute faster than value types at all times

Answer: A

Q494. What happens when you assign a float value to an int variable without casting?

- A. It works fine with no issues at all
- B. Compilation error in strongly typed languages
- C. The decimal part is automatically rounded up
- D. The program crashes with a runtime exception

Answer: B

Q495. What is an enumeration (enum)?

- A. A looping construct for iteration
- B. A dynamically resizable array type
- C. A function for string manipulation
- D. A set of named constant values

Answer: D

Q496. What is the difference between signed and unsigned integers?

- A. There is no meaningful difference between signed and unsigned types
- B. Signed holds only positive values; unsigned holds negative values
- C. They have different byte sizes in memory but the same value range
- D. Signed holds negative and positive; unsigned holds non-negative only

Answer: D

Q497. What is a nullable type?

- A. A type that is always null
- B. A type with no default value
- C. A type that cannot be null
- D. A type that can hold a value or null

Answer: D

Q498. What is the result of integer overflow?

- A. The value automatically becomes null
- B. An exception is always thrown by runtime
- C. The program always crashes immediately
- D. The value wraps around in most languages

Answer: D

Q499. What is a union type in TypeScript?

- A. A built-in type for numeric calculations
- B. A type that can be one of several types
- C. A type that combines properties of two types
- D. A class that extends multiple parent classes

Answer: B

Q500. What is type aliasing?

- A. Hiding a type from external modules
- B. Renaming a declared variable in scope
- C. Converting between different data types
- D. Creating a new name for existing type

Answer: D

Q501. What is the difference between ++i and i++?

- A. ++i always executes faster than i++ does overall
- B. ++i increments before use; i++ increments after
- C. There is no difference between them at all
- D. i++ increments the value by two instead of one

Answer: B

Q502. What is short-circuit evaluation?

- A. Stopping evaluation once result is known
- B. A hardware feature of modern processors
- C. Evaluating all conditions in every case
- D. A compiler optimization for loop bodies

Answer: A

Q503. What is the ternary operator?

- A. An operator that takes a single operand only
- B. A conditional operator with three operands
- C. A bitwise operator for binary manipulation
- D. An operator that takes exactly two operands

Answer: B

Q504. What does the << operator do in C/Java?

- A. Reads input from the console
- B. Performs a left bitwise shift
- C. Compares two values for equality
- D. Performs string stream insertion

Answer: B

Q505. What is operator precedence?

- A. The order in which operators are defined in code
- B. The rules determining operator evaluation order
- C. The execution speed of a particular operator
- D. The data type returned by a given operator

Answer: B

Q506. What is the result of 5 & 3 (bitwise AND)?

- A. 5
- B. 15
- C. 8
- D. 1

Answer: D

Q507. What is the difference between == and === in JavaScript?

- A. There is no difference between them
- B. == checks value; === checks value and type
- C. === is used for variable assignment
- D. == checks type without value comparison

Answer: B

Q508. What does the XOR (^) operator return?

- A. True when the operands are different
- B. Always false regardless of the operands
- C. True when both operands are the same
- D. Always true regardless of the operands

Answer: A

Q509. What is the null coalescing operator (??) in JavaScript?

- A. It checks the code for syntax errors at compile time
- B. It returns the right operand if the left is null
- C. It always returns a null value to the caller
- D. It performs integer division on two operands

Answer: B

Q510. What is operator associativity?

- A. How operators are stored internally within the memory
- B. The direction operators of same precedence are evaluated
- C. The underlying data type of an operator in the language
- D. The execution speed of evaluating a given expression

Answer: B

Q511. What is the difference between while and do-while loops?

- A. do-while is faster in execution speed compared to while loop
- B. while always runs the loop body at least one time guaranteed
- C. while checks condition first; do-while runs body at least once
- D. There is no meaningful difference between them at all

Answer: C

Q512. What is an infinite loop?

- A. A syntax error detected at compile time
- B. A loop that has an empty body
- C. A loop whose condition never becomes false
- D. A loop that executes very fast

Answer: C

Q513. What is the purpose of the 'default' case in a switch statement?

- A. It executes when no other case matches
- B. It is required in every switch
- C. It must always be first
- D. It resets the switch value

Answer: A

Q514. What is fall-through in a switch statement?

- A. Execution continues to next case without break
- B. A compilation error in the switch block
- C. The switch statement fails and throws an error
- D. The default case gets skipped during execution

Answer: A

Q515. What is a sentinel value in loop control?

- A. A special value signaling loop termination
- B. A constant defined in the loop body
- C. A randomly generated input value
- D. A variable used as a loop counter

Answer: A

Q516. What is the time complexity of a nested loop where both run n times?

- A. $O(n)$
- B. $O(2^n)$
- C. $O(\log n)$
- D. $O(n^2)$

Answer: D

Q517. What is a for-each loop?

- A. A loop that counts its own iterations explicitly
- B. A loop that runs indefinitely until interrupted
- C. A loop that skips every other element in turn
- D. A loop iterating over each element without index

Answer: D

Q518. What happens if you forget the break in a switch case in Java?

- A. A compilation error is raised by the compiler immediately
- B. Nothing happens and the switch works as normally expected
- C. The program crashes with an unrecoverable runtime error
- D. Fall-through: subsequent cases execute until a break is hit

Answer: D

Q519. What is a labeled break statement?

- A. A break that exits a specific labeled outer loop
- B. A break statement followed by a comment
- C. A syntax error that the compiler will reject
- D. A break statement that logs a debug message

Answer: A

Q520. What is loop unrolling?

- A. Making loops intentionally execute more slowly for debugging
- B. Reducing loop overhead by executing multiple iterations per pass
- C. Adding additional iterations to increase the loop precision
- D. Removing a loop from the code entirely

Answer: B

Q521. What is function overloading?

- A. Calling a function too many times in a row
- B. Same name functions with different parameter lists
- C. A runtime error from excessive function calls
- D. Calling a function from within itself recursively

Answer: B

Q522. What is the difference between pass by value and pass by reference?

- A. Pass by value copies data; pass by reference passes address
- B. Pass by value uses pointers to access the original variable
- C. Pass by reference is always slower than pass by value mode
- D. They are exactly the same thing with different names only

Answer: A

Q523. What is recursion?

- A. A function calling itself
- B. A loop construct
- C. An error in programming
- D. A type of variable

Answer: A

Q524. What is a base case in recursion?

- A. The condition that stops recursion
- B. The recursive call itself in code
- C. An optional function parameter
- D. The very first function call made

Answer: A

Q525. What is a lambda function?

- A. An anonymous short inline function expression
- B. A function that returns no value at all
- C. A function that calls itself recursively
- D. A function with an explicitly declared name

Answer: A

Q526. What is a callback function?

- A. A function that calls itself in a recursive way
- B. A function passed as an argument for later call
- C. A constructor that initializes object properties
- D. A function that contacts the user directly

Answer: B

Q527. What is variable scope in the context of functions?

- A. The memory size of a variable in bytes
- B. The declared data type of the variable
- C. The current assigned value of a variable
- D. The region where a variable is accessible

Answer: D

Q528. What are default parameters?

- A. Parameters that are always initialized to zero
- B. Parameters whose values cannot ever be changed
- C. Parameters with values used when none is passed
- D. Parameters that the caller must always provide

Answer: C

Q529. What is a higher-order function?

- A. A function with high computational time complexity
- B. A function defined in a higher-level parent class
- C. A function that accepts many input parameters
- D. A function that takes or returns other functions

Answer: D

Q530. What is method signature?

- A. Only the access modifier of the declared method
- B. The complete body of the method implementation
- C. Only the return type of the declared method
- D. The method name combined with its parameter list

Answer: D

Q531. What is buffered I/O?

- A. I/O that applies encryption to all data before transferring
- B. I/O that exclusively works with pre-allocated buffer arrays
- C. I/O that collects data in a buffer to reduce system calls
- D. I/O operations performed without any processing delays

Answer: C

Q532. What is the difference between print() and println() in Java?

- A. There is no difference between them at all
- B. print() executes faster than println() does
- C. println() only prints numeric values to output
- D. println() adds a newline; print() does not

Answer: D

Q533. What is file I/O?

- A. Reading from and writing to disk files
- B. Reading data from the keyboard input
- C. Allocating memory for program variables
- D. Communicating over the internet network

Answer: A

Q534. What is serialization?

- A. Encrypting data for secure network transmission
- B. Sorting data in ascending or descending order
- C. Converting an object into a byte stream for storage
- D. Compressing files to reduce their storage size

Answer: C

Q535. What does the flush() method do in I/O?

- A. Deletes the entire output buffer contents
- B. Forces buffered output to be written immediately
- C. Clears the entire console screen display
- D. Reads all contents from the input buffer

Answer: B

Q536. What is the difference between text mode and binary mode in file I/O?

- A. Text mode processes files faster than binary mode does
- B. There is no functional difference between the two modes
- C. Text mode translates newlines; binary reads raw bytes
- D. Binary mode is exclusively used for image file formats

Answer: C

Q537. What is standard error (stderr)?

- A. A specialized tool used for debugging programs
- B. A separate output stream for error messages only
- C. An error that occurs in the standard input stream
- D. It is the same stream as standard output stdout

Answer: B

Q538. What is the purpose of the 'with' statement for file I/O in Python?

- A. It loops through all files in a given directory
- B. It reads binary files into memory as byte arrays
- C. It writes data to multiple files simultaneously
- D. It ensures the file is properly closed after use

Answer: D

Q539. What is CSV and how is it used in I/O?

- A. Comma-Separated Values, a text format for tabular data
- B. A relational database management system for queries
- C. A compiled programming language for systems work
- D. A binary file format for storing structured records

Answer: A

Q540. What is piping in command-line I/O?

- A. A specialized type of network I/O communication
- B. Writing output data to a physical pipe file
- C. Redirecting one program output as another input
- D. Processing multiple data streams in parallel mode

Answer: C

Q541. What is the difference between mutable and immutable strings?

- A. Mutable strings always execute faster than immutable string types
- B. Immutable strings can dynamically grow in size without any limit
- C. There is no meaningful difference between the two string types
- D. Mutable strings can be modified in place; immutable ones cannot

Answer: D

Q542. What is a regular expression?

- A. A standard normal string literal value
- B. An algorithm for sorting string collections
- C. A pattern for matching and manipulating text
- D. A mathematical expression using operators

Answer: C

Q543. What is string interpolation?

- A. Converting strings to their numeric equivalents
- B. Splitting strings by a delimiter character
- C. Comparing two strings for equality or ordering
- D. Embedding variables directly within a string

Answer: D

Q544. What is the String Pool in Java?

- A. A thread pool dedicated to string processing
- B. A mutable buffer for building string values
- C. A collection of string utility methods
- D. A heap area that caches string literals for reuse

Answer: D

Q545. What is the difference between String, StringBuilder, and StringBuffer in Java?

- A. StringBuilder is immutable while String and StringBuffer are both mutable
- B. They are all identical in function and performance with no differences
- C. String is immutable; StringBuilder is mutable; StringBuffer is thread-safe
- D. StringBuffer is always the fastest option among all three implementations

Answer: C

Q546. What does the split() method do?

- A. Divides a string into an array of parts
- B. Joins multiple strings into one
- C. Converts string to a character array
- D. Removes specified characters from string

Answer: A

Q547. What is Unicode?

- A. A type of data encryption algorithm
- B. An extension of the ASCII character set
- C. A universal character encoding standard
- D. A specific font type used in displays

Answer: C

Q548. What is the difference between ASCII and Unicode?

- A. ASCII supports many more characters than Unicode ever can
- B. Unicode is the older standard that was developed before ASCII
- C. They are exactly the same encoding standard with no differences
- D. ASCII uses 7 bits for 128 chars; Unicode supports over 143,000

Answer: D

Q549. What is string encoding (like UTF-8)?

- A. Compressing a string to reduce storage size
- B. Encrypting a string for secure transmission
- C. Converting a string value into an integer
- D. Representing Unicode characters as byte sequences

Answer: D

Q550. What is a string builder pattern and when should you use it?

- A. A design pattern for constructing user interface strings
- B. A utility tool for building complex regular expressions
- C. A parser that transforms strings into structured data types
- D. Using a mutable class for efficient repeated concatenation

Answer: D

Q551. What is the time complexity of accessing an element by index in an array?

- A. $O(n^2)$
- B. $O(1)$
- C. $O(n)$
- D. $O(\log n)$

Answer: B

Q552. What is a hash table?

- A. A balanced binary tree for hierarchical storage
- B. A sorted array of ordered elements in memory
- C. A structure mapping keys to values via hashing
- D. A stack variant that allows random element access

Answer: C

Q553. What is a collision in a hash table?

- A. A runtime error in the hash function code
- B. When a requested key is not found in map
- C. When the hash table is completely full up
- D. When two keys hash to the same index slot

Answer: D

Q554. What is the difference between a singly linked list and a doubly linked list?

- A. Singly linked lists always use more memory than doubly linked
- B. There is no meaningful difference between the two list types
- C. Singly linked has next pointer; doubly linked has next and prev
- D. Doubly linked lists are always slower than singly linked lists

Answer: C

Q555. What is a priority queue?

- A. A sorted array with indexed element access only
- B. A queue where higher-priority elements dequeue first
- C. A stack with last-in first-out element ordering
- D. A regular first-in first-out queue structure

Answer: B

Q556. What is the difference between HashMap and TreeMap in Java?

- A. They are exactly the same data structure implementation
- B. HashMap maintains the insertion order of all its entries
- C. TreeMap is always faster than HashMap for all operations
- D. HashMap is unordered $O(1)$; TreeMap is sorted $O(\log n)$

Answer: D

Q557. What is a tuple?

- A. A mutable list that can change its elements
- B. A key-value map for looking up data by key
- C. An immutable ordered collection of mixed types
- D. A sorted set that maintains element ordering

Answer: C

Q558. What is an iterator?

- A. An array index used for element access
- B. An object for traversing a collection sequentially
- C. A sorting algorithm for ordering collections
- D. A type of loop construct for repeating code

Answer: B

Q559. What is the difference between a shallow copy and a deep copy of a collection?

- A. They are the same operation with identical results in every case
- B. Shallow copy shares element references; deep copy duplicates all
- C. Shallow copy is always slower than deep copy for all collections
- D. Deep copy shares references while shallow copy duplicates objects

Answer: B

Q560. What is a deque (double-ended queue)?

- A. A regular first-in first-out queue
- B. A queue allowing insertion at both ends
- C. A sorted list with binary search access
- D. A stack variant for ordered elements

Answer: B

Q561. What is the difference between method overloading and method overriding?

- A. They are the same concept with different names in different languages
- B. Overloading requires an inheritance hierarchy between the classes involved
- C. Overriding changes the method parameter list in the parent class definition
- D. Overloading: same name different params; overriding: same signature in subclass

Answer: D

Q562. What is an abstract class?

- A. A fully implemented class with all methods defined
- B. A static class that only contains class-level members
- C. A final class that cannot be extended by other classes
- D. A class that cannot be instantiated with abstract methods

Answer: D

Q563. What is an interface?

- A. A class with full method implementations provided
- B. A contract defining method signatures without bodies
- C. An abstract class with some methods implemented
- D. A type of variable for storing object references

Answer: B

Q564. What is the difference between composition and inheritance?

- A. Composition is always slower than inheritance in performance
- B. Inheritance is an is-a relationship; composition is has-a
- C. They are exactly the same concept with no difference at all
- D. Inheritance is more flexible and loosely coupled overall

Answer: B

Q565. What is a static method?

- A. A method belonging to the class not any specific instance
- B. A constructor method for initializing new object state
- C. A method that can never be overridden by subclasses
- D. A private method accessible only within the same class

Answer: A

Q566. What are getter and setter methods?

- A. Static methods belonging to the class directly
- B. Methods for controlled field read and write access
- C. Loop constructs for iterating over collections
- D. Constructor types for initializing objects

Answer: B

Q567. What is the super keyword?

- A. A global variable accessible everywhere in code
- B. A reference to parent class for calling its members
- C. The main class that serves as program entry point
- D. A type of access modifier restricting member access

Answer: B

Q568. What is multiple inheritance and which languages support it?

- A. Creating multiple instances of the same class simultaneously
- B. Inheriting from a single parent class in a linear hierarchy
- C. Inheriting from multiple parents; supported by C++ and Python
- D. All programming languages support this feature universally

Answer: C

Q569. What is the diamond problem?

- A. An error related to geometric shapes in rendering code
- B. A memory leak issue caused by circular object references only
- C. An ambiguity when inheriting from classes with common ancestor
- D. A compilation warning about unused variables in the program

Answer: C

Q570. What is the Liskov Substitution Principle (LSP)?

- A. A design pattern for constructing complex object hierarchies
- B. A principle for sorting elements in a collection efficiently
- C. A rule for managing memory allocation in large applications
- D. Subclass objects should be substitutable for superclass objects

Answer: D

Q571. What is a dangling pointer?

- A. A pointer referencing already freed memory
- B. A pointer to a valid live object in memory
- C. A pointer with a null value assigned to it
- D. A smart pointer that manages object lifetime

Answer: A

Q572. What is reference counting as a garbage collection strategy?

- A. Counting variables in the current scope of code
- B. Tracking reference count and freeing at zero count
- C. A manual memory management technique using counters
- D. Counting the total number of memory blocks allocated

Answer: B

Q573. What is a buffer overflow?

- A. Slow memory access due to fragmentation issues
- B. Writing data beyond the allocated buffer boundary
- C. Running out of available system memory completely
- D. A type of memory leak from unreleased resources

Answer: B

Q574. What is the difference between malloc() and calloc() in C?

- A. They are exactly the same function with no differences
- B. malloc initializes all allocated memory bytes to zero
- C. malloc allocates uninitialized; calloc initializes to zero
- D. calloc is always faster than malloc in all scenarios

Answer: C

Q575. What is virtual memory?

- A. Shared memory accessible by multiple processes at once
- B. Cloud storage accessible over the internet network
- C. Using disk space to extend memory beyond physical RAM
- D. Encrypted memory for storing sensitive data securely

Answer: C

Q576. What is a memory pool?

- A. A pre-allocated block for smaller allocations reducing fragmentation
- B. A collection of physical memory hardware modules
- C. A memory leak caused by unreleased dynamically allocated resources
- D. A type of processor cache that stores frequently accessed data values

Answer: A

Q577. What is the difference between deep copy and shallow copy regarding memory?

- A. Deep copy allocates new memory for nested objects; shallow copies refs
- B. Shallow copy always uses more memory than deep copy for same structure
- C. There is no difference in memory usage between the two copy methods
- D. Deep copy uses less memory than shallow copy by sharing object refs

Answer: A

Q578. What are smart pointers in C++?

- A. Regular raw pointers with no extra features at all
- B. Objects that wrap pointers and manage memory automatically
- C. Pointers that point to function addresses in the program
- D. Pointers that find data faster through optimized algorithms

Answer: B

Q579. What is memory fragmentation?

- A. Memory that has been encrypted for data security
- B. Memory that has been compressed to save space
- C. Corrupted memory caused by hardware failures in RAM
- D. Free memory broken into small non-contiguous blocks

Answer: D

Q580. What is the RAII pattern?

- A. A design pattern for building user interfaces
- B. A type of garbage collection used in managed languages
- C. Tying resource lifetime to object lifetime via destructors
- D. A memory allocation algorithm for dynamic memory pools

Answer: C

Q581. What is the difference between checked and unchecked exceptions in Java?

- A. Unchecked exceptions are always more severe than checked exceptions
- B. Checked exceptions are always faster to handle than unchecked ones
- C. Checked must be declared or caught; unchecked RuntimeExceptions do not
- D. There is no meaningful difference between the two exception types

Answer: C

Q582. What is exception propagation?

- A. Unhandled exception moving up the call stack to find a handler
- B. Fixing an exception by catching and logging it
- C. Logging all exceptions to a file for later review and analysis
- D. Throwing multiple exceptions at the same time from one method

Answer: A

Q583. What is a custom exception?

- A. A user-defined exception class for domain-specific errors
- B. A syntax error detected during the compilation process
- C. A warning generated by the IDE during code development
- D. A built-in exception provided by the language runtime

Answer: A

Q584. What is the 'throws' keyword in Java?

- A. A keyword for suppressing exceptions so they are ignored
- B. A mechanism for catching and handling thrown exceptions
- C. It is exactly the same as the throw keyword in Java
- D. A declaration of which checked exceptions a method may throw

Answer: D

Q585. What is a stack trace?

- A. A log file containing all program output and error data
- B. The call stack data structure itself in memory
- C. A memory dump of the entire program state at crash
- D. A report showing the method call chain to an exception

Answer: D

Q586. What is the purpose of try-with-resources in Java?

- A. To automatically close resources when the try block finishes
- B. To try executing multiple methods in parallel simultaneously
- C. To retry the try block harder if the first attempt fails
- D. To allocate additional resources for the try block execution

Answer: A

Q587. What is the difference between Error and Exception in Java?

- A. Errors are serious JVM problems; Exceptions are recoverable issues
- B. Exceptions cannot be caught or handled by any catch block
- C. They are the same thing with no meaningful differences at all
- D. Errors are less serious and easier to handle than Exceptions

Answer: A

Q588. What is a try-except-else block in Python?

- A. An advanced loop construct for iterating with error handling
- B. try runs risky code; except handles; else runs if no exception
- C. Invalid syntax that causes a compilation error
- D. A triple try block for handling three exceptions at once

Answer: B

Q589. What is exception chaining?

- A. Throwing many exceptions at the same time from one method call
- B. Catching exceptions in a specific order from most to least severe
- C. Wrapping one exception inside another to preserve original cause
- D. A linked list of error objects stored in chronological order

Answer: C

Q590. What is the principle of 'fail fast'?

- A. Testing the speed of program execution under various load levels
- B. Detecting and reporting errors as soon as they occur in the program
- C. Making programs crash as quickly as possible for testing purposes
- D. Running programs as quickly as possible to improve the performance

Answer: B

Q591. What is dependency management?

- A. Managing memory allocation for program variables only
- B. Tracking and maintaining external libraries and versions
- C. Sorting functions in alphabetical order within modules
- D. Managing source code files in a project directory

Answer: B

Q592. What is a package.json file?

- A. A database schema definition for SQL table structures
- B. A log file recording application events and errors
- C. A Node.js config file listing metadata and dependencies
- D. A generic JSON data file for storing values

Answer: C

Q593. What is semantic versioning (SemVer)?

- A. Alphabetical versioning using letter-based identifiers
- B. Date-based versioning using release date as version
- C. MAJOR.MINOR.PATCH scheme indicating type of changes
- D. Random version numbers assigned without any rules

Answer: C

Q594. What is a virtual environment in Python?

- A. A Docker container with a bundled application inside
- B. An isolated Python environment with its own packages
- C. A cloud-hosted computing environment for deployment
- D. A full virtual machine running a complete OS image

Answer: B

Q595. What is the difference between static and dynamic linking of libraries?

- A. Static includes library at compile time; dynamic loads at runtime
- B. Dynamic linking is always slower than static linking in every case
- C. Static linking uses less memory than dynamic linking at all times
- D. There is no meaningful difference between the two linking methods

Answer: A

Q596. What is a circular dependency?

- A. When two or more modules depend on each other
- B. A circular buffer data structure for streaming
- C. A loop in the code that repeats indefinitely
- D. A recursive function calling itself repeatedly

Answer: A

Q597. What is tree shaking?

- A. A data structure operation on binary tree nodes only
- B. A sorting technique that organizes elements by weight
- C. Removing trees from the project code repository
- D. Removing unused dead code from the final build bundle

Answer: D

Q598. What is the purpose of a lock file (e.g., package-lock.json)?

- A. To lock the project and prevent any code changes
- B. To encrypt installed packages for secure data storage use
- C. To record exact dependency versions for reproducible builds
- D. To prevent anyone from making changes to the source code

Answer: C

Q599. What is the difference between devDependencies and dependencies in npm?

- A. devDependencies are completely optional and never actually installed
- B. dependencies are operating system packages not application libraries
- C. There is no meaningful difference between the two dependency types
- D. dependencies are for production; devDependencies for development only

Answer: D

Q600. What is a monorepo?

- A. A repository containing only a single source file
- B. A read-only repository that cannot accept any changes
- C. A private repository with restricted access permissions
- D. A single repository containing multiple related projects

Answer: D

Q601. What is the Observer pattern?

- A. A logging pattern for recording application events to a file
- B. A security pattern for authenticating users before granting access
- C. A subject notifies dependent observers of state changes automatically
- D. Watching code execute step by step in the debugger tool

Answer: C

Q602. What is the Factory pattern?

- A. A singleton variant that creates exactly one object instance
- B. A manufacturing system for producing physical goods
- C. An iterator pattern for traversing collections sequentially
- D. A pattern providing an interface for creating objects flexibly

Answer: D

Q603. What is the Strategy pattern?

- A. A sorting method that orders elements in a specific sequence
- B. A game strategy for winning competitions against opponents
- C. A pattern defining interchangeable algorithms varying independently
- D. A caching technique for storing frequently accessed data values

Answer: C

Q604. What is the difference between composition and inheritance as design strategies?

- A. Composition offers flexibility and loose coupling; inheritance is tighter
- B. They are identical design strategies with no practical differences
- C. Inheritance is always better than composition in every design scenario
- D. Composition is always slower in execution than inheritance-based designs

Answer: A

Q605. What is the Model-View-Controller (MVC) pattern?

- A. A database pattern for organizing tables and their relationships
- B. A testing framework for writing and running automated test suites
- C. Separating application into Model (data), View (UI), Controller (logic)
- D. A data structure for organizing elements in memory efficiently

Answer: C

Q606. What is lazy loading?

- A. Loading resources in reverse chronological order
- B. Deferring initialization until actually needed
- C. A slow loading technique for large file downloads
- D. Loading all data and resources at startup time

Answer: B

Q607. What is the difference between aggregation and composition in UML?

- A. Composition implies weaker ownership than aggregation in all designs
- B. Aggregation implies stronger ownership than composition in all cases
- C. Aggregation implies weak ownership; composition implies strong ownership
- D. They are identical concepts with no practical differences at all

Answer: C

Q608. What is the Iterator pattern?

- A. Accessing collection elements sequentially without exposing internals
- B. A search technique for finding elements in a sorted collection
- C. A sorting algorithm for ordering elements in ascending sequence
- D. A loop construct for iterating over elements in arrays

Answer: A

Q609. What is the Decorator pattern?

- A. A user interface pattern for visual element styling
- B. A logging tool for recording method execution traces
- C. Adding annotations to class methods for documentation
- D. Dynamically adding responsibilities to objects through wrapping

Answer: D

Q610. What is the Adapter pattern?

- A. A data converter for transforming file format encodings
- B. A sorting adapter for converting between sort algorithms
- C. A pattern wrapping one interface to match another interface
- D. A physical power adapter for electrical devices

Answer: C

Q611. What is a semaphore?

- A. A counter-based primitive controlling shared resource access
- B. A thread type for running background tasks in parallel
- C. A simple flag variable for boolean state tracking
- D. A type of lock for exclusive thread synchronization

Answer: A

Q612. What is thread safety?

- A. A testing concept for validating thread performance
- B. Code functioning correctly under multi-thread access
- C. A debugging feature for analyzing thread behavior
- D. Threads that are guaranteed to never crash or fail

Answer: B

Q613. What is a thread pool?

- A. Pre-created worker threads reused for tasks
- B. A memory pool for thread-local storage data
- C. A collection of all threads in the system
- D. A connection pool for database access threads

Answer: A

Q614. What is the producer-consumer problem?

- A. A database issue with concurrent read and write transaction conflicts
- B. A business problem related to supply chain management
- C. A network problem caused by packet loss during data transmission
- D. A synchronization problem with shared buffer between producers and consumers

Answer: D

Q615. What is an atomic operation?

- A. An indivisible operation completing without interruption
- B. A nuclear physics operation on atomic particles
- C. A file operation that reads and writes data to disk
- D. A database transaction that groups multiple queries

Answer: A

Q616. What is the volatile keyword in Java?

- A. A final variable that cannot be modified after assignment
- B. A keyword ensuring reads always come from main memory
- C. A variable that changes randomly without any cause
- D. A type of exception thrown during concurrent operations

Answer: B

Q617. What is a Future/Promise?

- A. An object representing a value available in the future
- B. A type of thread that executes tasks asynchronously
- C. A variable that is declared for use at a later time
- D. A timer that triggers a callback after a set delay

Answer: A

Q618. What is context switching?

- A. Saving one thread state and loading another for CPU switching
- B. Changing the scope of a variable from local to global
- C. Changing between different programming languages in a project
- D. Switching between different source code files in an editor

Answer: A

Q619. What is the dining philosophers problem?

- A. A sorting problem for ordering elements in a collection
- B. A classic problem illustrating resource allocation and deadlock
- C. A database problem with concurrent transaction conflicts
- D. A food-related algorithm for meal planning optimization

Answer: B

Q620. What is async/await?

- A. A type of loop for iterating over collection elements
- B. A testing pattern for validating asynchronous behavior
- C. A syntax for writing async code that looks synchronous
- D. A threading model for managing parallel execution of tasks

Answer: C

Q621. What is Test-Driven Development (TDD)?

- A. A deployment strategy for releasing code to production
- B. Testing code only after all development is complete
- C. Writing tests before code to drive the design process
- D. A debugging technique for finding runtime exceptions

Answer: C

Q622. What is code coverage?

- A. How much source code has been written in total
- B. The percentage of code lines executed during testing
- C. A code review tool for examining code quality metrics
- D. A security measure for protecting source code files

Answer: B

Q623. What is the difference between black-box and white-box testing?

- A. There is no meaningful difference between the two testing approaches
- B. Black-box tests functionality without code; white-box tests internals
- C. White-box testing is fully automated while black-box is manual
- D. Black-box testing is always better than white-box in every case

Answer: B

Q624. What is a mock object in testing?

- A. A simulated object mimicking real behavior for tests
- B. A real database connection used in production
- C. A randomly generated object with unpredictable state
- D. A deleted object that has been garbage collected

Answer: A

Q625. What is integration testing?

- A. Testing interaction between multiple components together
- B. Testing the user interface for visual correctness
- C. Testing individual functions in complete isolation
- D. Testing performance under heavy load conditions

Answer: A

Q626. What is regression testing?

- A. Testing for performance regression and slower execution
- B. Re-running tests after changes to ensure nothing broke
- C. Testing only brand new features and functionality
- D. Testing backward compatibility with previous versions

Answer: B

Q627. What is profiling in software optimization?

- A. Writing documentation for the application source code
- B. Analyzing execution to identify performance bottlenecks
- C. Formatting code according to style guide conventions
- D. Creating user profiles for application personalization

Answer: B

Q628. What is the difference between stubs and mocks?

- A. Mocks are simpler and provide less functionality than stubs do
- B. They are identical testing concepts with no differences at all
- C. Stubs are more complex to implement than mocks in every case
- D. Stubs provide predefined responses; mocks also verify interactions

Answer: D

Q629. What is a memory profiler?

- A. A physical RAM module installed in the computer
- B. A tool monitoring memory usage and detecting leaks
- C. A compiler for translating source code to binaries
- D. A debugger for stepping through code line by line

Answer: B

Q630. What is the difference between manual and automated testing?

- A. There is no practical difference between the two testing methods
- B. Manual testing is done by humans; automated uses scripts and tools
- C. Automated testing is less reliable than manual in every case
- D. Manual testing is faster than automated testing for all suites

Answer: B

Q631. What is Continuous Integration (CI)?

- A. A deployment method for releasing code directly to production servers
- B. Integrating code changes only once at the very end of development
- C. A branching strategy for organizing feature development work in Git
- D. Frequently merging code with automated builds and tests for feedback

Answer: D

Q632. What is Continuous Deployment/Delivery (CD)?

- A. Automatically deploying or making release-ready every passing change
- B. A testing strategy for validating software behavior before release
- C. A branching model for organizing development work into branches
- D. Manual deployment performed by operations team members only

Answer: A

Q633. What is the KISS principle?

- A. A security principle for protecting sensitive user data
- B. A greeting or expression of affection between people
- C. A testing method for validating software behavior fully
- D. Keep It Simple: avoid unnecessary complexity in design

Answer: D

Q634. What is technical debt?

- A. Financial debt from purchasing technology equipment
- B. Server costs for hosting applications in the cloud
- C. The cost of future rework from choosing quick solutions
- D. A type of bug caused by incorrect logic in the code

Answer: C

Q635. What is the YAGNI principle?

- A. A testing approach for validating code correctness
- B. A design pattern for creating reusable components
- C. A programming language for building applications
- D. Do not implement functionality until actually needed

Answer: D

Q636. What is pair programming?

- A. Programming alone without any collaboration at all
- B. Writing duplicate code for redundancy and safety nets
- C. Two developers at one workstation: driver and navigator
- D. Programming with matched pairs of source code files

Answer: C

Q637. What is a sprint in Scrum?

- A. A fixed-length iteration for completing prioritized tasks
- B. A deployment window for releasing features to production
- C. A programming technique for optimizing code performance
- D. Running fast to meet project deadlines under pressure

Answer: A

Q638. What is a code smell?

- A. Malicious code injected by an attacker into the system
- B. A runtime bug that crashes the application unexpectedly
- C. A surface indication suggesting a deeper design problem
- D. A syntax error detected during the compilation process

Answer: C

Q639. What is the difference between waterfall and agile methodologies?

- A. Agile has no planning or structure and relies entirely on improvisation
- B. There is no meaningful difference between the two methodologies at all
- C. Waterfall is always faster than agile for delivering software to production
- D. Waterfall is sequential with fixed phases; agile is iterative and flexible

Answer: D

Q640. What is a merge conflict?

- A. A deployment error when releasing code to production servers
- B. A runtime error that occurs during program execution in prod
- C. A syntax error caused by incorrect code in the source file
- D. When Git cannot auto-merge because branches changed same code

Answer: D

Q641. What distinguishes a strongly typed language from a weakly typed one?

- A. Strongly typed languages do not support any string operations
- B. Weakly typed languages cannot handle any numeric data types
- C. Strongly typed languages enforce strict rules with fewer casts
- D. Strongly typed languages run faster than weakly typed ones always

Answer: C

Q642. What is the difference between a logical error and a runtime error?

- A. Logical errors crash the program; runtime errors give wrong results
- B. Both types always occur at compile time before program even starts
- C. Logical errors give wrong results; runtime errors halt execution
- D. Runtime errors give wrong output; logical errors are always harmless

Answer: C

Q643. What is the role of a preprocessor in languages like C?

- A. It processes directives like includes and macros before compiling
- B. It manages memory allocation and garbage collection automatically
- C. It links all object files together into one single final binary
- D. It executes the program line by line during the runtime phase

Answer: A

Q644. What is the key advantage of using an interpreted language?

- A. Interpreted languages cannot be used for web applications
- B. Interpreted languages always produce faster executables overall
- C. Interpreted languages enable platform-independent execution
- D. Interpreted languages require a separate linking step always

Answer: C

Q645. What does bytecode represent in languages like Java?

- A. The final machine code running directly on hardware
- B. An intermediate code executed by a virtual machine
- C. The original source code written by the programmer
- D. A binary format used only for storing databases

Answer: B

Q646. How does just-in-time (JIT) compilation improve performance?

- A. It compiles the entire program before any execution begins
- B. It translates bytecode to native code at runtime for speed
- C. It replaces the interpreter with a static linker entirely
- D. It removes all comments and whitespace from source code

Answer: B

Q647. What is the purpose of a symbol table during compilation?

- A. It maps identifiers to their types, scopes, and locations
- B. It stores the graphical icons used in the program interface
- C. It records user input received during program execution
- D. It contains the complete list of syntax errors in the code

Answer: A

Q648. What is the difference between static and dynamic typing?

- A. Static typing checks types at compile time; dynamic at runtime
- B. Static typing is only for scripting; dynamic for systems coding
- C. Static typing has no types; dynamic typing has strict types only
- D. Static typing is slower; dynamic typing is always faster overall

Answer: A

Q649. What does lexical analysis do during compilation?

- A. It links external libraries into the final binary
- B. It checks the logic correctness of the algorithm
- C. It optimizes the generated machine code for speed
- D. It breaks source code into tokens for the parser

Answer: D

Q650. What is a cross-compiler used for?

- A. It compiles code for a different target platform
- B. It converts machine code back into source code
- C. It interprets and compiles code at the same time
- D. It compiles two languages into one single program

Answer: A

Q651. What is the risk of implicit type conversion in weakly typed languages?

- A. It may produce unexpected results by silently converting
- B. It prevents the programmer from using numeric data types
- C. It always causes the program to crash immediately on start
- D. It makes the program significantly faster than explicit casts

Answer: A

Q652. Why might a developer choose a double over a float?

- A. A double provides greater precision for decimal values
- B. A double is faster to process than a float on all CPUs
- C. A double uses less memory than a float in all cases
- D. A double can store text while a float cannot do that

Answer: A

Q653. What is an enumeration (enum) data type used for?

- A. Creating dynamic arrays that resize automatically
- B. Defining a set of named constant integer values
- C. Encrypting sensitive string data in the program
- D. Storing floating-point numbers with high precision

Answer: B

Q654. What happens when integer overflow occurs?

- A. The program automatically switches to a larger type
- B. The OS allocates additional memory for the variable
- C. The compiler prevents the code from being compiled
- D. The value wraps around to the minimum of its range

Answer: D

Q655. What is the difference between value types and reference types?

- A. Value types require garbage collection; references do not
- B. Value types are slower to access than reference types
- C. Value types store data directly; references store addresses
- D. Reference types cannot be used inside any functions

Answer: C

Q656. Why are floating-point numbers sometimes imprecise?

- A. Computers cannot perform mathematical operations
- B. Binary representation cannot express all decimal values
- C. Languages intentionally introduce errors for speed
- D. Floating-point numbers are always rounded to integers

Answer: B

Q657. What is a union data type in languages like C?

- A. A type combining two arrays into one structure
- B. A type that converts between different types
- C. A type where all members share the same location
- D. A type that stores multiple values simultaneously

Answer: C

Q658. What is type narrowing in TypeScript?

- A. Restricting variables to only hold integer values
- B. Refining a variable type within a conditional
- C. Converting a large data type to a smaller one
- D. Removing type information from variables at runtime

Answer: B

Q659. What is the purpose of the void type in programming?

- A. To indicate a function returns no value at all
- B. To represent null pointer references in memory
- C. To declare variables with unspecified data type
- D. To store empty string values in memory locations

Answer: A

Q660. How does a BigInteger type differ from a standard integer?

- A. BigInteger uses less memory than a standard integer
- B. BigInteger stores decimal fractions unlike standard int
- C. BigInteger can represent arbitrarily large whole numbers
- D. BigInteger is faster but less accurate than standard

Answer: C

Q661. What is the difference between prefix and postfix increment?

- A. Prefix decrements and postfix increments the variable
- B. Prefix returns value after increment; postfix returns before
- C. Prefix works on integers only; postfix works on floats
- D. Prefix is faster and postfix is slower in all languages

Answer: B

Q662. What does the ternary operator (?:) do?

- A. It performs three separate arithmetic operations
- B. It provides a shorthand for if-else expression
- C. It creates three variables from one declaration
- D. It loops through a collection exactly three times

Answer: B

Q663. What does the bitwise left shift operator (<<) do?

- A. Moves bits left, effectively multiplying by powers of two
- B. Rotates bits in circular pattern within byte boundaries
- C. Moves bits right, effectively dividing by powers of two
- D. Compares two values bit by bit and returns differences

Answer: A

Q664. What is short-circuit evaluation in logical expressions?

- A. It skips the second operand when the result is determined
- B. It converts logical expressions into arithmetic for speed
- C. It evaluates all operands regardless of intermediate results
- D. It caches the results of all Boolean operations for reuse

Answer: A

Q665. What is operator overloading in object-oriented programming?

- A. Increasing operator precedence beyond default values
- B. Combining multiple operators into one new operator
- C. Defining custom behavior for operators with objects
- D. Using more operators than necessary in expressions

Answer: C

Q666. What does the null coalescing operator (??) do?

- A. It checks if a value is undefined and throws error
- B. It converts null values to empty strings always
- C. It prevents null values from being assigned anywhere
- D. It returns the right operand when left is null

Answer: D

Q667. How does bitwise XOR (^) differ from bitwise OR (|)?

- A. XOR returns one only when bits differ; OR either is one
- B. XOR returns one when both bits are one; OR returns zero
- C. XOR works on signed integers only; OR on unsigned ones
- D. XOR does logical operations; OR does arithmetic only

Answer: A

Q668. What is the purpose of the instanceof operator in Java?

- A. It creates a new instance of a class from constructor
- B. It deletes an instance and frees allocated memory
- C. It counts how many instances of a class exist now
- D. It checks if an object is instance of a specific class

Answer: D

Q669. What does the spaceship operator (<==>) return?

- A. Negative, zero, or positive based on comparison
- B. The average of two numeric values as float result
- C. A new object merging properties from two objects
- D. A Boolean true or false based on strict equality

Answer: A

Q670. What is the difference between == and === in JavaScript?

- A. Both perform the same comparison with no difference
- B. === checks value only; == checks value and type
- C. == checks value only; === checks value and type
- D. == is for numbers only; === for strings and objects

Answer: C

Q671. What is the advantage of a for-each loop over a traditional for loop?

- A. For-each loops can modify collection size in iteration
- B. For-each loops work only with arrays not other types
- C. For-each loops simplify iteration by abstracting index
- D. For-each loops execute faster than for loops always

Answer: C

Q672. What is a sentinel value in loop control?

- A. A special value that signals the loop should stop
- B. A flag tracking whether the loop has been started
- C. A variable counting the number of loop iterations
- D. A constant defining maximum loop iteration count

Answer: A

Q673. What is fall-through behavior in a switch statement?

- A. Execution continues into next case when break missing
- B. The switch exits immediately after matching first case
- C. The switch skips all cases and goes to default
- D. The default case always executes before other cases

Answer: A

Q674. What is tail recursion and why is it important?

- A. A technique to reverse order of recursive calls only
- B. Recursion at the end of an array for faster access
- C. A recursive call as last action enabling optimization
- D. Recursion that always uses the tail element of list

Answer: C

Q675. When should a developer use a do-while loop instead of while?

- A. When the loop condition depends on hardware signals
- B. When the loop needs to run a predetermined count
- C. When the loop should never execute if condition false
- D. When the loop body must execute at least one time

Answer: D

Q676. What is the purpose of labeled break statements in Java?

- A. They exit a specific outer loop from nested loops
- B. They add descriptive labels for code documentation
- C. They create named variables within loop block scope
- D. They mark loops for automatic parallel JVM execution

Answer: A

Q677. What is a guard clause in programming?

- A. A security check validating user authentication
- B. A try-catch block placed around every function call
- C. A mutex lock preventing concurrent shared data access
- D. An early return handling edge cases at function start

Answer: D

Q678. How does pattern matching differ from a traditional switch?

- A. Pattern matching is slower and less efficient than switch
- B. Pattern matching can destructure and match complex shapes
- C. Pattern matching cannot have a default case for unmatched
- D. Pattern matching only works with integer and string values

Answer: B

Q679. What is the risk of deeply nested control structures?

- A. They cause undefined behavior in all languages used
- B. They always cause the program to run out of memory
- C. They reduce readability and increase complexity greatly
- D. They prevent the compiler from generating optimized code

Answer: C

Q680. What is a loop invariant and why is it useful?

- A. A special loop type that cannot be modified in execution
- B. An optimization removing unnecessary variables from loop
- C. A condition true before and after each loop iteration
- D. A constant declared outside the loop that never changes

Answer: C

Q681. What is the difference between pass-by-value and pass-by-reference?

- A. Pass-by-value is faster than pass-by-reference in all cases
- B. Pass-by-value sends a copy; reference sends original location
- C. Both methods behave identically with no differences at all
- D. Pass-by-reference creates a copy of the argument each time

Answer: B

Q682. What is a lambda function?

- A. A small anonymous function defined inline in the code
- B. A function that runs automatically at program startup
- C. A function that cannot accept any parameters at all
- D. A function that can only return Boolean values always

Answer: A

Q683. What is function overloading?

- A. Defining multiple functions with same name different params
- B. Replacing an existing function with a new one entirely
- C. Calling a function more times than it can handle
- D. Loading a function into memory before it is needed

Answer: A

Q684. What is a callback function?

- A. A function that undoes the actions of another function
- B. A function that calls back the previous function always
- C. A function passed as an argument to another function
- D. A function that only executes during error handling

Answer: C

Q685. What is a closure in programming?

- A. A function that cannot be called more than once
- B. A function that retains access to its enclosing scope
- C. A function that closes the program when called
- D. A function that blocks all other functions from running

Answer: B

Q686. What is a default parameter in a function?

- A. A parameter with a preset value used if no arg given
- B. A parameter that overrides all other parameter values
- C. A parameter that must always be provided by caller
- D. A parameter that is automatically deleted after use

Answer: A

Q687. What is a higher-order function?

- A. A function that requires administrator access to run
- B. A function that takes or returns other functions
- C. A function with more than ten parameters defined
- D. A function that runs with higher priority than others

Answer: B

Q688. What is the purpose of the main function in C or Java?

- A. It handles all error messages in the entire program
- B. It defines all variables used throughout the program
- C. It serves as the entry point for program execution
- D. It manages memory allocation for all data structures

Answer: C

Q689. What is a variadic function?

- A. A function that can only be called once in program
- B. A function that accepts a variable number of args
- C. A function that changes its name during runtime
- D. A function that returns different types each time

Answer: B

Q690. What is a pure function in functional programming?

- A. A function written in a pure functional language only
- B. A function that only works with primitive data types
- C. A function with no side effects and deterministic output
- D. A function that has been optimized for maximum speed

Answer: C

Q691. What is buffered I/O and why is it used?

- A. It converts binary data to text format before file output
- B. It compresses files automatically to save disk space used
- C. It stores data in a buffer to reduce system call overhead
- D. It encrypts all data before writing to prevent data loss

Answer: C

Q692. What is the purpose of flushing a buffer?

- A. To convert buffer contents from binary to text encoding
- B. To clear the buffer and discard all data within it
- C. To force buffered data to be written to its destination
- D. To increase the size of the buffer for more data storage

Answer: C

Q693. What is serialization in the context of I/O?

- A. Converting objects into a storable or transmittable format
- B. Executing I/O operations in a strict serial sequence
- C. Assigning serial numbers to files for organization
- D. Sorting data in sequential order before processing

Answer: A

Q694. What is the difference between synchronous and asynchronous I/O?

- A. Synchronous blocks until complete; asynchronous does not block
- B. Synchronous only works with network; asynchronous with files
- C. Synchronous is always faster than asynchronous operations
- D. Asynchronous cannot read files only write to them on disk

Answer: A

Q695. What is a stream in I/O programming?

- A. A sequence of data elements available over time to read
- B. A database connection for querying stored information
- C. A graphical interface for displaying program output data
- D. A fixed-size block of memory for storing data values

Answer: A

Q696. What is the purpose of the with statement for file I/O in Python?

- A. It prevents other programs from accessing the same file
- B. It converts file contents to uppercase text characters
- C. It creates a new file with specific permissions on disk
- D. It ensures the file is properly closed after operations

Answer: D

Q697. What is CSV format used for?

- A. Compressing large files to reduce their disk size
- B. Storing executable program code in text files
- C. Encrypting sensitive data for secure transmission
- D. Storing tabular data with comma-separated values

Answer: D

Q698. What is the difference between absolute and relative file paths?

- A. Absolute paths can only reference files not directories
- B. Absolute starts from root; relative from current directory
- C. Absolute is shorter than relative paths in all cases
- D. Relative paths work across different operating systems only

Answer: B

Q699. What is JSON and why is it popular for data interchange?

- A. A binary format designed for storing image data on disk
- B. A protocol for encrypting data during network transfer
- C. A programming language for building web applications
- D. A lightweight text format that is easy to read and parse

Answer: D

Q700. What does the file seek operation do?

- A. It creates a backup copy of the file on another disk
- B. It moves the read/write position to a specific location
- C. It searches for a specific string within file content
- D. It locks the file to prevent concurrent access by others

Answer: B

Q701. What is the difference between mutable and immutable strings?

- A. Mutable strings use less memory; immutable use more always
- B. Mutable strings are faster; immutable are always slower
- C. Mutable strings can be changed; immutable cannot after creation
- D. Mutable strings have a fixed length; immutable can grow

Answer: C

Q702. What is string interpolation?

- A. Converting a string to a different character encoding
- B. Splitting a string by a specific delimiter character
- C. Embedding expressions directly inside a string literal
- D. Comparing two strings character by character position

Answer: C

Q703. What is a regular expression used for?

- A. Encrypting strings to protect sensitive data values
- B. Converting strings between different data type formats
- C. Defining patterns for searching and matching text
- D. Storing mathematical formulas as text strings

Answer: C

Q704. Why is string concatenation in a loop often inefficient?

- A. Because each concatenation creates a new string object
- B. Because the loop counter interferes with string length
- C. Because loops cannot process string data type values
- D. Because concatenation requires network access each time

Answer: A

Q705. What is Unicode and why is it important for strings?

- A. A standard encoding supporting characters from all languages
- B. A programming language designed for text processing
- C. A compression algorithm that reduces string memory usage
- D. A sorting algorithm designed specifically for text strings

Answer: A

Q706. What does the split function do to a string?

- A. It converts the string from uppercase to lowercase
- B. It duplicates the string into two identical copies
- C. It removes every other character from the string text
- D. It divides a string into an array using a delimiter

Answer: D

Q707. What is the difference between StringBuilder and String in Java?

- A. StringBuilder is slower than String for all text operations
- B. StringBuilder is mutable for efficient string modifications
- C. StringBuilder is immutable; String is mutable and changeable
- D. StringBuilder cannot store text only numeric data values

Answer: B

Q708. What is a string pool in Java?

- A. A sorting algorithm specifically designed for string arrays
- B. A cache of string literals reused to save memory space
- C. A collection of string utility functions in a library
- D. A data structure for storing strings in sorted order

Answer: B

Q709. What is the purpose of the replace function on strings?

- A. It substitutes occurrences of a pattern with new text
- B. It moves the string to a different memory location
- C. It renames the variable holding the string value
- D. It converts the string from text into binary format

Answer: A

Q710. What is URL encoding for strings?

- A. Replacing special characters with percent-encoded values
- B. Compressing URL strings to reduce their total length
- C. Encrypting URL strings to prevent unauthorized access
- D. Converting URLs into string variables in the program

Answer: A

Q711. What is the time complexity of accessing an element by index in an array?

- A. $O(1)$ because arrays provide direct index-based access
- B. $O(\log n)$ because arrays use binary search internally
- C. $O(n^2)$ because index calculation is quadratic
- D. $O(n)$ because it must search through all elements

Answer: A

Q712. What is a linked list and how does it differ from an array?

- A. A linked list cannot store more than one hundred elements
- B. A linked list is faster for index access than an array
- C. A linked list uses nodes with pointers allowing dynamic size
- D. A linked list stores elements contiguously like an array does

Answer: C

Q713. What is a hash map collision and how is it typically resolved?

- A. When two values are identical in different hash map entries
- B. When the hash map runs out of memory during insertion
- C. When the hash function produces negative index values
- D. When two keys map to the same bucket needing chain or probe

Answer: D

Q714. What is the difference between an ArrayList and a LinkedList in Java?

- A. ArrayList stores only strings; LinkedList stores only numbers
- B. ArrayList uses nodes with pointers; LinkedList uses an array
- C. ArrayList provides fast index access; LinkedList fast insertion
- D. ArrayList is immutable; LinkedList is mutable and changeable

Answer: C

Q715. What is a priority queue?

- A. A queue that can only store integer data type elements
- B. A queue where elements are processed in insertion order always
- C. A queue that automatically removes duplicate element entries
- D. A queue where elements are processed based on priority value

Answer: D

Q716. What is the purpose of the Collections.sort() method in Java?

- A. It sorts the elements of a list in their natural ordering
- B. It removes all duplicate elements from the given collection
- C. It converts a collection into an array of primitive values
- D. It reverses the order of elements in a collection object

Answer: A

Q717. What is a deque (double-ended queue)?

- A. A queue that only allows deletion not insertion operations
- B. A queue allowing insertion and removal at both front and back
- C. A queue that stores exactly two elements at any given time
- D. A queue that automatically sorts elements upon insertion

Answer: B

Q718. What is the advantage of a balanced binary search tree over a sorted array?

- A. Balanced BST uses less memory than a sorted array always
- B. Balanced BST has faster element access by index position
- C. Balanced BST provides efficient insertion and deletion both
- D. Balanced BST does not require any comparison operations

Answer: C

Q719. What is a sparse array?

- A. An array where most elements are default or zero values
- B. An array that stores elements in non-contiguous memory
- C. An array that only contains string type data elements
- D. An array with a fixed small number of total elements

Answer: A

Q720. What is the difference between a shallow copy and a deep copy of a collection?

- A. Deep copies share nested references; shallow copies clone all
- B. Shallow copies are slower to create than deep copies always
- C. Shallow copies share nested references; deep copies clone all
- D. Both shallow and deep copies produce identical independent results

Answer: C

Q721. What is the difference between an abstract class and an interface?

- A. Abstract classes can have implementation; interfaces cannot always
- B. Abstract classes cannot have fields; interfaces can have fields
- C. Interfaces support multiple inheritance; abstract classes do not
- D. Abstract classes and interfaces are functionally identical always

Answer: A

Q722. What is method overriding in OOP?

- A. Creating a method with a different number of parameters
- B. Deleting a parent method from the child class entirely
- C. Defining a method with the same name in a child class
- D. Calling a method from an unrelated class in the program

Answer: C

Q723. What is composition in OOP and how does it differ from inheritance?

- A. Composition is slower than inheritance in all execution scenarios
- B. Composition and inheritance produce identical code structure always
- C. Composition cannot reuse code from other classes unlike inheritance
- D. Composition uses has-a relationship; inheritance uses is-a relation

Answer: D

Q724. What is the purpose of access modifiers like public, private, protected?

- A. They determine the execution speed of methods in the class
- B. They control the visibility and accessibility of class members
- C. They define the order in which methods are called in class
- D. They specify the data type that a class member can store

Answer: B

Q725. What is the Liskov Substitution Principle?

- A. Objects should have only one reason to change at any time
- B. Subtypes must be substitutable for their base types safely
- C. A class should be open for extension closed for modification
- D. Classes should depend on abstractions not concrete classes

Answer: B

Q726. What is a static method in a class?

- A. A method that cannot accept any parameters at all
- B. A method that cannot be called from outside the class
- C. A method belonging to the class itself not instances
- D. A method that runs automatically when program starts

Answer: C

Q727. What is the diamond problem in multiple inheritance?

- A. A class has too many methods causing diamond-shaped UML
- B. A class cannot be instantiated due to circular references
- C. A class inherits from itself creating an infinite loop
- D. A class inherits from two classes sharing a common ancestor

Answer: D

Q728. What is dependency injection and why is it useful?

- A. Providing dependencies externally rather than creating inside
- B. Injecting code into a running program for hot patching
- C. Adding extra methods to a class during program execution
- D. Inserting breakpoints into code for debugging at runtime

Answer: A

Q729. What is the difference between aggregation and composition?

- A. Aggregation has strong ownership; composition has weak ownership
- B. Both aggregation and composition represent identical relationships
- C. Aggregation has weak ownership; composition has strong ownership
- D. Aggregation uses inheritance; composition uses interfaces only

Answer: C

Q730. What is the purpose of the final keyword in Java?

- A. It prevents classes from being inherited or methods overridden
- B. It specifies that a variable can only hold final data type
- C. It marks a method as the first one to execute in class
- D. It indicates the method will return the final calculated value

Answer: A

Q731. What is a dangling pointer and why is it dangerous?

- A. A pointer that takes too long to dereference in code
- B. A pointer that points to the beginning of an allocated block
- C. A pointer that is declared but never used in the program
- D. A pointer referencing freed memory causing undefined behavior

Answer: D

Q732. What is reference counting as a garbage collection strategy?

- A. Tracking how many references point to each object in memory
- B. Tracking how many times each function is called at runtime
- C. Counting the total amount of memory allocated by program
- D. Counting how many variables exist in the program scope

Answer: A

Q733. What is the difference between stack overflow and heap overflow?

- A. Both stack and heap overflow are caused by the same exact problem
- B. Stack overflow uses too much heap; heap overflow uses too much stack
- C. Stack overflow is harmless; heap overflow always crashes program
- D. Stack overflow is from deep recursion; heap from excess allocation

Answer: D

Q734. What is virtual memory and why do operating systems use it?

- A. A type of memory used only by virtual machines and emulators
- B. A memory encryption technique to protect sensitive program data
- C. A technique using disk to extend available memory beyond RAM
- D. Physical RAM that is faster than regular memory modules

Answer: C

Q735. What is a memory pool allocation strategy?

- A. Pooling memory from multiple computers on a network
- B. Storing all variables in a single continuous memory block
- C. Allocating memory from a single global heap always
- D. Pre-allocating fixed-size blocks for fast repeated allocation

Answer: D

Q736. What is the purpose of smart pointers in C++?

- A. They convert pointers into integers for easier comparison
- B. They automatically manage memory ownership and deallocation
- C. They make pointer arithmetic faster on modern CPUs
- D. They prevent pointers from being passed to any functions

Answer: B

Q737. What is memory fragmentation?

- A. When free memory exists but is split into small unusable chunks
- B. When memory is completely full with no free space left
- C. When memory hardware develops physical defects over time
- D. When a program accesses memory belonging to another process

Answer: A

Q738. What is a buffer overflow?

- A. Writing more data than a buffer can hold overwriting adjacent memory
- B. Reading data from a buffer that has already been fully emptied
- C. Allocating a buffer that is larger than available memory space
- D. Writing less data than a buffer can hold in its capacity

Answer: A

Q739. What is the RAII pattern in C++?

- A. A pattern for parallel processing of arrays using multiple threads
- B. A technique for reducing memory usage of string operations
- C. A pattern for implementing recursive algorithms efficiently
- D. Resource acquisition tied to object lifetime via constructor and destructor

Answer: D

Q740. What is the difference between malloc and new in C++?

- A. malloc is faster than new in all performance benchmarks
- B. malloc is for C++ only; new is for C language only
- C. new cannot allocate memory for arrays unlike malloc can
- D. malloc allocates raw memory; new also calls the constructor

Answer: D

Q741. What is the difference between checked and unchecked exceptions in Java?

- A. Checked exceptions are less severe than unchecked exceptions
- B. Checked exceptions occur at runtime; unchecked at compile time
- C. Both checked and unchecked exceptions behave identically always
- D. Checked must be declared or caught; unchecked are not required

Answer: D

Q742. What is exception chaining and why is it useful?

- A. Catching multiple exceptions in a single catch block always
- B. Throwing the same exception multiple times in succession
- C. Creating a chain of try-catch blocks for different error types
- D. Wrapping an exception in another to preserve the original cause

Answer: D

Q743. What is the purpose of custom exception classes?

- A. They make exceptions run faster than built-in exception types
- B. They automatically fix errors without any developer intervention
- C. They replace all built-in exceptions in the language entirely
- D. They provide domain-specific error types with relevant context

Answer: D

Q744. Why should you avoid using exceptions for normal control flow?

- A. Because exceptions prevent the program from being compiled
- B. Because exceptions cannot carry any data or message with them
- C. Because exceptions are expensive and obscure program logic flow
- D. Because exceptions only work inside the main function of program

Answer: C

Q745. What is the difference between throw and throws in Java?

- A. throw is for checked exceptions only; throws for unchecked only
- B. throw creates a new exception class; throws catches exceptions
- C. throw raises an exception; throws declares exceptions a method may throw
- D. Both throw and throws perform the exact same operation always

Answer: C

Q746. What is a try-with-resources statement in Java?

- A. A try block that limits CPU resources used during execution
- B. A try block that automatically imports required library classes
- C. A try block that automatically closes resources when done
- D. A try block that retries the operation with different data

Answer: C

Q747. What is the purpose of logging exceptions?

- A. To convert exceptions into warnings that can be safely ignored
- B. To automatically send exceptions to users via email alerts
- C. To prevent exceptions from occurring in future executions
- D. To record error details for debugging and monitoring purposes

Answer: D

Q748. What happens if an exception is thrown but not caught?

- A. The exception is automatically converted to a return value
- B. The program terminates and typically displays a stack trace
- C. The exception is silently ignored and execution continues
- D. The program pauses and waits for user input to continue

Answer: B

Q749. What is a multi-catch block in Java?

- A. Nesting multiple catch blocks inside one another deeply
- B. A catch block that runs multiple times for one exception
- C. A single catch block handling multiple exception types
- D. Catching exceptions from multiple try blocks at one time

Answer: C

Q750. What is defensive programming in relation to error handling?

- A. Anticipating potential errors and handling them proactively
- B. Only handling errors after they cause the program to crash
- C. Ignoring all possible errors to keep the code base simple
- D. Delegating all error handling to the operating system only

Answer: A

Q751. What is semantic versioning (SemVer)?

- A. Dating versions with the release date as the number
- B. Numbering versions sequentially with single integers
- C. Naming versions with random words for easy recall
- D. A system using MAJOR.MINOR.PATCH format for versions

Answer: D

Q752. What is dependency injection in the context of modules?

- A. Providing module dependencies externally rather than hardcoding
- B. Injecting malicious code into a module for exploitation
- C. Removing unused dependencies from the project configuration
- D. Automatically downloading dependencies from the internet

Answer: A

Q753. What is circular dependency and why is it problematic?

- A. When a module depends on too many other external modules
- B. When two modules have functions with the same name defined
- C. When a dependency is updated too frequently breaking code
- D. When module A depends on B and B depends on A causing issues

Answer: D

Q754. What is the difference between a static and dynamic library?

- A. Static is linked at compile time; dynamic is linked at runtime
- B. Static is for C only; dynamic is for all other languages only
- C. Static is faster but dynamic uses less total memory always
- D. Static cannot be updated; dynamic updates automatically always

Answer: A

Q755. What is a lockfile in dependency management?

- A. A file that limits the number of dependencies allowed
- B. A file that encrypts the dependencies for secure storage
- C. A file that locks the source code from being modified
- D. A file recording exact versions of all installed dependencies

Answer: D

Q756. What is tree shaking in module bundling?

- A. Converting modules from one format to another at build
- B. Reorganizing module code into a tree data structure
- C. Sorting modules alphabetically for better organization
- D. Removing unused code from the final bundle to reduce size

Answer: D

Q757. What is the difference between CommonJS and ES modules?

- A. CommonJS is newer than ES modules in JavaScript evolution
- B. CommonJS uses require/exports; ES modules use import/export
- C. CommonJS uses import/export; ES modules use require/exports
- D. Both systems use identical syntax and behave the same way

Answer: B

Q758. What is a monorepo?

- A. A single repository containing multiple related projects
- B. A repository containing only one small module of code
- C. A repository that stores only documentation not code
- D. A repository that cannot have more than one contributor

Answer: A

Q759. What is the purpose of a module bundler like Webpack?

- A. It compresses images used in web application projects
- B. It automatically writes unit tests for all module code
- C. It combines multiple modules into optimized output bundles
- D. It deploys applications to production servers directly

Answer: C

Q760. What is a transitive dependency?

- A. A dependency of a dependency that is indirectly required
- B. A dependency that transitions between different versions
- C. A dependency that is optional and not always installed
- D. A dependency that is only used during testing phases

Answer: A

Q761. What is the time complexity of binary search on a sorted array?

- A. $O(n^2)$ because it uses nested loops for searching
- B. $O(n)$ because it checks every element in the array
- C. $O(1)$ because it directly accesses the target element
- D. $O(\log n)$ because it halves the search space each step

Answer: D

Q762. What is memoization and how does it improve performance?

- A. It memorizes variable names for faster variable lookup
- B. It logs all function calls to memory for later review
- C. It caches function results to avoid redundant computation
- D. It allocates extra memory to make functions run faster

Answer: C

Q763. What is the observer pattern in software design?

- A. A pattern where one object observes system memory usage
- B. A pattern where objects subscribe to and receive event updates
- C. A pattern for creating exactly one instance of a class only
- D. A pattern for sorting collections using comparison callbacks

Answer: B

Q764. What is dynamic programming?

- A. Breaking problems into overlapping subproblems and caching
- B. Creating programs that adapt to user preferences at runtime
- C. Writing code that changes its own source during execution
- D. Programming in a dynamically typed language like Python

Answer: A

Q765. What is a hash function and what makes a good one?

- A. A function that encrypts data using a secret key for security
- B. A function that compresses files to reduce their storage size
- C. A function mapping data to fixed-size values with few collisions
- D. A function that sorts data into alphabetical order always

Answer: C

Q766. What is the singleton pattern?

- A. A pattern ensuring a class has only one instance globally
- B. A pattern for connecting a single client to a server only
- C. A pattern that creates multiple instances of different classes
- D. A pattern that limits functions to one parameter at most

Answer: A

Q767. What is the factory pattern?

- A. A pattern for converting objects between different types
- B. A pattern for destroying objects when no longer needed
- C. A pattern delegating object creation to a factory method
- D. A pattern for mass producing identical objects in batches

Answer: C

Q768. What is the difference between BFS and DFS graph traversal?

- A. BFS is only for trees; DFS is only for general graph structures
- B. BFS explores depth first; DFS explores breadth first always
- C. BFS uses a stack; DFS uses a queue for storing nodes to visit
- D. BFS explores level by level; DFS explores as deep as possible

Answer: D

Q769. What is a heap data structure?

- A. A complete binary tree satisfying the heap ordering property
- B. A hash table that automatically resizes when it gets full
- C. A linked list sorted in ascending order of element values
- D. A disorganized pile of unsorted data in memory blocks

Answer: A

Q770. What is the strategy pattern?

- A. A pattern for choosing between inheritance and composition
- B. A pattern for planning the development timeline of projects
- C. A pattern encapsulating interchangeable algorithms in objects
- D. A pattern that strategically allocates memory for performance

Answer: C

Q771. What is a semaphore and how does it differ from a mutex?

- A. A semaphore allows only one thread; a mutex allows multiple
- B. A semaphore is for processes only; a mutex is for threads only
- C. A semaphore allows multiple threads up to a count; mutex allows one
- D. Both semaphores and mutexes behave identically in all situations

Answer: C

Q772. What is a thread pool and why is it used?

- A. A pool of memory shared between all threads in a program
- B. A data structure for storing thread execution results only
- C. A group of pre-created threads reused for executing tasks
- D. A debugging tool that monitors thread activity in programs

Answer: C

Q773. What are the four necessary conditions for a deadlock to occur?

- A. Speed, memory, disk, and network resource limitations
- B. Compilation, linking, loading, and execution phase errors
- C. Input, processing, output, and storage operation failures
- D. Mutual exclusion, hold-and-wait, no preemption, circular wait

Answer: D

Q774. What is the producer-consumer problem?

- A. A problem of converting data between different encoding formats
- B. A problem of coordinating threads that produce and consume data
- C. A problem of allocating memory between different program modules
- D. A problem about optimizing compilation speed of programs

Answer: B

Q775. What is an atomic operation?

- A. An operation that completes indivisibly without interruption
- B. An operation that uses atomic energy for faster processing
- C. An operation that can be divided into smaller sub-steps
- D. An operation that only works on integer data type values

Answer: A

Q776. What is the difference between preemptive and cooperative multitasking?

- A. Both use identical scheduling mechanisms in all operating systems
- B. Preemptive only works on single-core; cooperative on multi-core
- C. Preemptive OS controls scheduling; cooperative tasks yield control
- D. Preemptive is slower; cooperative is faster in all situations

Answer: C

Q777. What is a condition variable used for?

- A. Storing the condition of an if-else statement in memory
- B. Checking if a variable meets certain validation requirements
- C. Allowing threads to wait for a specific condition to become true
- D. Defining constant values that cannot be changed during runtime

Answer: C

Q778. What is the dining philosophers problem about?

- A. Managing memory allocation in object-oriented program design
- B. Optimizing database queries for better application performance
- C. Designing efficient algorithms for sorting large data arrays
- D. Illustrating deadlock and resource contention among processes

Answer: D

Q779. What is thread safety?

- A. Code that functions correctly when accessed by multiple threads
- B. A technique for making threads run faster on modern hardware
- C. A security feature that prevents threads from being terminated
- D. Writing code that runs only on a single thread at one time

Answer: A

Q780. What is the difference between blocking and non-blocking algorithms?

- A. Blocking can cause threads to wait; non-blocking guarantee progress
- B. Both types have identical performance in all concurrent scenarios
- C. Blocking algorithms are faster; non-blocking are always slower
- D. Non-blocking algorithms cannot be used with multiple threads

Answer: A

Q781. What is test-driven development (TDD)?

- A. Writing tests after all code is complete and deployed
- B. Developing tests and code simultaneously without any plan
- C. Writing tests before code then implementing to pass tests
- D. Testing only the most critical features of the application

Answer: C

Q782. What is code coverage in testing?

- A. The total lines of code in the entire project codebase
- B. The percentage of code executed during test suite runs
- C. The number of developers who have reviewed the code
- D. The amount of documentation written for the codebase

Answer: B

Q783. What is an integration test?

- A. A test verifying a single function works in isolation
- B. A test ensuring code compiles without any syntax errors
- C. A test measuring the speed of algorithm execution time
- D. A test verifying that multiple components work together

Answer: D

Q784. What is mocking in unit testing?

- A. Replacing real dependencies with controlled fake objects
- B. Ridiculing code that is poorly written by developers
- C. Copying production data to use in test environments
- D. Running tests multiple times to check for consistency

Answer: A

Q785. What is regression testing?

- A. Testing the application on different operating systems platforms
- B. Re-running tests to ensure changes have not broken existing code
- C. Testing new features before they are implemented in code
- D. Testing the program under extreme load and stress conditions

Answer: B

Q786. What is a profiler used for in optimization?

- A. Measuring performance bottlenecks in program execution
- B. Formatting source code to follow style guidelines set
- C. Writing automated test cases for the program codebase
- D. Translating code from one programming language to another

Answer: A

Q787. What is the difference between white-box and black-box testing?

- A. Both approaches test code in exactly the same way always
- B. White-box tests the UI; black-box tests the backend code
- C. White-box is manual testing; black-box is automated testing
- D. White-box tests with code knowledge; black-box without it

Answer: D

Q788. What is assertion in testing?

- A. A statement that imports external libraries into the code
- B. A statement that declares a variable with a specific type
- C. A statement that verifies a condition is true during testing
- D. A statement that prints debug information to the console

Answer: C

Q789. What is continuous integration (CI)?

- A. Integrating third-party libraries into the project once
- B. Continuously writing code without any breaks or pauses
- C. Automatically building and testing code on every commit
- D. Integrating all code at the end of the development cycle

Answer: C

Q790. What is a flaky test and why is it problematic?

- A. A test that always fails consistently every time it runs
- B. A test that only works on the original developer's machine
- C. A test that passes or fails inconsistently without code changes
- D. A test that is too slow to run during the CI pipeline build

Answer: C

Q791. What is continuous deployment (CD)?

- A. Deploying all code changes at the end of the project
- B. Continuously writing deployment scripts for the team
- C. Deploying code only during scheduled maintenance windows
- D. Automatically deploying every passing build to production

Answer: D

Q792. What is the SOLID principle in software design?

- A. A single principle about writing solid unbreakable programs
- B. A principle about making code run on solid-state hardware
- C. Five design principles for maintainable object-oriented code
- D. A principle requiring all code to be stored in solid files

Answer: C

Q793. What is technical debt?

- A. The monetary cost of purchasing development tools and licenses
- B. The amount of time spent learning new programming technologies
- C. The implied cost of future rework from choosing quick solutions
- D. The storage cost of maintaining large code repositories online

Answer: C

Q794. What is a microservice architecture?

- A. An architecture using very small functions for all operations
- B. A development practice of writing very concise source code
- C. An architecture breaking an app into small independent services
- D. A very small application with minimal functionality only

Answer: C

Q795. What is pair programming?

- A. Two developers working together on the same code actively
- B. Two programs running in parallel on the same computer
- C. Two developers working on separate tasks simultaneously
- D. Two teams competing to write the same feature faster

Answer: A

Q796. What is the purpose of a linter?

- A. To encrypt source code to protect intellectual property
- B. To convert code from one programming language to another
- C. To analyze code for style issues and potential errors found
- D. To compile source code into optimized machine code output

Answer: C

Q797. What is the difference between monolithic and microservice architectures?

- A. Monolithic is one deployable unit; microservices are many separate
- B. Both architectures deploy and scale in exactly the same way
- C. Microservices use one language; monolithic uses many languages
- D. Monolithic is faster; microservices are slower in all cases

Answer: A

Q798. What is a sprint in Scrum methodology?

- A. A fixed-length iteration for completing a set of planned work
- B. A quick fix applied to production code in emergency situations
- C. A code review session held at the end of every work day
- D. A performance test measuring application response time speed

Answer: A

Q799. What is the purpose of a retrospective in agile development?

- A. To assign tasks to team members for the next sprint period
- B. To review the final product before releasing to customers
- C. To reflect on the process and identify areas for improvement
- D. To estimate the effort required for upcoming development work

Answer: C

Q800. What is infrastructure as code (IaC)?

- A. Managing infrastructure through machine-readable definition files
- B. Converting infrastructure diagrams into programming source code
- C. Writing code that runs on physical infrastructure hardware
- D. Coding directly on production servers without version control

Answer: A

Q801. What is the difference between a compiler error and a linker error?

- A. Linker errors happen before compiler errors in the build process
- B. Compiler errors are warnings while linker errors crash the system
- C. There is no difference between them
- D. Compiler errors occur in syntax checking while linker errors occur when combining object files

Answer: D

Q802. What is the purpose of an object file in compilation?

- A. It is the final executable program
- B. It contains machine code that has not yet been linked
- C. It stores the original source code
- D. It holds only debug information

Answer: B

Q803. What is the difference between procedural and object-oriented programming?

- A. Procedural languages cannot handle large programs
- B. OOP cannot use functions at all
- C. Procedural is faster than OOP in all cases
- D. Procedural uses functions to organize code while OOP uses classes and objects

Answer: D

Q804. What is a semantic error in programming?

- A. An error where the code has incorrect punctuation
- B. An error where the code is syntactically valid but logically meaningless
- C. An error caused by using the wrong file extension
- D. An error that prevents compilation due to missing brackets

Answer: B

Q805. What is the role of a loader in program execution?

- A. It loads the executable into memory and prepares it for execution
- B. It links object files together into an executable
- C. It compiles the source code into machine code
- D. It checks the program for syntax errors

Answer: A

Q806. What is the difference between compiled and managed languages?

- A. Managed languages must be interpreted line by line
- B. Compiled languages produce native code while managed languages run on a virtual machine
- C. Compiled languages cannot use garbage collection
- D. Managed languages are always slower than compiled languages

Answer: B

Q807. What is an abstract syntax tree (AST) used for?

- A. Representing the hierarchical structure of source code during compilation
- B. Drawing flowcharts of the program
- C. Storing the final executable code
- D. Managing memory allocation at runtime

Answer: A

Q808. What is the purpose of a garbage-collected runtime environment?

- A. To optimize CPU instruction scheduling
- B. To prevent all types of programming errors
- C. To compile code faster than traditional compilers
- D. To automatically reclaim memory that is no longer in use

Answer: D

Q809. What is the difference between a scripting language and a systems language?

- A. Scripting languages cannot define functions
- B. Systems languages are always object-oriented
- C. Scripting languages prioritize ease of use while systems languages prioritize performance and control
- D. Scripting languages can only run on web browsers

Answer: C

Q810. What is the purpose of intermediate representation (IR) in compilers?

- A. To display the program output to the user
- B. To serve as a platform-independent form between source code and machine code
- C. To manage the file system during compilation
- D. To encrypt the source code for security

Answer: B

Q811. What is autoboxing in Java?

- A. Automatically compiling code without user intervention
- B. Automatically converting primitive types to their wrapper class objects
- C. Automatically resizing arrays when they are full
- D. Automatically casting all types to strings

Answer: B

Q812. What is the difference between a weakly typed and a strongly typed language?

- A. Strongly typed languages cannot perform arithmetic operations
- B. Weakly typed languages are always interpreted
- C. Weakly typed languages do not have data types at all
- D. Weakly typed languages allow implicit type conversions while strongly typed languages restrict them

Answer: D

Q813. What is a tuple data type?

- A. A type that stores exactly two values
- B. An immutable ordered collection of elements that can have different types
- C. A mutable list of elements of the same type
- D. A type used only for database records

Answer: B

Q814. What is type coercion?

- A. Explicitly casting a variable to a new type using syntax
- B. Restricting a variable to a single type permanently
- C. Automatic conversion of a value from one type to another by the language
- D. Removing type information at compile time

Answer: C

Q815. What is the difference between mutable and immutable data types?

- A. Mutable types can be changed after creation while immutable types cannot
- B. Mutable types can only store numbers
- C. Mutable types use more memory than immutable types always
- D. Immutable types are only available in functional languages

Answer: A

Q816. What is a generic type parameter?

- A. A placeholder for a type that is specified when the class or method is used
- B. A type that is automatically inferred at runtime
- C. A default type assigned when no type is specified
- D. A type that can only hold generic string values

Answer: A

Q817. What is the purpose of the void type?

- A. To represent a variable that holds zero
- B. To declare a variable with no type
- C. To create an empty array
- D. To indicate that a function returns no value

Answer: D

Q818. What is a tagged union or discriminated union?

- A. A type that stores one of several possible types along with a tag indicating which type is active
- B. A type used only in database programming
- C. A type that merges two arrays into one
- D. A type that combines multiple unrelated types randomly

Answer: A

Q819. Why does 0.1 + 0.2 not equal 0.3 in most programming languages?

- A. Because floating-point representation cannot exactly represent some decimal fractions
- B. Because addition is not supported for decimal numbers
- C. Because decimal numbers are stored as strings internally
- D. Because the compiler rounds all numbers to integers

Answer: A

Q820. What is the difference between a struct and a class in C#?

- A. Structs support inheritance but classes do not
- B. Classes cannot be instantiated while structs can
- C. Structs can have methods but classes cannot
- D. Structs are value types allocated on the stack while classes are reference types allocated on the heap

Answer: D

Q821. What is the difference between logical OR (||) and bitwise OR (|)?

- A. Logical OR works on numbers while bitwise OR works on Booleans
- B. They produce identical results for all input types
- C. Bitwise OR short-circuits but logical OR does not
- D. Logical OR works on Boolean values and short-circuits while bitwise OR operates on individual bits

Answer: D

Q822. What is the purpose of the modulus operator in determining even or odd numbers?

- A. If $n \% 2$ equals 1 the number is even, if it equals 0 the number is odd
- B. If $n \% 3$ equals 0 the number is even
- C. If $n \% 2$ equals 0 the number is even, if it equals 1 the number is odd
- D. The modulus operator cannot be used for this purpose

Answer: C

Q823. What does the bitwise NOT (~) operator do to an integer?

- A. It sets all bits to zero
- B. It converts the integer to its absolute value
- C. It flips all the bits, changing 0s to 1s and 1s to 0s
- D. It doubles the value of the integer

Answer: C

Q824. What is the optional chaining operator (?.) used for?

- A. Creating optional function parameters
- B. Safely accessing nested object properties without throwing if a reference is null
- C. Defining nullable return types
- D. Forcing a null value to throw an exception

Answer: B

Q825. What is the difference between the assignment operator (=) and the equality operator (==)?

- A. Neither operator works with numeric values
- B. The assignment operator stores a value in a variable while the equality operator compares two values
- C. They perform the same function in all contexts
- D. The equality operator stores values while the assignment operator compares them

Answer: B

Q826. How does the right shift operator (>>) work on signed integers?

- A. It shifts bits to the right and fills the leftmost bits with the sign bit
- B. It divides the number by 10
- C. It shifts bits to the right and always fills with zeros
- D. It reverses the order of all bits

Answer: A

Q827. What is the spread operator (...) used for in JavaScript?

- A. Removing duplicate values from an array
- B. Multiplying all elements in an array
- C. Expanding an iterable into individual elements
- D. Converting an object to a string

Answer: C

Q828. What is the typeof operator used for in JavaScript?

- A. Returning a string indicating the type of the operand
- B. Comparing two types for equality
- C. Creating a new type at runtime
- D. Casting a value to a specified type

Answer: A

Q829. What is the result of using the bitwise AND operator (5 & 6)?

- A. 6
- B. 4
- C. 11
- D. 5

Answer: B

Q830. What is the exponentiation operator () in Python and JavaScript?**

- A. It raises the left operand to the power of the right operand
- B. It performs multiplication of two numbers
- C. It performs integer division
- D. It calculates the square root of a number

Answer: A

Q831. What is the advantage of using a switch statement over multiple if-else chains?

- A. Switch statements automatically handle all possible cases
- B. Switch statements can evaluate complex Boolean expressions better
- C. Switch statements are clearer and more efficient when comparing a single variable against many constant values
- D. Switch statements work with all data types in all languages

Answer: C

Q832. What is the difference between a pre-test loop and a post-test loop?

- A. A pre-test loop checks the condition before each iteration while a post-test loop checks after
- B. A pre-test loop runs faster than a post-test loop
- C. A pre-test loop always runs at least twice
- D. A post-test loop cannot use counter variables

Answer: A

Q833. What is a state machine and how does it relate to control flow?

- A. A type of loop that runs indefinitely
- B. A machine that stores all program variables
- C. A hardware device that controls program execution
- D. A model where behavior is determined by the current state and transitions triggered by events

Answer: D

Q834. Why should deeply nested control structures be avoided?

- A. They reduce code readability and increase cognitive complexity for developers
- B. They are not supported by modern compilers
- C. They always cause runtime errors in production
- D. They consume significantly more memory than flat structures

Answer: A

Q835. What is short-circuit evaluation in the context of control flow?

- A. Evaluating only part of a Boolean expression when the result can be determined early
- B. Skipping the entire if block when the condition is complex
- C. Terminating the program when an error is detected
- D. Running loops with fewer iterations than specified

Answer: A

Q836. What is the purpose of the 'yield' keyword in generators?

- A. It pauses the function execution and returns a value, resuming from that point on the next call
- B. It yields control to the operating system
- C. It creates a new thread for the function
- D. It terminates the function permanently

Answer: A

Q837. What is the difference between a counted loop and a conditional loop?

- A. A conditional loop always runs at least once
- B. A counted loop can only count up while a conditional loop counts down
- C. A counted loop runs a predetermined number of times while a conditional loop runs until a condition changes
- D. A counted loop does not use any variables

Answer: C

Q838. What is the ternary operator and how does it simplify control flow?

- A. It creates three separate code branches
- B. It allows three conditions to be checked simultaneously
- C. It replaces a simple if-else with a concise single-line expression that returns one of two values
- D. It replaces for loops with a shorter syntax

Answer: C

Q839. What is the purpose of the 'pass' statement in Python?

- A. It skips to the next iteration of a loop
- B. It passes a value to a function
- C. It terminates the program gracefully
- D. It serves as a placeholder where a statement is syntactically required but no action is needed

Answer: D

Q840. What is the difference between break and return inside a nested loop?

- A. They behave identically in all situations
- B. Break exits only the innermost loop while return exits the entire function
- C. Break exits all nested loops while return exits only one
- D. Break exits the function while return exits only the loop

Answer: B

Q841. What is the difference between named and anonymous functions?

- A. Named functions are faster than anonymous functions
- B. Anonymous functions cannot accept parameters
- C. Named functions cannot be passed as arguments
- D. Named functions have an identifier while anonymous functions are defined without a name

Answer: D

Q842. What is the purpose of the *args parameter in Python?

- A. It creates a pointer to another function
- B. It converts all arguments to strings
- C. It restricts the function to accept only one argument
- D. It allows a function to accept a variable number of positional arguments as a tuple

Answer: D

Q843. What is function composition?

- A. Writing multiple functions in the same file
- B. Inheriting functions from a parent class
- C. Creating a function with many parameters
- D. Combining two or more functions so the output of one becomes the input of another

Answer: D

Q844. What is the difference between synchronous and asynchronous function calls?

- A. Synchronous calls are always faster than asynchronous calls
- B. Synchronous calls block until completion while asynchronous calls return immediately and complete later
- C. Asynchronous calls cannot return values
- D. Synchronous calls run on multiple threads simultaneously

Answer: B

Q845. What is a decorator in Python?

- A. A comment that describes a function
- B. A tool for formatting output
- C. A special syntax for defining classes
- D. A function that wraps another function to modify or extend its behavior

Answer: D

Q846. What is the **kwargs parameter in Python used for?

- A. It converts arguments to key-value pairs automatically
- B. It blocks keyword arguments from being passed
- C. It creates two copies of each argument
- D. It accepts a variable number of keyword arguments as a dictionary

Answer: D

Q847. What is the purpose of the 'static' keyword for functions in Java?

- A. It makes the function run faster
- B. It prevents the function from being modified
- C. It restricts the function to a single thread
- D. It allows the function to be called without creating an instance of the class

Answer: D

Q848. What is an immediately invoked function expression (IIFE)?

- A. A function that waits for user input before executing
- B. A function that is defined and called at the same time
- C. A function that immediately throws an exception
- D. A function that is invoked only once per program run

Answer: B

Q849. What is the difference between a procedure and a function in traditional programming terminology?

- A. A function returns a value while a procedure performs an action without returning a value
- B. A procedure is faster than a function
- C. A procedure can only contain one statement
- D. A function cannot modify global state

Answer: A

Q850. What is the difference between character streams and byte streams in Java?

- A. Character streams are faster than byte streams
- B. Byte streams can only read files while character streams can read and write
- C. Character streams handle text data using Unicode encoding while byte streams handle raw binary data
- D. Character streams cannot handle non-English text

Answer: C

Q851. What is deserialization?

- A. Deleting serialized data from disk
- B. Compressing data for faster transmission
- C. Converting a stored byte sequence back into an object in memory
- D. Converting text to binary format

Answer: C

Q852. What is the purpose of a buffer in I/O operations?

- A. To permanently store data on disk
- B. To compress files before saving
- C. To encrypt data during transfer
- D. To temporarily hold data in memory to reduce the number of actual I/O operations

Answer: D

Q853. What is the difference between text mode and binary mode when opening a file?

- A. Text mode translates line endings and handles encoding while binary mode reads raw bytes without translation
- B. Text mode only works with ASCII characters
- C. Binary mode is slower than text mode
- D. Text mode is only for reading while binary mode is only for writing

Answer: A

Q854. What is the purpose of the StringIO class in Python?

- A. It converts strings to integers
- B. It encrypts string data for file storage
- C. It provides a file-like interface for reading and writing strings in memory
- D. It counts the number of I/O operations

Answer: C

Q855. What is the purpose of I/O redirection in command-line programs?

- A. It speeds up I/O operations by using faster hardware
- B. It redirects standard input, output, or error streams to files or other programs
- C. It prevents programs from reading input
- D. It converts all output to binary format

Answer: B

Q856. What is XML parsing and what are the two main approaches?

- A. DOM is faster than SAX for all file sizes
- B. DOM parsing loads the entire document into memory while SAX parsing processes it event by event
- C. SAX loads the entire document while DOM reads it line by line
- D. XML can only be parsed using regular expressions

Answer: B

Q857. What is the difference between formatted and unformatted I/O?

- A. Formatted I/O is always faster than unformatted I/O
- B. Unformatted I/O can only handle strings
- C. Formatted I/O is only available in C
- D. Formatted I/O converts data to human-readable text while unformatted I/O reads and writes raw binary data

Answer: D

Q858. What is the purpose of the encoding parameter when opening a file in Python?

- A. It specifies how characters are converted to and from bytes when reading or writing
- B. It encrypts the file contents for security
- C. It compresses the file to save disk space
- D. It sets the maximum file size allowed

Answer: A

Q859. What is the difference between polling and event-driven I/O?

- A. Polling is always more efficient than event-driven I/O
- B. Polling cannot handle multiple I/O sources
- C. Polling repeatedly checks for I/O readiness while event-driven I/O notifies the program when I/O is ready
- D. Event-driven I/O blocks the program until data arrives

Answer: C

Q860. What is the difference between `String.valueOf()` and `toString()` in Java?

- A. `valueOf()` handles null by returning the string 'null' while `toString()` throws a `NullPointerException` on null
- B. They are identical methods with different names
- C. `valueOf()` only works with primitive types
- D. `toString()` handles null better than `valueOf()`

Answer: A

Q861. What is a raw string literal and when is it useful?

- A. A string where escape sequences are treated as literal characters, useful for regex and file paths
- B. A string that is always stored in raw binary format
- C. A string that cannot contain any special characters
- D. A string that has not been processed by the compiler

Answer: A

Q862. Why is string concatenation in a loop inefficient for immutable strings?

- A. Because each concatenation creates a new string object, copying all existing characters
- B. Because the loop runs slower with string operations
- C. Because the compiler cannot optimize string operations in loops
- D. Because strings in loops are automatically encrypted

Answer: A

Q863. What is the purpose of the join() method for strings?

- A. It connects two string variables permanently
- B. It links a string to a file on disk
- C. It concatenates an iterable of strings using a specified separator
- D. It joins a string with a number

Answer: C

Q864. What is the difference between ASCII and extended ASCII?

- A. Extended ASCII is a completely different encoding system
- B. ASCII defines 128 characters using 7 bits while extended ASCII adds 128 more characters using a full 8 bits
- C. Extended ASCII is only used for Asian languages
- D. ASCII supports more characters than extended ASCII

Answer: B

Q865. What is a template literal (template string) in JavaScript?

- A. A string enclosed in backticks that supports embedded expressions and multi-line text
- B. A string that serves as a template for HTML documents
- C. A string defined in a separate template file
- D. A string that cannot be modified after creation

Answer: A

Q866. What is the purpose of the format() method or f-strings for string formatting?

- A. They format the string as valid HTML
- B. They change the font and styling of the string
- C. They compress the string to reduce memory usage
- D. They embed variable values and expressions directly within a string template

Answer: D

Q867. What is the difference between the equals() method and == for string comparison in Java?

- A. equals() is faster than == for all cases
- B. == compares content while equals() compares references
- C. equals() compares content while == compares object references in memory
- D. They perform identical comparisons

Answer: C

Q868. What is a character class in regular expressions?

- A. A CSS class applied to text characters
- B. A function that classifies characters as letters or digits
- C. A class in OOP that represents a single character
- D. A set of characters enclosed in square brackets that matches any single character from the set

Answer: D

Q869. What is the purpose of the strip() or trim() method beyond removing spaces?

- A. It strips the string of all vowels
- B. It only removes spaces and nothing else
- C. It reduces the string to a fixed length
- D. It removes specified leading and trailing characters, not just whitespace

Answer: D

Q870. What is the difference between open addressing and separate chaining for hash table collision resolution?

- A. Separate chaining stores colliding elements in linked lists at each bucket while open addressing probes for the next empty slot
- B. Separate chaining requires a sorted hash table
- C. Open addressing uses linked lists while separate chaining probes for empty slots
- D. They always produce identical performance characteristics

Answer: A

Q871. What is the time complexity of inserting an element at the beginning of a linked list?

- A. $O(\log n)$ because it uses binary search
- B. $O(n)$ because all elements must be shifted
- C. $O(1)$ because only the head pointer needs to be updated
- D. $O(n^2)$ because of nested iterations

Answer: C

Q872. What is a circular buffer (ring buffer)?

- A. A buffer that copies data in a circular pattern
- B. A buffer shaped like a circle in memory
- C. A fixed-size buffer that wraps around when the end is reached, reusing space from the beginning
- D. A buffer that stores only circular data structures

Answer: C

Q873. What is the load factor of a hash table?

- A. The ratio of stored elements to the total number of buckets
- B. The speed at which elements are inserted
- C. The maximum number of elements it can store
- D. The amount of memory each element consumes

Answer: A

Q874. What is the difference between a min-heap and a max-heap?

- A. Max-heaps can only store positive numbers
- B. Min-heaps use less memory than max-heaps
- C. Min-heaps are smaller than max-heaps
- D. In a min-heap the smallest element is at the root while in a max-heap the largest element is at the root

Answer: D

Q875. What is the advantage of using a LinkedHashMap over a regular HashMap?

- A. LinkedHashMap is faster for all operations
- B. LinkedHashMap uses less memory than HashMap
- C. HashMap cannot handle string keys
- D. LinkedHashMap maintains insertion order or access order while HashMap does not guarantee order

Answer: D

Q876. What is an immutable collection?

- A. A collection that automatically sorts its elements
- B. A collection that cannot be modified after creation, providing thread safety and predictability
- C. A collection that is stored in read-only memory
- D. A collection that can only hold immutable objects

Answer: B

Q877. What is the difference between a stack-based and a queue-based approach to tree traversal?

- A. A queue produces depth-first while a stack produces breadth-first
- B. A stack traverses faster than a queue
- C. A stack produces depth-first traversal while a queue produces breadth-first traversal
- D. Both produce the same traversal order

Answer: C

Q878. What is the time complexity of searching for an element in a balanced binary search tree?

- A. $O(1)$ because elements are directly accessible by index
- B. $O(n)$ because every node must be checked
- C. $O(n \log n)$ because it requires sorting first
- D. $O(\log n)$ because the search space halves at each step

Answer: D

Q879. What is the `Collections.unmodifiableList()` method used for in Java?

- A. It sorts the list permanently
- B. It converts the list to an array
- C. It returns an unmodifiable view of the list that throws an exception on modification attempts
- D. It removes all elements from the list

Answer: C

Q880. What is the difference between an interface and an abstract class in Java?

- A. They are identical constructs with different keywords
- B. Abstract classes support multiple inheritance while interfaces do not
- C. Interfaces can have constructors while abstract classes cannot
- D. An interface defines method signatures without state while an abstract class can have both abstract and concrete methods with state

Answer: D

Q881. What is the Open/Closed Principle?

- A. Software entities should be open for extension but closed for modification
- B. All methods should be public (open) and fields should be private (closed)
- C. Open source code should not be modified by closed source projects
- D. Classes should be open for use and closed for testing

Answer: A

Q882. What is the purpose of the 'protected' access modifier?

- A. It makes members accessible only within the same class
- B. It allows access within the same class, subclasses, and same package
- C. It prevents any access to the member
- D. It makes members accessible only through getter methods

Answer: B

Q883. What is method hiding in Java?

- A. Making a method invisible to other classes
- B. Encrypting method implementations for security
- C. Removing a method from a class at runtime
- D. When a subclass defines a static method with the same signature as a static method in the superclass

Answer: D

Q884. What is the Single Responsibility Principle?

- A. A program should have only one main class
- B. A class should have only one reason to change, meaning it should have only one responsibility
- C. Each method should have only one parameter
- D. Each class should have only one constructor

Answer: B

Q885. What is the difference between shallow copy and deep copy of an object?

- A. Shallow copy is always slower than deep copy
- B. They produce identical results for all object types
- C. Deep copy only copies primitive fields
- D. Shallow copy copies only field values (sharing referenced objects) while deep copy recursively copies all referenced objects

Answer: D

Q886. What is a sealed class in Kotlin or Java?

- A. A class that cannot have any methods
- B. A class that restricts which classes can extend it, defining a closed set of subclasses
- C. A class that cannot be imported into other packages
- D. A class that seals its data from garbage collection

Answer: B

Q887. What is the Interface Segregation Principle?

- A. All interfaces should be in a separate file
- B. All classes must implement at least one interface
- C. Interfaces should have exactly one method each
- D. Clients should not be forced to depend on methods they do not use

Answer: D

Q888. What is the Dependency Inversion Principle?

- A. Dependencies should always flow from child to parent classes
- B. Methods should be invoked in reverse order of definition
- C. All dependencies should be inverted to remove circular references
- D. High-level modules should depend on abstractions rather than concrete implementations

Answer: D

Q889. What is a data class in Kotlin or a record in Java?

- A. A class that stores only static data
- B. A class that stores data in binary format
- C. A class that automatically generates equals, hashCode, toString, and copy methods based on constructor properties
- D. A class that can only be used for database operations

Answer: C

Q890. What is a memory-mapped file and how does it differ from traditional file I/O?

- A. It maps a file directly into the process address space, allowing file access through memory operations instead of read/write calls
- B. It stores file data in a special map data structure
- C. It maps memory addresses to file names
- D. It compresses files to fit in memory

Answer: A

Q891. What is the difference between strong references and weak references?

- A. Weak references cannot be used with any data type
- B. Strong references prevent garbage collection of the referenced object while weak references allow it
- C. Weak references are faster than strong references
- D. Strong references use more memory per reference

Answer: B

Q892. What is memory alignment and why does it matter?

- A. Aligning data at memory addresses that are multiples of their size for efficient CPU access
- B. Sorting data in memory alphabetically
- C. Aligning code comments to the same column
- D. Matching memory sizes between different programs

Answer: A

Q893. What is the purpose of the finalize() method in Java?

- A. It finalizes the class definition preventing changes
- B. It is called by the garbage collector before reclaiming an object's memory, but its use is discouraged
- C. It permanently saves an object to disk
- D. It marks an object as complete and ready for use

Answer: B

Q894. What is a double-free error?

- A. Allocating twice the required memory
- B. Attempting to free memory that has already been freed, causing undefined behavior
- C. Using two different free functions on the same object
- D. Freeing two different objects at the same time

Answer: B

Q895. What is a phantom reference in Java?

- A. A reference to an object in another program
- B. A reference that allows determining when an object has been garbage collected without preventing collection
- C. An invisible reference that cannot be accessed
- D. A reference to a deleted object

Answer: B

Q896. What is the difference between stack allocation and heap allocation in terms of performance?

- A. Stack allocation is slower because it checks for overflow
- B. They have identical performance characteristics
- C. Heap allocation is always faster than stack allocation
- D. Stack allocation is faster because it only requires moving the stack pointer, while heap allocation involves finding suitable free blocks

Answer: D

Q897. What is the purpose of soft references in Java?

- A. They allow the garbage collector to reclaim objects only when memory is low, useful for caches
- B. They create softly linked objects that cannot be modified
- C. They create references that automatically become null after a timeout
- D. They reference objects stored on soft storage like SSDs

Answer: A

Q898. What is the concept of ownership in Rust?

- A. A design pattern for managing database connections
- B. A system where each value has exactly one variable that owns it, controlling when the value is dropped
- C. A way to assign copyright to code
- D. A security feature that restricts file access

Answer: B

Q899. What is memory compaction in garbage collection?

- A. Reducing the virtual memory size of a process
- B. Moving live objects together to eliminate fragmentation and create contiguous free space
- C. Compressing data to use less memory
- D. Deleting all objects from memory

Answer: B

Q900. What is the difference between try-except-else and try-except-finally in Python?

- A. The else block runs when an exception occurs while finally runs when it does not
- B. The else block runs only when no exception occurs while the finally block runs regardless of whether an exception occurred
- C. They are identical in behavior
- D. The else block handles exceptions while finally throws them

Answer: B

Q901. Why is catching generic exceptions (like catch Exception) considered a bad practice?

- A. Because generic exceptions take more memory than specific ones
- B. Because generic exceptions are slower to catch than specific ones
- C. Because the compiler does not allow generic exception catches
- D. Because it catches all exceptions including ones the code cannot handle, hiding bugs and unexpected errors

Answer: D

Q902. What is exception filtering in C# (when clause)?

- A. Adding a condition to a catch block that must be true for the catch to handle the exception
- B. Filtering out exceptions based on their message text only
- C. Removing exceptions from the program permanently
- D. Blocking certain exception types from being thrown

Answer: A

Q903. What is the purpose of the suppressed exceptions feature in Java?

- A. It attaches secondary exceptions that were suppressed during cleanup in try-with-resources to the primary exception
- B. It reduces the number of exceptions a program can throw
- C. It silently ignores all exceptions
- D. It prevents exceptions from being logged

Answer: A

Q904. What is the difference between assertion errors and exceptions?

- A. Assertions are faster than exceptions
- B. Assertions replace the need for all exception handling
- C. Exceptions cannot be caught while assertions can
- D. Assertions check for programmer errors that should never happen while exceptions handle expected error conditions

Answer: D

Q905. What is the anti-pattern of using exceptions for control flow?

- A. Using too few exception handlers in the program
- B. Throwing exceptions from constructors
- C. Catching exceptions and logging them
- D. Using try-catch blocks for normal program flow instead of conditional checks, harming performance and readability

Answer: D

Q906. What is exception wrapping or translation?

- A. Wrapping exception handling code in a separate class
- B. Catching a low-level exception and throwing a higher-level exception that is more meaningful to the caller
- C. Converting exception messages to different languages
- D. Converting compile-time errors to runtime exceptions

Answer: B

Q907. What is the purpose of the 'finally' block in resource cleanup?

- A. It guarantees that cleanup code (like closing files or connections) executes whether or not an exception occurred
- B. It finalizes the data and sends it to the database
- C. It prevents the exception from propagating further
- D. It runs only when no exception is thrown

Answer: A

Q908. What is the difference between re-throwing and wrapping an exception?

- A. Re-throwing is faster while wrapping provides more information
- B. Re-throwing propagates the same exception unchanged while wrapping creates a new exception with the original as the cause
- C. They are identical operations with different names
- D. Re-throwing creates a new exception while wrapping keeps the same one

Answer: B

Q909. What is the role of the getMessage() method on exceptions?

- A. It returns a human-readable description of the error that caused the exception
- B. It sends an error message to the user via email
- C. It creates a new exception with a custom message
- D. It translates the exception into a log entry

Answer: A

Q910. What is the purpose of a requirements.txt file in Python?

- A. It lists the hardware requirements for the program
- B. It lists the required test cases
- C. It specifies the Python package dependencies and their versions needed for the project
- D. It contains the project documentation

Answer: C

Q911. What is the difference between a bundler and a package manager?

- A. A package manager only works with frontend code
- B. A package manager installs and manages dependencies while a bundler combines source files into optimized bundles for deployment
- C. A bundler installs packages while a package manager bundles code
- D. They are identical tools with different names

Answer: B

Q912. What is dependency resolution in package management?

- A. Removing unnecessary dependencies from the project
- B. Converting dependencies to a different programming language
- C. Resolving conflicts between developers about which packages to use
- D. The process of determining compatible versions of all direct and transitive dependencies

Answer: D

Q913. What is the purpose of namespace imports in programming?

- A. Importing only private functions from a module
- B. Creating namespace aliases for the operating system
- C. Importing all exports from a module under a single namespace to avoid naming conflicts
- D. Creating new names for existing functions

Answer: C

Q914. What is the purpose of the peerDependencies field in package.json?

- A. It lists peer-reviewed packages only
- B. It defines packages used exclusively during peer programming
- C. It specifies packages that should be provided by the consuming project rather than installed as nested dependencies
- D. It lists packages that are optional for the project

Answer: C

Q915. What is lazy loading of modules?

- A. Deferring the loading of a module until it is actually needed, reducing initial startup time
- B. Loading modules slowly to reduce CPU usage
- C. Loading only the documentation of a module
- D. Loading modules without importing them

Answer: A

Q916. What is the difference between static imports and dynamic imports?

- A. Dynamic imports can only load built-in modules
- B. Static imports are resolved at compile time while dynamic imports load modules at runtime based on conditions
- C. Static imports are faster than dynamic imports in all cases
- D. Static imports happen at runtime while dynamic imports happen at compile time

Answer: B

Q917. What is the purpose of a module's public API?

- A. The internal implementation details of the module
- B. The set of exported functions, classes, and types that external code can use
- C. The private methods used for testing
- D. The documentation comments in the module

Answer: B

Q918. What is the npm audit command used for?

- A. Scanning project dependencies for known security vulnerabilities
- B. Checking the financial cost of dependencies
- C. Auditing the code for style violations
- D. Auditing the performance of installed packages

Answer: A

Q919. What is the difference between a workspace and a standalone package?

- A. Standalone packages cannot have dependencies
- B. Workspaces can only contain two packages
- C. A workspace manages multiple related packages in a single repository with shared dependencies while standalone packages are independent
- D. Workspaces are for development only while packages are for production

Answer: C

Q920. What is the Builder pattern and when should it be used?

- A. A pattern for building database tables
- B. A pattern that compiles code faster
- C. A pattern for building user interfaces
- D. A pattern that separates object construction from representation, useful for objects with many optional parameters

Answer: D

Q921. What is the Proxy pattern?

- A. A pattern that provides a surrogate object that controls access to another object
- B. A pattern that hides all methods of an object
- C. A pattern for configuring network proxies
- D. A pattern that copies objects between servers

Answer: A

Q922. What is memoization in the context of dynamic programming?

- A. Caching results of subproblems to avoid redundant computation in recursive algorithms
- B. Storing algorithm pseudocode in comments
- C. Writing notes about algorithm design
- D. Memorizing the source code for the exam

Answer: A

Q923. What is the Chain of Responsibility pattern?

- A. A pattern where a request is passed along a chain of handlers until one handles it
- B. A pattern for linking database tables
- C. A pattern for managing responsibility among team members
- D. A pattern that chains function calls together

Answer: A

Q924. What is the difference between space complexity and time complexity?

- A. They measure the same thing using different units
- B. Space complexity is always larger than time complexity
- C. Space complexity measures memory usage growth while time complexity measures execution time growth relative to input size
- D. Time complexity only applies to recursive algorithms

Answer: C

Q925. What is the Template Method pattern?

- A. A pattern for generating boilerplate code
- B. A pattern that defines the skeleton of an algorithm in a base class, letting subclasses override specific steps
- C. A pattern that templates all method signatures
- D. A pattern for creating HTML templates

Answer: B

Q926. What is the difference between top-down and bottom-up dynamic programming?

- A. They always produce different results
- B. Top-down is always faster than bottom-up
- C. Top-down uses recursion with memoization while bottom-up builds solutions iteratively from smallest subproblems
- D. Bottom-up uses recursion while top-down uses iteration

Answer: C

Q927. What is the Mediator pattern?

- A. A pattern that converts between data formats
- B. A pattern for mediating between the CPU and memory
- C. A pattern for middle-tier server components
- D. A pattern that defines an object to encapsulate how a set of objects interact, reducing direct dependencies

Answer: D

Q928. What is amortized analysis?

- A. A technique that averages the time per operation over a sequence of operations to give a tighter bound than worst-case
- B. Analyzing the amount of memory amortized over program lifetime
- C. Financial analysis of algorithm development costs
- D. Estimating the remaining time for a running algorithm

Answer: A

Q929. What is the difference between a monitor and a semaphore?

- A. A monitor provides mutual exclusion with condition variables as a high-level construct while a semaphore is a lower-level counting mechanism
- B. Monitors are faster than semaphores
- C. They are identical synchronization mechanisms
- D. Semaphores provide mutual exclusion while monitors do not

Answer: A

Q930. What is the purpose of the volatile keyword in concurrent programming?

- A. It ensures that reads and writes to a variable are visible to all threads by preventing CPU caching of the value
- B. It makes a variable faster to access
- C. It allocates the variable on the heap instead of the stack
- D. It prevents a variable from being modified

Answer: A

Q931. What is a barrier in concurrent programming?

- A. A hardware barrier between CPU cores
- B. A security barrier preventing unauthorized thread access
- C. A synchronization point where all threads must arrive before any can proceed past it
- D. A barrier preventing memory leaks

Answer: C

Q932. What is a livelock and how does it differ from a deadlock?

- A. A livelock is a deadlock that eventually resolves itself
- B. In a livelock, threads actively respond to each other but make no progress, unlike deadlock where threads are blocked indefinitely
- C. A deadlock involves active threads while a livelock involves blocked threads
- D. A livelock uses more memory than a deadlock

Answer: B

Q933. What is the purpose of a ReadWriteLock?

- A. It locks reading while allowing concurrent writes
- B. It provides separate locks for different data types
- C. It allows multiple threads to read simultaneously but requires exclusive access for writing
- D. It separates read and write operations into different files

Answer: C

Q934. What is the difference between a Future and a Promise?

- A. A Future is a read-only handle to an asynchronous result while a Promise is the writable side that resolves the value
- B. They are identical concepts in all languages
- C. Futures are faster than Promises
- D. Promises are used only in JavaScript while Futures are used everywhere

Answer: A

Q935. What is the difference between cooperative and preemptive scheduling of threads?

- A. They produce identical scheduling outcomes
- B. Cooperative scheduling requires threads to voluntarily yield control while preemptive scheduling allows the OS to interrupt threads at any time
- C. Preemptive scheduling cannot handle more than four threads
- D. Cooperative scheduling is always more efficient

Answer: B

Q936. What is the purpose of a CountdownLatch?

- A. It counts down to thread termination
- B. It allows one or more threads to wait until a set of operations in other threads completes
- C. It limits the number of threads that can run simultaneously
- D. It counts the number of threads in the system

Answer: B

Q937. What is the actor model of concurrency?

- A. A model where one main actor directs all other threads
- B. A model where independent actors communicate only through asynchronous message passing, avoiding shared state
- C. A model where actors perform computations in a theater-like environment
- D. A model that uses actors to represent database transactions

Answer: B

Q938. What is thread-local storage?

- A. A local database connection for each thread
- B. Storage on the thread's stack only
- C. Storage that is local to the computer running the thread
- D. Memory that is private to each thread, where each thread has its own independent copy of the variable

Answer: D

Q939. What is the difference between a stub and a mock in testing?

- A. A stub provides predetermined responses to method calls while a mock also verifies that expected interactions occurred
- B. They are identical testing concepts
- C. Stubs are faster than mocks
- D. Mocks provide data while stubs verify behavior

Answer: A

Q940. What is boundary value analysis in testing?

- A. Analyzing the boundaries of the codebase
- B. Analyzing code coverage boundaries
- C. Setting boundaries on test execution time
- D. Testing at the edges of input ranges where errors are most likely to occur

Answer: D

Q941. What is the purpose of test doubles?

- A. Double-checking test results manually
- B. Creating two versions of each test
- C. Running each test twice for verification
- D. Objects that stand in for real dependencies during testing, providing isolation and control

Answer: D

Q942. What is the arrange-act-assert (AAA) pattern in testing?

- A. A pattern for asserting code style compliance
- B. A pattern for arranging test files alphabetically
- C. A pattern for testing in three environments
- D. A pattern that structures tests into setup (arrange), execution (act), and verification (assert) phases

Answer: D

Q943. What is snapshot testing?

- A. Testing at a specific snapshot in version control
- B. Capturing the output of a component and comparing it against a stored reference snapshot in future test runs
- C. Testing memory snapshots for leaks
- D. Taking screenshots of the application for visual comparison

Answer: B

Q944. What is the purpose of a code coverage tool?

- A. Measuring how much of the source code is executed by the test suite
- B. Covering up bugs so they are not visible
- C. Covering code with comments for documentation
- D. Protecting code from unauthorized access

Answer: A

Q945. What is the difference between end-to-end testing and integration testing?

- A. They test the same scope at different speeds
- B. Integration tests cover more code than end-to-end tests
- C. End-to-end tests verify the entire application workflow from user perspective while integration tests verify interactions between specific components
- D. End-to-end tests are faster than integration tests

Answer: C

Q946. What is the purpose of conditional breakpoints in a debugger?

- A. Breaking execution conditionally based on CPU temperature
- B. Breaking execution only when a programmer-specified condition is true, avoiding stopping at every iteration
- C. Creating breakpoints that expire after a certain number of hits
- D. Setting breakpoints that only work on certain days

Answer: B

Q947. What is test parameterization?

- A. Setting global parameters for all tests
- B. Adjusting test framework parameters
- C. Parameterizing the test environment
- D. Running the same test logic with different input values and expected results

Answer: D

Q948. What is the difference between a smoke test and a sanity test?

- A. Sanity tests run before smoke tests in the pipeline
- B. They are identical types of tests
- C. Smoke tests are longer than sanity tests
- D. Smoke tests verify that critical functionality works after a build while sanity tests verify that specific bug fixes or features work correctly

Answer: D

Q949. What is the difference between continuous integration and continuous delivery?

- A. They are identical processes with different names
- B. CI works with all languages while CD only works with web applications
- C. CI deploys code while CD tests it
- D. CI automatically builds and tests code changes while CD ensures code is always in a deployable state and can be released at any time

Answer: D

Q950. What is the purpose of a code linter?

- A. Compiling code faster than the standard compiler
- B. Linking code files together into an executable
- C. Removing lint from the physical computer
- D. Analyzing source code to find potential errors, style violations, and suspicious patterns before execution

Answer: D

Q951. What is the difference between a hotfix and a regular release?

- A. A hotfix is an urgent fix for a critical production issue deployed outside the normal release cycle while a regular release follows the planned schedule
- B. Hotfixes are larger than regular releases
- C. Regular releases only contain bug fixes while hotfixes contain features
- D. Hotfixes do not require testing

Answer: A

Q952. What is the purpose of semantic versioning (SemVer)?

- A. Numbering each line of source code
- B. Versioning based on release dates
- C. Communicating the nature of changes through version numbers (MAJOR.MINOR.PATCH) so users know compatibility impact
- D. Assigning version numbers based on team vote

Answer: C

Q953. What is the purpose of a CI/CD pipeline?

- A. A tool for managing database migrations
- B. A physical pipeline for connecting servers
- C. A network protocol for transferring code
- D. An automated workflow that builds, tests, and deploys code changes through defined stages

Answer: D

Q954. What is the difference between blue-green deployment and canary deployment?

- A. Blue-green is faster than canary
- B. They deploy code in the same way but at different times
- C. Blue-green switches all traffic between two identical environments while canary gradually routes a percentage of traffic to the new version
- D. Canary deployment requires two complete environments while blue-green uses one

Answer: C

Q955. What is the purpose of a code formatter like Prettier or Black?

- A. Making code execute faster
- B. Converting code between programming languages
- C. Formatting code for printing on paper
- D. Automatically formatting code to follow consistent style rules, eliminating style debates in code reviews

Answer: D

Q956. What is the purpose of a pre-commit hook?

- A. Creating a backup before each commit
- B. Sending a notification before each commit
- C. Running automated checks (like linting, tests, or formatting) before a git commit is created, preventing bad code from entering the repository
- D. Committing code before anyone else

Answer: C

Q957. What is the difference between a monolith and microservices architecture?

- A. Monoliths are always slower than microservices
- B. A monolith deploys the entire application as a single unit while microservices decompose it into independently deployable services
- C. Monoliths do not support any form of modularity
- D. Microservices cannot share databases

Answer: B

Q958. What is the difference between eager evaluation and lazy evaluation of function arguments?

- A. Lazy evaluation computes all arguments immediately
- B. Eager evaluation is always slower than lazy evaluation
- C. Eager evaluation only works with pure functions
- D. Eager evaluation computes arguments before passing them while lazy evaluation delays computation until the value is actually needed

Answer: D

Q959. What is the difference between stable and unstable sorting algorithms?

- A. Stable sorts only work on numeric data
- B. Unstable sorts produce incorrect results for duplicate values
- C. Stable sorts are always faster than unstable sorts
- D. Stable sorts preserve the relative order of equal elements while unstable sorts may rearrange them

Answer: D

Q960. What is the purpose of a definition of done (DoD) in agile development?

- A. A list of developers assigned to each task
- B. Defining when the project is completely finished
- C. A shared checklist of criteria that must be met for a work item to be considered complete
- D. A document that defines the final release date

Answer: C

Programming (C++, Java, Python) — Hard

480 questions

Q961. What is the halting problem in computer science?

- A. Optimizing a program execution speed through advanced compiler techniques
- B. Determining whether an arbitrary program will finish running or loop forever
- C. Finding and reporting memory leaks occurring during a program execution
- D. Determining whether a program contains syntax errors in its source code

Answer: B

Q962. In language theory, what is a context-free grammar (CFG)?

- A. A grammar where production rules apply regardless of context
- B. A grammar equivalent to standard regular expressions
- C. A grammar where rules depend on surrounding token context
- D. A grammar that is exclusively used in natural languages

Answer: A

Q963. What is tail call optimization (TCO)?

- A. Optimizing the first function call in a chain
- B. Parallelizing multiple function calls at once
- C. Reusing the current stack frame for a tail call
- D. Removing unused function calls from the code

Answer: C

Q964. What distinguishes a pure function in functional programming?

- A. It returns the same output for the same input always
- B. It cannot accept any parameters from the caller
- C. It modifies global state and external variables freely
- D. It must use recursion as its primary control flow

Answer: A

Q965. What is referential transparency?

- A. A function that returns void and produces no output value
- B. An expression replaceable with its value without side effects
- C. A pointer that references itself in a circular data structure
- D. A variable that can be referenced from anywhere in the code

Answer: B

Q966. What is the difference between static and dynamic dispatch?

- A. Static dispatch is always slower than dynamic dispatch in practice
- B. Static dispatch resolves methods at compile time; dynamic at runtime
- C. They are identical concepts in object-oriented programming languages
- D. Dynamic dispatch is only available in the C programming language

Answer: B

Q967. What is a closure in programming?

- A. A method used to close open file handles
- B. A function bundled with its lexical scope
- C. A technique to terminate a running loop
- D. A destructor that cleans up class state

Answer: B

Q968. What is continuation-passing style (CPS)?

- A. A structured method for handling runtime errors
- B. Passing control explicitly via continuation functions
- C. A design pattern for building user interfaces
- D. Passing all arguments by reference to functions

Answer: B

Q969. What is homoiconicity in a programming language?

- A. All variables in the program share the same type
- B. The code can run on any platform without changes
- C. Code structure uses the language own data structures
- D. Functions return the exact same type they receive

Answer: C

Q970. What is the Curry-Howard correspondence?

- A. A technique for normalizing database tables
- B. A method for performing function currying
- C. A link between mathematical proofs and programs
- D. A protocol for networking between computers

Answer: C

Q971. What is the IEEE 754 standard?

- A. A specification for database schemas
- B. A standard for security encryption
- C. A protocol for computer networking
- D. A standard for floating-point numbers

Answer: D

Q972. What is a phantom type?

- A. A type providing compile-time safety without storing data
- B. A type that has been deprecated from the language standard
- C. A type reserved for representing ghost or phantom objects
- D. A type that only exists at runtime and not at compile time

Answer: A

Q973. What is the difference between structural typing and nominal typing?

- A. They are exactly the same concept with different names
- B. Structural typing is only applicable to struct data types
- C. Nominal typing is only applicable to numeric data types
- D. Structural checks compatibility by shape; nominal by name

Answer: D

Q974. What is type erasure in Java generics?

- A. Removing type information at the compile stage
- B. Deleting all variables of a particular given type
- C. Generic type info removed at runtime as raw types
- D. Converting every type to Object at compile time

Answer: C

Q975. What is a dependent type?

- A. A type that inherits from another
- B. A type that depends on a library
- C. A type that is defined by a value
- D. A type that requires garbage collection

Answer: C

Q976. What is the bottom type in type theory?

- A. A type with no values and subtype of every type
- B. The null type representing an absence of a value
- C. The base class that all other types inherit from
- D. The standard integer type used for whole numbers

Answer: A

Q977. What is variance in type systems?

- A. Random and unpredictable behavior in type inference
- B. The size variation of different data types in memory
- C. How subtyping of complex types relates to components
- D. The total range of values a type can hold

Answer: C

Q978. What is an algebraic data type (ADT)?

- A. An array type that exclusively stores numeric values
- B. A data type designed for mathematical operations only
- C. A type used for representing algebraic math expressions
- D. A composite type combining sum and product operations

Answer: D

Q979. What is the unit type?

- A. A type with exactly one possible value
- B. A type used for measurement units
- C. The integer constant value of one
- D. A class with a single instance only

Answer: A

Q980. What is the purpose of type witnesses in advanced type systems?

- A. To provide explicit proof of type relationships
- B. To help debug complex type errors in code
- C. To convert types dynamically during execution
- D. To observe and log type changes at runtime

Answer: A

Q981. What is operator overloading?

- A. Defining custom behavior for user-defined types
- B. An error caused by incorrect operator usage
- C. Increasing the default operator precedence level
- D. Using too many operators in one expression

Answer: A

Q982. What is the result of ~5 in a system using 32-bit signed integers?

- A. 5
- B. -5
- C. 6
- D. -6

Answer: D

Q983. What is the spaceship operator (<=>)?

- A. An assignment operator for setting variables
- B. A comparison operator returning -1, 0, or 1
- C. A bitwise shift operator for binary values
- D. A logical operator for boolean expressions

Answer: B

Q984. What is the difference between arithmetic right shift (>>) and logical right shift (>>>)?

- A. There is no difference between them at all
- B. >>> preserves the sign bit; >> fills with zeros
- C. >> preserves the sign bit; >>> fills with zeros
- D. >> always fills the vacant bit positions with zeros

Answer: C

Q985. What is the Elvis operator (?:) in Kotlin?

- A. Returns left if non-null, otherwise right
- B. A type-checking operator for null safety
- C. A standard ternary conditional operator
- D. A bitwise operator for binary operations

Answer: A

Q986. How does Python's 'is' operator differ from '=='?

- A. is runs faster but produces less accurate results
- B. is checks identity; == checks value equality
- C. They are functionally identical in all cases
- D. == checks identity while is checks equality

Answer: B

Q987. What is the safe navigation operator (?.) in Kotlin/TypeScript?

- A. It forces a null pointer exception to be thrown immediately
- B. It converts any null value to the integer zero automatically
- C. It always returns a null value regardless of the receiver
- D. It accesses a member only if the receiver is non-null

Answer: D

Q988. What does the >>> operator do in Java that >> does not?

- A. It fills leftmost bits with 0, ignoring the sign
- B. It operates more slowly than the >> operator
- C. It works on floating-point numbers unlike >>
- D. Nothing different from the >> operator at all

Answer: A

Q989. What is destructuring assignment?

- A. A type of memory deallocation for objects
- B. Deleting variables from the current scope
- C. Unpacking values from arrays or objects into variables
- D. Assigning null to multiple variables at once

Answer: C

Q990. What is the pipeline operator (|>) proposed for JavaScript?

- A. A bitwise OR operation on binary values
- B. A comparison operator for ordering two values
- C. It passes left result as argument to right function
- D. A type conversion operator between data types

Answer: C

Q991. What is tail recursion and how does it relate to loops?

- A. Recursion that uses a tail pointer data structure
- B. Recursion without any base case for termination
- C. A loop structure that invokes itself recursively
- D. A tail-position recursive call optimized into a loop

Answer: D

Q992. What is the difference between structured and unstructured control flow?

- A. Structured control flow is slower than unstructured control
- B. Unstructured control flow is more readable than structured
- C. There is no meaningful difference between the two approaches
- D. Structured uses blocks like if/while; unstructured uses goto

Answer: D

Q993. What is pattern matching as a control structure?

- A. Matching strings with regular expressions
- B. A generalized switch that destructures data types
- C. A repeating pattern within a loop construct
- D. A text search algorithm for finding substrings

Answer: B

Q994. What is the difference between eager and lazy evaluation in control flow?

- A. Eager evaluates expressions immediately; lazy defers until value needed
- B. Lazy evaluation is always faster than eager evaluation in all cases
- C. Eager evaluation is only used in purely functional language paradigms
- D. There is no practical difference between the two evaluation strategies

Answer: A

Q995. What is a coroutine and how does it differ from a subroutine?

- A. A coroutine is a specialized type of loop iteration control structure
- B. A subroutine can be paused and resumed at arbitrary execution points
- C. They are the same thing with different names in different languages
- D. A coroutine can suspend and resume; a subroutine runs to completion

Answer: D

Q996. What is the purpose of guard clauses?

- A. To lock and protect shared resources from concurrent thread access
- B. To guard against invalid memory allocation during program startup
- C. To protect systems against unauthorized network access attempts
- D. To handle edge cases early by returning at the start of functions

Answer: D

Q997. What is a trampoline in the context of recursion?

- A. A technique converting recursion into iterative loops
- B. A specialized debugging tool for stack overflow
- C. A physical device used for hardware testing
- D. A tree-based data structure for fast lookup

Answer: A

Q998. What is continuation in control flow?

- A. A loop continuation condition for iterations
- B. An alternative to the break statement in loops
- C. The next sequential statement in the code
- D. An abstract representation of remaining computation

Answer: D

Q999. What is the difference between deterministic and non-deterministic control flow?

- A. There is no practical difference between them at all
- B. Deterministic follows a fixed path; non-deterministic explores many
- C. Non-deterministic control flow always causes the program to crash
- D. Deterministic control flow always executes more slowly than others

Answer: B

Q1000. What is the 'goto considered harmful' argument?

- A. Goto should be used everywhere as the primary control flow method
- B. Goto causes memory leaks and resource allocation failures in code
- C. Dijkstra argued goto makes programs hard to follow and reason about
- D. Goto is always the most efficient control flow mechanism available

Answer: C

Q1001. What is function currying?

- A. Overloading a function with additional parameter types
- B. Caching the results of previous function calls
- C. Optimizing a function for better performance
- D. Transforming multi-argument function into single-argument chain

Answer: D

Q1002. What is memoization?

- A. Writing descriptive comments inside function body code
- B. Caching expensive function results to avoid recomputation
- C. Saving a function definition to persistent disk storage
- D. Allocating additional memory for function local variables

Answer: B

Q1003. What is the difference between early binding and late binding?

- A. Early binding resolves at compile time; late binding at runtime
- B. There is no meaningful difference between the two approaches
- C. Early binding is always slower than late binding in all cases
- D. Late binding only works in the C programming language alone

Answer: A

Q1004. What is a variadic function?

- A. A function that has a variable return data type
- B. A function that returns multiple values at once
- C. A function that accepts no input parameters
- D. A function accepting variable number of arguments

Answer: D

Q1005. What is partial application?

- A. Fixing some arguments to produce a new function taking the rest
- B. Calling a function with completely wrong argument types or values
- C. A function that only partially works and fails on some inputs
- D. An incomplete function definition that is missing its body code

Answer: A

Q1006. What is a thunk?

- A. A runtime error in the application
- B. A wrapper delaying computation evaluation
- C. A pre-allocated block of heap memory
- D. A particular type of variable binding

Answer: B

Q1007. What are first-class functions?

- A. Functions assignable to variables and passable as arguments
- B. Functions that have the highest execution priority level
- C. Functions that belong to the main class of the program
- D. Functions that are defined first in source code order

Answer: A

Q1008. What is the difference between a method and a function?

- A. Methods cannot return any values while functions always can
- B. Functions cannot accept any parameters while methods always can
- C. They are always the same thing in every programming language
- D. A method belongs to an object or class; a function is standalone

Answer: D

Q1009. What is a generator function?

- A. A function that creates and returns other functions
- B. A function that yields multiple values over time lazily
- C. A function that generates random numbers on demand
- D. A constructor that initializes a new class instance

Answer: B

Q1010. What is the Y combinator?

- A. A fixed-point combinator enabling anonymous recursion
- B. A popular comparison-based sorting algorithm
- C. A well-known startup incubator company
- D. A commonly used structural design pattern

Answer: A

Q1011. What is memory-mapped I/O?

- A. Mapping files into virtual memory address space
- B. Encrypting all I/O data during transfer
- C. Storing I/O data in the processor cache
- D. I/O that uses only RAM for data storage

Answer: A

Q1012. What is the difference between blocking and non-blocking I/O?

- A. Non-blocking I/O is always slower than blocking I/O overall
- B. There is no meaningful difference between the two modes
- C. Blocking I/O never waits for the operation to finish first
- D. Blocking waits until completion; non-blocking returns immediately

Answer: D

Q1013. What is asynchronous I/O?

- A. I/O that continues without waiting, notified on completion
- B. I/O that is identical to synchronous blocking I/O
- C. I/O operations that execute in strict sequential order
- D. I/O operations that are always extremely fast

Answer: A

Q1014. What is the purpose of the select() system call?

- A. Selecting a record from a database table query
- B. Selecting files to delete from the file system
- C. Monitoring file descriptors for I/O readiness
- D. Choosing which thread the scheduler should run

Answer: C

Q1015. What is zero-copy I/O?

- A. I/O operations that have zero financial cost
- B. I/O operations that transfer no data at all
- C. Deleting data as it is being transferred out
- D. Transferring data without copying between buffers

Answer: D

Q1016. What is the reactor pattern in I/O?

- A. A nuclear-physics computing simulation pattern
- B. An event-driven dispatcher that demultiplexes I/O events
- C. A chemical reaction simulation programming model
- D. A simple loop-based sequential processing pattern

Answer: B

Q1017. What are I/O multiplexing mechanisms like epoll and kqueue?

- A. Command-line utilities designed for copying files efficiently
- B. Multi-threaded I/O libraries for parallel data processing
- C. Mechanisms that duplicate I/O devices for redundancy
- D. Scalable kernel interfaces for monitoring many file descriptors

Answer: D

Q1018. What is the difference between character devices and block devices?

- A. Character devices transfer byte by byte; block in fixed chunks
- B. Block devices are exclusively used for text file operations
- C. There is no functional difference between device types
- D. Character devices are always faster than block-based devices

Answer: A

Q1019. What is Direct Memory Access (DMA) in the context of I/O?

- A. Hardware allowing device-to-memory transfer without CPU
- B. A software programming technique for data transfer
- C. A debugging method for diagnosing hardware I/O issues
- D. A specialized type of dynamic memory allocation method

Answer: A

Q1020. What is scatter-gather I/O (vectored I/O)?

- A. Reading/writing multiple non-contiguous buffers at once
- B. Distributing I/O operations across network nodes
- C. Random I/O patterns across scattered disk sectors
- D. Fragmented file storage across multiple disk drives

Answer: A

Q1021. What is the time complexity of naive string matching?

- A. $O(n*m)$
- B. $O(\log n)$
- C. $O(n)$
- D. $O(n^2)$

Answer: A

Q1022. What is the KMP (Knuth-Morris-Pratt) string matching algorithm?

- A. A comparison-based sorting algorithm for arrays
- B. A tree traversal algorithm for binary search trees
- C. A linear-time string matcher using a failure function
- D. A hashing algorithm for generating unique hash codes

Answer: C

Q1023. What is string interning?

- A. Compressing strings to reduce their memory size
- B. Storing one copy of each distinct string value
- C. Encrypting strings for secure data transmission
- D. Storing strings in a temporary memory buffer

Answer: B

Q1024. What is the Rabin-Karp algorithm?

- A. A graph traversal algorithm for shortest paths
- B. A string matcher using hashing for efficient search
- C. A comparison-based sorting algorithm for collections
- D. A compression algorithm for reducing data file sizes

Answer: B

Q1025. What is a trie (prefix tree) and how does it relate to strings?

- A. A linked list that stores strings in sequential memory order
- B. A standard binary search tree data structure
- C. A hash table that maps string keys to their computed values
- D. A tree where each node represents a character for prefix search

Answer: D

Q1026. What is the difference between UTF-8, UTF-16, and UTF-32?

- A. UTF-32 uses the least amount of storage space per character overall
- B. They are all identical encoding formats with no differences at all
- C. UTF-8 uses 1-4 bytes, UTF-16 uses 2-4 bytes, UTF-32 uses exactly 4
- D. UTF-8 is a fixed-width encoding that always uses exactly one byte

Answer: C

Q1027. What is a rope data structure for strings?

- A. A contiguous array of individual character values
- B. A hash map that stores character frequency counts
- C. A singly linked list of character nodes
- D. A balanced tree for efficient long string operations

Answer: D

Q1028. What is the Levenshtein distance?

- A. The total length of a string in characters
- B. The count of matching characters between strings
- C. The byte size of a string in memory allocation
- D. The minimum single-character edits between strings

Answer: D

Q1029. What is the Boyer-Moore string search algorithm's key insight?

- A. Start comparing from the beginning of the pattern each time
- B. Use hashing to compare the pattern against every position
- C. Compare every single character without skipping any at all
- D. Start from pattern end and use heuristics to skip sections

Answer: D

Q1030. What are surrogate pairs in UTF-16?

- A. Duplicate characters stored in the encoding table
- B. Error codes returned by the UTF-16 encoding process
- C. Pairs of 16-bit units for characters beyond the BMP
- D. Paired delimiter characters used in string literals

Answer: C

Q1031. What is a bloom filter?

- A. A comparison-based sorting algorithm for arrays
- B. A space-efficient probabilistic set membership tester
- C. An image processing filter for visual enhancement
- D. A standard hash table with separate chaining buckets

Answer: B

Q1032. What is a skip list?

- A. A filtered array that excludes elements matching a condition
- B. A probabilistic multi-layer linked list for $O(\log n)$ search
- C. A list that skips over certain elements during iteration
- D. A type of priority queue that maintains sorted element order

Answer: B

Q1033. What is a concurrent hash map?

- A. A hash map using multiple hash functions per key
- B. A thread-safe hash map without full map locking
- C. A distributed database across network nodes only
- D. A regular hash map with no special properties

Answer: B

Q1034. What is the amortized time complexity of adding an element to a dynamic array?

- A. $O(1)$ amortized
- B. Always $O(n)$
- C. $O(\log n)$ each
- D. $O(n \log n)$ each

Answer: A

Q1035. What is a persistent data structure?

- A. An immutable structure that can never be accessed again
- B. A structure preserving previous versions on modification
- C. A relational database schema structure for queries
- D. A structure saved to persistent disk storage

Answer: B

Q1036. What is a B-tree and where is it commonly used?

- A. A self-balancing tree with multiple keys per node for databases
- B. A hash table variant that uses tree-based collision resolution
- C. A standard binary tree with two children per node
- D. A linked list type that organizes data in sequential node chains

Answer: A

Q1037. What is consistent hashing?

- A. A type of encryption used for securing sensitive data values
- B. A collision resolution method for hash table bucket overflow
- C. A hashing scheme that minimally redistributes keys on change
- D. Regular hashing with standard hash function methods

Answer: C

Q1038. What is a lock-free data structure?

- A. An unprotected array that any thread can freely modify
- B. A concurrent structure using atomic operations not locks
- C. A structure with no synchronization protection at all
- D. A read-only data structure that cannot be changed ever

Answer: B

Q1039. What is the difference between external and internal iterators?

- A. Internal iterators always consume more memory than external iterators
- B. External iterators are always faster than internal iterators in practice
- C. There is no meaningful difference between the two iterator types
- D. External iterators are client-controlled; internal are collection-controlled

Answer: D

Q1040. What is a disjoint set (union-find) data structure?

- A. A structure tracking element partitions with union and find
- B. A sorted set that maintains elements in order
- C. A hash set variant that uses separate chaining for entries
- D. A set that has no intersections with any other set at all

Answer: A

Q1041. What is the SOLID principle in OOP?

- A. A coding style guide for naming conventions in code
- B. A data structure for organizing elements efficiently
- C. Five design principles: SRP, OCP, LSP, ISP, and DIP
- D. A testing framework for validating software behavior

Answer: C

Q1042. What is a virtual method table (vtable)?

- A. A hash table for caching method results quickly
- B. A debug table for tracking method execution and logging
- C. A lookup table for resolving dynamic method calls at runtime
- D. A method list defined in the source code of the program

Answer: C

Q1043. What is the difference between association, aggregation, and composition?

- A. Association is general; aggregation weak; composition strong ownership
- B. They are all identical concepts with just different names used
- C. Composition is always the better design choice in every single case
- D. Only naming differences exist with no behavioral distinctions at all

Answer: A

Q1044. What is a mixin?

- A. A class that mixes different data types together randomly
- B. A class providing methods to others without being standalone
- C. A type of interface that defines a strict method contract
- D. A structural design pattern for building complex objects

Answer: B

Q1045. What is double dispatch and how does it differ from single dispatch?

- A. Single dispatch uses two methods while double dispatch uses only one
- B. There is no practical difference between the two dispatch mechanisms
- C. Single dispatch selects by one type; double dispatch by two types
- D. Double dispatch is twice as fast in execution as single dispatch

Answer: C

Q1046. What is metaclass programming?

- A. Creating graphical user interfaces programmatically
- B. Writing classes whose instances are themselves classes
- C. A commonly used structural design pattern for code
- D. Programming about programs in general terms

Answer: B

Q1047. What is the difference between prototype-based and class-based OOP?

- A. Prototype-based OOP is always slower than class-based OOP overall
- B. Class-based uses blueprints; prototype-based clones existing objects
- C. They are the same approach with no meaningful differences at all
- D. Class-based OOP cannot support any form of inheritance at all

Answer: B

Q1048. What is the fragile base class problem?

- A. A compilation error from missing method implementations
- B. A memory leak caused by improper object disposal code
- C. A class that is too small to be useful on its own
- D. Base class changes can break derived classes unexpectedly

Answer: D

Q1049. What is covariant return type?

- A. A generic type parameter used in collection class definitions
- B. Allowing an overriding method to return a more specific subtype
- C. Always returning the exact same type as the parent declares
- D. A type error that occurs when return types do not match up

Answer: B

Q1050. What is the object slicing problem in C++?

- A. Splitting an object into smaller component parts for storage
- B. When assigning derived to base variable, derived data is lost
- C. A memory allocation issue caused by fragmented heap storage
- D. A threading problem from concurrent access to shared objects

Answer: B

Q1051. What is the mark-and-sweep garbage collection algorithm?

- A. Marking files for deletion from the disk system
- B. A disk cleanup algorithm for removing temporary files
- C. A memory allocation method for new object creation
- D. A GC that marks reachable objects then frees unmarked

Answer: D

Q1052. What is a generational garbage collector?

- A. A manual memory manager without automatic collection
- B. A garbage collector for old legacy programs only
- C. A GC dividing objects by age, collecting young often
- D. A reference counting garbage collection implementation

Answer: C

Q1053. What is the difference between `unique_ptr`, `shared_ptr`, and `weak_ptr` in C++?

- A. `unique_ptr` is exclusive; `shared_ptr` shares; `weak_ptr` observes only
- B. They are all the same smart pointer type with no differences
- C. `shared_ptr` cannot be copied or assigned to another `shared_ptr` var
- D. `unique_ptr` is always slower than the other two smart pointer types

Answer: A

Q1054. What is memory-mapped files and how do they work?

- A. Files mapped into virtual address space for memory I/O
- B. Files that have been encrypted for secure data storage
- C. Files that are stored only in volatile RAM memory
- D. Files that have been compressed to save disk space used

Answer: A

Q1055. What is a slab allocator?

- A. A garbage collector that runs periodically in background
- B. A simple wrapper around the standard `malloc` function call
- C. A disk allocator that manages file system block assignments
- D. A mechanism pre-allocating and caching object-sized blocks

Answer: D

Q1056. What is escape analysis in JVM?

- A. Compiler analysis determining if object references escape scope
- B. Network traffic analysis for monitoring data flow patterns
- C. Analyzing program exit codes and termination conditions
- D. Exception analysis for tracking error propagation in code

Answer: A

Q1057. What is the ABA problem in lock-free memory management?

- A. When a location changes A to B to A, making CAS incorrectly succeed
- B. A problem related to the alphabet ordering of values
- C. A variant of buffer overflow caused by writing past array boundaries
- D. A type of memory leak caused by circular reference chains in objects

Answer: A

Q1058. What is a write barrier in garbage collection?

- A. A mechanism intercepting pointer writes for GC invariants
- B. A memory protection scheme against buffer overflows
- C. A disk write cache for improving I/O performance
- D. A network firewall for filtering traffic

Answer: A

Q1059. What is Copy-on-Write (COW)?

- A. Sharing memory until a write triggers actual copying
- B. Copying files manually between directories on disk
- C. A garbage collection algorithm for reclaiming memory
- D. An error handling technique for runtime exceptions

Answer: A

Q1060. What is address space layout randomization (ASLR)?

- A. Randomizing process memory addresses to prevent attacks
- B. A memory allocation strategy for dynamic array growth
- C. An addressing mode for accessing hardware registers
- D. A sorting algorithm for ordering memory addresses

Answer: A

Q1061. What is the difference between fault tolerance and exception handling?

- A. Exception handling prevents all errors from ever occurring in the program
- B. Exception handling manages code errors; fault tolerance is system resilience
- C. They are exactly the same concept with no practical differences at all
- D. Fault tolerance is always faster and easier to implement than exceptions

Answer: B

Q1062. What is an exception safety guarantee?

- A. A guarantee that no exceptions will ever occur in the program
- B. Levels of state guarantees after exception: no-throw, strong, basic
- C. A compiler feature that eliminates all runtime exceptions automatically
- D. A testing tool that verifies exception handlers work correctly always

Answer: B

Q1063. What is the 'catch-all' anti-pattern?

- A. A testing pattern for verifying exception handler correctness
- B. Catching all exceptions generically which hides bugs in code
- C. Catching only specific well-defined exceptions in the code
- D. A recommended design pattern for robust exception handling

Answer: B

Q1064. What is the difference between recoverable and unrecoverable errors?

- A. There is no meaningful difference between the two error categories
- B. All errors in every program are always recoverable with proper code
- C. All errors in every program are always unrecoverable without fixes
- D. Recoverable errors can be handled; unrecoverable require termination

Answer: D

Q1065. What is Result/Either type as an alternative to exceptions?

- A. A logging mechanism for recording exception messages
- B. A type representing either success value or error value
- C. A direct replacement for try-catch in all situations
- D. A simple boolean type with true or false values

Answer: B

Q1066. What is the problem with exceptions and concurrency?

- A. Exceptions in one thread may not be visible in another thread
- B. No problems exist between exceptions and concurrency at all
- C. Concurrency completely prevents all exceptions from occurring
- D. Exceptions are inherently thread-safe in all implementations

Answer: A

Q1067. What is a panic in Rust/Go?

- A. A regular exception like any other in the language
- B. A warning message that can be safely ignored by developers
- C. An unrecoverable error that unwinds the stack and terminates
- D. A debug log entry recorded during program execution review

Answer: C

Q1068. What is structured concurrency's approach to exception handling?

- A. Ignoring all exceptions thrown by child tasks completely
- B. Propagating child exceptions to parent and cancelling siblings
- C. Logging exceptions only without any propagation to parents
- D. Catching all exceptions silently without any further action

Answer: B

Q1069. What is the difference between resumable and non-resumable exceptions?

- A. Resumable allows continuing at throw point; non-resumable unwinds
- B. There is no meaningful difference between the two exception types
- C. Non-resumable exceptions can be resumed after the handler finishes
- D. Resumable exceptions are always slower than non-resumable exceptions

Answer: A

Q1070. What is the 'exception specification' problem in C++?

- A. Exception specifications are completely reliable and always enforced
- B. They always improve performance of exception handling in all cases
- C. They are required by the C++ standard for every function definition
- D. C++ throw() specs were problematic and replaced by noexcept keyword

Answer: D

Q1071. What is dependency injection?

- A. Installing package dependencies from the package registry
- B. A package manager for downloading and installing third-party libs
- C. Providing dependencies from outside rather than creating internally
- D. An import statement for including external module code in file

Answer: C

Q1072. What is the OSGi framework?

- A. A build tool for compiling and packaging Java applications
- B. A dynamic Java module system supporting runtime bundle mgmt
- C. An operating system for mobile devices and desktops
- D. A testing framework for writing and running automated tests

Answer: B

Q1073. What is the difference between CommonJS and ES Modules?

- A. They are identical module systems with no meaningful differences
- B. ES Modules do not support any form of async module loading
- C. CommonJS uses require synchronously; ESM uses import/export
- D. CommonJS is the newer standard developed after ES Modules

Answer: C

Q1074. What is the diamond dependency problem in package management?

- A. Two dependencies requiring different versions of the same package
- B. A class inheritance issue in object-oriented programming code
- C. A circular dependency between two modules in the same project
- D. A build error caused by missing configuration files in project

Answer: A

Q1075. What is a plugin architecture?

- A. A fixed codebase that cannot be extended or modified at all
- B. A build system for compiling and packaging application binaries
- C. A testing framework for automated integration and unit testing
- D. A design allowing runtime extension via external loaded modules

Answer: D

Q1076. What is the Inversion of Control (IoC) container?

- A. A framework component managing object creation and dependencies
- B. A data structure for storing elements in a specific order only
- C. A reversed loop that iterates in backward order through data
- D. A version control system for tracking changes to source code

Answer: A

Q1077. What is ABI (Application Binary Interface) compatibility?

- A. A network protocol for communication between distributed services
- B. The same as API compatibility with no additional constraints
- C. Binary-level interface ensuring compiled modules interact correctly
- D. A data format for serializing objects to disk or network transfer

Answer: C

Q1078. What is the Service Provider Interface (SPI) pattern?

- A. A web service for hosting API endpoints on the internet
- B. A physical network interface for connecting hardware devices
- C. A design where providers implement a service-defined interface
- D. A build tool for automating compilation and deployment tasks

Answer: C

Q1079. What is reproducible builds and why is it important for packages?

- A. Building projects as fast as possible to save developer time
- B. Building multiple modules in parallel across available cores
- C. Building the same project twice in a row for verification
- D. Ensuring same source always produces bit-identical output binary

Answer: D

Q1080. What is the difference between peer dependencies and regular dependencies?

- A. Regular dependencies are always shared between all project packages
- B. There is no meaningful difference between the two dependency types
- C. Peer dependencies require the consumer to provide a shared version
- D. Peer dependencies are completely optional and never need installing

Answer: C

Q1081. What is the Visitor pattern and when would you use it?

- A. Defining new operations on objects without changing their classes
- B. An authentication pattern for verifying user identity securely
- C. A logging pattern for recording all application events to files
- D. Tracking website visitors for analytics and usage metrics

Answer: A

Q1082. What is a monad in functional programming?

- A. A single immutable value in the program code
- B. A pattern wrapping values for chaining operations with effects
- C. A primitive data type for storing basic values in memory
- D. A loop construct for iterating through collection elements

Answer: B

Q1083. What is the difference between a microkernel and a monolithic architecture?

- A. Microkernel architecture is always larger in size than monolithic
- B. Monolithic architecture is always more modular than microkernel
- C. Microkernel has minimal core with plugins; monolithic is all-in-one
- D. There is no meaningful difference between the two architecture styles

Answer: C

Q1084. What is reactive programming?

- A. Procedural programming with sequential statement execution
- B. A paradigm focused on async data streams and change propagation
- C. Programming with user interface reactions and animations
- D. Event-driven programming using callbacks and event listeners

Answer: B

Q1085. What is the Command Query Responsibility Segregation (CQRS) pattern?

- A. An authentication method for verifying user credentials
- B. A database query for selecting records from tables
- C. A sorting algorithm for ordering elements in collections
- D. Separating read and write operations into different models

Answer: D

Q1086. What is a domain-specific language (DSL)?

- A. A general-purpose programming language for all domains
- B. A scripting language for automating repetitive tasks
- C. A specialized language designed for a particular domain
- D. An assembly language for low-level hardware programming

Answer: C

Q1087. What is the actor model?

- A. Independent units communicating via asynchronous message passing
- B. A relational database model for organizing table schemas
- C. A user interface pattern for laying out visual components
- D. A design pattern for video game character development

Answer: A

Q1088. What is aspect-oriented programming (AOP)?

- A. A subtype of object-oriented programming methodology
- B. Separating cross-cutting concerns from business logic via aspects
- C. A user interface pattern for organizing visual layout components
- D. A testing approach for validating application behavior thoroughly

Answer: B

Q1089. What is the hexagonal architecture (ports and adapters)?

- A. A network topology for connecting distributed system nodes
- B. A six-sided geometric design for user interfaces
- C. Isolating core domain from externals through ports and adapters
- D. A database design for organizing tables and relationships

Answer: C

Q1090. What is algebraic effects as a programming concept?

- A. Expressing side effects as values handled by effect handlers separately
- B. An optimization technique for improving numerical computation speed
- C. Mathematical operations performed on algebraic expressions
- D. A specialized data structure for storing algebraic computation results

Answer: A

Q1091. What is the difference between optimistic and pessimistic concurrency control?

- A. There is no meaningful difference between the two control approaches
- B. Pessimistic concurrency control never uses any locks on resources
- C. Optimistic concurrency control uses locks to prevent all conflicts
- D. Optimistic assumes no conflicts and validates; pessimistic locks first

Answer: D

Q1092. What is the Compare-and-Swap (CAS) operation?

- A. A file swap operation for exchanging file contents
- B. A string operation for replacing character subsequences
- C. A sorting operation for ordering elements in arrays
- D. An atomic operation comparing and swapping memory values

Answer: D

Q1093. What is the Java Memory Model (JMM)?

- A. A memory leak detector for finding unreleased allocations
- B. A garbage collection model for reclaiming unused object memory
- C. A specification defining thread memory interaction and visibility
- D. How Java manages memory allocation for objects on the heap

Answer: C

Q1094. What is work stealing in thread pool implementations?

- A. A security vulnerability where threads access unauthorized data
- B. Interrupting running threads to reassign their execution priority
- C. Idle threads stealing tasks from busy threads for load balancing
- D. Taking another thread source code and executing it directly

Answer: C

Q1095. What is a memory barrier/fence?

- A. A hardware instruction enforcing memory operation ordering for CPUs
- B. A memory protection boundary between user and kernel space
- C. A memory limit restricting maximum allocation size for processes
- D. A garbage collection trigger that starts when memory is low

Answer: A

Q1096. What is the happens-before relationship in concurrency?

- A. A scheduling algorithm for determining thread execution priority
- B. Simple chronological ordering of events by their timestamps
- C. A debugging concept for tracing the order of function calls
- D. A guarantee that writes by one action are visible to another

Answer: D

Q1097. What is a read-write lock (ReentrantReadWriteLock)?

- A. A file lock for preventing concurrent file access
- B. A database lock for serializing transaction execution
- C. A lock allowing multiple readers but exclusive writers
- D. A mutex variant supporting recursive lock acquisition

Answer: C

Q1098. What is lock-free programming?

- A. A type of race condition caused by missing synchronization
- B. Programming without any synchronization mechanisms at all
- C. Single-threaded programming without any concurrent access
- D. Using atomic operations instead of locks for thread progress

Answer: D

Q1099. What is the difference between green threads and OS threads?

- A. Green threads are runtime-scheduled; OS threads are kernel-managed
- B. Green threads are always faster than OS threads in every scenario
- C. They are exactly the same with no meaningful differences at all
- D. OS threads use less memory than green threads in all situations

Answer: A

Q1100. What is Software Transactional Memory (STM)?

- A. A concurrency mechanism using transactions for shared memory with retry
- B. A memory allocation strategy for managing heap memory efficiently
- C. A thread scheduler for determining execution order of all threads
- D. A relational database system for persistent data storage

Answer: A

Q1101. What is property-based testing?

- A. Specifying invariants that hold for all generated inputs
- B. Testing object properties for correct values and types
- C. Testing CSS properties for correct visual rendering
- D. Testing configuration properties for application behavior

Answer: A

Q1102. What is fuzzing?

- A. Making code intentionally unclear and hard to understand
- B. Feeding random or malformed data to find vulnerabilities
- C. A string operation for making text fuzzy and unreadable
- D. A sorting technique that introduces randomness into order

Answer: B

Q1103. What is mutation testing?

- A. Testing DNA sequences for mutations in bioinformatics apps
- B. Introducing small code changes to check if tests catch them
- C. Testing genetic algorithms for correct evolution behavior
- D. Testing code changes for backward compatibility with old code

Answer: B

Q1104. What is the difference between static and dynamic analysis?

- A. Dynamic analysis is performed before compilation of the source code
- B. Static examines code without executing; dynamic examines during execution
- C. There is no meaningful difference between the two analysis approaches
- D. Static analysis is performed at runtime while the program is executing

Answer: B

Q1105. What is a flame graph in performance analysis?

- A. An error graph displaying exception frequency over time
- B. A fire hazard visualization for safety monitoring apps
- C. A visualization of call stacks showing CPU time by code path
- D. A heat map showing temperature distribution across hardware

Answer: C

Q1106. What is symbolic execution?

- A. Executing code with special symbol characters as input data
- B. Executing code with symbolic values to explore all possible paths
- C. A debugging mode that shows variable names instead of values
- D. Running code with special characters to test encoding correctness

Answer: B

Q1107. What is the difference between correctness testing and performance testing?

- A. They are exactly the same type of testing with no differences
- B. Correctness verifies behavior; performance measures speed and resources
- C. Correctness testing measures execution speed like performance does
- D. Performance testing checks for bugs just like correctness testing

Answer: B

Q1108. What is chaos engineering?

- A. Random testing with no specific goals or expected outcomes
- B. Unstructured development without any planning or methods
- C. Creating intentionally buggy software for entertainment
- D. Intentionally introducing failures to test system resilience

Answer: D

Q1109. What is taint analysis?

- A. Analyzing memory allocation patterns for optimization purposes
- B. Tracking untrusted input flow to find security vulnerabilities
- C. Checking code for bugs using standard debugging tools
- D. Formatting code according to standard style guide conventions

Answer: B

Q1110. What is the difference between benchmarking and profiling?

- A. They are identical performance analysis methods with no differences
- B. Benchmarking measures overall metrics; profiling identifies bottlenecks
- C. Profiling gives overall performance metrics; benchmarking is specific
- D. Benchmarking provides more detailed analysis than profiling overall

Answer: B

Q1111. What is the Twelve-Factor App methodology?

- A. Twelve testing phases that every software project must go through
- B. A math-based approach to solving programming problems algorithmically
- C. Twelve best practices for building scalable cloud-native applications
- D. Twelve programming languages that every developer should learn fully

Answer: C

Q1112. What is trunk-based development?

- A. A database design pattern for normalizing relational table schemas
- B. A branching strategy with single shared branch and short-lived branches
- C. Using tree data structures for organizing hierarchical information
- D. A testing strategy for validating software behavior systematically

Answer: B

Q1113. What is the difference between monorepo and polyrepo strategies?

- A. Polyrepo is only suitable for small projects with limited source code
- B. Monorepo is always the better choice regardless of project requirements
- C. There is no meaningful difference between the two repository strategies
- D. Monorepo stores all projects in one repo; polyrepo uses separate repos

Answer: D

Q1114. What is Infrastructure as Code (IaC)?

- A. Managing infrastructure through configuration files not manual processes
- B. A programming paradigm for organizing code into functional modules
- C. Writing source code directly on production servers for deployment
- D. A coding standard for formatting and naming conventions in code

Answer: A

Q1115. What is the concept of 'shift left' in testing?

- A. Moving code directly to production without any testing or review
- B. Left-aligning all source code for consistent formatting readability
- C. Performing testing earlier in the development lifecycle for detection
- D. Moving test files to the left side of the project directory tree

Answer: C

Q1116. What is feature flagging/toggling?

- A. A branching strategy for organizing feature development in Git
- B. A testing tool for validating feature behavior before release
- C. Deleting features permanently from the codebase and all traces
- D. Enabling or disabling features at runtime without deploying code

Answer: D

Q1117. What is the strangler fig pattern for legacy modernization?

- A. Gradually replacing legacy systems by building new functionality around
- B. A refactoring tool for automatically restructuring legacy code
- C. A tree-related data structure pattern for hierarchical organization
- D. Deleting all old code at once and replacing with a new system

Answer: A

Q1118. What is observability in software systems?

- A. A debugging tool for stepping through code execution line by line
- B. Watching code run step by step in a debugger tool window
- C. Monitoring only server uptime without any additional data collection
- D. Understanding system state from external outputs like logs and metrics

Answer: D

Q1119. What is the CAP theorem and how does it affect development practices?

- A. A design pattern for organizing code into reusable modular components
- B. In distributed systems, only two of Consistency, Availability, Partition tolerance
- C. A coding principle for writing clean and maintainable source code
- D. A testing theorem for determining the minimum number of test cases

Answer: B

Q1120. What is the concept of 'toil' in Site Reliability Engineering (SRE)?

- A. Testing software to validate that it meets all specified requirements
- B. Manual repetitive automatable work scaling linearly with service size
- C. Hard work that requires significant effort and long hours from team
- D. Debugging code to find and fix errors in the application source

Answer: B

Q1121. A program compiles without errors but produces incorrect output for certain edge cases. What type of error is this?

- A. A runtime error causing immediate termination
- B. A linker error from missing library references
- C. A syntax error caught by the compiler during build
- D. A logical error in the algorithm for edge cases

Answer: D

Q1122. In a multi-pass compiler, what is the primary advantage of separating analysis into multiple passes?

- A. It allows forward references and better optimization
- B. It makes the compiler run faster by skipping checks
- C. It eliminates the need for any optimization phase
- D. It removes the requirement for a symbol table

Answer: A

Q1123. A program works on the developer machine but fails in production. Which factor is most likely the cause?

- A. The source code changed itself during the deployment
- B. Environment differences such as OS or library versions
- C. The language behaves differently on each machine
- D. The compiler randomly generates different code each run

Answer: B

Q1124. What is the key difference between ahead-of-time (AOT) and just-in-time (JIT) compilation?

- A. AOT requires an interpreter; JIT does not need one
- B. JIT always produces slower code than AOT in every case
- C. AOT compiles before execution; JIT compiles during runtime
- D. AOT is only for scripting; JIT only for systems languages

Answer: C

Q1125. Why might a developer choose a dynamically typed language for rapid prototyping?

- A. Dynamic typing makes programs run faster on all hardware
- B. Dynamic typing enables faster iteration by skipping types
- C. Dynamic typing always produces more efficient machine code
- D. Dynamic typing prevents all runtime errors from occurring

Answer: B

Q1126. What problem does the halting problem describe in computer science?

- A. The difficulty of stopping an infinite loop in a program
- B. The challenge of compiling large programs within limits
- C. The problem of optimizing code for memory constraints
- D. The impossibility of deciding if any program will halt

Answer: D

Q1127. A language uses type inference to determine variable types. What is the main benefit?

- A. It makes the language dynamically typed at runtime
- B. It prevents the compiler from performing optimization
- C. It combines static type safety with reduced verbosity
- D. It eliminates type safety entirely from the language

Answer: C

Q1128. In language design, what does homoiconicity mean?

- A. The language can only represent one data type
- B. Code and data share the same representation
- C. The language does not support metaprogramming
- D. The compiler and interpreter are identical

Answer: B

Q1129. What is the primary purpose of an abstract syntax tree (AST) in compilation?

- A. To store the final machine code for the target
- B. To handle input and output during execution
- C. To represent hierarchical syntactic structure
- D. To manage memory allocation during runtime

Answer: C

Q1130. A team debates compiled vs interpreted for a real-time system. What is the strongest argument for compiled?

- A. Compiled languages always have simpler syntax
- B. Compiled languages are easier for beginners
- C. Compiled languages need no testing before use
- D. Compiled languages produce optimized native code

Answer: D

Q1131. A financial app uses float for currency and has rounding errors. What is the recommended fix?

- A. Convert all values to strings before performing calculations
- B. Use double type since it eliminates all rounding errors
- C. Increase float precision by adding more decimal places
- D. Use integer types storing values in cents to avoid issues

Answer: D

Q1132. What is the concept of type erasure in Java generics?

- A. Type information is stored in a separate metadata file
- B. The compiler removes all type info making code untyped
- C. The JVM dynamically creates new types for each generic use
- D. Generic type parameters are replaced with bounds at compile

Answer: D

Q1133. A developer encounters NaN in JavaScript. Which operation could produce this result?

- A. Multiplying a string that cannot be parsed as a number
- B. Comparing two floating-point numbers with strict equality
- C. Concatenating two numeric strings together into one
- D. Dividing a positive integer by a negative integer value

Answer: A

Q1134. Why does comparing floating-point numbers with exact equality often fail?

- A. The equality operator does not work with numeric types
- B. Binary representation introduces tiny precision errors
- C. Floating-point numbers are stored as strings internally
- D. Floating-point comparisons are not supported by CPUs

Answer: B

Q1135. In Rust, what is the purpose of the Option<T> type?

- A. It provides thread-safe access to shared mutable data
- B. It stores multiple values of different types at once
- C. It safely represents a value that may or may not exist
- D. It optimizes memory allocation for large structures only

Answer: C

Q1136. What is a phantom type in languages with advanced type systems?

- A. A type that cannot be instantiated under any circumstances
- B. A type that stores data in an encrypted format always
- C. A type that automatically converts between other data types
- D. A type existing only at compile time using no runtime data

Answer: D

Q1137. A C program assigns a negative signed integer to an unsigned variable. What is the likely outcome?

- A. The runtime throws an overflow exception and terminates
- B. The program will refuse to compile due to a type mismatch
- C. The unsigned variable automatically stores zero as default
- D. The value becomes a large positive number via reinterpretation

Answer: D

Q1138. What problem do algebraic data types (ADTs) solve in functional programming?

- A. They eliminate the need for functions in functional code
- B. They provide automatic serialization to network formats
- C. They optimize memory by compressing data automatically
- D. They model complex data as combinations of sum and product

Answer: D

Q1139. Why does JavaScript treat typeof null as object instead of null?

- A. Because null and objects share the same memory structure
- B. Because null is implemented as an empty object internally
- C. Because of a legacy bug in the original JS implementation
- D. Because the spec intentionally groups null with objects

Answer: C

Q1140. What is the difference between structural typing and nominal typing?

- A. Structural checks type names; nominal checks type shape
- B. Nominal typing does not support inheritance between types
- C. Structural checks type shape; nominal checks type names
- D. Structural typing is slower than nominal in every case

Answer: C

Q1141. A developer uses bitwise AND to check if a number is odd. Which expression correctly identifies odd numbers?

- A. $(n \& 2) == 1$ returns true for odd numbers in binary
- B. $(n \& 1) == 0$ returns true because odd clears last bit
- C. $(n \& 0) == 1$ returns true for odd numbers correctly
- D. $(n \& 1) == 1$ returns true because odd last bit is set

Answer: D

Q1142. In C++, what potential issue arises from overloading the comma operator?

- A. It may break the guaranteed left-to-right evaluation
- B. It causes compilation errors in all template-based code
- C. The comma operator cannot be overloaded in C++ standard
- D. It automatically converts all expressions to void type

Answer: A

Q1143. What does the unsigned right shift ($\gg$) do differently from signed right shift ($\gg$)?

- A. It shifts bits right and preserves the sign bit in position
- B. It rotates bits right wrapping them around to the left side
- C. It shifts bits left instead of right despite arrow direction
- D. It shifts bits right and fills with zeros regardless of sign

Answer: D

Q1144. A Python developer writes 'a is b' vs 'a == b'. When do these give different results?

- A. When a and b reference the exact same object in memory
- B. When a and b are the same integer literal used repeatedly
- C. When a and b have equal values but are different objects
- D. When both a and b are None compared in an if statement

Answer: C

Q1145. What is the result of applying De Morgan's law to $!(A \&\& B)$?

- A. $(!A \parallel !B)$ distributes the negation and flips the operator
- B. $(!A \&\& !B)$ negation of each operand combined with AND
- C. $(!A \&\& B)$ negates only the first operand in expression
- D. $(A \parallel B)$ simply removes the negation from the expression

Answer: A

Q1146. Why should developers avoid relying on operator precedence in complex expressions?

- A. Because parentheses are not allowed with operator precedence
- B. Because complex precedence reduces readability and causes bugs
- C. Because operator precedence varies between every language
- D. Because operator precedence only applies to arithmetic ops

Answer: B

Q1147. What is the purpose of the pipe operator ($|>$) in functional languages like Elixir?

- A. It passes the result of one expression as input to next
- B. It redirects standard output to a file on the system
- C. It creates a new parallel process for each function call
- D. It performs bitwise OR operations on integer operands

Answer: A

Q1148. In JavaScript, what is the result of {} + [] when evaluated as a statement?

- A. A type error because objects and arrays cannot be added
- B. The string '{}[]' because both operands convert to string
- C. An empty object combined with empty array resulting in NaN
- D. The number 0 because {} is empty block and +[] coerces to 0

Answer: D

Q1149. What advantage does the walrus operator (:=) provide in Python 3.8+?

- A. It performs parallel assignment of multiple variables at once
- B. It creates constants that cannot be reassigned after init
- C. It defines default parameter values for function declarations
- D. It assigns a value and returns it within a single expression

Answer: D

Q1150. How does operator precedence interact with associativity when precedence is equal?

- A. Associativity determines evaluation order for same precedence
- B. The compiler randomly selects which operator to evaluate first
- C. Operators with equal precedence always evaluate left to right
- D. Operators with equal precedence cannot appear in one expression

Answer: A

Q1151. A function uses recursion with no base case. What will happen during execution?

- A. The compiler automatically adds a base case to stop
- B. The call stack overflows causing a stack overflow error
- C. The function returns null after one recursive call
- D. The function loops exactly once then exits normally

Answer: B

Q1152. In a switch with intentional fall-through, what is the best practice for maintainability?

- A. Convert the entire switch to unrelated if statements
- B. Remove all break statements for code consistency
- C. Add explicit comments documenting intentional fall-through
- D. Use goto statements instead of fall-through for clarity

Answer: C

Q1153. A developer replaces nested if-else with a strategy pattern. What is the main benefit?

- A. Memory usage is reduced because fewer objects are created
- B. The code executes faster because polymorphism is quicker
- C. The number of classes in the codebase decreases greatly
- D. Each strategy is encapsulated making code more extensible

Answer: D

Q1154. What is the time complexity of a triply nested loop where each iterates n times?

- A. $O(n^3)$ because each nesting multiplies by factor n
- B. $O(n)$ because only the innermost loop affects complexity
- C. $O(n^2)$ because the outer loop does not count
- D. $O(\log n)$ because nested loops divide problem recursively

Answer: A

Q1155. How does continuation-passing style (CPS) change program control flow?

- A. It uses goto statements to jump between code sections
- B. It eliminates all function calls using only loops instead
- C. It converts recursive functions into iterative ones always
- D. It passes a callback representing the next step to each

Answer: D

Q1156. A loop uses floating-point comparison as its termination condition. Why is this risky?

- A. The loop will always terminate early before full completion
- B. Floating-point loops always execute one extra iteration
- C. Floating-point numbers cannot be used in loop conditions
- D. Precision errors may prevent termination condition triggering

Answer: D

Q1157. What is the advantage of iterators over index-based loops for data structures?

- A. Iterators use less memory than index-based loops in all cases
- B. Iterators always process elements faster than index access
- C. Iterators prevent any modifications to underlying collection
- D. Iterators provide a uniform interface across data structures

Answer: D

Q1158. What problem does the loop-and-a-half pattern solve?

- A. It creates loops executing exactly one and a half times
- B. It converts while loops into for loops for performance
- C. It handles loops needing to check condition in middle
- D. It optimizes loops to run at half the time of regular

Answer: C

Q1159. How do higher-order functions like map and filter replace loops in functional programming?

- A. They convert loops into goto statements for faster speed
- B. They apply transformations declaratively without iteration
- C. They eliminate the need for conditional logic in programs
- D. They only work with numeric data not other types at all

Answer: B

Q1160. Why might a compiler transform a recursive function into an iterative loop?

- A. Because iteration uses more memory improving caching
- B. Because recursive functions always produce wrong output
- C. Because iteration avoids stack overhead and overflow
- D. Because recursion is not supported by modern CPUs

Answer: C

Q1161. A recursive function for Fibonacci has exponential time complexity. How can this be optimized?

- A. By converting the function parameters to global variables
- B. By using memoization to cache previously computed values
- C. By adding more recursive calls to speed up computation
- D. By removing the base case to reduce function calls

Answer: B

Q1162. What is the Y combinator and what problem does it solve in lambda calculus?

- A. It validates the types of arguments passed to functions
- B. It combines two functions into a single optimized one
- C. It enables recursion in languages without named functions
- D. It converts iterative loops into recursive function calls

Answer: C

Q1163. A function modifies a global variable as a side effect. Why is this considered poor practice?

- A. Because side effects always cause the program to crash immediately
- B. Because side effects make functions unpredictable and harder to test
- C. Because global variables use too much memory in programs
- D. Because programming languages prohibit modifying global variables

Answer: B

Q1164. What is the difference between currying and partial application?

- A. Currying combines multiple functions; partial splits them into pieces
- B. Currying splits a function into single-arg chain; partial fixes some args
- C. Currying and partial application are exactly the same technique always
- D. Currying only works with two arguments; partial works with any count

Answer: B

Q1165. How does tail call optimization (TCO) prevent stack overflow in recursive functions?

- A. It moves recursive calls to a separate memory heap location
- B. It converts all recursive calls into asynchronous operations
- C. It limits the depth of recursion to a fixed maximum count
- D. It reuses the current stack frame for the next recursive call

Answer: D

Q1166. What is a thunk in the context of lazy evaluation?

- A. A deferred computation wrapped in a zero-argument function
- B. A data structure that stores function parameter information
- C. A compiled machine code fragment stored in memory cache
- D. An error handler that catches exceptions in lazy code blocks

Answer: A

Q1167. A developer uses function composition $f(g(x))$. What is the main benefit of this approach?

- A. It builds complex operations from simple reusable functions
- B. It eliminates the need for any error handling in code
- C. It guarantees the composed functions execute in parallel
- D. It ensures both functions always return the same data type

Answer: A

Q1168. What is a functor in functional programming?

- A. An object that stores multiple functions in an internal array
- B. A function that can only be called once during execution
- C. A special variable that holds a reference to a function pointer
- D. A type that can be mapped over with a structure-preserving function

Answer: D

Q1169. Why are first-class functions important for functional programming paradigms?

- A. They enable functions to be passed, returned, and assigned like data
- B. They prevent functions from having any parameters or return values
- C. They allow functions to be stored in databases for persistence
- D. They make all functions execute faster than in other paradigms

Answer: A

Q1170. What problem does the trampolining technique solve for recursive functions?

- A. It automatically parallelizes recursive calls across CPU cores
- B. It prevents stack overflow by converting recursion to loop steps
- C. It speeds up recursive calculations by using hardware acceleration
- D. It eliminates the need for base cases in recursive algorithms

Answer: B

Q1171. A program reads a large file line by line instead of loading it all at once. What is the main advantage?

- A. It prevents the file from being modified by other processes
- B. Line-by-line reading is always faster than loading at once
- C. It automatically handles character encoding conversion issues
- D. It reduces memory usage by processing one line at a time

Answer: D

Q1172. What is memory-mapped I/O and when is it beneficial?

- A. Allocating extra RAM to speed up sequential file reading
- B. Mapping files into virtual memory for faster random access
- C. Storing all program variables in external files on disk
- D. Converting memory addresses to file paths automatically

Answer: B

Q1173. A multi-threaded program writes to the same file simultaneously. What problem can occur?

- A. Race conditions cause corrupted or interleaved file data
- B. Each thread creates its own separate copy of the file
- C. The file automatically becomes read-only preventing writes
- D. The operating system duplicates the file for each thread

Answer: A

Q1174. What is the difference between blocking and non-blocking I/O in server design?

- A. Blocking handles more connections; non-blocking handles fewer
- B. Non-blocking cannot read from network sockets at all ever
- C. Blocking waits for completion; non-blocking returns immediately
- D. Blocking is only for files; non-blocking only for networks

Answer: C

Q1175. What is the purpose of a write-ahead log (WAL) in database I/O?

- A. It logs all read operations for performance monitoring only
- B. It encrypts data before writing to prevent unauthorized access
- C. It compresses write operations to reduce disk space usage
- D. It records changes before applying them for crash recovery

Answer: D

Q1176. A developer needs to parse a 10GB XML file. Why would a SAX parser be preferred over DOM?

- A. DOM parsers cannot handle files containing nested elements
- B. SAX processes XML as a stream without loading it all in memory
- C. SAX is more accurate at parsing XML structure than DOM
- D. SAX automatically validates XML against its schema definition

Answer: B

Q1177. What is the reactor pattern in asynchronous I/O programming?

- A. A technique for converting synchronous code to asynchronous
- B. A single-threaded event loop dispatching I/O events to handlers
- C. A method of buffering all output until program termination
- D. A pattern that creates a new thread for every I/O request

Answer: B

Q1178. How does zero-copy I/O improve performance compared to traditional I/O?

- A. It avoids copying data between kernel and user space buffers
- B. It compresses data to zero bytes before transferring it out
- C. It uses zero system calls by directly accessing hardware
- D. It eliminates the need for any disk storage by using RAM only

Answer: A

Q1179. What is the purpose of the fsync system call?

- A. It synchronizes file access between multiple running threads
- B. It converts file system format between different OS types
- C. It synchronizes file timestamps with the system clock value
- D. It ensures file data is physically written to storage device

Answer: D

Q1180. A program handles both file I/O and network I/O. Why might it use an event-driven architecture?

- A. Event-driven guarantees faster disk I/O than any alternative
- B. Event-driven efficiently handles many concurrent I/O sources
- C. Event-driven converts network data to file format automatically
- D. Event-driven eliminates all errors in I/O operations always

Answer: B

Q1181. A program compares user passwords using == instead of a constant-time comparison. What is the security risk?

- A. The program will crash when processing long password strings
- B. The comparison may return incorrect results for all input
- C. The passwords will be stored in plain text in memory always
- D. Timing attacks can reveal password characters one by one

Answer: D

Q1182. Why is the KMP algorithm preferred over naive string matching for large texts?

- A. KMP requires the pattern to be sorted before searching starts
- B. KMP uses more memory but is simpler to implement correctly
- C. KMP avoids rechecking characters using a failure function table
- D. KMP only works with numeric strings not alphabetic text data

Answer: C

Q1183. What is the purpose of string interning and when can it cause problems?

- A. It translates strings between languages causing encoding issues
- B. It encrypts strings for security but slows down all comparisons
- C. It caches unique strings saving memory but can cause leaks if overused
- D. It compresses strings for storage but prevents substring extraction

Answer: C

Q1184. How does the Rabin-Karp algorithm use hashing for string matching?

- A. It creates a hash table of all possible patterns before searching
- B. It hashes the entire text once and compares with pattern hash
- C. It uses rolling hash to efficiently compare pattern with substrings
- D. It hashes each character individually and sorts them for matching

Answer: C

Q1185. What is a rope data structure and when is it better than a standard string?

- A. A rope compresses strings to use minimal memory allocation
- B. A rope converts strings to binary for faster CPU processing
- C. A rope stores strings in encrypted form for better security
- D. A rope is a tree of small strings efficient for large text edits

Answer: D

Q1186. What is the difference between UTF-8 and UTF-16 encoding?

- A. UTF-8 uses 8 bits per character always; UTF-16 uses 16 always
- B. UTF-8 only supports English; UTF-16 supports all world languages
- C. UTF-8 uses variable 1-4 bytes; UTF-16 uses 2 or 4 byte units
- D. UTF-8 is binary format; UTF-16 is a text-based format only

Answer: C

Q1187. A developer finds that reversing a string containing emoji produces corrupted output. What is the cause?

- A. The reversal algorithm has a bug unrelated to character type
- B. Emoji use multi-code-unit sequences broken by naive reversal
- C. Emoji characters are not valid in any programming language
- D. The string library does not support any non-ASCII characters

Answer: B

Q1188. What is the purpose of normalization forms (NFC, NFD) in Unicode string processing?

- A. They ensure equivalent character sequences have canonical form
- B. They convert strings from Unicode to ASCII encoding format
- C. They validate that strings contain only printable characters
- D. They compress Unicode strings to reduce their storage size

Answer: A

Q1189. Why might a trie data structure be preferred for autocomplete over a hash map of strings?

- A. Tries automatically sort strings in reverse alphabetical order
- B. Tries use less memory than hash maps for all data sizes
- C. Tries are faster for exact match lookups than hash maps
- D. Tries support efficient prefix-based searching and traversal

Answer: D

Q1190. What is a homoglyph attack in the context of string security?

- A. An attack that overflows string buffers with excess data
- B. An attack that deletes all string data from the database
- C. An attack that encrypts strings making them unreadable
- D. An attack using visually similar characters to deceive users

Answer: D

Q1191. A developer uses a HashMap with mutable objects as keys. What problem can occur?

- A. The map automatically prevents mutation of all key objects
- B. The map will throw an error when any key is first inserted
- C. Mutable keys cause the map to sort entries in reverse order
- D. Mutating keys changes their hash, making entries unretrievable

Answer: D

Q1192. What is the amortized time complexity of adding an element to a dynamic array (ArrayList)?

- A. $O(\log n)$ because dynamic arrays use binary search for insert
- B. $O(n^2)$ because each insertion triggers a full array sort
- C. $O(n)$ because every insertion requires copying all elements
- D. $O(1)$ amortized because resizing cost is spread over operations

Answer: D

Q1193. What is a bloom filter and what tradeoff does it make?

- A. A compression technique that trades accuracy for file size
- B. A probabilistic structure allowing false positives not negatives
- C. A sorting algorithm that trades stability for speed
- D. A search algorithm trading memory for faster query execution

Answer: B

Q1194. Why is a red-black tree preferred over a simple BST for implementing TreeMap?

- A. Red-black trees guarantee $O(\log n)$ by maintaining balance always
- B. Red-black trees use less memory than simple BSTs in all cases
- C. Red-black trees do not require any comparison between elements
- D. Simple BSTs cannot store key-value pairs only single values

Answer: A

Q1195. What is the difference between a B-tree and a binary search tree?

- A. B-trees cannot be balanced while binary search trees can be
- B. B-trees have multiple children per node optimized for disk I/O
- C. B-trees store only two children per node like binary trees
- D. B-trees only work with string keys not with numeric values

Answer: B

Q1196. A concurrent program uses a regular HashMap and encounters data corruption. What is the fix?

- A. Use ConcurrentHashMap which provides thread-safe operations
- B. Use a larger initial capacity for the HashMap allocation
- C. Add more entries to the HashMap to prevent hash collisions
- D. Convert the HashMap to a TreeMap for sorted data access

Answer: A

Q1197. What is a skip list and what advantage does it offer?

- A. A list that skips every other element for faster traversal
- B. A list that automatically removes duplicate elements on insert
- C. A probabilistic structure providing $O(\log n)$ search in linked list
- D. A list optimized for storing very large string values only

Answer: C

Q1198. What is the difference between a weak reference map and a regular map?

- A. Weak maps allow garbage collection of keys not strongly referenced
- B. Weak maps are faster for lookup operations than regular maps
- C. Weak maps cannot store null values while regular maps can
- D. Weak maps store values with less precision than regular maps

Answer: A

Q1199. What is cache-oblivious algorithm design and how does it relate to array processing?

- A. It disables caching to ensure consistent performance results
- B. It ignores CPU cache entirely for simpler algorithm design
- C. It fills the CPU cache completely before processing any data
- D. It optimizes memory access patterns without knowing cache size

Answer: D

Q1200. Why does a hash table with a poor hash function degrade to $O(n)$ lookup time?

- A. Because many collisions cluster entries into the same bucket
- B. Because poor hash functions produce negative index values
- C. Because poor hash functions prevent the table from resizing
- D. Because the hash table automatically switches to linear search

Answer: A

Q1201. A developer violates the Single Responsibility Principle by creating a class that handles both data validation and database storage. What is the consequence?

- A. The class automatically becomes thread-safe for concurrent use
- B. The compiler will refuse to compile the class with both concerns
- C. The class will execute faster due to fewer method calls needed
- D. Changes to validation logic may unintentionally break storage code

Answer: D

Q1202. What is the visitor pattern and when should it be used?

- A. A pattern for creating multiple instances of a single class
- B. A pattern to add operations to objects without modifying classes
- C. A pattern for sorting objects in a collection by their type
- D. A pattern for managing user sessions in web applications

Answer: B

Q1203. How does the SOLID Open/Closed Principle guide class design?

- A. Classes should be open for both extension and modification always
- B. Classes should be closed for both extension and modification
- C. Classes should be open for extension and closed for modification
- D. Classes should be open for modification and closed for extension

Answer: C

Q1204. What is the difference between covariance and contravariance in generic types?

- A. Both covariance and contravariance preserve subtype ordering
- B. Neither covariance nor contravariance affects subtype ordering
- C. Covariance preserves subtype ordering; contravariance reverses it
- D. Covariance reverses subtype ordering; contravariance preserves it

Answer: C

Q1205. What is the template method pattern and how does it use inheritance?

- A. It generates code templates for creating new class files quickly
- B. It replaces all inheritance with composition for better flexibility
- C. It creates multiple templates of the same class for different uses
- D. It defines algorithm skeleton in base class deferring steps to sub

Answer: D

Q1206. Why should developers prefer composition over inheritance in most cases?

- A. Because inheritance is not supported in modern languages anymore
- B. Because composition provides more flexibility and looser coupling
- C. Because composition always uses less memory than inheritance does
- D. Because inheritance cannot be used with interfaces in any language

Answer: B

Q1207. What is double dispatch and how does the visitor pattern implement it?

- A. Resolving a method call based on two object types at runtime
- B. Dispatching a method call to two different servers simultaneously
- C. Creating two instances of the same class for parallel processing
- D. Calling the same method twice with different arguments each time

Answer: A

Q1208. What problem does the fragile base class issue describe?

- A. Changes to base class may unexpectedly break derived classes
- B. Base classes consume too much memory in the inheritance chain
- C. Base classes cannot have more than one level of inheritance
- D. Derived classes always override every method in the base class

Answer: A

Q1209. How does the CQRS pattern separate read and write operations in OOP design?

- A. It combines all reads and writes into a single unified model
- B. It uses separate models for reading queries and writing commands
- C. It prevents any reading operations during write transactions
- D. It uses different programming languages for reads and writes

Answer: B

Q1210. What is the expression problem and how do OOP and FP approach it differently?

- A. Both OOP and FP solve the expression problem in identical ways
- B. OOP easily adds new operations; FP easily adds new types always
- C. Neither OOP nor FP can add new types or operations at all ever
- D. OOP easily adds new types; FP easily adds new operations on types

Answer: D

Q1211. A program has a memory leak that only manifests after running for several days. What approach best identifies the leak?

- A. Adding more RAM to the server to delay the out-of-memory crash
- B. Using a memory profiler to track allocation growth over time
- C. Reviewing source code manually for every allocation and free
- D. Restarting the program more frequently to prevent the leak

Answer: B

Q1212. What is the generational hypothesis in garbage collection?

- A. Older objects are more likely to be collected than newer ones
- B. Most objects die young so collecting young generation is efficient
- C. Garbage collection should run only once per program execution
- D. All objects have the same lifetime regardless of creation time

Answer: B

Q1213. What is a use-after-free vulnerability and how can it be exploited?

- A. Freeing memory twice causing the allocator to add extra memory
- B. Accessing freed memory that may contain attacker-controlled data
- C. Using free software after a trial period has expired completely
- D. Using a variable after its scope ends causing a compiler error

Answer: B

Q1214. How does Rust's ownership system prevent memory safety bugs at compile time?

- A. Each value has one owner and memory is freed when owner goes out of scope
- B. It prevents all heap allocation forcing everything onto the stack
- C. It uses garbage collection that runs at compile time instead
- D. It requires programmers to manually free every allocation made

Answer: A

Q1215. What is the difference between mark-and-sweep and mark-and-compact garbage collection?

- A. Mark-sweep leaves objects in place; mark-compact moves them together
- B. Mark-sweep moves live objects; mark-compact leaves them in place
- C. Mark-compact cannot handle circular references unlike mark-sweep
- D. Mark-sweep is faster than mark-compact in all possible scenarios

Answer: A

Q1216. What is a slab allocator and when is it used in operating systems?

- A. An allocator that only works with very large memory blocks
- B. An allocator that stores data on disk instead of in memory
- C. An allocator caching fixed-size objects for frequent kernel allocations
- D. An allocator that compresses memory to fit more data in RAM

Answer: C

Q1217. How does address space layout randomization (ASLR) improve memory security?

- A. It encrypts all memory contents to prevent unauthorized reading
- B. It randomizes memory layout making exploit addresses unpredictable
- C. It prevents any program from allocating memory on the heap
- D. It locks memory pages so they cannot be written to by code

Answer: B

Q1218. What is false sharing in multi-threaded programs and how does it affect performance?

- A. Threads falsely reporting memory as free when it is still in use
- B. Sharing read-only data between threads causing unnecessary copying
- C. Multiple threads sharing the same variable causing data corruption
- D. Threads on different cores invalidate cache lines they do not truly share

Answer: D

Q1219. What is the purpose of memory-mapped files and how do they differ from traditional file I/O?

- A. They compress files in memory to reduce the total memory used
- B. They encrypt files in memory to prevent unauthorized data reading
- C. They store files entirely in CPU registers for faster access
- D. They map file contents to virtual memory allowing direct pointer access

Answer: D

Q1220. What is a garbage collection pause and why is it problematic for real-time applications?

- A. A delay caused by the GC writing collection logs to disk
- B. A delay when the GC starts running for the very first time
- C. A stop-the-world pause halting application threads during collection
- D. A pause occurring only when the program first allocates memory

Answer: C

Q1221. A developer wraps every method in try-catch blocks that silently swallow exceptions. What is the consequence?

- A. Memory usage decreases because exceptions are not stored
- B. The application runs faster due to fewer exception propagations
- C. The application becomes completely immune to all runtime errors
- D. Errors are hidden making debugging extremely difficult and slow

Answer: D

Q1222. What is the difference between fault tolerance and error recovery in system design?

- A. Fault tolerance continues despite faults; recovery restores state
- B. Fault tolerance prevents all errors; recovery fixes them after
- C. Fault tolerance is for hardware; recovery is for software only
- D. Both terms mean exactly the same thing in all system contexts

Answer: A

Q1223. How does the circuit breaker pattern prevent cascading failures in distributed systems?

- A. It duplicates every request to ensure at least one succeeds
- B. It physically disconnects failing servers from the network
- C. It stops calling a failing service after threshold allowing recovery
- D. It encrypts all communication to prevent transmission errors

Answer: C

Q1224. What is the difference between fail-fast and fail-safe error handling strategies?

- A. Fail-fast is for testing; fail-safe is for production environments
- B. Both strategies handle errors in exactly the same manner always
- C. Fail-fast ignores errors; fail-safe reports them immediately
- D. Fail-fast reports errors immediately; fail-safe continues operating

Answer: D

Q1225. A microservice architecture experiences a cascading failure. Which pattern best prevents this?

- A. Increasing timeout values to give failing services more time
- B. Using bulkhead isolation to contain failures within boundaries
- C. Adding more servers to handle the increased error load
- D. Removing all error handling to let services fail naturally

Answer: B

Q1226. What is the purpose of structured error handling using Result types instead of exceptions?

- A. Result types are faster to execute than exception handling code
- B. Result types prevent any errors from occurring during runtime
- C. Result types make error handling explicit in function signatures
- D. Result types automatically fix errors without developer action

Answer: C

Q1227. How does the retry pattern with exponential backoff improve error handling?

- A. It retries immediately without any delay between each attempt
- B. It retries a fixed number of times with constant delay between
- C. It decreases delay between retries to resolve errors faster
- D. It increases delay between retries reducing load on failing service

Answer: D

Q1228. What is the difference between recoverable and unrecoverable errors in Rust?

- A. Recoverable use Result type; unrecoverable use panic macro
- B. Rust does not distinguish between recoverable and unrecoverable
- C. Recoverable use panic macro; unrecoverable use Result type
- D. Both types are handled using the same mechanism in Rust

Answer: A

Q1229. What is the supervisor pattern in Erlang/OTP for fault tolerance?

- A. A design that prevents any process from ever failing at all
- B. A thread that monitors CPU usage and kills slow processes
- C. A process that monitors child processes and restarts on failure
- D. A function that validates all input before processing it

Answer: C

Q1230. Why is it important to include contextual information when throwing custom exceptions?

- A. Context helps developers quickly diagnose the root cause of errors
- B. Context information makes exceptions run faster in production
- C. Context reduces the memory footprint of exception objects created
- D. Context automatically fixes the error without human intervention

Answer: A

Q1231. A project has conflicting versions of the same dependency required by two libraries. How is this typically resolved?

- A. The project must choose one library and remove the other
- B. Dependency resolution algorithms select a compatible version
- C. Both versions are deleted and the dependency is removed
- D. All dependencies are updated to the latest version available

Answer: B

Q1232. What is the difference between a plugin architecture and a monolithic architecture?

- A. Plugins require more memory than monolithic architecture always
- B. Monolithic supports more features than plugin architecture can
- C. Plugins allow extending functionality without modifying core code
- D. Plugins are slower; monolithic is always faster in execution

Answer: C

Q1233. What is dependency hell and what strategies mitigate it?

- A. Dependencies that are too large consuming excessive disk space
- B. Conflicting version requirements across the dependency graph
- C. Having too few dependencies causing limited functionality
- D. Dependencies that require payment to use in production apps

Answer: B

Q1234. How does lazy loading of modules improve application performance?

- A. It defers loading modules until they are actually needed
- B. It compresses modules to reduce their memory footprint
- C. It loads all modules at startup to prevent later delays
- D. It caches all modules permanently in browser local storage

Answer: A

Q1235. What is the difference between a micro-frontend architecture and a traditional monolithic frontend?

- A. Micro-frontends split UI into independently deployable modules
- B. Monolithic frontends load faster than micro-frontend solutions
- C. Micro-frontends cannot share any state between components
- D. Micro-frontends use only one framework; monolithic uses many

Answer: A

Q1236. What is a supply chain attack in the context of package management?

- A. Compromising a dependency to inject malicious code downstream
- B. An attack that corrupts the package manager configuration file
- C. An attack that prevents packages from being downloaded online
- D. An attack that targets the physical delivery of hardware

Answer: A

Q1237. What is the purpose of code splitting in modern web applications?

- A. Separating code comments from executable statements in files
- B. Splitting code across multiple programming languages for speed
- C. Dividing code equally among team members for parallel coding
- D. Breaking application code into chunks loaded on demand for speed

Answer: D

Q1238. How does the facade pattern simplify complex module interactions?

- A. It removes dependencies between modules by duplicating all code
- B. It hides all modules and prevents any external access to them
- C. It converts all module functions into a single large function
- D. It provides a simplified interface to a complex subsystem of modules

Answer: D

Q1239. What is the hexagonal architecture and how does it relate to module organization?

- A. An architecture using exactly six modules in the application
- B. An architecture isolating core logic from external adapters and ports
- C. An architecture requiring six layers of abstraction in modules
- D. An architecture that arranges modules in a hexagonal grid pattern

Answer: B

Q1240. What is the difference between hard and soft dependencies in module design?

- A. Hard dependencies are faster; soft dependencies are always slower
- B. Hard dependencies are for production; soft are for development only
- C. Hard dependencies are required; soft are optional or gracefully absent
- D. Both hard and soft dependencies behave identically in all cases

Answer: C

Q1241. What is the difference between greedy algorithms and dynamic programming approaches?

- A. Both approaches always produce identical results for all problems
- B. Greedy makes locally optimal choices; DP considers all subproblems
- C. Greedy always finds the optimal solution; DP finds approximate
- D. DP makes locally optimal choices; greedy considers all subproblems

Answer: B

Q1242. What is a monad in functional programming and what problem does it solve?

- A. A pattern for chaining operations while managing side effects
- B. A single unit of memory allocation in functional programs
- C. A function that converts between different data type formats
- D. A data type that can only hold one value at any given time

Answer: A

Q1243. How does the A* algorithm combine features of Dijkstra and greedy best-first search?

- A. A* runs both algorithms separately and picks the better result
- B. A* ignores heuristics and relies only on actual path cost found
- C. A* uses actual cost plus heuristic estimate to guide its search
- D. A* uses Dijkstra for graphs and greedy for trees exclusively

Answer: C

Q1244. What is the CAP theorem and how does it affect distributed system design?

- A. It states only two of consistency, availability, partition tolerance
- B. It applies only to single-machine systems not distributed systems
- C. It guarantees all three properties simultaneously in all systems
- D. It states systems can achieve consistency, availability, and partitions

Answer: A

Q1245. What is the difference between a trie and a balanced BST for string operations?

- A. Tries cannot store strings with common prefixes unlike BSTs
- B. Tries are slower for prefix queries than balanced BSTs always
- C. Tries provide $O(m)$ lookup by key length; BSTs provide $O(m \log n)$
- D. BSTs provide faster prefix-based searching than tries in all cases

Answer: C

Q1246. What is the actor model for concurrent programming?

- A. A model that uses only one thread for all program operations
- B. A model that prevents all concurrency to avoid race conditions
- C. A model where threads share mutable state through locks
- D. A model where actors communicate through asynchronous messages

Answer: D

Q1247. What problem does the flyweight pattern solve in software design?

- A. It prevents objects from growing beyond a certain memory limit
- B. It shares common state among many objects to reduce memory use
- C. It makes heavy objects lighter by removing unnecessary methods
- D. It converts heavyweight processes into lightweight threads only

Answer: B

Q1248. How does consistent hashing improve distributed hash table scalability?

- A. It minimizes key redistribution when nodes are added or removed
- B. It sorts all keys alphabetically across all nodes in the system
- C. It eliminates all hash collisions in the distributed hash table
- D. It ensures all hash values are consecutive integers in sequence

Answer: A

Q1249. What is the difference between optimistic and pessimistic concurrency control?

- A. Optimistic locks before access; pessimistic assumes no conflict
- B. Optimistic is for reads only; pessimistic is for writes exclusively
- C. Both approaches use identical locking mechanisms for all access
- D. Optimistic assumes no conflict and validates; pessimistic locks first

Answer: D

Q1250. What is event sourcing and how does it differ from traditional CRUD?

- A. Event sourcing uses events only for logging not for state recovery
- B. Event sourcing stores only the current state like CRUD does
- C. Event sourcing stores all state changes as immutable event sequence
- D. Event sourcing deletes old data automatically unlike CRUD approach

Answer: C

Q1251. What is lock-free programming and why is it challenging to implement correctly?

- A. A technique that prevents any thread from ever being interrupted
- B. A style that avoids all shared memory between concurrent threads
- C. Using atomic operations for thread safety without traditional locks
- D. Programming without any synchronization for maximum speed always

Answer: C

Q1252. What is the ABA problem in lock-free programming?

- A. When a thread reads value A but another writes B before commit
- B. When two threads both try to set the same value simultaneously
- C. When atomic operations fail due to hardware memory limitations
- D. When a value changes from A to B to A, making change undetectable

Answer: D

Q1253. How does the fork-join framework improve parallel computation?

- A. It recursively splits tasks and merges results for parallelism
- B. It joins multiple programs into one before executing them all
- C. It creates a new thread for every single instruction to execute
- D. It forks the program into separate processes that never rejoin

Answer: A

Q1254. What is the happens-before relationship in the Java memory model?

- A. A rule preventing any reordering of instructions by the compiler
- B. A requirement that all code must execute in written source order
- C. A guarantee that one action's effects are visible to another action
- D. A constraint requiring all threads to start in a specific order

Answer: C

Q1255. What is a memory barrier or fence instruction?

- A. A mechanism for allocating memory in a thread-safe manner
- B. A technique for protecting memory from unauthorized access
- C. A hardware limit on the total amount of memory a program uses
- D. An instruction ensuring memory operations complete in order

Answer: D

Q1256. How does software transactional memory (STM) simplify concurrent programming?

- A. It allows composable atomic memory transactions without locks
- B. It automatically detects and removes all race conditions found
- C. It stores all thread data in a transactional database system
- D. It converts multi-threaded code into single-threaded execution

Answer: A

Q1257. What is the thundering herd problem in concurrent systems?

- A. When threads are distributed unevenly across available CPU cores
- B. When a single thread consumes all available CPU resources alone
- C. When many waiting threads wake simultaneously overwhelming resources
- D. When many threads are created causing the system to slow down

Answer: C

Q1258. What is work stealing in parallel task scheduling?

- A. Idle threads take tasks from busy threads' queues for balance
- B. Threads duplicating work done by other threads for redundancy
- C. Threads stealing CPU time from other threads for faster execution
- D. The scheduler removing low-priority tasks to free up resources

Answer: A

Q1259. How does the read-copy-update (RCU) mechanism work in concurrent systems?

- A. Readers lock data before reading; writers wait for all readers
- B. All operations require exclusive locks for both reads and writes
- C. Readers access data without locks; writers create updated copies
- D. Data is copied to each thread's private memory before any access

Answer: C

Q1260. What is the difference between data parallelism and task parallelism?

- A. Both data and task parallelism are identical concepts in practice
- B. Task parallelism applies different operations to same data always
- C. Data parallelism is for CPUs only; task parallelism for GPUs only
- D. Data parallelism applies same operation to different data portions

Answer: D

Q1261. A test suite has 95% code coverage but critical bugs still reach production. What does this indicate?

- A. That code coverage is a useless metric that should be abandoned
- B. That coverage alone does not guarantee test quality or edge cases
- C. That 95% coverage is too low and 100% is always required
- D. That the remaining 5% of uncovered code contains all the bugs

Answer: B

Q1262. What is mutation testing and how does it evaluate test suite quality?

- A. It tests the program with mutated or corrupted input data files
- B. It modifies the test execution order to find order dependencies
- C. It introduces small code changes to check if tests detect them
- D. It randomly changes test inputs to find flaky test failures

Answer: C

Q1263. What is the difference between performance testing and load testing?

- A. Performance tests measure speed; load tests measure correctness
- B. Performance measures response under conditions; load tests capacity
- C. Performance testing is manual; load testing is always automated
- D. Both terms describe identical testing activities in all contexts

Answer: B

Q1264. A developer uses a memory profiler and finds objects that are referenced but never used. What is this problem called?

- A. A segmentation fault caused by accessing invalid memory address
- B. A buffer overflow caused by writing past array boundaries
- C. A logical memory leak where references prevent garbage collection
- D. A stack overflow caused by deep recursive function calls

Answer: C

Q1265. What is property-based testing and how does it differ from example-based testing?

- A. Property-based verifies invariants with generated inputs randomly
- B. Both approaches use identical methodologies for test generation
- C. Property-based is slower and less effective than example-based
- D. Property-based uses fixed examples; example-based uses random ones

Answer: A

Q1266. What is chaos engineering and how does it improve system reliability?

- A. It intentionally injects failures to discover system weaknesses
- B. It randomly deletes source code files to test backup systems
- C. It introduces random code changes to test developer adaptability
- D. It creates chaotic user interfaces to test user error handling

Answer: A

Q1267. What is the difference between static analysis and dynamic analysis?

- A. Static runs code to find bugs; dynamic examines code without running
- B. Static examines code without running; dynamic analyzes during execution
- C. Static is for compiled languages only; dynamic for interpreted only
- D. Both static and dynamic analysis require running the program code

Answer: B

Q1268. How does delta debugging systematically minimize a failing test case?

- A. It deletes random lines until the test no longer demonstrates failure
- B. It adds more test cases until the failure becomes easier to understand
- C. It compares failing test with passing test to find code differences
- D. It systematically removes portions to find minimal failure-inducing input

Answer: D

Q1269. What is the purpose of fuzzing as a testing technique?

- A. Generating clear and readable test cases for documentation
- B. Measuring the fuzziness or uncertainty of test result accuracy
- C. Feeding random or malformed input to find crashes and vulnerabilities
- D. Testing the user interface with blurred or fuzzy screen rendering

Answer: C

Q1270. What is the testing pyramid and what does it recommend for test distribution?

- A. More unit tests at base, fewer integration, fewest UI tests at top
- B. More UI tests at top, fewer unit tests at bottom of pyramid
- C. Only unit tests with no integration or end-to-end tests at all
- D. Equal numbers of each test type across all levels of the pyramid

Answer: A

Q1271. A team has a large codebase with no tests. What is the recommended approach to introduce testing?

- A. Write tests for all code at once before making any changes
- B. Hire a separate testing team to write all tests independently
- C. Start by adding tests around code that changes most frequently
- D. Delete all existing code and rewrite it with tests from scratch

Answer: C

Q1272. What is the strangler fig pattern for legacy system modernization?

- A. Gradually replacing legacy components while keeping system running
- B. Wrapping the legacy system in a new interface without changes
- C. Immediately replacing the entire legacy system with new code
- D. Documenting the legacy system before shutting it down entirely

Answer: A

Q1273. How does trunk-based development differ from GitFlow?

- A. Both approaches use identical branching and merging strategies
- B. Trunk-based uses short-lived branches merging to main frequently
- C. Trunk-based does not use version control; GitFlow requires it
- D. Trunk-based uses long-lived branches; GitFlow uses short-lived ones

Answer: B

Q1274. What is the twelve-factor app methodology?

- A. A methodology requiring exactly twelve source code files per app
- B. A set of best practices for building scalable cloud-native apps
- C. A testing methodology requiring twelve types of tests minimum
- D. A security framework with twelve levels of access permissions

Answer: B

Q1275. What is observability in software systems and how does it differ from monitoring?

- A. Observability infers internal state from outputs; monitoring tracks metrics
- B. Observability and monitoring are identical concepts in practice
- C. Monitoring provides deeper insight than observability in all cases
- D. Observability only tracks errors; monitoring tracks all system events

Answer: A

Q1276. What is the purpose of feature flags in software deployment?

- A. They indicate which programming language features are being used
- B. They enable toggling features on or off without code deployment
- C. They flag code that contains bugs for developers to fix later
- D. They mark features as complete in the project management tool

Answer: B

Q1277. How does domain-driven design (DDD) improve complex software projects?

- A. It restricts development to a single programming language only
- B. It aligns code structure with business domain using ubiquitous language
- C. It eliminates the need for any testing in the development process
- D. It focuses on optimizing database domain and query performance

Answer: B

Q1278. What is the difference between horizontal and vertical scaling strategies?

- A. Horizontal adds more machines; vertical adds resources to existing
- B. Horizontal adds resources to one machine; vertical adds more machines
- C. Horizontal is for databases only; vertical is for applications only
- D. Both strategies add resources in exactly the same way to systems

Answer: A

Q1279. What is the concept of eventual consistency in distributed systems?

- A. All nodes always have the exact same data at every point in time
- B. Only the primary node has consistent data; replicas do not
- C. Data consistency is never achieved in any distributed system
- D. All nodes will converge to the same state given enough time

Answer: D

Q1280. What is the purpose of a service mesh in microservice architectures?

- A. It handles service-to-service communication, security, and observability
- B. It combines all microservices into a single monolithic application
- C. It stores all microservice data in a single shared database
- D. It generates source code for new microservices automatically

Answer: A

Q1281. How does the LLVM compiler infrastructure enable language-independent optimization?

- A. By using a common intermediate representation that multiple language frontends can target
- B. By interpreting all programs at runtime without compilation
- C. By compiling all languages directly to x86 machine code
- D. By requiring all languages to use the same syntax

Answer: A

Q1282. What is the difference between structural and nominal type equivalence?

- A. Structural equivalence is used only in compiled languages
- B. Nominal equivalence ignores all type information
- C. They produce identical results in every programming language
- D. Structural equivalence compares type structure while nominal equivalence compares type names

Answer: D

Q1283. What is the Church-Turing thesis and its significance for programming?

- A. It proves that all programs will eventually halt
- B. It states that any computable function can be computed by a Turing machine
- C. It defines the maximum speed of any computer program
- D. It establishes that compiled code is always faster than interpreted code

Answer: B

Q1284. What is the expression problem in programming language design?

- A. The challenge of parsing mathematical expressions efficiently
- B. The problem of evaluating boolean expressions with short-circuit logic
- C. The difficulty of adding both new data types and new operations without modifying existing code
- D. The difficulty of handling operator precedence in complex expressions

Answer: C

Q1285. How does dependent typing differ from traditional static typing?

- A. Dependent typing eliminates the need for any type annotations
- B. Dependent types only work with integer values
- C. Dependent typing is another name for dynamic typing
- D. Dependent types allow types to depend on runtime values, enabling more precise type specifications

Answer: D

Q1286. What is the difference between call-by-name and call-by-need evaluation strategies?

- A. Call-by-name re-evaluates arguments each time they are used while call-by-need caches the result after first evaluation
- B. Call-by-need always evaluates arguments before passing them
- C. Call-by-name prevents all side effects in function calls
- D. Call-by-name is the same as call-by-value

Answer: A

Q1287. What is effect typing and how does it extend traditional type systems?

- A. It measures the performance impact of type checking
- B. It tracks computational side effects in the type system alongside value types
- C. It replaces all runtime errors with compile-time type errors
- D. It only applies to visual effects in graphical programming

Answer: B

Q1288. What is the significance of the lambda calculus as a foundation for programming languages?

- A. It establishes the rules for object-oriented inheritance hierarchies
- B. It provides a minimal formal system that can express any computable function using only function abstraction and application
- C. It is a specialized calculus for mathematical computation only
- D. It defines how compilers optimize machine code instructions

Answer: B

Q1289. What is gradual typing and what problem does it solve?

- A. It allows mixing statically typed and dynamically typed code in the same program
- B. It gradually removes type annotations as the program matures
- C. It automatically converts all types to strings at runtime
- D. It types variables based on the order they are declared

Answer: A

Q1290. What is the difference between total and partial functions in programming language theory?

- A. Total functions are only found in imperative languages
- B. Total functions handle all data types while partial functions handle only one
- C. Partial functions are faster because they skip some computations
- D. Total functions return a result for every possible input while partial functions may not terminate or may be undefined for some inputs

Answer: D

Q1291. What is a higher-kinded type and which languages support it?

- A. A type reserved for advanced mathematical computations
- B. A type that is always at the top of the inheritance hierarchy
- C. A type constructor that takes other type constructors as parameters, supported by Haskell and Scala
- D. A type that can store higher-precision decimal numbers

Answer: C

Q1292. What is the difference between covariance and contravariance in generic type parameters?

- A. Covariance applies to input parameters and contravariance to output parameters
- B. They both produce identical behavior in all type systems
- C. Covariance preserves the type ordering while contravariance reverses it
- D. Covariance is used only in dynamically typed languages

Answer: C

Q1293. What is a refinement type in programming languages?

- A. A type that restricts a base type with a predicate specifying allowed values
- B. A type that refines a class through inheritance only
- C. A type that can only be used in pattern matching
- D. A type that has been optimized for faster runtime performance

Answer: A

Q1294. How does Rust's ownership model interact with data types to ensure memory safety?

- A. Rust uses garbage collection for all heap-allocated types
- B. Rust copies all values automatically without restriction
- C. All data types in Rust are allocated on the stack
- D. Each value has exactly one owner, and the value is dropped when the owner goes out of scope

Answer: D

Q1295. What is the difference between existential types and universal types?

- A. Existential types are used only for numbers while universal types handle strings
- B. Universal types must be defined at compile time but existential at runtime
- C. They are different names for the same concept
- D. Universal types work for all types (forall) while existential types hide the concrete type (there exists)

Answer: D

Q1296. What is type-level programming and how is it used in practice?

- A. Using types only for documentation purposes
- B. Automatically generating types from database schemas
- C. Programming without any type annotations
- D. Writing programs that execute entirely at the type level during compilation to enforce complex constraints

Answer: D

Q1297. What is the difference between nominal subtyping and structural subtyping for interfaces?

- A. Structural subtyping requires classes to declare they implement an interface
- B. Nominal subtyping is only used in interpreted languages
- C. Nominal subtyping requires explicit declaration of subtype relationships while structural subtyping checks compatibility by shape
- D. They produce identical behavior in all object-oriented languages

Answer: C

Q1298. What is a linear type system and what guarantee does it provide?

- A. A type system that arranges all types in a linear hierarchy
- B. A type system that evaluates type expressions in linear time
- C. A type system that only supports linear data structures
- D. A type system that ensures every value is used exactly once, preventing resource leaks

Answer: D

Q1299. What is a GADT (Generalized Algebraic Data Type)?

- A. A data type that can only hold algebraic expressions
- B. An algebraic data type where constructors can specify different type parameters for the resulting type
- C. A type alias for complex generic signatures
- D. A standard generic type available in all languages

Answer: B

Q1300. What is the bottom type (Nothing/Never) and how is it used in type systems?

- A. A type that is the subtype of all types and has no possible values, used for functions that never return
- B. The default type assigned to uninitialized variables
- C. A type used exclusively for error codes
- D. A type representing the smallest possible integer value

Answer: A

Q1301. Why can operator overloading lead to maintenance problems in large codebases?

- A. Because operator overloading always causes runtime performance degradation
- B. Because most languages prohibit any form of operator overloading
- C. Because overloaded operators cannot be used with primitive types
- D. Because overloaded operators may behave in unexpected ways that differ from their conventional meaning

Answer: D

Q1302. How can bitwise operators be used to swap two variables without a temporary variable?

- A. Bitwise operators cannot be used to swap variables
- B. By using AND: `a &= b; b &= a; a &= b` swaps the values
- C. By using XOR: `a ^= b; b ^= a; a ^= b` swaps the values
- D. By using OR: `a |= b; b |= a; a |= b` swaps the values

Answer: C

Q1303. What is the purpose of the three-way comparison (spaceship) operator in modern languages?

- A. It returns negative, zero, or positive to indicate less than, equal, or greater than in a single operation
- B. It performs three sequential comparisons automatically
- C. It compares three variables simultaneously
- D. It creates a three-element tuple from two values

Answer: A

Q1304. What is the significance of De Morgan's laws for simplifying Boolean expressions?

- A. They state that AND and OR operators are always interchangeable
- B. They define the order of evaluation for nested Boolean expressions
- C. They prove that all Boolean expressions can be reduced to a single operator
- D. They state that $\text{NOT}(A \text{ AND } B)$ equals $(\text{NOT } A) \text{ OR } (\text{NOT } B)$ and $\text{NOT}(A \text{ OR } B)$ equals $(\text{NOT } A) \text{ AND } (\text{NOT } B)$

Answer: D

Q1305. How does the nullish coalescing operator (??) differ from the logical OR (||) in JavaScript?

- A. ?? only considers null and undefined as falsy while || considers 0, empty string, and false as falsy too
- B. ?? works only with strings while || works with all types
- C. They behave identically for all input values
- D. || only considers null as falsy while ?? considers all falsy values

Answer: A

Q1306. What is the role of the comma operator in C and JavaScript?

- A. It evaluates both operands from left to right and returns the value of the rightmost operand
- B. It concatenates two strings with a comma separator
- C. It splits a string into multiple parts
- D. It creates an array containing both operands

Answer: A

Q1307. Why is using bit shifting for multiplication and division by powers of two considered an optimization?

- A. Because bit shifting produces more accurate results than multiplication
- B. Because multiplication operators are not supported for integers
- C. Because bit shifting operations are executed in a single CPU cycle while multiplication may take multiple cycles
- D. Because bit shifting works on all data types including strings

Answer: C

Q1308. What problem does the double-checked locking pattern solve using comparison operators?

- A. It compares two objects twice to ensure deep equality
- B. It validates input parameters using two different comparison methods
- C. It reduces the overhead of synchronization by checking a condition before and after acquiring a lock
- D. It performs two sequential comparisons for sorting stability

Answer: C

Q1309. What is the difference between strict equality and abstract equality in type-coercing languages?

- A. Abstract equality never performs type conversion
- B. Strict equality is only available in statically typed languages
- C. Strict equality is slower than abstract equality in all cases
- D. Strict equality compares value and type without coercion while abstract equality converts types before comparing

Answer: D

Q1310. How does the Elvis operator (?:) in Kotlin simplify null handling compared to traditional null checks?

- A. It automatically throws an exception when null is encountered
- B. It provides a default value when the left expression is null in a single concise expression
- C. It converts null values to zero for arithmetic operations
- D. It eliminates all null values from the program

Answer: B

Q1311. How does the visitor pattern implement double dispatch to avoid complex conditional logic?

- A. By using reflection to dynamically invoke methods
- B. By storing all behavior in a single switch statement
- C. By using two virtual method calls to determine behavior based on both the visitor and element types at runtime
- D. By using nested if-else chains with type checking

Answer: C

Q1312. What is the difference between structured exception handling and setjmp/longjmp in C?

- A. Structured exceptions cannot cross function boundaries
- B. setjmp/longjmp automatically free allocated memory during the jump
- C. Structured exceptions use language constructs with proper stack unwinding while setjmp/longjmp perform non-local jumps without cleanup
- D. setjmp/longjmp provide better type safety than structured exceptions

Answer: C

Q1313. How does Rust's match expression enforce exhaustive pattern matching?

- A. It uses a default catch-all case automatically
- B. The compiler requires all possible patterns to be covered, refusing to compile if any case is missing
- C. It only works with integer values
- D. It throws a runtime exception for unmatched patterns

Answer: B

Q1314. What is the difference between cooperative and preemptive multitasking in terms of control flow?

- A. Cooperative multitasking automatically prevents deadlocks
- B. Preemptive multitasking cannot handle more than two tasks
- C. Cooperative multitasking requires tasks to explicitly yield control while preemptive multitasking allows the scheduler to interrupt tasks
- D. Cooperative multitasking is always faster than preemptive

Answer: C

Q1315. How do algebraic effects provide a more composable alternative to traditional control flow mechanisms?

- A. They eliminate all side effects from programs
- B. They replace all loops with recursive functions
- C. They separate the description of an effect from its handler, allowing different interpretations of the same effectful code
- D. They automatically parallelize sequential code

Answer: C

Q1316. What is the purpose of the computed goto (or indirect branch) in low-level optimization?

- A. It computes the result of a mathematical expression before branching
- B. It creates multiple goto statements in a single line
- C. It jumps to a target address computed at runtime, enabling efficient dispatch tables for interpreters
- D. It optimizes recursive function calls by removing the call stack

Answer: C

Q1317. What is the relationship between monadic composition and control flow in functional programming?

- A. Monads eliminate the need for conditional statements
- B. Monads chain computations where each step depends on the previous result, encoding control flow as data transformations
- C. Monads replace all loops with simple function calls
- D. Monads are only used for mathematical computations

Answer: B

Q1318. How does speculative execution in modern CPUs interact with branch prediction for control structures?

- A. The CPU always executes both branches simultaneously
- B. The CPU predicts which branch will be taken and speculatively executes instructions along that path before the condition is resolved
- C. Branch prediction only works with simple if-else structures
- D. Speculative execution skips all conditional checks for performance

Answer: B

Q1319. What is the difference between call/cc (call with current continuation) and standard exception handling?

- A. They are identical mechanisms with different names
- B. call/cc is simpler to implement than exception handling
- C. call/cc captures the entire remaining computation as a first-class value that can be invoked multiple times, while exceptions only unwind the stack
- D. Exception handling can capture continuations but call/cc cannot

Answer: C

Q1320. Why is the halting problem relevant to static analysis of loops and control flow?

- A. It proves that recursive functions always terminate
- B. It shows that all loops will eventually halt if written correctly
- C. It proves that no algorithm can determine in general whether an arbitrary loop will terminate, limiting what static analyzers can guarantee
- D. It only applies to infinite loops in interpreted languages

Answer: C

Q1321. How does memoization improve the performance of recursive functions?

- A. By executing recursive calls in parallel threads
- B. By reducing the number of parameters a function accepts
- C. By converting all recursive calls into iterative loops automatically
- D. By caching previously computed results and returning them for repeated inputs instead of recomputing

Answer: D

Q1322. What is the difference between currying and partial application in functional programming?

- A. Currying fixes arguments while partial application chains functions
- B. They are identical techniques with different names
- C. Currying transforms a function with multiple arguments into a chain of single-argument functions, while partial application fixes some arguments of a function
- D. Currying only works with two arguments

Answer: C

Q1323. What is a continuation and how is it used in functional programming?

- A. A representation of the rest of the computation at a given point, passed as an argument to control execution flow
- B. A function that continues executing after an error
- C. A loop that never terminates
- D. A variable that persists between function calls

Answer: A

Q1324. What is the difference between a free variable and a bound variable in a closure?

- A. Free variables are faster to access than bound variables
- B. Free variables must be global variables
- C. A bound variable is defined within the function while a free variable is defined in an enclosing scope and captured by the closure
- D. Bound variables cannot be modified inside the function

Answer: C

Q1325. What is a functor in functional programming and how does it relate to function application?

- A. A type that implements a map operation, allowing a function to be applied to wrapped values without unwrapping
- B. A debugging tool for tracking function calls
- C. A special type of constructor in OOP
- D. A function that creates other functions

Answer: A

Q1326. How does the trampolining technique prevent stack overflow in languages without tail call optimization?

- A. It increases the stack size dynamically at runtime
- B. It wraps recursive calls in thunks and uses a loop to evaluate them iteratively, keeping the stack flat
- C. It converts all functions to asynchronous operations
- D. It splits recursive calls across multiple threads

Answer: B

Q1327. What is referential transparency and why is it important for reasoning about functions?

- A. It ensures functions can reference variables in any scope
- B. It requires all functions to be visible from any part of the program
- C. It means all function names must clearly describe their purpose
- D. An expression is referentially transparent if it can be replaced with its value without changing program behavior

Answer: D

Q1328. What is the difference between applicative functors and monads in terms of function application?

- A. Applicative functors apply independent wrapped functions to wrapped values while monads allow dependent sequential computations
- B. Applicative functors are always faster than monads
- C. Applicative functors require mutable state
- D. Monads cannot be used for error handling

Answer: A

Q1329. What is a fixed-point combinator and what role does it play in lambda calculus?

- A. It finds the optimal parameters for a function
- B. It converts any function into a constant function
- C. It enables recursion in lambda calculus where functions cannot refer to themselves by name
- D. It fixes errors in function definitions automatically

Answer: C

Q1330. How does defunctionalization transform higher-order functions into first-order programs?

- A. By converting functions into global variables
- B. By removing all function definitions from the program
- C. By replacing function values with data constructors and using an apply function to dispatch on them
- D. By inlining all function calls at compile time

Answer: C

Q1331. How does the proactor pattern differ from the reactor pattern in asynchronous I/O?

- A. The reactor only works with network I/O while the proactor works with file I/O
- B. The proactor blocks on I/O while the reactor does not
- C. They are identical patterns with different names
- D. The reactor demultiplexes events and dispatches to handlers while the proactor initiates operations and handles completion notifications

Answer: D

Q1332. What is the purpose of the sendfile() system call and how does it optimize file transfer?

- A. It sends files as email attachments
- B. It transfers data between file descriptors directly in kernel space without copying to user space
- C. It encrypts files before sending them over the network
- D. It splits large files into smaller chunks for parallel transfer

Answer: B

Q1333. What is the io_uring interface in Linux and why is it significant?

- A. It encrypts I/O data using ring signatures
- B. It is a circular buffer for logging I/O errors
- C. It manages USB device connections in a ring topology
- D. It provides a high-performance asynchronous I/O interface using shared ring buffers between user and kernel space

Answer: D

Q1334. What is the write amplification problem in storage I/O?

- A. When the actual amount of data written to storage is significantly larger than the logical data being written
- B. When multiple programs write to the same file simultaneously
- C. When write operations are slower than read operations
- D. When data is written in the wrong encoding format

Answer: A

Q1335. How does memory-mapped I/O differ from port-mapped I/O at the hardware level?

- A. Port-mapped I/O uses the same address space as main memory
- B. Memory-mapped I/O uses the same address space for memory and I/O devices while port-mapped I/O uses a separate address space
- C. Memory-mapped I/O is slower in all cases
- D. Memory-mapped I/O is only available on ARM processors

Answer: B

Q1336. What is the purpose of the O_DIRECT flag when opening files on Linux?

- A. It opens the file in a special directory
- B. It encrypts all data written to the file
- C. It bypasses the operating system page cache and performs direct I/O between user buffers and the storage device
- D. It directs output to the console instead of the file

Answer: C

Q1337. What is the difference between level-triggered and edge-triggered I/O notification?

- A. Level-triggered reports readiness as long as the condition holds while edge-triggered reports only when the state changes
- B. Edge-triggered is always more efficient than level-triggered
- C. Level-triggered only works with read operations
- D. Edge-triggered requires blocking I/O

Answer: A

Q1338. What is the purpose of vectored I/O (scatter-gather) and when is it beneficial?

- A. It reads or writes data from multiple non-contiguous buffers in a single system call, reducing overhead
- B. It gathers I/O statistics from multiple processes
- C. It splits a single buffer into multiple files
- D. It encrypts data by scattering bits across storage

Answer: A

Q1339. What is the durability guarantee provided by fsync versus fdatasync?

- A. fsync flushes both file data and metadata to disk while fdatasync flushes only the file data and essential metadata
- B. They provide identical durability guarantees in all cases
- C. fdatasync provides stronger guarantees than fsync
- D. fsync only flushes metadata while fdatasync flushes data

Answer: A

Q1340. What is the thundering herd problem in the context of I/O multiplexing with accept()?

- A. When multiple threads waiting on the same listening socket all wake up for a single connection, but only one succeeds
- B. When too many connections arrive simultaneously and crash the server
- C. When I/O buffers overflow due to rapid data arrival
- D. When multiple files are opened simultaneously causing disk contention

Answer: A

Q1341. What is the Aho-Corasick algorithm and when is it used for string matching?

- A. It searches for multiple patterns simultaneously in a text by building an automaton from all patterns
- B. It sorts strings in alphabetical order efficiently
- C. It matches a single pattern against multiple texts
- D. It compresses strings using pattern-based encoding

Answer: A

Q1342. What is the suffix array data structure and how does it improve string operations?

- A. A linked list of all string prefixes
- B. An array that stores only the last character of each string
- C. A hash table mapping string suffixes to their positions
- D. A sorted array of all suffixes of a string that enables efficient substring search, longest common prefix computation, and other operations

Answer: D

Q1343. How does the Burrows-Wheeler Transform improve text compression?

- A. It rearranges characters so that similar characters are grouped together, making the result more compressible
- B. It removes duplicate characters from the text
- C. It encrypts the text to reduce its size
- D. It replaces all characters with shorter binary codes

Answer: A

Q1344. What is the difference between greedy and lazy quantifiers in regular expressions?

- A. Greedy quantifiers match as much text as possible while lazy quantifiers match as little as possible
- B. Lazy quantifiers match more text than greedy quantifiers
- C. They produce identical matches in all cases
- D. Greedy quantifiers are faster than lazy quantifiers

Answer: A

Q1345. What is catastrophic backtracking in regular expressions?

- A. When a regex engine takes exponential time due to ambiguous patterns that cause excessive backtracking
- B. When backtracking causes the program to run out of memory
- C. When a regex accidentally matches the wrong string
- D. When a regex fails to match any string

Answer: A

Q1346. What is the Z-algorithm for string matching?

- A. It constructs a Z-array where $Z[i]$ is the length of the longest substring starting at position i that matches a prefix of the string
- B. It finds the last occurrence of a pattern in a string
- C. It sorts characters in a string alphabetically
- D. It compresses strings using a zigzag encoding

Answer: A

Q1347. How do persistent string data structures maintain previous versions efficiently?

- A. By compressing all previous versions into a single archive
- B. By keeping complete copies of every version in memory
- C. By storing only the most recent version and discarding older ones
- D. By sharing unchanged portions between versions and only allocating new memory for changed parts

Answer: D

Q1348. What is Unicode normalization and why can two visually identical strings have different byte representations?

- A. Unicode only affects non-English text
- B. Different byte representations indicate file corruption
- C. Normalization removes all special characters from a string
- D. Characters can be represented as single code points or as combining character sequences, and normalization converts between these forms

Answer: D

Q1349. What is the difference between DFA and NFA-based regex engines?

- A. DFA engines are always slower than NFA engines
- B. DFA engines guarantee linear time matching but cannot support backreferences while NFA engines support backreferences but may have exponential worst case
- C. NFA engines cannot match basic patterns
- D. DFA engines support all regex features including backreferences

Answer: B

Q1350. What is the longest common subsequence (LCS) problem and its string application?

- A. Determining which string is longer
- B. Finding the longest palindrome within a string
- C. Finding the longest sequence of characters common to two strings in the same order but not necessarily contiguous, used in diff algorithms
- D. Finding the longest substring that appears in both strings at the same position

Answer: C

Q1351. What is a cuckoo hash table and how does it achieve $O(1)$ worst-case lookups?

- A. It stores elements in sorted order for binary search
- B. It uses a single hash function with no collisions
- C. It uses two hash functions and two tables, displacing existing elements on collision, guaranteeing each key is in one of two possible locations
- D. It uses three hash functions and three tables

Answer: C

Q1352. What is the difference between an AVL tree and a red-black tree in terms of balancing?

- A. They maintain identical balance guarantees
- B. AVL trees maintain stricter balance with at most 1 height difference, while red-black trees allow up to $2x$ height difference, making AVL faster for lookups but slower for insertions
- C. AVL trees do not support deletion operations
- D. Red-black trees are always perfectly balanced

Answer: B

Q1353. What is a Fibonacci heap and why is it used in graph algorithms?

- A. A heap with exactly 5 children per node
- B. A heap used only for sorting Fibonacci sequences
- C. A heap that stores Fibonacci numbers
- D. A heap with amortized $O(1)$ decrease-key operation, making it optimal for algorithms like Dijkstra's shortest path

Answer: D

Q1354. What is the difference between an R-tree and a B-tree for indexing?

- A. B-trees can index spatial data better than R-trees
- B. R-trees index multi-dimensional spatial data using bounding rectangles while B-trees index one-dimensional ordered data
- C. R-trees are used for text search while B-trees are for spatial data
- D. They provide identical functionality for all data types

Answer: B

Q1355. How does a count-min sketch provide approximate frequency counts with bounded error?

- A. It uses multiple hash functions mapping to a matrix of counters, providing an upper bound estimate with configurable error probability
- B. It stores only the most frequent elements exactly
- C. It counts exactly by using unlimited memory
- D. It compresses all data into a single counter

Answer: A

Q1356. What is a treap and how does it combine properties of trees and heaps?

- A. A special array that combines tree and heap indices
- B. A heap that supports tree traversal operations
- C. A tree that stores elements in heap order only
- D. A BST where each node has a random priority, maintaining BST property on keys and heap property on priorities for probabilistic balance

Answer: D

Q1357. What is the difference between LSM trees and B-trees for write-heavy workloads?

- A. LSM trees do not support read operations
- B. They perform identically for all workload types
- C. B-trees are always faster than LSM trees for writes
- D. LSM trees buffer writes in memory and merge sorted runs sequentially, optimizing write throughput, while B-trees update pages in place with random I/O

Answer: D

Q1358. What is a HAT-trie and why is it more cache-friendly than a standard trie?

- A. It stores multiple characters per node in contiguous arrays, reducing pointer chasing and improving CPU cache utilization
- B. It stores the entire trie in a single array
- C. It hashes all keys before insertion into the trie
- D. It uses hardware acceleration for trie operations

Answer: A

Q1359. What is the difference between wait-free and lock-free concurrent data structures?

- A. They provide identical progress guarantees
- B. Wait-free structures are slower than lock-free structures always
- C. Lock-free guarantees system-wide progress while wait-free guarantees per-thread progress in bounded steps
- D. Lock-free structures use locks internally while wait-free does not

Answer: C

Q1360. What is a CRDT (Conflict-free Replicated Data Type) and why is it important for distributed collections?

- A. A compressed data type for reducing network bandwidth
- B. A data type that prevents all conflicts by using locks
- C. A data type designed so that concurrent updates on different replicas always converge to the same state without coordination
- D. A data type that replicates data by copying entire collections

Answer: C

Q1361. How does the bridge pattern separate abstraction from implementation?

- A. By using two separate inheritance hierarchies connected by composition, allowing them to vary independently
- B. By merging all implementations into a single abstract class
- C. By using global variables to connect unrelated classes
- D. By creating a bridge between two interfaces using static methods

Answer: A

Q1362. What is the Liskov Substitution Principle's impact on exception handling in subclasses?

- A. Subclasses must throw the exact same exceptions as the superclass
- B. Subclasses should never throw any exceptions
- C. Subclass methods should not throw broader exceptions than the superclass method specifies to maintain substitutability
- D. The LSP does not apply to exception handling

Answer: C

Q1363. What is the difference between the state pattern and the strategy pattern?

- A. The state pattern is for concurrency while the strategy pattern is for sorting
- B. They are identical patterns with different names
- C. The state pattern encapsulates state-dependent behavior with transitions between states while the strategy pattern selects an algorithm without transitions
- D. The strategy pattern manages state transitions while the state pattern selects algorithms

Answer: C

Q1364. What is the object pool pattern and when is it beneficial?

- A. A pattern that distributes objects across multiple servers
- B. A pattern that creates objects in a swimming pool metaphor
- C. A pattern that pools all objects into a single collection for easy access
- D. A pattern that maintains a pool of reusable objects to avoid expensive creation and destruction costs

Answer: D

Q1365. What is the problem with inheritance-based reuse known as the 'yo-yo problem'?

- A. When multiple inheritance creates an infinite loop
- B. When understanding a class requires tracing through many levels of inheritance, bouncing up and down the hierarchy
- C. When objects repeatedly create and destroy themselves
- D. When a class inherits from both a parent and grandchild class

Answer: B

Q1366. How does the specification pattern encapsulate business rules as recombining objects?

- A. By storing rules as string expressions evaluated at runtime
- B. By hardcoding rules into if-else chains
- C. By writing all business rules as database queries
- D. By representing each business rule as an object with an isSatisfiedBy method that can be combined using AND, OR, and NOT operations

Answer: D

Q1367. What is the difference between type classes in Haskell and interfaces in Java?

- A. Type classes are slower than interfaces
- B. They are identical concepts in different languages
- C. Java interfaces support more features than type classes
- D. Type classes can add behavior to existing types without modifying them while Java interfaces require implementation at class definition time

Answer: D

Q1368. What is the memento pattern and how does it support undo functionality?

- A. It stores all objects in persistent memory
- B. It creates memory snapshots of the entire application
- C. It memorizes method call history in a static log
- D. It captures an object's internal state in a separate memento object that can be used to restore the state later

Answer: D

Q1369. How does the entity-component-system (ECS) architecture differ from traditional OOP?

- A. ECS requires all entities to share the same base class
- B. ECS is just another name for the MVC pattern
- C. ECS uses deep inheritance hierarchies for entity behavior
- D. ECS separates data (components) from behavior (systems) and uses composition over inheritance, favoring cache-friendly memory layouts

Answer: D

Q1370. What is the expression problem and how do OOP and functional programming approach it differently?

- A. OOP cannot handle any expressions while FP handles all expressions
- B. Both paradigms solve the expression problem identically
- C. FP cannot define new types while OOP cannot define new functions
- D. OOP easily adds new types but struggles to add new operations, while FP easily adds new operations but struggles to add new types

Answer: D

Q1371. What is the tri-color marking algorithm in garbage collection?

- A. It colors memory pages for security purposes
- B. It marks objects based on their data type using three categories
- C. It uses three passes to determine which objects to collect
- D. It classifies objects as white (unreachable), gray (to be scanned), and black (scanned) to safely identify garbage during concurrent collection

Answer: D

Q1372. How does the Boehm-Demers-Weiser conservative garbage collector work for C programs?

- A. It requires the programmer to annotate all pointers
- B. It only collects objects on the stack
- C. It converts C programs to Java for garbage collection
- D. It treats any value in memory that could be a pointer as a potential reference, preventing collection of possibly-referenced objects

Answer: D

Q1373. What is the difference between stop-the-world and concurrent garbage collection?

- A. Concurrent GC always takes longer than stop-the-world
- B. Stop-the-world only pauses one thread at a time
- C. They produce identical pause times in all scenarios
- D. Stop-the-world pauses all application threads during collection while concurrent GC runs alongside the application with minimal pauses

Answer: D

Q1374. What is the ZGC garbage collector in Java designed to achieve?

- A. Maximum throughput at the expense of longer pauses
- B. Sub-millisecond pause times regardless of heap size by using colored pointers and load barriers
- C. Smaller memory footprint than serial GC
- D. Compatibility with C code through JNI

Answer: B

Q1375. What is the purpose of Rust's borrow checker?

- A. It enforces rules at compile time ensuring references do not outlive the data they point to and preventing data races
- B. It monitors runtime memory usage for debugging
- C. It automatically frees memory when borrowing ends
- D. It checks if the program borrows external libraries correctly

Answer: A

Q1376. What is the difference between arena allocation and general-purpose heap allocation?

- A. Arena allocation is slower than heap allocation for all use cases
- B. Arena allocation requires garbage collection to function
- C. Arena allocation groups objects with similar lifetimes and frees them all at once, avoiding individual deallocation overhead
- D. General-purpose allocation always uses less memory than arena allocation

Answer: C

Q1377. What is the Cheney's algorithm for copying garbage collection?

- A. It copies garbage to a separate memory region for analysis
- B. It creates backup copies of all objects for safety
- C. It uses three memory spaces in a rotating pattern
- D. It uses two equal-sized semi-spaces, copying live objects from one to the other, compacting memory and eliminating fragmentation

Answer: D

Q1378. What is the problem of false sharing in concurrent programs and how is it mitigated?

- A. When multiple threads allocate memory from the same pool
- B. When different threads modify variables on the same cache line, causing unnecessary cache invalidation and performance degradation
- C. When shared memory is falsely reported as freed
- D. When threads share incorrect data due to synchronization bugs

Answer: B

Q1379. What is the Shenandoah GC's approach to concurrent compaction?

- A. It compacts memory only during application idle time
- B. It uses stop-the-world pauses for all compaction operations
- C. It relies on the operating system for compaction
- D. It uses Brooks forwarding pointers to redirect references to relocated objects, enabling compaction concurrent with the application

Answer: D

Q1380. What is the concept of escape analysis and how does it optimize memory allocation?

- A. It analyzes memory escape routes during buffer overflow attacks
- B. It determines when variables escape from their declared scope
- C. It detects when objects escape the program's memory space
- D. It analyzes whether an object escapes the method or thread that created it, enabling stack allocation or elimination for non-escaping objects

Answer: D

Q1381. What is the difference between the Result type in Rust and traditional exception handling?

- A. Result encodes success or failure in the return type, forcing callers to handle errors explicitly at compile time, while exceptions propagate implicitly
- B. Result types can only represent two types of errors
- C. Exceptions provide better type safety than Result
- D. Result types are slower than exception handling

Answer: A

Q1382. What is the concept of exception safety in C++ and its three guarantee levels?

- A. Low, medium, and high exception severity levels
- B. Compile-time safety, runtime safety, and thread safety
- C. Type safety, memory safety, and null safety
- D. Basic guarantee (no leaks), strong guarantee (transaction-like rollback), and no-throw guarantee (never throws exceptions)

Answer: D

Q1383. How does Kotlin's approach to checked exceptions differ from Java's?

- A. Kotlin uses a different keyword for checked exceptions
- B. Kotlin requires all exceptions to be checked
- C. Kotlin only allows checked exceptions in coroutines
- D. Kotlin does not have checked exceptions, treating all exceptions as unchecked, because studies showed checked exceptions often lead to empty catch blocks

Answer: D

Q1384. What is the relationship between exceptions and monadic error handling using Either/Result?

- A. Monadic error handling replaces all try-catch blocks with recursion
- B. Exceptions are a subset of monadic error handling
- C. Monadic error handling cannot represent multiple error types
- D. Both represent computations that may fail, but monadic error handling makes failure explicit in types and composable through flatMap/bind

Answer: D

Q1385. What is the zero-cost exception handling model used in modern C++ compilers?

- A. It eliminates all exception-related code at compile time
- B. Exceptions are completely free even when thrown
- C. It replaces exceptions with return codes automatically
- D. It adds no performance overhead when exceptions are not thrown, using table-based stack unwinding only when exceptions occur

Answer: D

Q1386. What is the problem with exceptions in asynchronous or concurrent code?

- A. Exceptions cannot cross thread or async boundaries naturally and may be lost if not properly captured and propagated
- B. Concurrent code cannot throw any exceptions
- C. Exceptions are always thread-safe and work identically in concurrent code
- D. Exceptions in threads automatically propagate to the main thread

Answer: A

Q1387. How does structured concurrency improve exception handling compared to unstructured async code?

- A. It handles exceptions by restarting failed tasks indefinitely
- B. It ensures that all concurrent tasks are scoped to a parent, and exceptions from child tasks automatically cancel siblings and propagate to the parent
- C. It defers all exceptions until the program exits
- D. It eliminates all exceptions in concurrent code

Answer: B

Q1388. What is the effect handler approach to exception handling and how does it generalize try-catch?

- A. Effect handlers define how effects (including exceptions) are interpreted, allowing the same code to have different error handling strategies depending on the handler
- B. They add hardware-level exception handling support
- C. Effect handlers only work in statically typed languages
- D. Effect handlers replace all exception types with a single error type

Answer: A

Q1389. What is the supervisor pattern in actor systems for handling failures?

- A. A thread monitor that prevents all exceptions from occurring
- B. A design pattern that replaces all try-catch with logging
- C. A parent actor monitors child actors and applies a restart, stop, or escalate strategy when a child fails with an exception
- D. A senior developer supervises code reviews for exception handling

Answer: C

Q1390. What is the module resolution algorithm in Node.js and how does it find modules?

- A. It uses a random search through all directories
- B. It only searches the current working directory
- C. It always looks in the global installation directory first
- D. It searches node_modules directories ascending from the requiring file's location, then global locations, checking for files, directories with index.js, or package.json main fields

Answer: D

Q1391. What is the purpose of import maps in modern JavaScript?

- A. They provide a map visualization of module dependencies
- B. They create documentation maps for modules
- C. They allow controlling how module specifiers are resolved in the browser without a build step
- D. They map imports to different programming languages

Answer: C

Q1392. What is the difference between side-effect-free and side-effectful module imports?

- A. Side-effect-free imports are slower
- B. They produce identical behavior in all bundlers
- C. Side-effectful imports cannot export any values
- D. Side-effect-free imports only use the exported values while side-effectful imports execute code that modifies global state on import

Answer: D

Q1393. What is the challenge of diamond dependency conflicts in package management?

- A. When a package depends on itself recursively
- B. When two packages have identical names in different registries
- C. When a dependency graph forms a perfect diamond shape
- D. When two dependencies require different incompatible versions of the same transitive dependency

Answer: D

Q1394. How does the Java Platform Module System (JPMS) differ from traditional classpath-based loading?

- A. Classpath provides stronger encapsulation than JPMS
- B. JPMS uses module declarations to explicitly define dependencies and encapsulated packages, unlike the flat classpath that exposes everything
- C. JPMS is slower than classpath loading
- D. JPMS only works with Java 7 and earlier

Answer: B

Q1395. What is supply chain security in the context of package management?

- A. Protecting against malicious code injected into dependencies through compromised packages or maintainer accounts
- B. Managing the physical supply chain of hardware components
- C. Ensuring packages are delivered in the correct order
- D. Securing the network connection used to download packages

Answer: A

Q1396. What is the purpose of a Software Bill of Materials (SBOM) for packages?

- A. It describes the hardware requirements for the software
- B. It lists the financial cost of each dependency
- C. It provides a comprehensive inventory of all components, libraries, and dependencies in a software project for security and compliance
- D. It documents the development timeline of each package

Answer: C

Q1397. How does Deno's module system differ from Node.js in terms of dependency management?

- A. Deno uses the same npm and node_modules system as Node.js
- B. Deno requires all dependencies to be bundled before execution
- C. Deno does not support external modules
- D. Deno imports modules directly from URLs without a centralized package manager or node_modules directory

Answer: D

Q1398. What is the purpose of module federation in webpack 5?

- A. Allowing multiple independently deployed applications to share modules at runtime without rebuilding
- B. Federating modules across different government agencies
- C. Merging all modules into a single federated package
- D. Creating federal backups of all modules

Answer: A

Q1399. What is the difference between vendoring and using a package manager for dependencies?

- A. Vendoring copies dependency source code directly into the project repository while package managers download them on demand
- B. Package managers copy all code into the repository
- C. Vendoring only works with interpreted languages
- D. Vendoring is always faster than using a package manager

Answer: A

Q1400. What is the difference between the Abstract Factory and Factory Method patterns?

- A. Abstract Factory is a simpler version of Factory Method
- B. Abstract Factory creates families of related objects through an interface while Factory Method delegates creation of a single object to subclasses
- C. They are identical patterns used in different programming languages
- D. Factory Method creates multiple objects while Abstract Factory creates one

Answer: B

Q1401. How does the CQRS pattern improve scalability in distributed systems?

- A. By combining all queries and commands into a single optimized model
- B. By caching all queries on the client side
- C. By separating read and write models, allowing each to be scaled, optimized, and evolved independently
- D. By reducing the number of database tables

Answer: C

Q1402. What is the difference between compile-time and runtime metaprogramming?

- A. Compile-time metaprogramming is always slower
- B. They both execute at the same phase
- C. Compile-time metaprogramming generates or transforms code during compilation while runtime metaprogramming modifies program structure during execution
- D. Runtime metaprogramming cannot create new functions

Answer: C

Q1403. What is the difference between event sourcing and traditional state storage?

- A. Event sourcing stores every state change as an immutable event, deriving current state by replaying events, while traditional storage saves only current state
- B. Traditional storage keeps complete history while event sourcing does not
- C. They store data in identical formats
- D. Event sourcing only stores the final state

Answer: A

Q1404. How does the saga pattern manage distributed transactions across microservices?

- A. It retries all failed transactions indefinitely
- B. It uses a single distributed lock across all services
- C. It orchestrates a sequence of local transactions with compensating actions to undo completed steps if a later step fails
- D. It rolls back all services using two-phase commit

Answer: C

Q1405. What is the difference between the interpreter pattern and an actual language interpreter?

- A. The interpreter pattern compiles code while a language interpreter interprets it
- B. The interpreter pattern defines a grammar representation and an interpreter for sentences in that grammar, used for simple DSLs, while a language interpreter is a full program execution engine
- C. A language interpreter is simpler than the interpreter pattern
- D. They are identical in scope and implementation

Answer: B

Q1406. What is the purpose of the circuit breaker pattern in distributed systems?

- A. It manages electrical circuits in server hardware
- B. It circuits all requests through a central router
- C. It breaks circular dependencies between services
- D. It prevents cascading failures by stopping requests to a failing service and allowing it time to recover

Answer: D

Q1407. What is the difference between a red-black tree and a 2-3-4 tree?

- A. A red-black tree is a binary representation of a 2-3-4 tree where red links represent nodes merged within 2-3-4 tree nodes
- B. Red-black trees have more nodes than 2-3-4 trees for the same data
- C. They are completely unrelated data structures
- D. 2-3-4 trees are always faster for all operations

Answer: A

Q1408. What is backpressure in reactive programming and why is it important?

- A. Pressure applied to undo the last operation
- B. Network congestion that slows down all requests
- C. Memory pressure from running out of heap space
- D. A mechanism that allows consumers to signal producers to slow down when they cannot keep up with the data flow rate

Answer: D

Q1409. What is the difference between optimistic and pessimistic concurrency control in application design?

- A. They are identical strategies with different names
- B. Pessimistic control never uses any locks
- C. Optimistic control assumes conflicts are rare and detects them at commit time, while pessimistic control prevents conflicts by acquiring locks before access
- D. Optimistic control is always faster than pessimistic control

Answer: C

Q1410. What is the difference between lock-free and wait-free algorithms?

- A. Lock-free algorithms are always faster than wait-free
- B. Lock-free guarantees system-wide progress while wait-free guarantees bounded completion for every thread
- C. They provide identical progress guarantees
- D. Wait-free algorithms use locks while lock-free algorithms do not

Answer: B

Q1411. What is the epoch-based reclamation (EBR) technique for concurrent memory management?

- A. It reclaims memory at fixed time intervals
- B. It creates backup copies of memory at each epoch
- C. It uses epoch timestamps to sort memory allocations
- D. It divides time into epochs and defers memory reclamation until all threads have advanced past the epoch when the memory was freed

Answer: D

Q1412. How does the Disruptor pattern achieve high-performance inter-thread communication?

- A. It disrupts thread scheduling to gain priority
- B. It uses a lock-free ring buffer with sequencing to enable producer-consumer communication with mechanical sympathy for CPU caches
- C. It uses multiple locks for each data element
- D. It stores all data in a shared database

Answer: B

Q1413. What is the difference between linearizability and serializability?

- A. They are identical consistency models
- B. Linearizability requires operations to appear atomic at a single point in real time while serializability requires the result to be equivalent to some serial execution
- C. Serializability is stronger than linearizability
- D. Linearizability only applies to single-threaded programs

Answer: B

Q1414. What is the purpose of hazard pointers in lock-free data structures?

- A. They mark memory locations that are unsafe to write to
- B. They protect nodes from being reclaimed while other threads still reference them, solving the safe memory reclamation problem
- C. They point to hazardous code sections that should not be executed
- D. They point to threads that may cause deadlocks

Answer: B

Q1415. What is the difference between strong and weak memory ordering on modern CPUs?

- A. Strong ordering prevents all concurrency bugs automatically
- B. Weak ordering is always faster than strong ordering
- C. Strong ordering guarantees operations appear in program order to all threads while weak ordering allows reordering for performance, requiring explicit barriers
- D. They only affect floating-point operations

Answer: C

Q1416. What is structured concurrency and why is it considered safer than unstructured thread creation?

- A. It requires all threads to run the same structured code
- B. It only allows creating threads in specific code structures
- C. It ensures concurrent tasks are scoped to a defined lifetime, guaranteeing all tasks complete or are cancelled before the scope exits
- D. It structures threads in a hierarchical tree permanently

Answer: C

Q1417. What is the consensus problem in distributed concurrent systems?

- A. Agreeing on the number of threads to allocate
- B. Getting multiple processes to agree on a single value despite failures, foundational for distributed coordination
- C. Getting all stakeholders to agree on the software architecture
- D. Reaching consensus on which programming language to use

Answer: B

Q1418. What is the FLP impossibility result and its significance for concurrent systems?

- A. It demonstrates that threads cannot share memory safely
- B. It shows that lock-free algorithms are impossible
- C. It proves that deterministic consensus is impossible in an asynchronous system where even one process can crash
- D. It proves that all concurrent programs eventually deadlock

Answer: C

Q1419. What is the difference between virtual threads (Project Loom) and platform threads in Java?

- A. Virtual threads cannot perform I/O operations
- B. Platform threads use less memory than virtual threads
- C. Virtual threads are lightweight user-mode threads managed by the JVM that can be created in millions, while platform threads are OS threads with higher overhead
- D. Virtual threads are faster for all workloads

Answer: C

Q1420. What is concolic testing and how does it combine concrete and symbolic execution?

- A. It tests concurrent code with symbolic debuggers
- B. It uses concrete test data and symbolic names for variables
- C. It runs concrete execution alongside symbolic execution, using concrete values to guide path exploration and symbolic constraints for input generation
- D. It combines console output testing with logic testing

Answer: C

Q1421. What is the difference between deterministic and non-deterministic testing of concurrent programs?

- A. They produce identical results for concurrent code
- B. Deterministic testing controls thread scheduling to explore specific interleavings while non-deterministic relies on random scheduling
- C. Non-deterministic testing is more thorough than deterministic
- D. Deterministic tests always pass while non-deterministic may fail

Answer: B

Q1422. What is metamorphic testing and when is it useful?

- A. Testing where outputs of related test inputs are compared using known relationships when expected outputs are hard to determine
- B. Testing the metadata of test files
- C. Testing morphological transformations of data structures
- D. Testing that code changes (morphs) correctly across versions

Answer: A

Q1423. How does reverse debugging (time-travel debugging) work?

- A. It debugs code before it is compiled
- B. It reverses the order of test execution
- C. It runs the program in reverse to undo changes
- D. It records the entire program execution state, allowing developers to step backward through execution to find the root cause of bugs

Answer: D

Q1424. What is the difference between generation-based and mutation-based fuzzing?

- A. Generation-based fuzzing creates inputs from grammar specifications while mutation-based fuzzing modifies existing valid inputs
- B. They produce identical test coverage
- C. Mutation-based fuzzing requires manual test case writing
- D. Generation-based fuzzing is always faster

Answer: A

Q1425. What is the purpose of formal verification compared to testing?

- A. Formal verification is faster than testing
- B. Testing provides stronger guarantees than formal verification
- C. Formal verification replaces the need for all testing
- D. Formal verification mathematically proves correctness for all possible inputs while testing can only check a finite number of cases

Answer: D

Q1426. What is coverage-guided fuzzing and how does it improve upon random fuzzing?

- A. It focuses only on covering previously tested paths
- B. It uses code coverage feedback to guide input mutations toward unexplored code paths, achieving deeper code coverage
- C. It guides tests toward code that already has high coverage
- D. It reduces coverage to speed up fuzzing

Answer: B

Q1427. What is the oracle problem in software testing?

- A. The difficulty of choosing the right testing framework
- B. A problem with Oracle database testing
- C. The challenge of determining the correct expected output for a given test input, especially for complex systems
- D. A problem with predicting which tests will fail

Answer: C

Q1428. What is the difference between white-box fuzzing and black-box fuzzing?

- A. White-box fuzzing only tests visible code while black-box tests hidden code
- B. They explore the same paths using different input formats
- C. White-box fuzzing uses program analysis to systematically generate inputs that explore specific paths while black-box fuzzing treats the program as opaque
- D. Black-box fuzzing requires source code access while white-box does not

Answer: C

Q1429. What is the purpose of differential testing (differential fuzzing)?

- A. Testing the difference between old and new code versions only
- B. Testing the performance difference between two algorithms
- C. Testing equivalent implementations of the same specification against each other to find discrepancies indicating bugs
- D. Testing differences between development and production environments

Answer: C

Q1430. What is the purpose of chaos engineering and how does Netflix's Chaos Monkey work?

- A. Chaos Monkey introduces syntax errors into code
- B. It randomly assigns developers to different teams
- C. Chaos Monkey randomly terminates production instances to verify that the system can tolerate failures, building confidence in resilience
- D. It chaotically reorders database records for testing

Answer: C

Q1431. What is the difference between observability and monitoring?

- A. They are identical practices with different names
- B. Monitoring tracks predefined metrics and alerts while observability enables exploring and understanding system behavior from its outputs without predefined queries
- C. Monitoring provides more insight than observability
- D. Observability is simpler than monitoring

Answer: B

Q1432. How does GitOps extend DevOps practices using Git as the single source of truth?

- A. GitOps uses Git repositories as the declarative source of truth for infrastructure and application configuration, with automated reconciliation
- B. GitOps eliminates the need for CI/CD pipelines
- C. GitOps only applies to frontend development
- D. GitOps replaces Git with a new version control system

Answer: A

Q1433. What is the purpose of a service mesh and how does it relate to microservice development?

- A. It creates a mesh network between physical servers
- B. It provides a dedicated infrastructure layer handling service-to-service communication including load balancing, encryption, and observability without changing application code
- C. It provides networking hardware for services
- D. It meshes all services into a single application

Answer: B

Q1434. What is the concept of developer experience (DX) and why does it matter?

- A. DX focuses on making tools, APIs, documentation, and workflows efficient and pleasant for developers, directly impacting productivity and code quality
- B. DX only applies to designing developer-facing UI
- C. DX measures how many years of experience a developer has
- D. DX is about decorating the developer workspace

Answer: A

Q1435. What is the difference between Platform Engineering and traditional DevOps?

- A. Platform Engineering builds internal developer platforms as a product to enable self-service capabilities, while DevOps focuses on culture and practices for collaboration
- B. DevOps provides self-service while Platform Engineering requires manual ops
- C. They are identical approaches to infrastructure management
- D. Platform Engineering replaces DevOps entirely

Answer: A

Q1436. What is the DORA metrics framework for measuring software delivery performance?

- A. It measures developer satisfaction and code quality only
- B. It measures server uptime and network latency
- C. It measures the number of lines of code written per day
- D. It measures deployment frequency, lead time for changes, change failure rate, and time to restore service

Answer: D

Q1437. What is the purpose of dependency injection containers and how do they implement inversion of control?

- A. They invert the direction of data flow in the application
- B. They contain all project dependencies in a single file
- C. They inject security vulnerabilities for penetration testing
- D. They manage object creation and lifecycle, automatically resolving and injecting dependencies based on configuration, inverting control of dependency creation from application code to the container

Answer: D

Q1438. What is the concept of immutable infrastructure?

- A. Infrastructure that cannot be deleted once created
- B. Infrastructure that uses immutable data structures only
- C. Infrastructure where servers are never modified after deployment; changes require building and deploying entirely new instances
- D. Infrastructure that never changes its IP addresses

Answer: C

Q1439. What is the difference between vertical and horizontal scaling and when is each appropriate?

- A. Horizontal scaling requires a single powerful server
- B. Vertical scaling is always better than horizontal
- C. Vertical scaling adds more resources to a single machine while horizontal scaling adds more machines, with horizontal being better for distributed workloads and vertical for simpler architectures
- D. They achieve identical results in all scenarios

Answer: C

Q1440. How does the error kernel pattern improve fault tolerance in distributed systems?

- A. It creates a kernel-level exception handler for all processes
- B. It prevents all errors by running code in a secure kernel
- C. It logs all errors to a central kernel database
- D. It isolates error-prone code in separate processes supervised by a minimal, highly reliable kernel that handles restarts

Answer: D

SUBJECT

Software Engineering

1,440 Multiple Choice Questions

Software Engineering — Easy

480 questions

Q1. What does software engineering primarily deal with?

- A. Systematic software development
- B. Configuring computer network infrastructure
- C. Managing enterprise database systems
- D. Building and maintaining hardware systems

Answer: A

Q2. Who is considered the first person to use the term 'software engineering'?

- A. Alan Turing
- B. Edsger Dijkstra
- C. Dennis Ritchie
- D. Margaret Hamilton

Answer: D

Q3. Which of the following is NOT a characteristic of good software?

- A. Dependability
- B. Complexity
- C. Maintainability
- D. Efficiency

Answer: B

Q4. What is the main goal of software engineering?

- A. To incorporate the latest emerging technology
- B. To minimize the overall development team size
- C. To produce quality software within budget and schedule
- D. To write source code as quickly as possible

Answer: C

Q5. Software engineering is a branch of which field?

- A. Computer science and engineering
- B. Electrical engineering and circuits
- C. Mechanical engineering and design
- D. Civil engineering and structures

Answer: A

Q6. What does the term 'software crisis' refer to?

- A. Rapidly increasing hardware component costs
- B. Insufficient programming language features
- C. Problems in developing large-scale software
- D. A critical shortage of trained programmers

Answer: C

Q7. Which of the following is a software product?

- A. Operating System
- B. Mechanical keyboard
- C. Monitor display unit
- D. Laser printer device

Answer: A

Q8. What is a software process?

- A. A standalone computer program in the development
- B. A relational database system within the project scope
- C. A set of activities for software development
- D. A physical hardware component during the software

Answer: C

Q9. Which attribute is essential for software quality?

- A. Large file size
- B. Complex algorithms
- C. Reliability
- D. Maximum features

Answer: C

Q10. What is the purpose of software documentation?

- A. To increase overall project file size
- B. To help understand and maintain the software
- C. To make onboarding harder for new hires
- D. To intentionally slow down the development

Answer: B

Q11. What is the Waterfall model?

- A. A circular iterative development process
- B. A random unstructured coding process
- C. An agile methodology with sprint cycles
- D. A linear sequential software development approach

Answer: D

Q12. Which phase comes first in the Waterfall model?

- A. Implementation phase
- B. Testing the system
- C. Requirements analysis
- D. Deployment to users

Answer: C

Q13. What is an iterative process model?

- A. A model that omits all testing phases
- B. A model that executes only a single run
- C. A hardware-focused design model only
- D. A model that repeats development cycles

Answer: D

Q14. What does the 'V-Model' emphasize?

- A. Only source code implementation tasks
- B. Hardware testing procedures and checks
- C. Only requirements documentation writing
- D. Verification and validation at each development stage

Answer: D

Q15. In which model are requirements expected to be fully known at the start?

- A. Spiral
- B. Prototype
- C. Waterfall
- D. Agile

Answer: C

Q16. What is a software development life cycle (SDLC)?

- A. The process of planning, creating, testing, and deploying software
- B. A physical computing hardware component unit in all development efforts
- C. A specific type of programming language syntax for all project stakeholders
- D. A specialized category of database system type within the given constraints

Answer: A

Q17. Which model is also known as the 'Classic Life Cycle'?

- A. Waterfall
- B. RAD to achi
- C. Spiral by
- D. Agile and

Answer: A

Q18. What is prototyping in software development?

- A. Building a preliminary version to explore requirements
- B. Delivering the final production product in the engineering
- C. Performing hardware acceptance testing as part of the methodology
- D. Removing outdated legacy source code for effective project outcomes

Answer: A

Q19. Which process model involves risk analysis in each iteration?

- A. RAD
- B. Spiral
- C. V-Model
- D. Waterfall

Answer: B

Q20. What is the main disadvantage of the Waterfall model?

- A. Spending too much time on testing activities
- B. Being excessively flexible and unstructured
- C. Moving too fast through development phases
- D. Difficult to accommodate changes after a phase is completed

Answer: D

Q21. What is Agile software development?

- A. A hardware design and manufacturing method as defined by standards
- B. An iterative approach emphasizing flexibility and customer collaboration
- C. A documentation-only waterfall approach for all project stakeholders
- D. A strict sequential step-by-step approach over the entire lifecycle

Answer: B

Q22. Which of the following is an Agile methodology?

- A. Scrum
- B. CMMI
- C. V-Model
- D. Waterfall

Answer: A

Q23. What is a 'Sprint' in Scrum?

- A. A formal documentation writing phase only
- B. A time-boxed iteration typically lasting 2-4 weeks
- C. A physical running exercise for team health
- D. A specific category of software defect type

Answer: B

Q24. Who is the Product Owner in Scrum?

- A. The quality assurance tester on the project in all development efforts
- B. The person responsible for maximizing the value of the product
- C. The database administrator managing storage by the project team members
- D. The chief executive officer of the company within the given constraints

Answer: B

Q25. What is the Agile Manifesto?

- A. A declaration of four core values and twelve principles for Agile development
- B. A programming language specification document to achieve project objectives
- C. A legally binding contractual document only and related components
- D. A hardware installation and setup manual in the engineering discipline

Answer: A

Q26. How many values does the Agile Manifesto contain?

- A. 2
- B. 8
- C. 4
- D. 6

Answer: C

Q27. What does Scrum emphasize?

- A. Hardware design and manufacturing work
- B. Individual solo development practices only
- C. Self-organizing teams and iterative progress
- D. Producing extensive formal documentation

Answer: C

Q28. What is a 'User Story' in Agile?

- A. A fictional novel written about end users for effective project outcomes
- B. A comprehensive automated test case only in the development process
- C. A formal detailed software bug report only as part of the methodology
- D. A short description of a feature from the user's perspective

Answer: D

Q29. What is a Daily Standup meeting?

- A. A brief daily meeting where team members share progress and blockers
- B. An extensive annual strategic planning event for the development team
- C. A comprehensive weekly team meeting session during the software lifecycle
- D. A detailed monthly project review session within the project scope

Answer: A

Q30. Which Agile value prioritizes 'working software' over what?

- A. Individual interactions
- B. Responding to change
- C. Customer collaboration
- D. Comprehensive documentation

Answer: D

Q31. What is requirements engineering?

- A. Performing software testing and validation in the development process
- B. Designing hardware system architectures during the software lifecycle
- C. Writing application source code for features as part of the methodology
- D. The process of defining, documenting, and maintaining software requirements

Answer: D

Q32. What is a functional requirement?

- A. A constraint on the system design choices
- B. A measurable performance goal for the system
- C. A requirement that describes what the system should do
- D. A detailed hardware specification document

Answer: C

Q33. What is a non-functional requirement?

- A. A requirement that specifies quality attributes like performance or security
- B. A requirement that is impossible to implement for the development team
- C. A broken or flawed software requirement only within the project scope
- D. A specification for hardware system components throughout the project

Answer: A

Q34. What is requirements elicitation?

- A. The process of gathering requirements from stakeholders
- B. Performing systematic software testing runs
- C. Writing application source code for modules
- D. Deploying software to production servers

Answer: A

Q35. Which of the following is a requirements elicitation technique?

- A. Interview sessions
- B. Debugging errors
- C. Coding source logic
- D. Code compilation

Answer: A

Q36. What is a Software Requirements Specification (SRS)?

- A. The application source code implementation
- B. A comprehensive software test plan document
- C. A complete end-user operational and help manual
- D. A document describing all requirements of the system

Answer: D

Q37. Who are stakeholders in requirements engineering?

- A. Only the programmers writing the source code
- B. Only the paying customers of the software product
- C. Only the project managers overseeing the work
- D. Anyone who has an interest in or is affected by the system

Answer: D

Q38. What is the difference between user requirements and system requirements?

- A. They are fundamentally the same concept entirely in the system context
- B. User requirements are high-level; system requirements are detailed technical specifications
- C. System requirements are always much simpler overall during implementation
- D. User requirements are far more technically detailed for quality purposes

Answer: B

Q39. What is requirements validation?

- A. Implementing requirements directly into code by the organization
- B. Initially writing new requirements documents in practice typically
- C. Checking that requirements are correct, complete, and consistent
- D. Permanently deleting unnecessary requirements as a standard approach

Answer: C

Q40. What is a use case?

- A. A description of how a user interacts with the system to achieve a goal
- B. A category of reported software defect type across all phases
- C. A specific automated test case scenario only at every stage
- D. A step in the deployment process workflow in a systematic way

Answer: A

Q41. What is software project management?

- A. Planning, organizing, and controlling software development activities
- B. Designing hardware system architectures throughout the project
- C. Writing application source code and modules within the project scope
- D. Performing software testing and debugging for the development team

Answer: A

Q42. What is a Gantt chart?

- A. A bar chart showing project schedule and task dependencies
- B. A relational database schema design diagram
- C. A specific type of source code format only
- D. A specialized software testing automation tool

Answer: A

Q43. What does WBS stand for?

- A. Work Based Standards
- B. Web Browser Software
- C. Work Breakdown Structure
- D. Wireless Broadcasting System

Answer: C

Q44. What is a project milestone?

- A. An established coding standard and guideline
- B. A significant point or event in a project timeline
- C. A physical unit of measured distance only
- D. A specific category of software defect type

Answer: B

Q45. What is the critical path in project management?

- A. The longest sequence of dependent tasks determining the minimum project duration
- B. The path with the fewest total listed tasks for quality purposes
- C. The shortest possible project path for tasks during implementation
- D. The set of easiest tasks in the project plan in the system context

Answer: A

Q46. What is project scope?

- A. The total number of developers on the team as a standard approach
- B. The total size of the source code base only in practice typically
- C. The defined boundaries of what the project will and will not deliver
- D. Only the financial budget for the project by the organization

Answer: C

Q47. What is a deliverable in project management?

- A. A tangible or intangible output produced as a result of project work
- B. A scheduled meeting agenda and minutes record in a systematic way
- C. A food delivery order to the project team at every stage
- D. A formal software defect bug report document across all phases

Answer: A

Q48. What is project estimation?

- A. Measuring physical hardware performance speeds
- B. Predicting the effort, cost, and duration needed for a project
- C. Simply counting total lines of application code
- D. Making random guesses without any real basis

Answer: B

Q49. What is resource allocation?

- A. Deleting unnecessary project data and files
- B. Assigning available resources to project tasks
- C. Writing comprehensive project documentation
- D. Purchasing new computing hardware equipment

Answer: B

Q50. What are the three constraints of project management?

- A. Design, Build, Ship within the system boundary
- B. Code, Test, Deploy for the project goals
- C. Scope, Time, Cost (the triple constraint)
- D. Plan, Do, Check according to best practices

Answer: C

Q51. What is software design?

- A. Writing detailed end-user operation manual docs as a standard approach
- B. Deploying software to production server systems in practice typically
- C. Writing comprehensive test case scenario suites for quality purposes
- D. The process of defining the architecture, components, and interfaces of a system

Answer: D

Q52. What is modularity in software design?

- A. Using only one file for all the source code
- B. Dividing a system into separate, independent modules
- C. Writing one single large monolithic program
- D. Avoiding the use of functions in the code

Answer: B

Q53. What is cohesion in software design?

- A. Unnecessary duplication of source code and logic
- B. Multiple modules depending on each other heavily
- C. A specific category of software defect and bug
- D. The degree to which elements within a module belong together

Answer: D

Q54. What is coupling in software design?

- A. A high degree of internal module cohesion only
- B. A specific type of data structure or element
- C. The degree of interdependence between modules
- D. A programming language built-in feature type

Answer: C

Q55. Which is preferred: high cohesion or low cohesion?

- A. No cohesion at all
- B. Both are equally good
- C. Low cohesion is preferred
- D. High cohesion is preferred

Answer: D

Q56. Which is preferred: tight coupling or loose coupling?

- A. Loose coupling is preferred
- B. No coupling at all works
- C. Tight coupling is preferred
- D. Both are equally good

Answer: A

Q57. What is a design pattern?

- A. A specific coding style and convention set
- B. A user interface visual color scheme choice
- C. A reusable solution to a commonly occurring design problem
- D. A comprehensive software testing method type

Answer: C

Q58. What is abstraction in design?

- A. A specific type of runtime software error type
- B. Adding increasingly more implementation detail
- C. Removing all application source code and files
- D. Hiding complex details and showing only essential features

Answer: D

Q59. What is information hiding?

- A. Concealing internal design decisions within a module from other modules
- B. Permanently deleting stored information across all phases
- C. Hiding files on the operating system disk at every stage
- D. Encrypting sensitive data during transit by the organization

Answer: A

Q60. What is the difference between high-level and low-level design?

- A. They are fundamentally the same thing exactly in a systematic way
- B. High-level defines architecture; low-level defines detailed component design
- C. Low-level design is always more important overall for the project goals
- D. High-level design is done after coding is finished according to best practices

Answer: B

Q61. What is software architecture?

- A. The high-level structure of a software system defining its components and their relationships
- B. A specific type of programming language syntax in the engineering discipline
- C. A comprehensive software testing framework type for effective project outcomes
- D. The actual application source code itself only and related components to achieve project objectives

Answer: A

Q62. What is a client-server architecture?

- A. A standalone desktop application design only during the software lifecycle
- B. An architecture where clients request services from a central server
- C. A decentralized peer-to-peer network system in the development process
- D. A single standalone computer system by itself as part of the methodology

Answer: B

Q63. What is a layered architecture?

- A. An architecture organized into horizontal layers, each providing services to the layer above
- B. A completely flat system structure layout design within the project scope
- C. A random unorganized structure for the code throughout the project in the system context
- D. A circular system structure design layout type for the development team

Answer: A

Q64. What is a monolithic architecture?

- A. A client-server communication system setup only in practice typically
- B. A single-tiered application where all components are tightly integrated
- C. A fully distributed computing system setup design during implementation
- D. A microservices-based architecture approach type for quality purposes

Answer: B

Q65. What is the purpose of software architecture?

- A. To write application source code much faster as a standard approach
- B. To provide a blueprint for the system and enable communication among stakeholders
- C. To completely eliminate the software testing phase by the organization
- D. To reduce the overall project development team at every stage

Answer: B

Q66. What is a three-tier architecture?

- A. A three-story office building design layout across all phases
- B. An architecture with presentation, business logic, and data tiers
- C. Three different programming languages used for the project goals
- D. A development team of three programmers in a systematic way

Answer: B

Q67. What is a repository architecture?

- A. A network infrastructure architecture type only by the development process
- B. A Git source code version control repository according to best practices
- C. An architecture where components share data through a central data store
- D. An operating system file storage system only within the system boundary

Answer: C

Q68. What is a pipe-and-filter architecture?

- A. An access security management system type only as defined by standards
- B. A physical plumbing infrastructure system design and its related activities
- C. A network traffic filtering system setup only over the entire lifecycle
- D. An architecture where data flows through a sequence of processing components

Answer: D

Q69. What is an event-driven architecture?

- A. An architecture where components communicate through events
- B. A sequential processing architecture style only
- C. A scheduling calendar management system only
- D. A batch data processing system design only

Answer: A

Q70. What is a distributed system architecture?

- A. An architecture where components run on multiple networked computers
- B. A standalone desktop application design approach within the given constraints
- C. A single standalone computer hardware unit only for all project stakeholders
- D. A local desktop application installation setup in all development efforts

Answer: A

Q71. What does UI stand for?

- A. User Information
- B. User Interface
- C. Universal Integration
- D. Unified Input

Answer: B

Q72. What does UX stand for?

- A. User Experience
- B. Universal Exchange
- C. Unified Expression
- D. User Extension

Answer: A

Q73. What is usability?

- A. The ease with which users can learn and use a software system
- B. Application processing execution speed rating
- C. System memory consumption and usage metrics
- D. Internal source code logic complexity metrics

Answer: A

Q74. What is a wireframe?

- A. A basic visual guide showing the layout and structure of a web page or app
- B. A type of network cable connector wire type during the software lifecycle
- C. A general-purpose programming language tool set within the project scope
- D. A specialized software testing tool suite only for the development team

Answer: A

Q75. What is responsive design?

- A. Websites that load extremely fast for users throughout the project
- B. A design that responds to voice command input in the system context
- C. A type of programming language paradigm type during implementation
- D. Design that adapts the layout to different screen sizes and devices

Answer: D

Q76. What is a mockup in UI design?

- A. A relational database schema design model type in practice typically
- B. A specific automated test case scenario setup for quality purposes
- C. A source code implementation template file set as a standard approach
- D. A static visual representation of how the final product will look

Answer: D

Q77. What is navigation in UI design?

- A. The system that allows users to move between different sections of an application
- B. A physical GPS location navigation system tool by the organization
- C. Network routing and traffic configuration setup at every stage
- D. Operating system file directory browsing tool across all phases

Answer: A

Q78. What is consistency in UI design?

- A. Using random and varying page layouts designs in a systematic way
- B. Making every page look distinctly different each for the project goals
- C. Changing interface colors very frequently always according to best practices
- D. Maintaining uniform design elements and behaviors throughout the interface

Answer: D

Q79. What is a call-to-action (CTA) button?

- A. A phone call button for customer support line
- B. A window close or dismiss button on the page
- C. A button designed to prompt users to take a specific action
- D. A help documentation access button on the page

Answer: C

Q80. What is accessibility in UI design?

- A. Database access control and permissions setup
- B. Access control to application source code files
- C. Designing software so it can be used by people with disabilities
- D. Internet access and connectivity service plans

Answer: C

Q81. What is coding in software development?

- A. Performing software testing and debugging work
- B. Writing comprehensive project documentation work
- C. Assembling physical hardware components together
- D. The process of writing source code to implement software design

Answer: D

Q82. What is a coding standard?

- A. A comprehensive software testing standard only
- B. A hardware specification and standard set only
- C. A specific type of source code module and file
- D. A set of guidelines for writing consistent and readable code

Answer: D

Q83. What is code review?

- A. Compiling source code into executable files by the project team members
- B. Writing new feature source code logic only in all development efforts
- C. Permanently deleting source code files only within the given constraints
- D. Systematic examination of source code by peers to find defects

Answer: D

Q84. What is refactoring?

- A. Permanently deleting old source code and files
- B. Completely rewriting everything from scratch again
- C. Adding entirely new features and functionality
- D. Restructuring existing code without changing its external behavior

Answer: D

Q85. What is version control?

- A. Managing changes to source code over time
- B. Controlling hardware component versions only
- C. A type of software testing methodology only
- D. Controlling software versions in a retail store

Answer: A

Q86. What is debugging?

- A. Deploying software to production server systems
- B. Intentionally adding bugs to the source code
- C. Writing brand new application source code only
- D. The process of finding and fixing defects in code

Answer: D

Q87. What is an IDE?

- A. Integrated Development Environment — a software tool for writing and debugging code
- B. An internet web hosting service provider only and related components
- C. A standard network communication protocol type in the engineering discipline
- D. A relational database management system only to achieve project objectives

Answer: A

Q88. What is source code?

- A. Human-readable instructions written in a programming language
- B. Binary data stored on disk drives and memory
- C. Low-level machine instruction code and binary
- D. Hardware specifications and schematics diagrams

Answer: A

Q89. What is a build in software development?

- A. A physical construction building project plan
- B. The process of converting source code into executable software
- C. A comprehensive design document and artifact
- D. A specific type of software test execution run

Answer: B

Q90. What is technical documentation?

- A. End user reviews and feedback comment forms as part of the methodology
- B. Sales reports and revenue projections summary in the development process
- C. Written descriptions of code structure, APIs, and system behavior
- D. Marketing and promotional campaign materials for effective project outcomes

Answer: C

Q91. What is software testing?

- A. Designing software system architecture diagrams as defined by standards
- B. The process of evaluating software to find defects and verify it meets requirements
- C. Writing application source code for new features and its related activities
- D. Deploying software to production server systems over the entire lifecycle

Answer: B

Q92. What is a test case?

- A. A set of conditions and expected results for testing a specific aspect of software
- B. A specific type of source code module and library in all development efforts
- C. A suitcase for carrying test documents and files within the given constraints
- D. A legal court case and proceedings in a courtroom for all project stakeholders

Answer: A

Q93. What is unit testing?

- A. Testing graphical user interface screens and flows
- B. Testing physical hardware units and device parts
- C. Testing the entire integrated system all at once
- D. Testing individual components or functions in isolation

Answer: D

Q94. What is integration testing?

- A. Testing documentation to achieve project objectives
- B. Testing in isolation and related components
- C. Testing the interaction between integrated components
- D. Unit testing by the project team members

Answer: C

Q95. What is a bug in software?

- A. A recognized software design pattern and approach
- B. A new feature request from project stakeholders
- C. A defect or error in software that causes incorrect behavior
- D. An insect found inside a computer case housing

Answer: C

Q96. What is black-box testing?

- A. Testing with a completely black display screen view
- B. Testing physical hardware system components only
- C. Testing software without knowledge of its internal code structure
- D. Testing in a completely dark room with no light

Answer: C

Q97. What is white-box testing?

- A. Testing with a completely white display screen view
- B. Testing software with knowledge of its internal code structure
- C. Testing comprehensive project documentation items
- D. Testing written on white paper documents and sheets

Answer: B

Q98. What is regression testing?

- A. Going backwards in the development lifecycle flow in the engineering discipline
- B. Testing the software for the very first time ever for effective project outcomes
- C. Testing the user registration feature flow only as part of the methodology
- D. Re-testing software after changes to ensure existing functionality still works

Answer: D

Q99. What is the purpose of a test plan?

- A. To outline the testing strategy, objectives, and schedule
- B. To design the user interface screen layout pages
- C. To deploy software to production server systems
- D. To write application source code for new modules

Answer: A

Q100. What is acceptance testing?

- A. Testing to determine if the software meets user requirements and is ready for delivery
- B. Accepting all reported software bugs as features in the development process
- C. Testing performed by internal developers only ever within the project scope
- D. Testing document formatting and acceptance rules during the software lifecycle

Answer: A

Q101. What is software maintenance?

- A. Writing brand new software from scratch entirely in the development process
- B. Maintaining physical hardware equipment and parts during the software lifecycle
- C. Installing software on new workstations and PCs within the project scope
- D. Modifying software after delivery to correct faults, improve performance, or adapt to changes

Answer: D

Q102. What is corrective maintenance?

- A. Improving overall system performance speed rates
- B. Fixing defects and bugs discovered after deployment
- C. Adapting software to new operating environments
- D. Adding new features and functionality to the app

Answer: B

Q103. What is adaptive maintenance?

- A. Adding brand new features to the product
- B. Modifying software to work in a changed environment
- C. Fixing bugs found after release for the development team
- D. Improving performance and speed throughout the project

Answer: B

Q104. What is perfective maintenance?

- A. Adapting software to new operating platforms only for quality purposes
- B. Making software absolutely perfect and flawless in the system context
- C. Fixing only critical security bugs and flaws only during implementation
- D. Enhancing software functionality and performance based on user feedback

Answer: D

Q105. What is preventive maintenance?

- A. Preventing all use of the software product system in practice typically
- B. Making changes to prevent future problems and improve maintainability
- C. Preventing all user access to the entire system by the organization
- D. Preventing only software bugs from occurring only as a standard approach

Answer: B

Q106. What percentage of software cost is typically spent on maintenance?

- A. 60-80%
- B. 25% acr
- C. 10% at
- D. 5% in

Answer: A

Q107. What is a software patch?

- A. A physical hardware fix and repair procedure doc
- B. A completely new software release version number
- C. A piece of code designed to fix or update existing software
- D. A fabric patch for clothing and textile repairs

Answer: C

Q108. What is legacy software?

- A. Brand new recently developed software application
- B. Open source freely available software components
- C. Older software that is still in use but may be difficult to maintain
- D. Mobile application software for phones and tablets

Answer: C

Q109. What is software evolution?

- A. Darwin's biological theory of species evolution for the project goals
- B. Permanently deleting outdated software and files according to best practices
- C. Physical hardware evolution over many years time within the system boundary
- D. The process of continuously changing and adapting software over its lifecycle

Answer: D

Q110. What is a software release?

- A. Permanently deleting the software product files
- B. A press release about the software product launch
- C. A version of software made available to users
- D. A specific type of software defect or bug found

Answer: C

Q111. What does QA stand for in software?

- A. Quantitative Assessment
- B. Query Analysis
- C. Quick Application
- D. Quality Assurance

Answer: D

Q112. What is software quality?

- A. The overall speed of software development activities
- B. The total number of features available in the app
- C. The degree to which software meets requirements and user expectations
- D. The total length of all source code lines and files

Answer: C

Q113. What is the difference between QA and testing?

- A. The two concepts are fundamentally the same exact thing across all phases
- B. QA focuses on preventing defects through processes; testing focuses on finding defects
- C. Testing is always much broader than QA practices are in a systematic way
- D. QA only involves software testing activities and nothing else for the project goals

Answer: B

Q114. What is a software standard?

- A. A physical flag or banner displayed for events according to best practices
- B. A physical computing hardware component and part by the development process
- C. A specific type of application source code module within the system boundary
- D. A documented agreement containing rules and guidelines for software development

Answer: D

Q115. What is a code inspection?

- A. A formal review of source code by peers to find defects
- B. Running the compiled application directly for users
- C. Compiling the source code into binary executables
- D. Looking at a computer display screen only visually

Answer: A

Q116. What is a software defect?

- A. An intended software feature or product capability and its related activities
- B. A scheduled software update or patch file release over the entire lifecycle
- C. A recognized software design pattern and approach as defined by standards
- D. A flaw in software that causes it to produce incorrect or unexpected results

Answer: D

Q117. What is the purpose of quality control?

- A. Checking that deliverables meet quality standards
- B. Controlling the overall project scope boundary
- C. Controlling physical hardware components and parts
- D. Controlling the overall project team size numbers

Answer: A

Q118. What is a review in software QA?

- A. A systematic examination of software artifacts to find issues
- B. A movie review and rating evaluation by critics
- C. An employee performance review and appraisal form
- D. A consumer product rating and evaluation review

Answer: A

Q119. What is ISO 9001?

- A. An international standard for quality management systems
- B. A specialized software testing tool suite and program
- C. A general-purpose programming language tool and set
- D. A specific type of application source code file only

Answer: A

Q120. What is the cost of quality?

- A. The total cost of ensuring quality plus the cost of poor quality
- B. Only the prevention costs of quality effort spent
- C. Only the rework and bug fixing cost totals only
- D. Only the software testing costs and effort totals

Answer: A

Q121. What are software metrics?

- A. A comprehensive software testing method type only for effective project outcomes
- B. Quantitative measures used to assess software quality, process, and productivity
- C. A specific type of application source code file type in the engineering discipline
- D. Physical measurements of hardware component parts to achieve project objectives

Answer: B

Q122. What is Lines of Code (LOC)?

- A. A poem or literary piece of creative written work as part of the methodology
- B. A metric that measures software size by counting the number of lines in source code
- C. A specialized debugging and tracing tool and suite during the software lifecycle
- D. A specific type of software coding error and defect in the development process

Answer: B

Q123. What is a product metric?

- A. A process metric for development workflow tracking
- B. A metric used for measuring sales revenue totals
- C. A measure of some attribute of the software product itself
- D. A hardware performance metric for device benchmarks

Answer: C

Q124. What is a process metric?

- A. A network performance metric for bandwidth speed
- B. A physical hardware component metric measurement
- C. A measure of the software product itself directly
- D. A measure of some attribute of the software development process

Answer: D

Q125. What is productivity in software metrics?

- A. The total number of meetings held per week time
- B. Working overtime hours every single week constantly
- C. The ratio of output (software produced) to input (resources used)
- D. The typing speed of individual developer teammates

Answer: C

Q126. What is defect rate?

- A. A metric for software testing execution speed rate
- B. Speed of creating new defects per work hour only
- C. The number of defects found per unit of software or time
- D. A specific type of reported software bug and defect

Answer: C

Q127. What does KLOC stand for?

- A. King Lines of Code within the
- B. Known Lines of Code throughout
- C. Thousands of Lines of Code
- D. Key Lines of Code for the

Answer: C

Q128. What is code complexity?

- A. The total number of declared variable names only for quality purposes
- B. The total length of all source code lines and files during implementation
- C. How hard source code is to initially write out in the system context
- D. A metric measuring how difficult code is to understand, test, and maintain

Answer: D

Q129. What is mean time between failures (MTBF)?

- A. The average time between system failures, indicating reliability
- B. The maximum allowed software testing time duration
- C. The average time to repair a system from failure
- D. The minimum testing frequency and interval schedule

Answer: A

Q130. What is mean time to repair (MTTR)?

- A. The average time between system failures and outages
- B. The maximum time allowed for running test suites
- C. The average time it takes to fix a failure and restore the system
- D. The minimum time to respond to a user web request

Answer: C

Q131. What is Software Configuration Management (SCM)?

- A. A creational object-oriented design pattern type
- B. The process of tracking and controlling changes to software
- C. A source code implementation coding technique only
- D. A comprehensive software testing method type only

Answer: B

Q132. What is version control?

- A. A software architecture and design method approach in the engineering discipline
- B. Controlling video game software versions and builds and related components
- C. A type of software testing methodology and approach to achieve project objectives
- D. A system that records changes to files over time so specific versions can be recalled

Answer: D

Q133. What is a baseline in configuration management?

- A. A specific line of application source code and logic as part of the methodology
- B. A starting position in a sports competition event for effective project outcomes
- C. A software testing benchmark result point and score in the development process
- D. A formally reviewed and agreed-upon specification serving as the basis for further development

Answer: D

Q134. What is a configuration item (CI)?

- A. Any artifact placed under configuration management control
- B. A user story in the product backlog items listing
- C. A piece of physical hardware equipment and component
- D. A specific automated test case scenario and script

Answer: A

Q135. What is Git?

- A. A programming language within the project
- B. A testing tool for the development team
- C. A distributed version control system
- D. A command during the software lifecycle

Answer: C

Q136. What is a commit in version control?

- A. A personal promise or commitment to other people
- B. A production deployment to end users and clients
- C. A recorded change or set of changes to the repository
- D. A test execution run and its result log report

Answer: C

Q137. What is a branch in version control?

- A. A physical tree branch in nature and the outdoors
- B. A separate line of development diverging from the main codebase
- C. A specific type of reported software bug and defect
- D. A deployment stage in the release pipeline process

Answer: B

Q138. What is merging in version control?

- A. Deleting branches in the system context
- B. Creating new files during implementation
- C. Combining changes throughout the project
- D. Integrating changes from one branch into another

Answer: D

Q139. What is a repository?

- A. A specific software testing environment and setup only in practice typically
- B. A central location where version-controlled files and their history are stored
- C. A production deployment server location and address as a standard approach
- D. A physical library building for books and resources for quality purposes

Answer: B

Q140. What is a change request?

- A. A formal proposal to modify a software configuration item
- B. A new feature request from end users and clients
- C. A request to change current employment job position
- D. A software defect bug report document filed only

Answer: A

Q141. What is risk in software project management?

- A. An uncertain event that could positively or negatively affect the project
- B. A task that has already been fully completed and done in a systematic way
- C. A documented project functional requirement and spec for the project goals
- D. An absolute certainty in the project plan document across all phases

Answer: A

Q142. What is risk identification?

- A. The process of determining which risks might affect the project
- B. Intentionally creating new project risks and issues
- C. Completely eliminating all identified project risks
- D. Deliberately ignoring all project risks completely

Answer: A

Q143. What is risk analysis?

- A. A source code implementation coding technique only
- B. Analyzing application source code logic and syntax
- C. A comprehensive software testing method approach
- D. Evaluating identified risks to determine their probability and impact

Answer: D

Q144. What is risk mitigation?

- A. Accepting all identified risks without any action
- B. Taking actions to reduce the probability or impact of a risk
- C. Deliberately ignoring all identified project risks
- D. Avoiding all projects and work activities entirely

Answer: B

Q145. What is a risk register?

- A. A physical cash register in a retail store space according to best practices
- B. A hardware register for storing CPU data and values by the development process
- C. A document listing identified risks, their analysis, and planned responses
- D. A specific type of application source code file only within the system boundary

Answer: C

Q146. What are the two components used to assess risk?

- A. Code and tests over the
- B. Scope and quality
- C. Probability and impact
- D. Time and money and its

Answer: C

Q147. What is a risk response strategy?

- A. Deleting the risk register and all documents too
- B. Running away from all identified project risks now
- C. A planned approach to address an identified risk
- D. Deliberately ignoring the identified risk entirely

Answer: C

Q148. What is risk avoidance?

- A. Accepting the risk without any planned action taken
- B. Changing the project plan to eliminate a risk or its impact
- C. Deliberately ignoring the identified risk in full
- D. Avoiding the project entirely from the very start

Answer: B

Q149. What is risk transfer?

- A. Transferring application source code ownership
- B. Moving data to a different storage location setup
- C. Shifting the impact of a risk to a third party
- D. Moving to a new office building location downtown

Answer: C

Q150. What is risk acceptance?

- A. Accepting all reported bugs as intended features only
- B. Accepting all proposed requirement changes submitted
- C. Accepting that the project will certainly fail overall
- D. Acknowledging a risk and deciding to take no preemptive action

Answer: D

Q151. What is software security?

- A. Locking the physical computer server room and door across all phases
- B. Using strong passwords for user accounts only ever for the project goals
- C. Protecting software from unauthorized access, use, modification, and destruction
- D. Installing antivirus software applications only ever in a systematic way

Answer: C

Q152. What is authentication?

- A. Verifying the identity of a user or system
- B. Encryption within the system boundary
- C. Firewall configuration by the development process
- D. Authorization according to best practices

Answer: A

Q153. What is authorization?

- A. Encryption over the entire lifecycle as defined by standards
- B. Authentication and its related activities
- C. Determining what permissions an authenticated user has
- D. Decryption for all project stakeholders within the given

Answer: C

Q154. What is encryption?

- A. Authentication in the engineering discipline for effective project outcomes
- B. Converting data into a coded form to prevent unauthorized access
- C. Compression in all development efforts by the project team members
- D. Decryption and related components to achieve project objectives

Answer: B

Q155. What is a vulnerability in software?

- A. A software defect fix and patch release and update
- B. A specific automated test case and scenario and script
- C. An intended software feature and product capability
- D. A weakness that can be exploited to compromise security

Answer: D

Q156. What is a security threat?

- A. A scheduled software update release event and launch as part of the methodology
- B. A formal source code peer review session and meeting during the software lifecycle
- C. A potential cause of an unwanted incident that may result in harm to a system
- D. A new feature request from stakeholders and clients in the development process

Answer: C

Q157. What is SQL injection?

- A. A database installation and setup procedure and guide
- B. An attack that inserts malicious SQL code into application queries
- C. A scheduled database backup and restore job and task
- D. A standard SQL database query feature and capability

Answer: B

Q158. What is cross-site scripting (XSS)?

- A. An attack where malicious scripts are injected into web pages viewed by other users
- B. A JavaScript library for DOM manipulation and events throughout the project
- C. A CSS framework for styling web content and layouts for the development team
- D. A source code implementation coding technique and tool within the project scope

Answer: A

Q159. What is a firewall?

- A. A type of computer virus or malware threat and attack during implementation
- B. A general-purpose programming language tool and system for quality purposes
- C. A physical wall constructed of fire bricks and mortar in the system context
- D. A network security device that monitors and controls incoming and outgoing traffic

Answer: D

Q160. What is HTTPS?

- A. A general-purpose programming language type and tool in practice typically
- B. A specific type of database storage system and service as a standard approach
- C. A comprehensive software testing framework and tool set by the organization
- D. HTTP Secure — a protocol for secure communication over a network using encryption

Answer: D

Q161. What is the primary purpose of software engineering practices?

- A. To eliminate the need for any project documentation
- B. To maximize the number of programming languages used
- C. To focus exclusively on writing source code quickly
- D. To apply systematic methods to software development

Answer: D

Q162. Which term describes software that is free from defects?

- A. Reliable software
- B. Recursive software
- C. Redundant software
- D. Reflective software

Answer: A

Q163. What is a software development life cycle (SDLC)?

- A. A programming language used for building systems
- B. A network protocol for transferring project data
- C. A framework defining steps in software development
- D. A hardware specification for running applications

Answer: C

Q164. Which of these is a key challenge in software engineering?

- A. Increasing the number of operating systems used
- B. Managing changing project requirements over time
- C. Ensuring hardware components are always upgraded
- D. Reducing the physical size of server equipment

Answer: B

Q165. What does the term 'stakeholder' mean in software projects?

- A. A testing tool used for automated regression tests
- B. A developer who writes the majority of source code
- C. A server that hosts the application in production
- D. Anyone with an interest in the software project outcome

Answer: D

Q166. What is meant by software maintainability?

- A. Number of features included in the first release
- B. Amount of memory the software consumes at runtime
- C. Ease of modifying software after initial deployment
- D. Speed at which software executes user operations

Answer: C

Q167. Which activity comes first in most software development processes?

- A. Performance testing and tuning
- B. Source code implementation phase
- C. Requirements gathering and analysis
- D. System deployment and release

Answer: C

Q168. What is the role of a software engineer?

- A. To design, develop, and maintain software systems
- B. To manage financial accounting for the company
- C. To install electrical wiring in office buildings
- D. To manufacture physical computer hardware units

Answer: A

Q169. What does 'scalability' mean for a software system?

- A. Requirement to rewrite code for every new feature
- B. Tendency to decrease in performance under any load
- C. Ability to handle growing amounts of work efficiently
- D. Capability to run on a single device without issues

Answer: C

Q170. Which of the following best describes a software prototype?

- A. The final production release of the application
- B. An early working model of the proposed system
- C. A hardware device used during system testing
- D. A legal contract between client and developers

Answer: B

Q171. What is the waterfall model in software development?

- A. A random unstructured method without any planning steps
- B. A circular iterative approach with no defined ending point
- C. A sequential linear development approach with distinct phases
- D. A parallel development technique using multiple teams only

Answer: C

Q172. Which phase typically follows design in the waterfall model?

- A. Implementation and coding
- B. System deployment step
- C. Requirements gathering
- D. Project initiation phase

Answer: A

Q173. What is an iterative development process?

- A. Repeating development cycles to refine the software product
- B. Skipping testing phases to accelerate delivery timelines
- C. Completing all development in a single pass without changes
- D. Eliminating design activities to focus on coding tasks

Answer: A

Q174. What does the V-model emphasize in software development?

- A. Eliminating all forms of documentation from the process
- B. Combining all phases into a single continuous activity
- C. Removing verification activities to save project time
- D. Corresponding testing phase for each development stage

Answer: D

Q175. Which model allows returning to previous phases if needed?

- A. Incremental model
- B. Pure waterfall model
- C. Big bang model only
- D. Code and fix model

Answer: A

Q176. What is the main advantage of using a process model?

- A. It eliminates the need for skilled software developers
- B. It guarantees the software will have zero defect count
- C. It removes all project risks from the development work
- D. It provides structure and predictability to development

Answer: D

Q177. In which model is software delivered in small functional pieces?

- A. Ad hoc coding method
- B. Big bang development way
- C. Incremental delivery model
- D. Pure waterfall approach

Answer: C

Q178. What is a spiral model primarily concerned with?

- A. Eliminating documentation
- B. Avoiding testing phases
- C. Reducing team size needs
- D. Risk analysis and management

Answer: D

Q179. What is the prototyping model used for?

- A. Replacing all testing with user observation sessions
- B. Building early versions to clarify system requirements
- C. Eliminating the need for any design documentation
- D. Skipping requirements and jumping to final deployment

Answer: B

Q180. Which model is best suited for well-understood requirements?

- A. Spiral model technique
- B. Prototyping model plan
- C. Waterfall model approach
- D. Agile methodology way

Answer: C

Q181. What is the core principle of agile software development?

- A. Following a strict sequential development process
- B. Completing comprehensive documentation before coding
- C. Avoiding customer collaboration during development
- D. Responding to change over following a rigid plan

Answer: D

Q182. What is a sprint in Scrum methodology?

- A. A method for deploying applications to production servers
- B. A tool for measuring source code execution performance
- C. A document describing all system requirements upfront
- D. A fixed time period for completing a set of work items

Answer: D

Q183. Who is the Product Owner in Scrum?

- A. The developer who writes the most lines of source code
- B. The tester who executes all automated regression test suites
- C. The person who manages the server infrastructure setup
- D. The person responsible for maximizing product value delivered

Answer: D

Q184. What is a user story in agile development?

- A. A formal contract between the client and development team
- B. A detailed technical specification for database schema design
- C. A short description of a feature from the user perspective
- D. A comprehensive test plan covering all system components

Answer: C

Q185. What does the Agile Manifesto value most?

- A. Contract negotiation over customer collaboration efforts
- B. Following a plan over responding to change requests
- C. Individuals and interactions over processes and tools
- D. Comprehensive documentation over working software delivery

Answer: C

Q186. What is a daily standup meeting in agile?

- A. A monthly review of the project budget and resources
- B. A brief daily meeting to share progress and obstacles
- C. A quarterly assessment of organizational strategy goals
- D. A weekly planning session for the entire project scope

Answer: B

Q187. What is the purpose of a product backlog?

- A. To list all desired features and work items for the product
- B. To track employee attendance and working hours precisely
- C. To document the organizational chart of the company fully
- D. To store source code versions in a repository management tool

Answer: A

Q188. How long is a typical Scrum sprint?

- A. One to two days only
- B. One to four weeks
- C. Eight to ten months
- D. Six to twelve months

Answer: B

Q189. What is the Scrum Master's primary role?

- A. To approve all design choices
- B. To manage project budget
- C. To facilitate the Scrum process
- D. To write most of the code

Answer: C

Q190. What happens during a sprint review?

- A. All unfinished tasks are permanently removed from scope
- B. The team demonstrates completed work to stakeholders
- C. The development environment is reset to default state
- D. The project budget is reduced by senior management

Answer: B

Q191. What is requirements engineering in software development?

- A. The process of discovering and documenting system needs
- B. A strategy for deploying applications to cloud servers
- C. A technique for writing efficient source code algorithms
- D. A method for testing software performance under load

Answer: A

Q192. What is a functional requirement?

- A. A specification of what the system should do for users
- B. A plan for marketing the software product to customers
- C. A schedule for training end users on system operations
- D. A description of the hardware needed to run the system

Answer: A

Q193. What is a non-functional requirement?

- A. A project schedule milestone for the delivery deadline
- B. A feature that the system must implement for the user
- C. A programming language choice for the development team
- D. A constraint on how the system performs its functions

Answer: D

Q194. Who are the primary sources of software requirements?

- A. Hardware manufacturers and network equipment vendors
- B. Operating system kernel developers and maintainers
- C. Compiler designers and programming language creators
- D. Stakeholders and end users of the system being built

Answer: D

Q195. What is a Software Requirements Specification (SRS)?

- A. A network diagram showing system topology and connections
- B. A database schema defining all tables and relationships
- C. A source code file containing the main application logic
- D. A document that describes all system requirements in detail

Answer: D

Q196. What does 'requirements elicitation' mean?

- A. Testing the software against its documented requirements
- B. Gathering requirements from stakeholders and other sources
- C. Deploying the finished software to the production server
- D. Deleting unnecessary requirements from the project scope

Answer: B

Q197. Which of these is an example of a non-functional requirement?

- A. The system shall generate monthly financial reports
- B. The system shall send email notifications to users
- C. The system shall respond to queries within two seconds
- D. The system shall allow users to create new accounts

Answer: C

Q198. What is the purpose of requirements validation?

- A. To ensure requirements accurately reflect stakeholder needs
- B. To train end users on how to operate the new system
- C. To deploy the software to the staging environment first
- D. To write source code that implements the system features

Answer: A

Q199. What is a use case in requirements engineering?

- A. A report on the system's performance test results
- B. A list of programming languages used in the project
- C. A diagram of the database schema and relationships
- D. A description of how users interact with the system

Answer: D

Q200. Why is requirements traceability important?

- A. It links requirements to design, code, and test artifacts
- B. It eliminates the need for user acceptance testing work
- C. It reduces the amount of memory the application uses
- D. It speeds up the compilation of the source code files

Answer: A

Q201. What is the primary goal of software project management?

- A. Installing and configuring the production server hardware equipment
- B. Writing all the source code for the project without any team members
- C. Designing the user interface layout and choosing the color schemes
- D. Delivering software on time, within budget, and meeting quality standards

Answer: D

Q202. What is a project milestone?

- A. A hardware component required for the server infrastructure
- B. A significant checkpoint marking completion of a project phase
- C. A type of programming error found during code review sessions
- D. A daily task assigned to individual software developers on team

Answer: B

Q203. What is the purpose of a Gantt chart in project management?

- A. To document all the source code changes made by developers
- B. To track the number of defects found during system testing
- C. To visually represent the project schedule and task timelines
- D. To calculate the total budget required for hardware purchases

Answer: C

Q204. What does WBS stand for in project management?

- A. Workflow Business Strategy
- B. Wireless Bandwidth System
- C. Web Based Software tool
- D. Work Breakdown Structure

Answer: D

Q205. Who is responsible for overall project success?

- A. The quality assurance tester only
- B. The external client exclusively
- C. The project manager leading the team
- D. Each individual developer equally

Answer: C

Q206. What is project scope in software development?

- A. The defined boundaries of what the project will deliver
- B. The programming language selected for implementation
- C. The total number of developers assigned to the team
- D. The number of servers allocated for production use

Answer: A

Q207. What is resource allocation in project management?

- A. Assigning people, tools, and budget to project activities
- B. Designing the database schema for the system storage
- C. Deleting unnecessary files from the project repository
- D. Running automated tests on the application source code

Answer: A

Q208. What is the critical path in a project schedule?

- A. A shortcut method for skipping non-essential project activities
- B. The easiest set of tasks that any team member can complete alone
- C. A backup plan executed only when the main project plan fails
- D. The longest sequence of dependent tasks determining project duration

Answer: D

Q209. What is a project stakeholder?

- A. Only the software developers who write the application source code
- B. Just the project manager who oversees the entire development team
- C. Exclusively the client who pays for the software development work
- D. Anyone who has an interest in or is affected by the project outcome

Answer: D

Q210. What does project monitoring involve?

- A. Tracking progress and comparing it against the original plan
- B. Writing source code for the application features and modules
- C. Conducting final user acceptance testing before deployment
- D. Designing the user interface screens and navigation flows

Answer: A

Q211. What is software design in the development process?

- A. A technique for deploying software to production servers
- B. A strategy for gathering requirements from stakeholders
- C. A method for testing software under heavy load conditions
- D. The process of defining system structure and components

Answer: D

Q212. What is cohesion in software design?

- A. The degree to which elements within a module belong together
- B. The total number of lines of code in a software application
- C. The speed at which the application responds to user actions
- D. The amount of dependencies between different software modules

Answer: A

Q213. What is coupling in software design?

- A. The speed at which the application compiles from source
- B. The degree of interdependence between software modules
- C. The total number of classes in the application codebase
- D. The amount of documentation written for each module

Answer: B

Q214. What is the goal of good software design?

- A. Neither cohesion nor coupling matter in quality design work
- B. High coupling between modules and low cohesion within them
- C. High cohesion within modules and low coupling between them
- D. Equal cohesion and coupling across all system components

Answer: C

Q215. What is an interface in software design?

- A. A network protocol for transmitting data between servers
- B. A contract defining how components interact with each other
- C. A database table storing application configuration settings
- D. A visual screen layout designed for end user interactions only

Answer: B

Q216. What is modularity in software design?

- A. Writing all code in a single file without any organization
- B. Maximizing dependencies between all parts of the system
- C. Dividing software into separate independent functional units
- D. Avoiding any separation of concerns in the code structure

Answer: C

Q217. What is abstraction in software design?

- A. Avoiding any simplification of the system's internal logic
- B. Making all internal data structures visible to every module
- C. Including every implementation detail in the public interface
- D. Hiding complex details and showing only essential features

Answer: D

Q218. What is the purpose of a design pattern?

- A. To increase the complexity of the software architecture
- B. To provide reusable solutions to common design problems
- C. To replace the need for requirements analysis activities
- D. To create unique solutions that cannot be reused anywhere

Answer: B

Q219. What is encapsulation in object-oriented design?

- A. Exposing all internal data to every part of the program
- B. Allowing unrestricted access to all object internal states
- C. Bundling data and methods together and restricting access
- D. Separating data from the methods that operate on the data

Answer: C

Q220. What is a class diagram used for in software design?

- A. To display the project timeline and scheduling milestones
- B. To show the structure of classes and their relationships
- C. To illustrate network topology and server configurations
- D. To represent database queries and their execution plans

Answer: B

Q221. What is software architecture?

- A. A detailed line-by-line description of the source code logic
- B. A specific programming language used for building applications
- C. A testing framework for validating user interface interactions
- D. The high-level structure of a software system and its components

Answer: D

Q222. What is a client-server architecture?

- A. A design pattern for sorting data in ascending order quickly
- B. A system where all processing occurs on the user device only
- C. A system where clients request services from a central server
- D. A testing methodology for validating database query results

Answer: C

Q223. What is a layered architecture?

- A. An architecture using a single flat structure without layers
- B. An architecture organizing software into hierarchical layers
- C. A deployment strategy for distributing code across servers
- D. A testing technique for validating multi-step user workflows

Answer: B

Q224. What is a monolithic architecture?

- A. A single unified application where all components are interconnected
- B. A database architecture using multiple separate data storage nodes
- C. A network topology with redundant connections between all nodes
- D. A distributed system with many independent microservice components

Answer: A

Q225. What is the purpose of an architectural pattern?

- A. To define specific algorithms for data processing and sorting
- B. To provide proven solutions for common structural design problems
- C. To specify the exact programming language for implementation
- D. To determine the number of developers needed for a project

Answer: B

Q226. What is a microservices architecture?

- A. Small independent services that communicate over network protocols
- B. A single large application built as one deployable unit together
- C. A programming style using only one function for all logic needs
- D. A database design using only a single table for all data items

Answer: A

Q227. What is a pipe-and-filter architecture?

- A. Data flows through processing components connected in sequence
- B. A user interface pattern for displaying forms and input fields
- C. All components execute simultaneously without any data flow order
- D. A database technique for filtering query results by conditions

Answer: A

Q228. What is a repository architecture?

- A. Data is distributed randomly across components without any order
- B. Each component maintains its own isolated copy of all system data
- C. Components never share any data and operate fully independently
- D. Components share data through a central data store or repository

Answer: D

Q229. What does 'architectural style' refer to?

- A. A family of systems sharing structural and behavioral properties
- B. A method for writing unit tests for individual code functions
- C. A specific color scheme used for the application user interface
- D. A technique for compressing files to reduce storage space used

Answer: A

Q230. What is the role of an architect in software development?

- A. Writing all the unit tests for the application source code now
- B. Making high-level design decisions about system structure choices
- C. Managing the project budget and timeline schedules for delivery
- D. Conducting user interviews to gather system requirements only

Answer: B

Q231. What is user interface (UI) design?

- A. Managing version control repositories for source code
- B. Writing backend database queries for data retrieval tasks
- C. Designing visual elements that users interact with on screen
- D. Configuring server infrastructure for application hosting

Answer: C

Q232. What is usability in UI design?

- A. The total number of colors used in the application theme
- B. The programming language used to implement the interface
- C. How easy and efficient it is for users to use the interface
- D. The amount of data stored in the application database

Answer: C

Q233. What is a wireframe in UI design?

- A. A basic visual layout showing the structure of a page
- B. A database diagram showing tables and their relationships
- C. A network map displaying server connections and topology
- D. A fully functional prototype with all features implemented

Answer: A

Q234. What does 'responsive design' mean?

- A. Design that adapts to different screen sizes and devices
- B. Design that responds quickly to user input and actions
- C. Design that avoids any visual elements on the interface
- D. Design that uses only one fixed layout for all screens

Answer: A

Q235. What is the purpose of user feedback in UI design?

- A. To reduce the number of features available to end users
- B. To understand user needs and improve the interface design
- C. To increase the amount of code in the application files
- D. To eliminate the need for any future design improvements

Answer: B

Q236. What is a call-to-action (CTA) in UI design?

- A. A prompt encouraging users to take a specific action step
- B. A backend process running on the application server side
- C. A database constraint enforcing data integrity rules now
- D. A technical error message displayed during system failure

Answer: A

Q237. What is navigation in user interface design?

- A. The server-side logic that processes user form inputs
- B. The encryption algorithm protecting sensitive user data
- C. The means by which users move through an application
- D. The database indexing strategy for faster data queries

Answer: C

Q238. What is visual hierarchy in UI design?

- A. Hiding important elements behind multiple menu layers
- B. Removing all visual distinctions between page elements
- C. Arranging elements to guide user attention by importance
- D. Placing all elements at the same size and visual weight

Answer: C

Q239. What is the goal of accessibility in UI design?

- A. Making interfaces only usable by experienced tech users
- B. Reducing the number of interactive elements on a page
- C. Restricting access to the interface based on user roles
- D. Making interfaces usable by people with diverse abilities

Answer: D

Q240. What is a tooltip in user interface design?

- A. A small popup providing information when hovering over an element
- B. A large modal window requiring user input before proceeding further
- C. A background service processing data without any user interaction
- D. A database record storing user preferences and account settings

Answer: A

Q241. What is source code in software development?

- A. A network configuration file for setting up server connections
- B. The physical hardware on which software applications run today
- C. Human-readable instructions written in a programming language
- D. A project management document describing the timeline and budget

Answer: C

Q242. What is a compiler used for in software development?

- A. Translating source code into machine-executable binary code
- B. Creating database schemas and defining table relationships
- C. Designing the user interface layout for web applications only
- D. Managing project team members and assigning work to them

Answer: A

Q243. What is code refactoring?

- A. Removing all comments and documentation from the source code
- B. Deploying the application to a new production server environment
- C. Restructuring existing code without changing its external behavior
- D. Adding new features and functionality to the software product

Answer: C

Q244. What is version control in software development?

- A. A system for tracking and managing changes to source code files
- B. A tool for managing hardware inventory in the server data room
- C. A method for testing the application performance under load now
- D. A technique for designing the user interface with color themes

Answer: A

Q245. What is the purpose of code comments?

- A. To explain the intent and logic of code for future readers
- B. To encrypt the source code to prevent unauthorized access now
- C. To increase the execution speed of the compiled application
- D. To add new features without modifying any existing source code

Answer: A

Q246. What is an Integrated Development Environment (IDE)?

- A. A database management system for storing application data now
- B. A software tool combining editor, compiler, and debugger features
- C. A physical room where developers work together on a project
- D. A hardware device used for testing software on mobile devices

Answer: B

Q247. What is a syntax error in programming?

- A. A violation of the programming language grammar and structure rules
- B. A performance issue that causes the application to run very slowly
- C. A logical mistake that produces incorrect output from the program
- D. A design flaw in the system architecture causing scalability issues

Answer: A

Q248. What is debugging in software development?

- A. Finding and fixing defects and errors in the source code logic
- B. Deploying the application to the production server environment
- C. Writing new source code to add features to the application
- D. Designing the database schema for the application data store

Answer: A

Q249. What is a code review?

- A. Running automated performance tests on the production environment
- B. Deleting all source code and starting the project from scratch now
- C. Installing software updates on all developer workstation machines
- D. Examining source code by peers to find defects and improve quality

Answer: D

Q250. What is the purpose of coding standards?

- A. To prevent any developer from modifying code written by other people
- B. To ensure consistent code style and quality across the development team
- C. To eliminate the need for testing by ensuring code is always correct
- D. To restrict developers from using any external libraries or frameworks

Answer: B

Q251. What is the main purpose of software testing?

- A. To design the user interface layout and visual style elements
- B. To deploy the application to the production server environment
- C. To find defects and verify the software meets its requirements
- D. To write the source code for the application being developed

Answer: C

Q252. What is a test case in software testing?

- A. A set of conditions and expected results for verifying functionality
- B. A hardware component required for running the test environment
- C. A programming language used for writing application source code
- D. A project management document listing all team member assignments

Answer: A

Q253. What is unit testing?

- A. Testing network connectivity between all production server nodes
- B. Testing the entire integrated system from end to end completely
- C. Testing the user interface for visual design and layout accuracy
- D. Testing individual components or functions in isolation from others

Answer: D

Q254. What is integration testing?

- A. Testing the project schedule against the planned delivery dates
- B. Testing how multiple components work together as a combined unit
- C. Testing individual functions in complete isolation from all others
- D. Testing the application user interface for accessibility standards

Answer: B

Q255. What is a bug or defect in software?

- A. A new feature requested by the client during the development phase
- B. A hardware failure in the production server causing system downtime
- C. A scheduled maintenance window for updating the operating system
- D. A flaw causing the software to produce incorrect or unexpected results

Answer: D

Q256. What is regression testing?

- A. Testing new features for the first time before release to production
- B. Removing features from the software to simplify the application now
- C. Retesting software after changes to ensure existing features still work
- D. Writing new source code to implement additional system requirements

Answer: C

Q257. What is system testing?

- A. Testing a single function or method in isolation from all other code
- B. Testing only the network configuration of the production servers
- C. Testing only the database queries for correctness and performance
- D. Testing the complete integrated system against specified requirements

Answer: D

Q258. What is the difference between manual and automated testing?

- A. Manual testing is done by humans; automated testing uses scripts and tools
- B. Automated testing cannot find any bugs that manual testing would miss
- C. Manual and automated testing produce identical results in all scenarios
- D. Manual testing is always faster than automated testing in every situation

Answer: A

Q259. What is acceptance testing?

- A. Testing the network bandwidth between the client and server nodes
- B. Testing to determine if the system satisfies the acceptance criteria
- C. Testing individual database tables for data integrity constraints
- D. Testing the internal code structure for compliance with style guides

Answer: B

Q260. What is a test plan?

- A. A database query for retrieving user account information data
- B. A document describing the testing scope, approach, and schedule
- C. A network diagram showing the production server architecture
- D. A source code file containing the main application entry point

Answer: B

Q261. What is software maintenance?

- A. Modifying software after delivery to correct faults or improve performance
- B. Writing the initial source code for a brand new software application
- C. Designing the system architecture before any development work begins
- D. Gathering user requirements during the early project planning phases

Answer: A

Q262. What is corrective maintenance?

- A. Fixing bugs and defects discovered after software has been deployed
- B. Adapting software to work in a new operating system environment
- C. Improving performance without changing any existing functionality
- D. Adding brand new features requested by the users after deployment

Answer: A

Q263. What is adaptive maintenance?

- A. Adding new features that were not in the original requirements set
- B. Fixing defects found during production use of the deployed system
- C. Modifying software to work in a changed or new environment context
- D. Restructuring code to improve readability without behavior change

Answer: C

Q264. What is perfective maintenance?

- A. Fixing critical bugs that prevent the system from functioning at all
- B. Removing the software from production and replacing it with a new one
- C. Modifying the software to run on a completely different platform now
- D. Enhancing software by adding new features or improving existing ones

Answer: D

Q265. What percentage of total software costs does maintenance typically represent?

- A. About twenty percent of total lifecycle costs
- B. Over sixty percent of total lifecycle costs
- C. Less than five percent of total lifecycle costs
- D. Exactly ten percent of total lifecycle costs

Answer: B

Q266. What is preventive maintenance?

- A. Making changes to prevent future problems and improve maintainability
- B. Adding features only when explicitly requested by the project sponsor
- C. Fixing bugs only after users report them in the production environment
- D. Removing all documentation from the codebase to simplify the system

Answer: A

Q267. What is a software patch?

- A. A full version upgrade adding many new features and capabilities now
- B. A small update released to fix specific bugs or security issues quickly
- C. A complete rewrite of the entire application from scratch using new code
- D. A hardware replacement required to run updated software on the server

Answer: B

Q268. Why is documentation important for software maintenance?

- A. It increases the file size of the project without adding any value
- B. It is only useful during initial development and never after that
- C. It helps maintainers understand the system to make changes correctly
- D. It slows down maintenance by requiring reading before any changes

Answer: C

Q269. What is software evolution?

- A. The continuous process of changing software throughout its lifetime
- B. A one-time event that happens only during initial development phase
- C. The process of permanently discontinuing a software product fully
- D. A testing technique applied only before the first release of code

Answer: A

Q270. What is legacy software?

- A. Brand new software developed using the latest programming frameworks
- B. A type of testing framework used exclusively for mobile applications
- C. Older software that remains in use despite outdated technology choices
- D. A project management methodology for small startup development teams

Answer: C

Q271. What is quality assurance (QA) in software engineering?

- A. A programming language designed for writing high-quality source code automatically
- B. A specific testing technique used only during the final phase of development work
- C. A hardware specification defining minimum requirements for running applications
- D. Planned activities ensuring the development process produces quality software products

Answer: D

Q272. What is the difference between quality assurance and quality control?

- A. QA focuses on processes; quality control focuses on product inspection and testing
- B. QA and quality control are identical concepts with no meaningful differences at all
- C. QA is done after release; quality control is done before development starts now
- D. QA tests the product; quality control improves the development process activities

Answer: A

Q273. What is a software quality standard?

- A. A hardware requirement for running the quality assurance testing tools now
- B. A documented set of criteria that software must meet for acceptable quality
- C. A project management template for scheduling development team meetings
- D. A specific programming language recommended for building quality software

Answer: B

Q274. What is the purpose of a quality audit?

- A. To deploy the application to the production environment for user access
- B. To evaluate whether quality processes are being followed correctly by teams
- C. To design the database schema and define table relationships for storage
- D. To write source code for the application features and user interface now

Answer: B

Q275. What does ISO 9001 relate to in software engineering?

- A. A quality management system standard applicable to software development
- B. A specific programming language standard for embedded system software
- C. A hardware interface specification for connecting peripheral devices now
- D. A network protocol standard for transmitting data between computers

Answer: A

Q276. What is a defect in the context of quality assurance?

- A. A positive user review about the software application performance
- B. Any deviation from the expected behavior defined in the requirements
- C. A new feature added to the software after the initial release date
- D. A planned system downtime for performing scheduled maintenance work

Answer: B

Q277. What is the role of a QA engineer?

- A. Managing the project budget and negotiating contracts with vendors now
- B. Ensuring software quality through testing, reviews, and process improvement
- C. Designing the network infrastructure for the production environment
- D. Writing all the source code for the application without any supervision

Answer: B

Q278. What is peer review in quality assurance?

- A. A management review of project budget and timeline progress reports
- B. A single developer reviewing their own code without any external feedback
- C. Team members examining each other's work to find defects and improvements
- D. An automated tool scanning source code for syntax errors and warnings

Answer: C

Q279. What is a quality metric?

- A. A hardware sensor measuring server temperature in the data center
- B. A type of source code comment used for documenting class interfaces
- C. A network monitoring tool tracking bandwidth usage and latency now
- D. A measurable indicator of software quality attributes and characteristics

Answer: D

Q280. Why is quality important in software engineering?

- A. It increases the number of defects found during production operations
- B. It makes the source code longer and more difficult to understand now
- C. It ensures user satisfaction, reduces costs, and builds customer trust
- D. It slows down development without providing any measurable benefits

Answer: C

Q281. What are software metrics?

- A. Quantitative measures used to assess software quality and processes
- B. A type of programming language for building web applications today
- C. A hardware specification for measuring processor clock speed rates
- D. A project management tool for scheduling team meetings and events

Answer: A

Q282. What does Lines of Code (LOC) measure?

- A. The amount of memory the software uses during runtime execution
- B. The speed at which the application executes user requests today
- C. The number of team members working on the software project now
- D. The size of a software program by counting its source code lines

Answer: D

Q283. What is cyclomatic complexity?

- A. A method for designing user interfaces for mobile application screens
- B. A strategy for managing project budgets and resource allocations today
- C. A technique for deploying software to cloud computing environments now
- D. A measure of the number of independent paths through a program's code

Answer: D

Q284. Why are software metrics important?

- A. They replace the need for experienced developers on the team now
- B. They eliminate the need for any testing or quality assurance work
- C. They provide objective data for making informed project decisions
- D. They guarantee that all software products will be defect-free always

Answer: C

Q285. What is a product metric?

- A. A measure of some attribute of the software product being developed
- B. A financial metric tracking company revenue from software licenses
- C. A hardware metric measuring server uptime and availability rates
- D. A measure of the development process performance and efficiency now

Answer: A

Q286. What is a process metric?

- A. A type of user interface element used in dashboard design layouts
- B. A measure of the final product features and characteristics directly
- C. A network measurement tool for tracking data transfer speed rates
- D. A measure of the software development process effectiveness and quality

Answer: D

Q287. What does defect density measure?

- A. The physical density of storage media used by the application today
- B. The number of defects per unit size of the software being measured
- C. The visual density of elements on the user interface screen layout
- D. The network traffic density between the client and server systems

Answer: B

Q288. What is the purpose of measuring code coverage?

- A. To determine what percentage of code is exercised by test suites
- B. To count the total number of source code files in the project now
- C. To track the number of developers contributing to the codebase
- D. To measure the physical disk space occupied by the application

Answer: A

Q289. What is mean time between failures (MTBF)?

- A. The time it takes to write one line of source code on average
- B. The average time a system operates between consecutive failures
- C. The average salary of developers working on the software project
- D. The number of features added to each software release on average

Answer: B

Q290. What is a baseline in software measurement?

- A. A default user interface theme applied when the application starts
- B. A specific line of code that forms the foundation of the application
- C. A reference point for comparing future measurements and tracking change
- D. A minimum hardware requirement for running the software application

Answer: C

Q291. What is software configuration management (SCM)?

- A. Managing and tracking changes to software throughout its lifecycle
- B. A hardware setup process for servers in the data center facility
- C. A programming technique for writing configuration file parsers now
- D. A testing method for verifying system configuration settings only

Answer: A

Q292. What is version control in configuration management?

- A. A technique for designing user interfaces with multiple theme options
- B. A strategy for managing team member schedules and work assignments
- C. A method for testing different versions of the software simultaneously
- D. A system that records changes to files over time for later retrieval

Answer: D

Q293. What is a software baseline in configuration management?

- A. A preliminary draft of the source code before any reviews take place
- B. An informal agreement between developers about coding style preferences
- C. A formally reviewed and agreed-upon specification serving as a reference
- D. A temporary test environment used during development and testing only

Answer: C

Q294. What is a configuration item (CI)?

- A. An artifact that is placed under configuration management and tracked
- B. A physical server component that needs regular hardware maintenance
- C. A project management tool for scheduling team meetings and events
- D. A financial metric tracking development costs against the project budget

Answer: A

Q295. What is the purpose of a change control board (CCB)?

- A. To conduct performance testing on the application before release to users
- B. To design the user interface screens and navigation flows for the system
- C. To evaluate and approve or reject proposed changes to the project baseline
- D. To write all the source code for the application without any team input

Answer: C

Q296. What is a code repository?

- A. A customer support center handling user complaints and feature requests
- B. A central location where source code is stored and version controlled
- C. A training facility where developers learn new programming languages
- D. A physical library containing printed copies of programming textbooks

Answer: B

Q297. What is branching in version control?

- A. Deploying the application to multiple production servers simultaneously
- B. Creating a separate line of development from the main codebase path
- C. Merging all team members' work into a single file without any review
- D. Deleting old versions of the source code to save disk storage space

Answer: B

Q298. What is merging in version control?

- A. Combining changes from different branches into a single unified branch
- B. Splitting a single file into multiple smaller files for better organization
- C. Creating a new repository from scratch without any existing source code
- D. Deleting all branches except the main branch to simplify the repository

Answer: A

Q299. What is a commit in version control?

- A. A snapshot of changes saved to the repository at a specific point in time
- B. A financial transaction related to purchasing software licenses for tools
- C. A verbal agreement between team members about the project scope and goals
- D. A hardware upgrade performed on the development workstation machines now

Answer: A

Q300. What is a release in software configuration management?

- A. A meeting where the team discusses upcoming features and priorities now
- B. A training session for new developers joining the project team currently
- C. A testing phase where all automated test suites are executed and reviewed
- D. A version of the software distributed to users for installation and use

Answer: D

Q301. What is risk in software project management?

- A. A completed task that has already been delivered successfully now
- B. An uncertain event that could negatively impact the project outcome
- C. A team meeting scheduled to discuss upcoming project milestones
- D. A guaranteed problem that will definitely occur during development

Answer: B

Q302. What is risk identification?

- A. The process of eliminating all possible risks from the project scope
- B. The process of finding and documenting potential project risks early
- C. A technique for writing source code without any potential defects
- D. A method for deploying software to production without any testing

Answer: B

Q303. What is risk mitigation?

- A. Taking actions to reduce the probability or impact of identified risks
- B. Ignoring identified risks and hoping they will not occur during work
- C. Removing all project constraints to eliminate potential risk factors
- D. Increasing the likelihood of risks to test the team's response ability

Answer: A

Q304. What is a risk register used for?

- A. Tracking employee attendance and work hours for payroll processing
- B. Storing source code backups on external hard drives for recovery
- C. Managing customer support tickets and feature request submissions
- D. Recording identified risks with their assessments and response plans

Answer: D

Q305. What is risk probability?

- A. The likelihood that a specific risk event will actually occur today
- B. The guaranteed certainty that a risk will happen in every project
- C. The cost of fixing a problem after it occurs in production later
- D. The time required to complete the project from start to finish

Answer: A

Q306. What is risk impact?

- A. The total budget allocated for the software development project
- B. The number of team members assigned to work on the project now
- C. The severity of consequences if a risk event actually materializes
- D. The programming language selected for implementing the features

Answer: C

Q307. What is risk avoidance?

- A. Increasing the risk probability to learn from potential failure events
- B. Changing the project plan to eliminate the risk or its impact entirely
- C. Accepting the risk and taking no action to address it at all currently
- D. Transferring the risk to another team without any formal agreement

Answer: B

Q308. What is risk acceptance?

- A. Actively working to increase the probability of the risk event occurring
- B. Denying that any risks exist in the project scope and schedule plan
- C. Transferring all project risks to external contractors without oversight
- D. Acknowledging a risk exists and deciding not to take action against it

Answer: D

Q309. What is a contingency plan?

- A. A training program for teaching developers new programming skills
- B. A budget report showing how much money has been spent so far now
- C. A predefined plan to execute if a specific risk event actually occurs
- D. A daily standup meeting where team members share progress updates

Answer: C

Q310. Who is responsible for managing risks in a software project?

- A. The project manager with support from the entire project team
- B. The hardware vendor who provides the production server equipment
- C. The external client who commissioned the software development
- D. Only the most junior developer on the project team exclusively

Answer: A

Q311. What is software security engineering?

- A. A strategy for managing team schedules and project milestone dates
- B. Building software that continues to function correctly under attack
- C. A technique for optimizing database query execution and performance
- D. A method for testing user interface responsiveness and visual design

Answer: B

Q312. What is authentication in software security?

- A. Designing the user interface for accessibility compliance only
- B. Verifying the identity of a user or system requesting access
- C. Testing the application for performance under heavy load now
- D. Encrypting all data stored in the application database tables

Answer: B

Q313. What is authorization in software security?

- A. Encrypting data during transmission between client and the server
- B. Verifying the identity of a user attempting to log into the system
- C. Testing the application for compatibility across web browsers now
- D. Determining what actions an authenticated user is permitted to do

Answer: D

Q314. What is encryption used for in software security?

- A. Compressing files to reduce storage space on the server drives
- B. Protecting data by converting it into an unreadable format safely
- C. Speeding up database query execution for better performance now
- D. Formatting user interface elements for better visual appearance

Answer: B

Q315. What is a firewall in security?

- A. A programming language designed for building secure applications
- B. A system that monitors and controls network traffic based on rules
- C. A project management tool for tracking team progress and tasks
- D. A testing framework for validating software against requirements

Answer: B

Q316. What is a software vulnerability?

- A. A documentation gap that makes the codebase harder to read now
- B. A hardware component that needs replacement in the server rack
- C. A weakness in software that can be exploited by an attacker now
- D. A planned feature that has not been implemented yet in the code

Answer: C

Q317. What is the principle of least privilege?

- A. Giving all users full administrative access to the entire system now
- B. Granting maximum privileges to reduce the number of access errors
- C. Removing all access controls to simplify the system architecture
- D. Giving users only the minimum access rights needed for their tasks

Answer: D

Q318. What is a security patch?

- A. A software update that fixes known security vulnerabilities quickly
- B. A project management document describing the sprint backlog items
- C. A decorative design element added to the user interface layout now
- D. A hardware component that improves server processing speed rates

Answer: A

Q319. What is malware?

- A. A project management metric tracking team productivity and output
- B. A testing tool for measuring application performance under load
- C. Software designed to damage, disrupt, or gain unauthorized access
- D. A feature enhancement requested by users during product feedback

Answer: C

Q320. What is a security audit?

- A. A performance test measuring application response time and speed
- B. A code review focused only on visual design and layout of pages
- C. A financial review of the project budget expenditure and savings
- D. A systematic evaluation of security measures and vulnerabilities now

Answer: D

Q321. What is the primary goal of software engineering?

- A. To write code as fast as possible
- B. To develop reliable software systematically
- C. To eliminate all bugs
- D. To use the latest technology

Answer: B

Q322. Which of the following is a key attribute of good software?

- A. Complexity
- B. Maintainability
- C. Obscurity
- D. Rigidity

Answer: B

Q323. What is the software crisis?

- A. A shortage of programmers
- B. The difficulty of writing correct, understandable software on time and within budget
- C. A virus that destroys software
- D. The rapid decline in hardware prices

Answer: B

Q324. What does the term 'software process' refer to?

- A. The act of compiling code
- B. A set of activities that leads to the production of a software product
- C. The process of installing software
- D. A method for deleting software

Answer: B

Q325. Which activity is NOT part of a generic software process?

- A. Specification
- B. Development
- C. Validation
- D. Hardware manufacturing

Answer: D

Q326. What is a software product?

- A. Only the executable code
- B. Code, documentation, and associated data
- C. Only the user manual
- D. Only the source code files

Answer: B

Q327. What is meant by software dependability?

- A. Software that depends on hardware
- B. Software that is reliable, secure, and safe
- C. Software that requires constant updates
- D. Software written by a single developer

Answer: B

Q328. Who are the stakeholders in a software project?

- A. Only the programmers
- B. Anyone affected by or involved in the project
- C. Only the customers
- D. Only the project manager

Answer: B

Q329. What does the acronym CASE stand for in software engineering?

- A. Computer-Aided Software Engineering
- B. Central Application System Environment
- C. Code Analysis and Structured Editing
- D. Comprehensive Automated System Evaluation

Answer: A

Q330. What is the difference between generic and customized software products?

- A. There is no difference
- B. Generic products are sold to any customer; customized products are built for a specific client
- C. Generic products are always free
- D. Customized products cannot be modified

Answer: B

Q331. What is a software process model?

- A. A physical model of a computer
- B. A simplified representation of a software development process
- C. A type of programming language
- D. A hardware design specification

Answer: B

Q332. In the Waterfall model, can you return to a previous phase easily?

- A. Yes, it encourages going back
- B. No, it follows a strict linear sequence
- C. Only during testing
- D. Only on weekends

Answer: B

Q333. What is a prototype in software development?

- A. The final product
- B. An early working model used to explore ideas and gather feedback
- C. A type of bug report
- D. A deployment tool

Answer: B

Q334. What is the main advantage of the iterative development model?

- A. It never requires documentation
- B. It allows for early delivery of partial systems and gradual improvement
- C. It eliminates the need for testing
- D. It requires no planning

Answer: B

Q335. Which phase of the Waterfall model involves defining what the system should do?

- A. Implementation
- B. Requirements analysis and definition
- C. System design
- D. Maintenance

Answer: B

Q336. What is incremental development?

- A. Developing the entire system at once
- B. Developing and delivering the system in small portions called increments
- C. Developing only the user interface
- D. Delaying all development until requirements are final

Answer: B

Q337. Which process model is best suited when requirements are well understood and unlikely to change?

- A. Agile model
- B. Waterfall model
- C. Spiral model
- D. Prototype model

Answer: B

Q338. What does the term 'process activity' mean in software engineering?

- A. A recreational team event
- B. A fundamental step in a software development process such as specification or testing
- C. A marketing campaign
- D. A hardware installation step

Answer: B

Q339. What distinguishes throwaway prototyping from evolutionary prototyping?

- A. They are the same approach
- B. Throwaway prototypes are discarded after gathering feedback; evolutionary prototypes are refined into the final product
- C. Throwaway prototyping takes longer
- D. Evolutionary prototyping is always discarded

Answer: B

Q340. What is the purpose of the design phase in a process model?

- A. To write marketing materials
- B. To define the system architecture and component structure
- C. To recruit developers
- D. To delete old code

Answer: B

Q341. How many values are stated in the Agile Manifesto?

- A. 2
- B. 4
- C. 6
- D. 10

Answer: B

Q342. What does the Agile Manifesto value over comprehensive documentation?

- A. Detailed contracts
- B. Working software
- C. Extensive planning
- D. Formal processes

Answer: B

Q343. What is a Sprint Review in Scrum?

- A. A meeting to fire underperforming team members
- B. A meeting at the end of a Sprint where the team demonstrates completed work to stakeholders
- C. A daily coding session
- D. A meeting to write documentation

Answer: B

Q344. What is a retrospective in Agile?

- A. A look at competitor products
- B. A meeting where the team reflects on the process and identifies improvements
- C. A code compilation step
- D. A customer presentation

Answer: B

Q345. Which Agile principle emphasizes face-to-face communication?

- A. Documentation first
- B. The most efficient method of conveying information is face-to-face conversation
- C. Email is preferred
- D. All communication should be written

Answer: B

Q346. What is the role of the Product Owner in Scrum?

- A. Writing all the code
- B. Representing the customer and managing the Product Backlog
- C. Managing servers
- D. Designing the user interface

Answer: B

Q347. What is the purpose of a Software Requirements Specification (SRS)?

- A. To write code
- B. To document what the software should do and its constraints
- C. To deploy software
- D. To test the final product

Answer: B

Q348. What is a stakeholder in requirements engineering?

- A. Only the CEO
- B. Any person or organization that has an interest in or is affected by the system
- C. Only the end user
- D. Only the developer

Answer: B

Q349. What is a feasibility study in requirements engineering?

- A. A study on team morale
- B. An assessment of whether a proposed system is technically, economically, and operationally viable
- C. A review of competitor products
- D. A performance test

Answer: B

Q350. What does 'requirements validation' ensure?

- A. That the code compiles
- B. That the documented requirements accurately reflect stakeholder needs
- C. That the hardware is working
- D. That the team is on schedule

Answer: B

Q351. What is an example of a non-functional requirement?

- A. The system shall allow users to log in
- B. The system shall respond to queries within 2 seconds
- C. The system shall display a list of products
- D. The system shall allow users to add items to a cart

Answer: B

Q352. What is a requirements interview?

- A. A job interview for developers
- B. A technique where analysts ask stakeholders questions to understand their needs
- C. A code review session
- D. A testing technique

Answer: B

Q353. Why is requirements documentation important?

- A. It is not important
- B. It provides a shared reference that reduces misunderstandings and supports verification
- C. It replaces the need for testing
- D. It is only needed for legal reasons

Answer: B

Q354. What is the main purpose of project planning?

- A. To write code
- B. To define the project scope, schedule, and resources needed
- C. To test the software
- D. To deploy the final product

Answer: B

Q355. What is a milestone in project management?

- A. A unit of distance
- B. A significant point or event in the project schedule marking the completion of a major deliverable
- C. A type of programming error
- D. A software tool

Answer: B

Q356. What does the critical path represent in project scheduling?

- A. The easiest path through the project
- B. The longest sequence of dependent tasks that determines the minimum project duration
- C. The shortest task in the project
- D. A backup plan

Answer: B

Q357. What is effort estimation in software projects?

- A. Estimating the weight of hardware
- B. Predicting the amount of work (person-hours or person-months) needed to complete the project
- C. Counting the number of employees
- D. Estimating electricity costs

Answer: B

Q358. What is a project schedule?

- A. A list of holidays
- B. A timeline showing when project activities will be performed and deliverables completed
- C. A team roster
- D. A list of programming languages

Answer: B

Q359. What is the purpose of a project status report?

- A. To advertise the product
- B. To communicate the current state of the project, including progress, issues, and risks to stakeholders
- C. To write code documentation
- D. To create test cases

Answer: B

Q360. What does the term 'scope' mean in project management?

- A. The range of a telescope
- B. The boundaries of the project defining what will and will not be delivered
- C. The number of developers on the team
- D. The programming language used

Answer: B

Q361. What is a PERT chart?

- A. A bar chart showing resource usage
- B. A network diagram showing task dependencies and estimated durations for project scheduling
- C. A pie chart showing budget allocation
- D. A flow chart for code logic

Answer: B

Q362. What is the role of a project manager in software development?

- A. Writing all the code
- B. Planning, organizing, and controlling project activities to meet objectives within constraints
- C. Only attending meetings
- D. Designing the database

Answer: B

Q363. What is information hiding in software design?

- A. Encrypting all data
- B. Restricting access to module internals so that other modules interact only through well-defined interfaces
- C. Hiding code from developers
- D. Deleting documentation

Answer: B

Q364. What is a class diagram in object-oriented design?

- A. A classroom schedule
- B. A UML diagram showing classes, their attributes, methods, and relationships
- C. A network topology diagram
- D. A flowchart of code execution

Answer: B

Q365. What is the purpose of architectural design?

- A. To choose office furniture
- B. To define the overall structure and organization of the software system
- C. To write unit tests
- D. To deploy the software

Answer: B

Q366. What is stepwise refinement?

- A. Refining sugar for cooking
- B. A top-down design strategy that progressively decomposes a high-level design into more detailed components
- C. Optimizing database queries
- D. A testing technique

Answer: B

Q367. What is an interface in object-oriented design?

- A. A monitor screen
- B. A contract that specifies a set of methods that a class must implement
- C. A type of database
- D. A network protocol

Answer: B

Q368. What does 'high cohesion' mean in software design?

- A. Modules that do many unrelated things
- B. A module whose elements are closely related and focused on a single well-defined purpose
- C. High coupling between modules
- D. A module with many dependencies

Answer: B

Q369. What is a sequence diagram used for?

- A. Showing the order of DNA sequences
- B. Showing the order of interactions between objects over time
- C. Showing the project schedule
- D. Showing the database schema

Answer: B

Q370. What is a peer-to-peer architecture?

- A. An architecture with a central server
- B. An architecture where each node acts as both client and server, sharing resources directly
- C. A hierarchical architecture
- D. A single-user system

Answer: B

Q371. What is the role of middleware in software architecture?

- A. To design user interfaces
- B. To provide services that enable communication and data exchange between different applications or components
- C. To write documentation
- D. To test software

Answer: B

Q372. What is the pipe-and-filter architectural style?

- A. A plumbing design pattern
- B. An architecture where data flows through a series of processing components (filters) connected by channels (pipes)
- C. A testing methodology
- D. A security technique

Answer: B

Q373. What is scalability in software architecture?

- A. The size of the codebase
- B. The ability of a system to handle increased workload by adding resources without fundamental changes
- C. The number of files in a project
- D. The font size in the UI

Answer: B

Q374. What is a repository architectural style?

- A. A version control system
- B. An architecture where components share data through a central data store
- C. A type of database
- D. A code hosting platform

Answer: B

Q375. What is the purpose of an architectural view?

- A. A scenic view from the office
- B. A representation of the system architecture from a particular perspective or concern
- C. A code review
- D. A test report

Answer: B

Q376. What is a component in software architecture?

- A. A hardware chip
- B. A modular, deployable, and replaceable unit of software that encapsulates a set of related functions
- C. A test case
- D. A project document

Answer: B

Q377. What is the purpose of user-centered design?

- A. Designing for developers only
- B. Placing the needs, abilities, and limitations of end users at the center of the design process
- C. Designing only the database
- D. Focusing exclusively on aesthetics

Answer: B

Q378. What is the purpose of visual hierarchy in UI design?

- A. Making all elements the same size
- B. Organizing and prioritizing elements so users naturally see the most important information first
- C. Hiding important information
- D. Making the design more complex

Answer: B

Q379. What is a tooltip in UI design?

- A. A physical tool tip
- B. A small informational pop-up that appears when a user hovers over or focuses on an element
- C. A debugging message
- D. A server error message

Answer: B

Q380. What is white space (negative space) in UI design?

- A. A bug in the interface
- B. The empty areas between UI elements that improve readability and reduce visual clutter
- C. Unused storage space
- D. Deleted content areas

Answer: B

Q381. What is a variable naming convention?

- A. A meeting about variable names
- B. A set of rules for how variables should be named in code to improve readability
- C. A type of data structure
- D. A debugging technique

Answer: B

Q382. What is an IDE (Integrated Development Environment)?

- A. A type of programming language
- B. A software application that provides comprehensive tools for coding, debugging, testing, and building software in one interface
- C. A database management system
- D. A project management tool

Answer: B

Q383. What is the difference between a compiler and an interpreter?

- A. They are the same thing
- B. A compiler translates the entire source code at once into machine code; an interpreter translates and executes code line by line
- C. Compilers are slower
- D. Interpreters produce machine code files

Answer: B

Q384. What is version control used for in implementation?

- A. Controlling the version of the operating system
- B. Tracking and managing changes to source code over time, allowing collaboration and rollback
- C. Controlling access to the internet
- D. Managing database versions

Answer: B

Q385. What is a build process?

- A. Constructing a building
- B. The automated process of compiling source code, linking dependencies, and producing executable software
- C. A meeting to plan features
- D. A manual testing procedure

Answer: B

Q386. What is a test suite?

- A. A hotel room for testers
- B. A collection of test cases organized together to test a particular feature or aspect of the system
- C. A single test case
- D. A testing tool

Answer: B

Q387. What is a test oracle?

- A. A fortune-telling tool
- B. A mechanism or reference used to determine whether a test has passed or failed by comparing actual results to expected results
- C. A database management tool
- D. A type of programming language

Answer: B

Q388. What is the difference between a bug and a defect?

- A. They are completely different concepts
- B. They are generally used interchangeably to refer to a flaw in the software that causes incorrect behavior
- C. Bugs are in hardware; defects are in software
- D. Defects are intentional; bugs are not

Answer: B

Q389. What is preventive maintenance in software?

- A. Preventing users from using the software
- B. Making changes to software to prevent potential future problems before they occur
- C. Preventing new features from being added
- D. Uninstalling the software

Answer: B

Q390. What percentage of a software system's total lifecycle cost is typically spent on maintenance?

- A. Less than 10%
- B. 60% to 80% or more
- C. Exactly 50%
- D. Less than 5%

Answer: B

Q391. What is a patch in software maintenance?

- A. A fabric patch for clothing
- B. A small update released to fix specific bugs or security vulnerabilities without a full new version
- C. A complete system rewrite
- D. A new feature release

Answer: B

Q392. What triggers corrective maintenance?

- A. A request for new features
- B. The discovery of bugs or defects that need to be fixed
- C. A change in management
- D. A system upgrade

Answer: B

Q393. What triggers adaptive maintenance?

- A. User complaints about the color scheme
- B. Changes in the operating environment such as new hardware, operating systems, or regulations
- C. Developer preferences
- D. Marketing campaigns

Answer: B

Q394. What is a legacy system?

- A. A system that was recently built
- B. An older software system that remains in use because it fulfills a critical business need despite using outdated technology
- C. A system with no users
- D. A brand-new prototype

Answer: B

Q395. What is the purpose of a maintenance request?

- A. Requesting a day off
- B. A formal document describing a needed change, fix, or enhancement to an existing software system
- C. Requesting new hardware
- D. Requesting a team meeting

Answer: B

Q396. What is the purpose of quality assurance in software?

- A. To find all bugs
- B. To establish processes and standards that prevent defects and ensure quality throughout development
- C. To replace testing
- D. To increase project costs

Answer: B

Q397. What is a quality standard?

- A. A high-quality flag
- B. A documented set of criteria, guidelines, and best practices that products or processes must meet
- C. A type of programming language
- D. A testing tool

Answer: B

Q398. What is a software audit?

- A. A financial audit of the company
- B. An independent examination of software products or processes to assess compliance with standards and specifications
- C. A code compilation step
- D. A deployment procedure

Answer: B

Q399. What is a checklist in QA?

- A. A grocery list
- B. A predefined list of items or criteria to be verified during quality reviews to ensure completeness
- C. A list of team members
- D. A deployment schedule

Answer: B

Q400. What is process improvement in QA?

- A. Buying better hardware
- B. Systematically analyzing and enhancing development processes to increase product quality and efficiency
- C. Hiring more developers
- D. Increasing project budgets

Answer: B

Q401. What is a defect report?

- A. A report card for developers
- B. A document that describes a found defect, including steps to reproduce, expected behavior, and actual behavior
- C. A financial report
- D. A project plan

Answer: B

Q402. What is peer review in the context of QA?

- A. A review of peer-to-peer networks
- B. A process where colleagues examine each other's work products to identify defects and share knowledge
- C. A performance review by managers
- D. A customer review

Answer: B

Q403. What is the purpose of software metrics?

- A. To count developers
- B. To quantitatively measure attributes of software products and processes for decision-making and improvement
- C. To measure hardware performance
- D. To count meetings

Answer: B

Q404. What is the difference between size metrics and complexity metrics?

- A. They are the same
- B. Size metrics measure the quantity of code (like LOC); complexity metrics measure how difficult the code is to understand and maintain
- C. Size is always more important
- D. Complexity cannot be measured

Answer: B

Q405. What is defect removal efficiency (DRE)?

- A. The speed of removing code
- B. The percentage of defects found before software release compared to the total defects found before and after release
- C. The efficiency of the development team
- D. The speed of code compilation

Answer: B

Q406. What is the purpose of measuring lines of code (LOC)?

- A. To determine developer pay
- B. To estimate the size of a software system, which can be used for effort estimation and productivity measurement
- C. To count the number of files
- D. To measure code quality directly

Answer: B

Q407. What is a project metric?

- A. A metric about the project manager
- B. A measurement that tracks project progress and performance, such as schedule variance, cost variance, or team velocity
- C. A metric about the building
- D. A metric about company revenue

Answer: B

Q408. Why can LOC be misleading as a productivity metric?

- A. LOC is always accurate
- B. It penalizes efficient code that achieves more with fewer lines and varies greatly by programming language
- C. LOC is never misleading
- D. All lines of code are equally valuable

Answer: B

Q409. What is a baseline in software metrics?

- A. A fishing line
- B. A set of reference measurements collected from past projects used for comparison and estimation in future projects
- C. A line of code
- D. A base class

Answer: B

Q410. What is a direct metric versus an indirect metric?

- A. They are the same
- B. A direct metric is measured directly (like LOC); an indirect metric is derived from other measurements (like defect density)
- C. Direct metrics are more complex
- D. Indirect metrics are always inaccurate

Answer: B

Q411. What is the purpose of a version control system?

- A. To control the version of the operating system
- B. To track and manage changes to files over time, enabling collaboration and history tracking
- C. To control file access permissions
- D. To manage database versions

Answer: B

Q412. What is the purpose of a release in configuration management?

- A. Releasing employees
- B. A formally distributed version of the software that has been tested and approved for deployment to users
- C. Releasing disk space
- D. Releasing a news article

Answer: B

Q413. What is a repository in version control?

- A. A physical storage room
- B. A central storage location that contains all files, their version history, and metadata managed by the version control system
- C. A library building
- D. A data center

Answer: B

Q414. What is a change request in configuration management?

- A. A request to change office furniture
- B. A formal proposal to modify a configuration item, documenting the reason, impact, and details of the requested change
- C. A request for a new computer
- D. A request for vacation

Answer: B

Q415. What is a merge in version control?

- A. Merging two companies
- B. Combining changes from different branches or versions into a single unified version
- C. Merging database tables
- D. Merging network connections

Answer: B

Q416. What is the difference between risk avoidance and risk acceptance?

- A. They are the same strategy
- B. Risk avoidance changes plans to eliminate the risk; risk acceptance acknowledges the risk and chooses not to take action unless it occurs
- C. Risk avoidance is always possible
- D. Risk acceptance means ignoring risks

Answer: B

Q417. What is the difference between a risk and an issue?

- A. They are the same thing
- B. A risk is a potential future problem; an issue is a problem that has already occurred
- C. Risks are always worse than issues
- D. Issues cannot be managed

Answer: B

Q418. What is the probability of a risk?

- A. Always 100%
- B. The likelihood that the risk event will actually occur, typically expressed as a percentage or qualitative rating
- C. Always 0%
- D. The cost of the risk

Answer: B

Q419. Why is early risk identification important?

- A. It is not important
- B. Identifying risks early allows more time and options for developing effective responses before they become costly problems
- C. Early identification wastes time
- D. Risks should only be identified at the end

Answer: B

Q420. What is encryption in software security?

- A. Compressing files
- B. The process of converting data into a coded format that can only be read by someone with the proper decryption key
- C. Deleting files permanently
- D. Backing up data

Answer: B

Q421. What is a firewall in network security?

- A. A wall that is on fire
- B. A security system that monitors and controls incoming and outgoing network traffic based on predetermined security rules
- C. A physical wall in a building
- D. A type of antivirus software

Answer: B

Q422. What is a vulnerability in software security?

- A. A strong point in the software
- B. A weakness or flaw in the software that could be exploited by an attacker to compromise the system
- C. A feature request
- D. A type of software update

Answer: B

Q423. What is multi-factor authentication (MFA)?

- A. Using the same password multiple times
- B. A security mechanism requiring users to provide two or more different types of verification to prove their identity
- C. Multiple usernames
- D. Multiple login pages

Answer: B

Q424. What is the purpose of access control in software?

- A. Controlling physical building access
- B. Restricting who can access what resources and what actions they can perform within the system
- C. Controlling internet speed
- D. Controlling screen brightness

Answer: B

Q425. What is phishing?

- A. Going fishing
- B. A social engineering attack that tricks users into revealing sensitive information by impersonating a trustworthy entity
- C. A type of programming
- D. A network protocol

Answer: B

Q426. What is data integrity in security?

- A. The amount of data stored
- B. Ensuring that data has not been altered, tampered with, or corrupted in an unauthorized manner
- C. The speed of data transfer
- D. The format of data storage

Answer: B

Q427. What is the purpose of security logging?

- A. Logging into secure systems
- B. Recording security-relevant events and actions to enable monitoring, auditing, and forensic analysis
- C. Logging trees for wood
- D. Creating log files for debugging

Answer: B

Q428. What is a Sprint Backlog in Scrum?

- A. A list of all features ever requested for the product
- B. The set of product backlog items selected for the current sprint plus a plan for delivering them
- C. A document that tracks bugs found during testing
- D. A report generated after each sprint is completed

Answer: B

Q429. What does the term 'iteration' mean in Agile development?

- A. A single line of code written by a developer
- B. A fixed-length time period during which a team works on a set of features and produces a working increment
- C. The process of hiring new team members
- D. A method for deploying software to production servers

Answer: B

Q430. What is the purpose of a burndown chart in Agile?

- A. To track the budget spent on a project
- B. To show the remaining work in a sprint or project over time
- C. To list all the bugs found during development
- D. To assign tasks to individual team members

Answer: B

Q431. What is the recommended size of a Scrum team?

- A. Exactly 3 members
- B. Between 20 and 50 members
- C. Typically 5 to 9 members plus Scrum Master and Product Owner
- D. There is no recommended size for Scrum teams

Answer: C

Q432. What is the difference between functional and non-functional requirements?

- A. Functional requirements describe what the system should do while non-functional requirements describe how well it should perform
- B. Functional requirements are optional while non-functional requirements are mandatory
- C. Non-functional requirements describe features while functional requirements describe constraints
- D. There is no difference; they are interchangeable terms

Answer: A

Q433. What is a requirements review meeting?

- A. A meeting where developers write code based on requirements
- B. A meeting where stakeholders and the team examine requirements documents to identify errors, ambiguities, and omissions
- C. A meeting held only after the software is deployed to users
- D. A meeting to decide the project budget and timeline

Answer: B

Q434. What is a work package in project management?

- A. The entire project plan document
- B. The smallest unit of work in a Work Breakdown Structure that can be estimated, scheduled, and monitored
- C. A software package used for managing projects
- D. The final deliverable shipped to the customer

Answer: B

Q435. What is the principle of separation of concerns in software design?

- A. Keeping the development team separated into isolated groups
- B. Dividing a program into distinct sections where each section addresses a separate concern or functionality
- C. Ensuring that all code is written in a single file for simplicity
- D. Separating the testing phase from the development phase

Answer: B

Q436. What is an activity diagram in software design?

- A. A diagram showing the physical hardware components of a system
- B. A flowchart-like diagram that shows the flow of activities and actions in a process or system
- C. A chart showing project team member availability
- D. A diagram that displays database table relationships

Answer: B

Q437. What does 'low coupling' mean in software design?

- A. Modules have many dependencies on each other and share data extensively
- B. Modules are relatively independent with minimal dependencies between them
- C. The software has very few modules in total
- D. All modules are combined into a single large component

Answer: B

Q438. What is a distributed system in software architecture?

- A. A system where all code runs on a single computer
- B. A system whose components are located on different networked computers that communicate and coordinate actions by passing messages
- C. A system that is distributed to users via USB drives
- D. A system that only works without an internet connection

Answer: B

Q439. What is a prototype in UI design?

- A. The final production-ready version of the software
- B. An early model or simulation of the user interface used to explore and test design ideas before development
- C. A type of programming language used for building interfaces
- D. A document listing all the bugs found in the interface

Answer: B

Q440. What is a modal dialog in UI design?

- A. A full-screen window that replaces the entire application
- B. A window or box that appears on top of the main content and requires user interaction before they can return to the main interface
- C. A type of navigation menu that appears at the bottom of the screen
- D. A background process that runs without any visual indication

Answer: B

Q441. What is a breadcrumb in UI design?

- A. A type of animation effect applied to buttons
- B. A navigation aid that shows the user's current location within the site hierarchy and allows navigation back to parent pages
- C. A small cookie stored in the user's browser
- D. A debugging tool for tracking user errors

Answer: B

Q442. What does 'affordance' mean in UI design?

- A. The cost of developing the user interface
- B. A design property that suggests how an element should be used, such as a button looking clickable
- C. The number of colors used in the interface
- D. The amount of text displayed on a single screen

Answer: B

Q443. What is user-centered design (UCD)?

- A. A design approach where developers make all design decisions without user input
- B. A design philosophy that places the end user's needs, preferences, and limitations at the center of each stage of the design process
- C. A technique for designing database schemas based on user data
- D. A project management method for scheduling design tasks

Answer: B

Q444. What is a runtime error in software development?

- A. An error that occurs only during the design phase
- B. An error that occurs while the program is executing, causing it to crash or produce incorrect results
- C. An error in the project management timeline
- D. An error that can only be detected by reading the source code manually

Answer: B

Q445. What is a logic error in programming?

- A. An error that prevents the program from compiling
- B. An error where the program runs without crashing but produces incorrect results due to a flaw in the algorithm or logic
- C. An error caused by hardware malfunction
- D. An error that only occurs when the program is deployed to production

Answer: B

Q446. What is a code repository used for?

- A. Storing only compiled binary files for deployment
- B. Storing, managing, and tracking changes to source code files in a centralized or distributed location
- C. Providing a graphical interface for writing code
- D. Running automated tests on the production server

Answer: B

Q447. What is pseudocode?

- A. A real programming language used for production systems
- B. An informal, high-level description of an algorithm using natural language and basic programming constructs
- C. Encrypted source code that cannot be read by humans
- D. A tool for automatically generating documentation from code

Answer: B

Q448. What is the purpose of indentation in source code?

- A. It makes the program run faster by optimizing memory usage
- B. It improves code readability by visually representing the structure and nesting of code blocks
- C. It is required for all programming languages to compile successfully
- D. It adds comments to the code automatically

Answer: B

Q449. What is a test environment?

- A. The office where testers sit and work
- B. A configured setup of hardware, software, and network used to execute tests that simulates the production environment
- C. A programming language used exclusively for writing tests
- D. The final version of the software deployed to end users

Answer: B

Q450. What is the purpose of smoke testing?

- A. To test the software under extreme stress conditions
- B. To perform a quick preliminary test to check whether the most critical functions of the software work before deeper testing begins
- C. To test the software's behavior when the hardware overheats
- D. To measure the performance of the software under normal load

Answer: B

Q451. What is alpha testing?

- A. Testing performed by end users in their own environment
- B. Testing performed by internal staff at the developer's site before release to external users
- C. Testing performed automatically without any human involvement
- D. The first test case written for any software project

Answer: B

Q452. What is beta testing?

- A. Testing performed only by the development team using automated tools
- B. Testing performed by a limited number of external users in their real environment before the final release
- C. Testing that occurs after the software has been fully deployed and is in production
- D. A type of unit testing focused on mathematical calculations

Answer: B

Q453. What is a test fixture in software testing?

- A. A physical device used to test hardware components
- B. A fixed state or set of preconditions used as a baseline for running tests to ensure consistent and repeatable results
- C. A metric that measures the percentage of code tested
- D. A report generated after all tests have been executed

Answer: B

Q454. What does 'test coverage' measure?

- A. The number of testers assigned to a project
- B. The degree to which the source code or requirements are exercised by a set of tests
- C. The amount of time spent on testing activities
- D. The cost of testing relative to the total project budget

Answer: B

Q455. What is software re-engineering?

- A. Building completely new software from scratch without referencing existing systems
- B. The process of examining and restructuring existing software to reconstitute it in a new form while preserving its functionality
- C. A marketing strategy for promoting outdated software products
- D. The process of removing all documentation from a legacy system

Answer: B

Q456. Why is regression testing important during software maintenance?

- A. It only tests new features and ignores existing functionality
- B. It ensures that changes or fixes to the software have not introduced new defects in previously working functionality
- C. It measures the financial cost of maintaining the software
- D. It is only performed when the entire software is being rewritten

Answer: B

Q457. What is the difference between software maintenance and software support?

- A. They are identical terms with no difference
- B. Maintenance involves modifying the software code and system while support involves helping users resolve issues and answering questions
- C. Support involves changing the code while maintenance involves only documentation updates
- D. Maintenance is performed by users while support is performed by developers

Answer: B

Q458. What is a code walkthrough in quality assurance?

- A. The physical act of walking around the office while reviewing code
- B. An informal review where a developer leads team members through code to find errors and share knowledge
- C. An automated tool that scans code for security vulnerabilities
- D. A formal audit conducted by external quality assessors

Answer: B

Q459. What is the difference between a defect and a failure in quality assurance?

- A. They are exactly the same thing with no difference
- B. A defect is a flaw in the software code or design, while a failure is the observable incorrect behavior when a defect is executed
- C. A failure occurs during development while a defect occurs during testing
- D. Defects are found by users while failures are found by developers

Answer: B

Q460. What is the purpose of a quality management plan?

- A. To list all the features the software should have
- B. To define the quality standards, processes, metrics, and responsibilities for ensuring that the project meets quality requirements
- C. To schedule marketing activities for the software release
- D. To calculate the total budget for the development project

Answer: B

Q461. What is defect density as a software metric?

- A. The total number of developers on a project
- B. The number of defects found per unit size of software, typically per thousand lines of code (KLOC)
- C. The time it takes to fix a single defect
- D. The percentage of the project budget spent on defect prevention

Answer: B

Q462. What is a pull request in version control?

- A. A request to download the latest version of the software
- B. A proposal to merge changes from one branch into another, allowing team members to review and discuss the changes before integration
- C. A request to remove files from the repository
- D. A notification that the server is pulling updates automatically

Answer: B

Q463. What is the purpose of a .gitignore file?

- A. To list all the files that should be included in every commit
- B. To specify patterns of files and directories that Git should not track or include in the repository
- C. To store Git configuration settings for the repository
- D. To record the history of all commits made to the repository

Answer: B

Q464. What is a merge conflict in version control?

- A. When two repositories have the same name and cannot coexist
- B. When two developers have made changes to the same part of a file on different branches and the system cannot automatically combine them
- C. When a developer accidentally deletes the entire repository
- D. When the version control server runs out of storage space

Answer: B

Q465. What is a software build in configuration management?

- A. The physical construction of hardware to run the software
- B. The process of compiling source code, linking dependencies, and packaging the result into an executable or deployable artifact
- C. A meeting where the team discusses the next sprint
- D. A document describing the software architecture

Answer: B

Q466. What is a contingency plan in risk management?

- A. The original project plan that never changes
- B. A predefined set of actions to be taken if a specific risk event occurs
- C. A plan for hiring additional developers
- D. A marketing strategy for the software product

Answer: B

Q467. What is risk transfer in software project management?

- A. Moving the project to a different department
- B. Shifting the responsibility or financial impact of a risk to a third party, such as through insurance or outsourcing
- C. Ignoring the risk and hoping it does not occur
- D. Transferring all project files to a new repository

Answer: B

Q468. What is the purpose of risk monitoring in a software project?

- A. To eliminate all risks from the project permanently
- B. To continuously track identified risks, watch for new risks, and evaluate the effectiveness of risk responses throughout the project
- C. To create a final report after the project is complete
- D. To assign blame when things go wrong

Answer: B

Q469. What is risk impact in software risk management?

- A. The likelihood that a risk will occur during the project
- B. The severity of the consequences if the risk event actually occurs
- C. The number of team members affected by project risks
- D. The total number of risks identified in the risk register

Answer: B

Q470. What is a risk assessment matrix?

- A. A spreadsheet listing all team members and their salaries
- B. A grid that maps risks by their probability of occurrence and severity of impact to prioritize which risks need attention
- C. A mathematical formula for calculating project costs
- D. A chart showing the project timeline and milestones

Answer: B

Q471. What is a security threat in software engineering?

- A. A feature that improves the software's performance
- B. Any potential danger that could exploit a vulnerability to cause harm to a system, organization, or users
- C. A type of software license agreement
- D. A coding standard that developers must follow

Answer: B

Q472. What is input sanitization in software security?

- A. Physically cleaning the keyboard and mouse used for development
- B. The process of cleaning and validating user input to remove or neutralize potentially harmful characters or code before processing
- C. Deleting all user data from the database periodically
- D. A network configuration technique for blocking external connections

Answer: B

Q473. What is the purpose of a requirements baseline in software engineering?

- A. To set a maximum number of requirements allowed in a project
- B. To establish a formally approved set of requirements that serves as the agreed-upon foundation for development
- C. To create a backup copy of the source code repository
- D. To determine the programming language for the project

Answer: B

Q474. What is a service in service-oriented architecture (SOA)?

- A. A physical server that hosts websites
- B. A self-contained unit of functionality that can be accessed remotely and used independently
- C. A customer support team that helps users
- D. A database table that stores user information

Answer: B

Q475. What is fault tolerance in software architecture?

- A. The ability of a system to blame developers for errors
- B. The ability of a system to continue operating properly even when some of its components fail
- C. A technique for writing code without any bugs
- D. The process of testing software until no faults remain

Answer: B

Q476. What is a dropdown menu in user interface design?

- A. A menu that permanently displays all options on screen at all times
- B. A UI element that reveals a list of options when activated, allowing the user to select one from the list
- C. A type of error message that drops down from the top of the screen
- D. A navigation bar fixed at the bottom of the page

Answer: B

Q477. What is a defect report (bug report) in software testing?

- A. A marketing document describing software features
- B. A formal document that records the details of a discovered defect including steps to reproduce, expected behavior, and actual behavior
- C. A project schedule showing testing deadlines
- D. A contract between the client and the development company

Answer: B

Q478. What is code churn as a software metric?

- A. The total number of developers who have ever worked on the project
- B. A measure of the amount of code that is added, modified, or deleted over a period of time
- C. The speed at which the compiler processes source code files
- D. The number of comments in the source code divided by total lines

Answer: B

Q479. What is a diff in version control?

- A. A type of programming error that is difficult to find
- B. A representation showing the differences between two versions of a file, highlighting added, removed, and changed lines
- C. A command for deleting files from the repository permanently
- D. A way to create a new branch in the repository

Answer: B

Q480. What is risk mitigation in software project management?

- A. Completely eliminating all risks from the project
- B. Taking proactive steps to reduce the probability or impact of an identified risk
- C. Ignoring risks until they become actual problems
- D. Transferring the entire project to another team

Answer: B

Software Engineering — Medium

480 questions

Q481. Which IEEE standard defines software engineering?

- A. IEEE 754
- B. IEEE 610.12
- C. IEEE 802.11
- D. IEEE 1394

Answer: B

Q482. What is the difference between software engineering and computer science?

- A. CS primarily focuses on project management
- B. They are fundamentally the same discipline
- C. CS focuses on theory; SE focuses on practical development
- D. SE primarily focuses on hardware architecture

Answer: C

Q483. Which of the following is a generic software process activity?

- A. Software specification
- B. Network setup
- C. Hardware installation
- D. Printing reports

Answer: A

Q484. What is 'software reuse'?

- A. Using existing software components in new systems
- B. Writing all source code from scratch every time
- C. Permanently deleting outdated legacy software
- D. Copying proprietary code without any permission

Answer: A

Q485. Which factor contributed most to the software crisis?

- A. Overly simple user requirements specifications
- B. Rapidly advancing hardware computing capabilities
- C. An oversaturation of qualified trained programmers
- D. Increasing software complexity outpacing development methods

Answer: D

Q486. What is a software engineering method?

- A. A specific type of programming language tool
- B. A classification of computing hardware types
- C. A structured approach for developing software
- D. A specialized device for testing code logic

Answer: C

Q487. What is the significance of the NATO Conference 1968?

- A. The initial public launch of the internet era for the development team
- B. The initial development and creation of the UNIX system
- C. The original invention of the C programming language throughout the project
- D. First formal discussion of the software crisis and software engineering

Answer: D

Q488. Which is NOT a type of software application?

- A. Hardware software
- B. System software
- C. Web applications
- D. Embedded software

Answer: A

Q489. What does CASE stand for in software engineering?

- A. Computer-Aided Software Engineering
- B. Common Architecture System Engineering
- C. Coded Application Standard Environment
- D. Central Application Software Environment

Answer: A

Q490. What is the role of a software engineer?

- A. Writing source code exclusively and nothing else
- B. Administering and managing databases exclusively
- C. Designing, developing, testing, and maintaining software systems
- D. Performing software testing activities exclusively

Answer: C

Q491. What are the four quadrants of the Spiral model?

- A. Planning, Risk Analysis, Engineering, Evaluation
- B. Gather, Analyze, Build, Ship within the project scope
- C. Design, Code, Test, Review during the software lifecycle
- D. Code, Test, Deploy, Maintain in the development process

Answer: A

Q492. What is RAD (Rapid Application Development)?

- A. An incremental model emphasizing short development cycles of 60-90 days
- B. A standardized software testing framework tool for the development team
- C. A formal documentation standard for projects throughout the project
- D. A general-purpose programming language format in the system context

Answer: A

Q493. Which model combines elements of the Waterfall and Iterative models?

- A. Spiral model
- B. Big Bang model
- C. RAD
- D. Incremental model

Answer: A

Q494. What is the incremental model?

- A. A model that skips the planning phase for quality purposes
- B. Building the complete system all at once during implementation
- C. A model used only for testing purposes in practice typically
- D. Delivering the system in increments, each adding functionality

Answer: D

Q495. In the V-Model, what corresponds to the coding phase?

- A. Integration testing
- B. System testing
- C. Unit testing
- D. Acceptance testing

Answer: C

Q496. What is evolutionary development?

- A. Developing software that remains unchanged permanently as a standard approach
- B. Only creating project plans without writing code by the organization
- C. Developing an initial version, exposing it to users, and refining through versions
- D. Focusing solely on hardware evolution processes at every stage

Answer: C

Q497. What is the main advantage of the incremental model?

- A. The model requires absolutely no testing phase in a systematic way
- B. Working software is produced early and feedback can be incorporated
- C. No formal planning phase is ever required across all phases
- D. It is always the fastest model available today for the project goals

Answer: B

Q498. What is a phase gate in process models?

- A. An established coding standard for the team
- B. A specific category of reported software bug
- C. A review point at the end of each phase before proceeding
- D. A physical entry gate for developer access

Answer: C

Q499. Which model is best suited for large, mission-critical projects?

- A. Code and Fix
- B. Big Bang accord
- C. Spiral model
- D. RAD within the

Answer: C

Q500. What is throwaway prototyping?

- A. A category of finalized production product only and its related activities
- B. Retaining and maintaining all prototypes built by the development process
- C. A formal software testing methodology approach over the entire lifecycle
- D. Building a prototype to understand requirements, then discarding it

Answer: D

Q501. What is the role of the Scrum Master?

- A. Writing all of the source code for the team
- B. Designing the relational database architecture
- C. Managing the overall project budget allocations
- D. Facilitating the Scrum process and removing impediments

Answer: D

Q502. What is Extreme Programming (XP)?

- A. A video game development methodology only throughout the project
- B. An Agile methodology emphasizing engineering practices like pair programming and TDD
- C. A project management scheduling tool only in the system context
- D. A unit testing automation framework only during implementation for quality purposes

Answer: B

Q503. What is a Product Backlog?

- A. A finalized list of all completed work tasks
- B. An ordered list of everything needed in the product
- C. A comprehensive list of known bugs and issues
- D. A physical hardware inventory listing sheet

Answer: B

Q504. What is the purpose of a Sprint Retrospective?

- A. To reflect on the sprint and identify improvements
- B. To plan all the tasks for the upcoming sprint
- C. To demonstrate completed features to stakeholders
- D. To write all required project documentation

Answer: A

Q505. What is Kanban in software development?

- A. A visual workflow management method using boards and cards
- B. A general-purpose programming language tool
- C. A comprehensive testing automation framework
- D. A relational database management system

Answer: A

Q506. What is 'velocity' in Agile?

- A. The amount of work a team can complete in a sprint
- B. The physical typing speed of the developers
- C. The network communication transfer bandwidth
- D. The code compilation and build execution speed

Answer: A

Q507. What is pair programming?

- A. Two programmers working together at one workstation
- B. Two people using the same computer for different tasks
- C. Two separate teams coding on different features
- D. Programming in pairs of related source files

Answer: A

Q508. What is a Sprint Review?

- A. A comprehensive team evaluation process event
- B. A meeting to demonstrate completed work to stakeholders
- C. A formal source code review session for the team
- D. An individual performance review meeting session

Answer: B

Q509. What is the 'Definition of Done' in Scrum?

- A. A shared understanding of what it means for work to be complete
- B. When the source code compiles without errors
- C. When the project manager gives final approval
- D. When all documentation has been written and reviewed

Answer: A

Q510. What is Continuous Integration in Agile?

- A. Integrating code once at the very end of the project in practice typically
- B. Frequently merging code changes into a shared repository with automated testing
- C. Performing only manual source code reviews periodically as a standard approach
- D. Conducting annual system integration events for release by the organization

Answer: B

Q511. What is the difference between verification and validation in requirements?

- A. Verification checks if we're building the product right; validation checks if we're building the right product
- B. They are fundamentally identical concepts entirely for the project goals according to best practices
- C. Verification is testing code; validation is writing code within the system boundary
- D. Validation always occurs before verification ever does by the development process and its related activities

Answer: A

Q512. What is requirements traceability?

- A. Tracking individual developer working hours over the entire lifecycle
- B. The ability to trace each requirement through design, implementation, and testing
- C. An established coding standard for the project for all project stakeholders
- D. A specific debugging and troubleshooting technique as defined by standards

Answer: B

Q513. What is a use case diagram?

- A. A process execution flowchart diagram only within the given constraints
- B. A relational database schema diagram layout in all development efforts
- C. A UML diagram showing actors and their interactions with the system
- D. A network topology and routing diagram map by the project team members

Answer: C

Q514. What is requirements prioritization?

- A. Permanently deleting all unimportant requirements
- B. Ranking requirements by importance, risk, or business value
- C. Grouping requirements by assigned developer team
- D. Alphabetical ordering of all requirements listed

Answer: B

Q515. What is prototyping used for in requirements engineering?

- A. Delivering the final production product to users
- B. Performing application security penetration tests
- C. Conducting system performance load testing runs
- D. Helping stakeholders visualize and validate requirements

Answer: D

Q516. What is a scenario in requirements engineering?

- A. A real-life example describing how a system might be used
- B. An established coding guideline for the teams
- C. A comprehensive deployment plan document only
- D. A specific automated test execution script only

Answer: A

Q517. What is requirements negotiation?

- A. Rejecting all stakeholder proposed requirements
- B. Resolving conflicts between stakeholders regarding requirements
- C. Demanding that all requirements absolutely be met
- D. Deliberately ignoring all stakeholder input

Answer: B

Q518. What is domain analysis in requirements engineering?

- A. Studying specific programming language syntax in the engineering discipline
- B. Studying the application domain to understand its concepts and constraints
- C. Analyzing the database schema domain structure and related components
- D. Analyzing network domain name configurations to achieve project objectives

Answer: B

Q519. What is the IEEE 830 standard?

- A. A networking communication protocol standard
- B. A standard for writing software requirements specifications
- C. A software testing methodology and standard
- D. A hardware design and manufacturing standard

Answer: B

Q520. What is a constraint in requirements engineering?

- A. A defect discovered in the source code base for effective project outcomes
- B. A restriction or limitation on the system or development process
- C. A programming language built-in feature set in the development process
- D. A specific type of software test case only as part of the methodology

Answer: B

Q521. What is the COCOMO model?

- A. A comprehensive software testing methodology and its related activities
- B. A creational object-oriented design pattern over the entire lifecycle
- C. A popular chocolate confectionery brand name by the development process
- D. A model for estimating software development effort based on lines of code

Answer: D

Q522. What is function point analysis?

- A. A method for measuring software size based on functionality delivered to users
- B. A specific software testing automation technique for all project stakeholders
- C. A systematic debugging and tracing methodology within the given constraints
- D. Counting total functions in application code as defined by standards

Answer: A

Q523. What is Earned Value Management (EVM)?

- A. A corporate employee salary payment system in all development efforts
- B. A technique for measuring project performance by comparing planned vs actual progress
- C. An established coding standard and guideline set and related components
- D. A specific software testing coverage metric only by the project team members

Answer: B

Q524. What is the difference between PERT and CPM?

- A. PERT does not produce any chart output at all for effective project outcomes
- B. The two techniques are completely identical overall to achieve project objectives
- C. CPM is exclusively used for software projects in the engineering discipline
- D. PERT uses probabilistic time estimates; CPM uses deterministic time estimates

Answer: D

Q525. What is slack (float) in project scheduling?

- A. A specific category of software defect type during the software lifecycle
- B. Additional unnecessary source code that was written in the development process
- C. Being unproductive and lazy at work always as part of the methodology
- D. The amount of time a task can be delayed without delaying the project

Answer: D

Q526. What is a project baseline?

- A. The very first line of application source code for the development team
- B. An approved version of the project plan used to measure performance
- C. A performance testing benchmark result value throughout the project
- D. The initial starting point for all coding work within the project scope

Answer: B

Q527. What is the purpose of a project charter?

- A. To write application source code for features in the system context
- B. To perform software testing and validation runs during implementation
- C. To formally authorize the project and define its objectives and stakeholders
- D. To deploy software to production server systems for quality purposes

Answer: C

Q528. What is the difference between effort and duration in project estimation?

- A. Effort is total person-hours; duration is calendar time
- B. The two terms are exactly the same thing always
- C. Effort is always measured in monetary currency
- D. Duration is always longer than effort estimates

Answer: A

Q529. What is a risk in project management?

- A. An uncertain event that could positively or negatively affect the project
- B. An absolute certainty in the project plan only in practice typically
- C. A documented project functional requirement by the organization
- D. A task that has already been fully completed as a standard approach

Answer: A

Q530. What is the purpose of a status report?

- A. To design relational database architectures in a systematic way
- B. To write application source code for features at every stage
- C. To compile and build software executable files across all phases
- D. To communicate project progress, issues, and plans to stakeholders

Answer: D

Q531. What is the Singleton design pattern?

- A. A pattern that ensures a class has only one instance with a global access point
- B. A comprehensive software testing design pattern by the development process
- C. A relational database schema design pattern type and its related activities
- D. A pattern designed for creating multiple instances within the system boundary

Answer: A

Q532. What is the Observer design pattern?

- A. A pattern where objects are notified of state changes in another object
- B. A creational object instantiation design pattern as defined by standards
- C. A structural composition and wrapping pattern for all project stakeholders
- D. A system security and access control pattern over the entire lifecycle

Answer: A

Q533. What is the Factory Method pattern?

- A. A pattern that defines an interface for creating objects, letting subclasses decide which class to instantiate
- B. A specialized debugging and tracing tool suite to achieve project objectives in the engineering discipline
- C. A comprehensive software testing method and tool by the project team members and related components
- D. A physical manufacturing production process flow within the given constraints in all development efforts

Answer: A

Q534. What is the MVC design pattern?

- A. A comprehensive software testing pattern type as part of the methodology
- B. A specific type of program variable declaration for effective project outcomes
- C. Model-View-Controller, separating data, presentation, and control logic
- D. A software deployment automation pattern type in the development process

Answer: C

Q535. What is the Strategy design pattern?

- A. A specific software testing strategy and plan within the project scope
- B. A project management planning approach method during the software lifecycle
- C. A pattern that defines a family of algorithms and makes them interchangeable
- D. A software deployment automation strategy type for the development team

Answer: C

Q536. What are the three categories of GoF design patterns?

- A. Input, Process, Output in the system
- B. Creational, Structural, Behavioral
- C. Design, Code, Test during implementation
- D. Easy, Medium, Hard throughout the project

Answer: B

Q537. What is the Open/Closed Principle?

- A. Software entities should be open for extension but closed for modification
- B. Never closing running desktop applications ever as a standard approach
- C. Always keeping file handles open in the code in practice typically
- D. Using only open source software for projects for quality purposes

Answer: A

Q538. What is the Liskov Substitution Principle?

- A. A specific naming convention for all variables by the organization at every stage
- B. A comprehensive software testing principle type across all phases in a systematic way
- C. A relational database normalization principle for the project goals according to best practices
- D. Objects of a superclass should be replaceable with objects of a subclass without affecting correctness

Answer: D

Q539. What is the DRY principle?

- A. Keep code dry and clean within the system boundary
- B. Delete Redundant Yields by the development process
- C. Don't Repeat Yourself — avoid code duplication
- D. Develop Robust Yields and its related activities

Answer: C

Q540. What is a class diagram?

- A. A project timeline for all project stakeholders within the given constraints
- B. A network diagram in all development efforts by the project team members
- C. A classroom layout over the entire lifecycle as defined by standards
- D. A UML diagram showing classes, attributes, methods, and relationships

Answer: D

Q541. What is microservices architecture?

- A. An architecture where the application is composed of small, independent services
- B. A traditional monolithic design approach to apps and related components
- C. A single centralized database system approach to achieve project objectives
- D. One single large monolithic service application by the project team members

Answer: A

Q542. What is the difference between SOA and microservices?

- A. SOA is a much newer architectural approach style as part of the methodology
- B. SOA uses enterprise service bus for communication; microservices use lightweight protocols
- C. Microservices are generally larger in scope overall for effective project outcomes
- D. The two approaches are completely identical overall in the engineering discipline

Answer: B

Q543. What is an architectural style?

- A. A named collection of architectural design decisions applicable to recurring design problems
- B. A user interface visual style and theme design during the software lifecycle
- C. A specific coding style and convention guideline in the development process
- D. A project documentation format and standard set within the project scope

Answer: A

Q544. What is the Model-View-ViewModel (MVVM) pattern?

- A. An architectural pattern separating UI, presentation logic, and business logic/data
- B. A relational database normalization pattern type for the development team
- C. A comprehensive software testing pattern design throughout the project
- D. A production deployment automation pattern type in the system context

Answer: A

Q545. What are architectural views?

- A. Database views defined with SQL query language for quality purposes
- B. User interface screens and layout page designs in practice typically
- C. Different perspectives of a system architecture for different stakeholders
- D. Screen views displayed to the end users only during implementation

Answer: C

Q546. What is the 4+1 View Model?

- A. A comprehensive software testing model and plan by the organization at every stage
- B. A relational database normalization model type across all phases in a systematic way
- C. An architecture description using Logical, Process, Development, Physical views plus Scenarios
- D. Five physical computer display monitors together as a standard approach

Answer: C

Q547. What is a message broker in architecture?

- A. A general-purpose programming language and tool within the system boundary
- B. A specific type of database storage system tool according to best practices
- C. An intermediary program that translates messages between different systems
- D. A person who physically delivers messages by hand for the project goals

Answer: C

Q548. What is the publish-subscribe pattern?

- A. A messaging pattern where publishers send messages to subscribers through a topic
- B. An established coding standard and guideline set over the entire lifecycle
- C. A relational database design pattern type only and its related activities
- D. A physical magazine subscription service plan by the development process

Answer: A

Q549. What is a service-oriented architecture (SOA)?

- A. An architecture where services communicate over a network to provide functionality
- B. A hardware system architecture blueprint only within the given constraints
- C. A single isolated standalone service application as defined by standards
- D. A traditional monolithic application design style for all project stakeholders

Answer: A

Q550. What is an API Gateway?

- A. A physical security entry gate device system in all development efforts
- B. A hardware network switching device and unit and related components
- C. A server that acts as a single entry point for a set of microservices
- D. A relational database gateway and adapter tool by the project team members

Answer: C

Q551. What are Nielsen's 10 usability heuristics?

- A. Ten specific software testing methodology types
- B. Ten established coding standards and rule sets
- C. Guidelines for evaluating user interface design quality
- D. Ten strict programming coding rules for teams

Answer: C

Q552. What is Fitts' Law?

- A. An established coding law and standard rule only and its related activities over the entire lifecycle
- B. A fundamental law of classical physics and motion within the system boundary by the development process
- C. A relational database normalization law and rule as defined by standards for all project stakeholders
- D. The time to reach a target is proportional to the distance and inversely proportional to the target size

Answer: D

Q553. What is a heuristic evaluation?

- A. A mathematical algorithm analysis method only within the given constraints
- B. A usability inspection method where experts evaluate UI against established principles
- C. A formal source code peer review session only by the project team members
- D. A system performance load testing method only in all development efforts

Answer: B

Q554. What is the difference between UI and UX?

- A. UX is only about writing source code logic only as part of the methodology in the development process
- B. The two concepts are fundamentally the same thing and related components to achieve project objectives
- C. UI focuses on visual design; UX encompasses the entire user experience including emotions and satisfaction
- D. UI is always more important than UX design work in the engineering discipline for effective project outcomes

Answer: C

Q555. What is A/B testing in UI design?

- A. Testing against two different database systems
- B. Testing on two different mobile device models
- C. Comparing two versions of a design to see which performs better
- D. Testing two different API endpoints separately

Answer: C

Q556. What is the concept of 'affordance' in UI design?

- A. The financial cost of design work and effort
- B. A particular application color scheme and theme
- C. A specific type of user interface animation style
- D. A visual clue that suggests how an element can be used

Answer: D

Q557. What is a design system?

- A. A comprehensive software testing system and suite for the development team
- B. A computer operating system installation setup during the software lifecycle
- C. A collection of reusable components, guidelines, and standards for consistent design
- D. A specific application coding framework tool type within the project scope

Answer: C

Q558. What is the principle of 'progressive disclosure'?

- A. Showing every option and detail at once to users throughout the project
- B. Hiding absolutely all system information entirely in the system context
- C. Showing only essential information initially, revealing more as needed
- D. Disclosing security information to all end users during implementation

Answer: C

Q559. What is a user persona?

- A. A specific type of user profile avatar image in practice typically
- B. A user login name and credentials identifier for quality purposes
- C. A user uploaded profile picture image file as a standard approach
- D. A fictional character representing a key user group based on research data

Answer: D

Q560. What is the Z-pattern layout?

- A. A relational database query plan pattern and type across all phases in a systematic way
- B. A comprehensive software testing pattern approach for the project goals
- C. A layout following the natural eye scanning pattern from top-left to bottom-right in a Z shape
- D. A zigzag code structure in the code base layout by the organization at every stage

Answer: C

Q561. What is continuous integration (CI)?

- A. Manually integrating code without any automation for the development team
- B. Occasional and infrequent code merging events during the software lifecycle
- C. The practice of frequently merging code changes with automated building and testing
- D. Annual scheduled system integration events only within the project scope

Answer: C

Q562. What is continuous deployment (CD)?

- A. Annual scheduled deployment release events only in the system context
- B. Deployment without any automated testing at all during implementation
- C. Manual deployment to production server systems throughout the project
- D. Automatically deploying every code change that passes automated tests to production

Answer: D

Q563. What is the difference between compilation and interpretation?

- A. Compilation is always done only at runtime always at every stage across all phases in a systematic way
- B. Compilation translates entire code to machine code before execution; interpretation translates line by line during execution
- C. Interpretation is always faster than compilation is as a standard approach by the organization
- D. The two processes are fundamentally the same thing for quality purposes in practice typically

Answer: B

Q564. What is pair programming?

- A. Programming for exactly two hours at a time only
- B. Programming on two separate display monitors only
- C. Two developers working together at one workstation
- D. Two separate teams coding independently on tasks

Answer: C

Q565. What is code smell?

- A. An actual physical smell from hardware component
- B. A simple code formatting and indentation error
- C. A symptom in the source code that may indicate a deeper problem
- D. A type of computer virus or malware threat only

Answer: C

Q566. What is static code analysis?

- A. Executing and running the application code live
- B. Analyzing code without executing it to find potential errors
- C. Dynamic runtime testing of the application code
- D. Performance load testing of the application code

Answer: B

Q567. What is Git branching?

- A. A comprehensive software testing method type
- B. Creating separate lines of development within a repository
- C. A type of sorting algorithm technique approach
- D. Physical branches of a tree in nature settings

Answer: B

Q568. What is code coverage?

- A. A project documentation completeness metric type
- B. Physical coverage of printed code documents only
- C. A metric measuring the percentage of code executed during testing
- D. A security protection and control measure type

Answer: C

Q569. What is the DRY principle in coding?

- A. Delete Redundant Yields according to best practices
- B. Develop Robust Yields within the system boundary
- C. Keep code moisture-free for the project goals
- D. Don't Repeat Yourself — avoid duplicating code or logic

Answer: D

Q570. What is a linter?

- A. A tool that analyzes code for potential errors, style violations, and best practices
- B. A type of clothing fabric material only exactly by the development process
- C. A source code compilation tool program and build over the entire lifecycle
- D. A specialized debugging and tracing tool for code and its related activities

Answer: A

Q571. What is boundary value analysis?

- A. A testing technique focusing on values at the edges of input ranges
- B. A software architecture design technique approach throughout the project
- C. Analyzing overall project scope boundary limits for the development team
- D. A source code implementation technique approach in the system context

Answer: A

Q572. What is equivalence partitioning?

- A. A creational object-oriented design pattern type for quality purposes
- B. Dividing input data into groups that should be treated the same by the software
- C. A source code implementation technique approach in practice typically
- D. Equal distribution of work across team members during implementation

Answer: B

Q573. What is the difference between verification and validation in testing?

- A. Verification is entirely optional in all practice in a systematic way for the project goals
- B. The two concepts are fundamentally the same thing as a standard approach by the organization
- C. Verification checks if the product is built right; validation checks if the right product is built
- D. Validation always occurs before verification process at every stage across all phases

Answer: C

Q574. What is system testing?

- A. Testing just the operating system installation only within the system boundary
- B. Testing only individual isolated code units first according to best practices
- C. Testing the complete integrated system to verify it meets requirements
- D. Testing physical hardware system components only by the development process

Answer: C

Q575. What is performance testing?

- A. Testing how the system performs under various conditions of load and stress
- B. Testing the overall user experience quality level over the entire lifecycle
- C. Testing overall source code quality metrics only and its related activities
- D. Testing application security vulnerabilities only as defined by standards

Answer: A

Q576. What is stress testing?

- A. Testing comprehensive project documentation files in all development efforts
- B. Testing the stress levels of developer team members for all project stakeholders
- C. Testing the system beyond normal operational capacity to find its breaking point
- D. Testing with easy and simple valid input data only within the given constraints

Answer: C

Q577. What is test-driven development (TDD)?

- A. Writing tests before writing the code to make them pass
- B. Performing testing without any source code at all
- C. Performing all testing after coding is fully done
- D. Developing test plans and nothing else at all

Answer: A

Q578. What is a test stub?

- A. A test case that has previously failed and broke and related components
- B. A very short and brief test case scenario only by the project team members
- C. A comprehensive test report and document summary to achieve project objectives
- D. A simplified implementation that provides predetermined responses during testing

Answer: D

Q579. What is a mock object?

- A. A specific type of database storage system type as part of the methodology
- B. A decorative object for the office workspace area for effective project outcomes
- C. A simulated object that mimics the behavior of real objects in a controlled way for testing
- D. A counterfeit fake commercial product item only in the engineering discipline

Answer: C

Q580. What is alpha testing vs beta testing?

- A. Alpha is internal testing by developers; beta is external testing by end users
- B. Alpha testing is always done by external end users within the project scope
- C. The two types of testing are the same thing exactly in the development process
- D. Beta testing always comes before alpha testing does during the software lifecycle

Answer: A

Q581. What is Lehman's Law of Increasing Complexity?

- A. As a system evolves, its complexity increases unless work is done to reduce it
- B. Complexity is completely irrelevant to all quality over the entire lifecycle
- C. Complexity always stays perfectly constant overall and its related activities
- D. Complexity always decreases over time by itself by the development process

Answer: A

Q582. What is reverse engineering in software maintenance?

- A. Analyzing existing software to understand its design and implementation
- B. Completely uninstalling the software product system within the given constraints
- C. Writing application source code backwards manually for all project stakeholders
- D. Building and manufacturing physical cars and parts as defined by standards

Answer: A

Q583. What is re-engineering in software?

- A. Deploying software to production server systems now and related components
- B. Restructuring or rewriting existing software to improve its quality without changing functionality
- C. Permanently deleting the software product entirely by the project team members
- D. Starting completely over from scratch and beginning in all development efforts

Answer: B

Q584. What is the impact analysis in maintenance?

- A. Conducting performance benchmarking analysis tests
- B. Analyzing user behavior and usage pattern metrics
- C. Performing financial analysis of the project budget
- D. Assessing the effects of proposed changes on the rest of the system

Answer: D

Q585. What is software aging?

- A. Developer aging and gaining experience over career for effective project outcomes
- B. Physical hardware aging over many years of running in the engineering discipline
- C. The degradation of software quality over time due to accumulated changes and environmental evolution
- D. Software physically getting old and worn down over time to achieve project objectives

Answer: C

Q586. What is the difference between maintenance and evolution?

- A. Maintenance is always more comprehensive overall during the software lifecycle
- B. Maintenance fixes and adapts; evolution is the broader process of continuous change
- C. The two concepts are completely identical overall as part of the methodology
- D. Evolution is just a type of maintenance activity in the development process

Answer: B

Q587. What is program comprehension?

- A. Reading a technical programming textbook chapter
- B. Understanding existing code to perform maintenance or modifications
- C. Compiling source code into executable file formats
- D. Writing brand new application source code logic

Answer: B

Q588. What is a maintenance request?

- A. A physical hardware equipment purchase request doc
- B. A purchase order for new office supply materials
- C. A formal request to change, fix, or enhance existing software
- D. A personal vacation and time off request document

Answer: C

Q589. What is the concept of 'software entropy'?

- A. The energy consumption of running software systems for the development team
- B. The tendency of software to become more disordered and difficult to maintain over time
- C. A concept from physics thermodynamics discipline within the project scope
- D. An established coding standard and guideline type throughout the project

Answer: B

Q590. What is migration in software maintenance?

- A. Moving to a new country or city location abroad in the system context
- B. Moving software from one environment, platform, or technology to another
- C. Installing new physical hardware equipment devices for quality purposes
- D. Permanently deleting old legacy software and files during implementation

Answer: B

Q591. What is the difference between a walkthrough and an inspection?

- A. A walkthrough always has defined formal roles setup in all development efforts
- B. A walkthrough is informal and author-led; an inspection is formal with defined roles
- C. An inspection is always informal and casual in tone within the given constraints
- D. The two approaches are completely identical overall for all project stakeholders

Answer: B

Q592. What is the ISO/IEC 25010 quality model?

- A. A standard defining software quality characteristics like functionality, reliability, and usability
- B. A relational database normalization model and form in the engineering discipline
- C. A specific automobile car model type and category by the project team members
- D. A software architecture design model pattern type and related components to achieve project objectives

Answer: A

Q593. What is formal technical review (FTR)?

- A. A regular source code coding session for features as part of the methodology
- B. A structured review technique with specific roles and procedures to find defects
- C. An informal casual team meeting with no structure for effective project outcomes
- D. A production deployment meeting and schedule plan in the development process

Answer: B

Q594. What is the defect density metric?

- A. Number of defects per individual developer person during the software lifecycle
- B. The number of defects found per unit size of software (e.g., per KLOC)
- C. The severity rating of individual defects and bugs for the development team
- D. The total number of all defects combined overall within the project scope

Answer: B

Q595. What is the concept of 'shift left' in quality?

- A. Moving the computer screen display to the left side throughout the project
- B. Moving deployment earlier in the schedule timeline during implementation
- C. Moving testing and quality activities earlier in the development lifecycle
- D. Shifting team members to different project assignments in the system context

Answer: C

Q596. What is a quality audit?

- A. An independent evaluation of software processes and products against standards
- B. A financial accounting audit process only exclusively for quality purposes
- C. A system performance load test execution and report as a standard approach
- D. A formal source code peer review session and meeting in practice typically

Answer: A

Q597. What is the Pareto principle in QA?

- A. All modules have an equal number of bugs and issues
- B. Equal distribution of bugs across all code modules
- C. Approximately 80% of defects come from 20% of the modules
- D. Testing all modules equally and consistently overall

Answer: C

Q598. What is defect prevention?

- A. Activities aimed at identifying and addressing the root causes of defects before they occur
- B. Testing only at the very end of the whole project in a systematic way
- C. Finding defects only after production release launch at every stage across all phases
- D. Deliberately ignoring all known defects and issues by the organization

Answer: A

Q599. What is the role of a QA engineer?

- A. Ensuring software quality through planning, testing, and process improvement
- B. Only writing project documentation materials only within the system boundary
- C. Only writing application source code exclusively for the project goals
- D. Only managing projects and schedules exclusively according to best practices

Answer: A

Q600. What are the internal and external failure costs?

- A. Internal failure costs are always much higher overall for all project stakeholders within the given constraints
- B. External failure costs are always much cheaper overall over the entire lifecycle as defined by standards
- C. The two cost types are fundamentally the same thing by the development process and its related activities
- D. Internal failures are found before release (rework); external failures are found after release (support, reputation)

Answer: D

Q601. What is cyclomatic complexity?

- A. A complexity metric related to bicycles and riding in practice typically
- B. The total count of all declared variable name types by the organization
- C. The total length of all source code files and lines as a standard approach
- D. A metric measuring the number of linearly independent paths through a program's source code

Answer: D

Q602. What is function point analysis?

- A. Counting total functions in source code and files at every stage
- B. A method of measuring software size based on the functionality delivered to users
- C. A specific software testing technique approach only across all phases
- D. An established coding standard and guideline set only in a systematic way

Answer: B

Q603. What is the Halstead complexity metric?

- A. A set of metrics based on counting operators and operands in source code
- B. A comprehensive software testing metric set and type according to best practices
- C. A subjective difficulty rating for the code base for the project goals
- D. A software architecture design metric set and type within the system boundary

Answer: A

Q604. What is the difference between direct and indirect metrics?

- A. Indirect metrics are always more accurate and precise over the entire lifecycle as defined by standards
- B. Direct metrics are always calculated from other data for all project stakeholders
- C. Direct metrics are measured directly (LOC); indirect metrics are derived from other measures (productivity)
- D. The two metric types are completely the same thing by the development process and its related activities

Answer: C

Q605. What is the maintainability index?

- A. A comprehensive software testing score and rating
- B. An index at the back of a textbook publication
- C. A production deployment readiness rating and score
- D. A composite metric indicating how easy it is to maintain software

Answer: D

Q606. What is cohesion metric?

- A. A coupling metric between different system modules in all development efforts
- B. A comprehensive software testing metric and score by the project team members
- C. A measure of how strongly related the responsibilities within a module are
- D. A measure of team togetherness and morale level within the given constraints

Answer: C

Q607. What is coupling metric?

- A. A production deployment readiness metric and score
- B. A measure of how strongly one module depends on other modules
- C. A comprehensive software testing metric and score
- D. A cohesion metric within a single code module only

Answer: B

Q608. What is the fan-in and fan-out metric?

- A. A cooling system performance metric for hardware and related components
- B. A relational database performance metric and score in the engineering discipline
- C. A network bandwidth performance metric measurement to achieve project objectives
- D. Fan-in counts modules calling a module; fan-out counts modules called by a module

Answer: D

Q609. What is the depth of inheritance tree (DIT) metric?

- A. The depth of a relational database schema and tables as part of the methodology
- B. The height of a tree in a garden setting outdoors for effective project outcomes
- C. The depth of software testing coverage and breadth in the development process
- D. The maximum length of the path from a class to the root class in an inheritance hierarchy

Answer: D

Q610. What is the weighted methods per class (WMC) metric?

- A. The total number of classes in the project source
- B. The total number of source code files in project
- C. The average physical weight of all methods defined
- D. The sum of complexities of all methods defined in a class

Answer: D

Q611. What is the purpose of a Change Control Board (CCB)?

- A. A physical whiteboard in the office space and room by the organization
- B. A dedicated software testing team or group of people at every stage
- C. A development source coding team or group of people across all phases
- D. A group responsible for evaluating and approving or rejecting change requests

Answer: D

Q612. What is a merge conflict?

- A. A situation where two branches have competing changes that cannot be automatically merged
- B. A software testing failure or assertion error result according to best practices
- C. A disagreement or argument between the team members in a systematic way
- D. A production deployment failure or error issue event for the project goals

Answer: A

Q613. What is continuous integration in the context of SCM?

- A. Frequently merging code changes to a shared repository with automated builds and tests
- B. Manually merging code without any automation tools by the development process
- C. Performing one-time integration at the very end and its related activities
- D. Performing annual scheduled integration events only within the system boundary

Answer: A

Q614. What is a tag in version control?

- A. A price tag attached to a retail product for sale over the entire lifecycle
- B. A commit message attached to a changeset in version control for all project stakeholders
- C. A marker that identifies a specific point in the repository's history, typically a release
- D. A specific type of development branch in the project as defined by standards

Answer: C

Q615. What is the difference between centralized and distributed version control?

- A. Centralized version control is the newer approach today by the project team members
- B. Distributed version control has only one server overall in all development efforts
- C. The two systems are completely identical in every way within the given constraints
- D. Centralized has one server; distributed gives each developer a full copy of the repository

Answer: D

Q616. What is a build system in configuration management?

- A. A physical construction building system and process and related components
- B. A project documentation management system and process in the engineering discipline
- C. A tool that automates the process of compiling source code into executable software
- D. A comprehensive software testing system and tool suite to achieve project objectives

Answer: C

Q617. What is release management?

- A. A comprehensive software testing method and approach type in the development process
- B. Releasing employees from their positions and roles for effective project outcomes
- C. A source code implementation coding technique and method as part of the methodology
- D. The process of planning, scheduling, and controlling software builds through different stages

Answer: D

Q618. What is a software configuration audit?

- A. A financial accounting audit process and procedure only during the software lifecycle
- B. A system performance load test execution and run report for the development team
- C. A formal source code peer review session and meeting only within the project scope
- D. A review to verify that configuration items conform to specifications and standards

Answer: D

Q619. What is GitFlow?

- A. A software testing flow and process model and approach in the system context
- B. A water flow through pipes and channels and drains throughout the project
- C. A production deployment pipeline and flow and process during implementation
- D. A branching model for Git that defines a strict branching structure for projects

Answer: D

Q620. What is trunk-based development?

- A. A branching strategy where developers merge small, frequent updates to a core trunk or main branch
- B. Developing software in physical tree trunks outdoors for quality purposes in practice typically
- C. A comprehensive software testing approach and method only as a standard approach
- D. A software architecture and design method approach only by the organization

Answer: A

Q621. What is a risk exposure (risk magnitude)?

- A. A production deployment issue and concern problem
- B. A type of security vulnerability and exposure found
- C. The product of risk probability and risk impact
- D. Physical exposure to sunlight and weather outdoors

Answer: C

Q622. What is the difference between known risks and unknown risks?

- A. Known risks cannot be managed effectively at all within the given constraints
- B. Unknown risks are far more common than known risks for all project stakeholders
- C. Known risks can be identified and planned for; unknown risks cannot be anticipated
- D. The two categories are fundamentally the same thing as defined by standards

Answer: C

Q623. What is Boehm's risk management approach?

- A. A production deployment automation approach and plan
- B. A framework with two main components: risk assessment and risk control
- C. A source code implementation coding approach and plan
- D. A comprehensive software testing approach and process

Answer: B

Q624. What is the RMMM plan?

- A. A comprehensive software testing plan and document only and related components
- B. Risk Mitigation, Monitoring, and Management Plan — a document for managing project risks
- C. A source code implementation coding plan and document by the project team members
- D. A plan based on Roman numeral notation and numbering in all development efforts

Answer: B

Q625. What is a contingency plan?

- A. The main and primary project plan document overall
- B. A production deployment plan and schedule doc
- C. A comprehensive software testing plan document
- D. A backup plan activated when a risk materializes

Answer: D

Q626. What are the top 10 software risks according to Boehm?

- A. Ten common source code coding errors and mistakes to achieve project objectives
- B. Ten common software testing risk types and categories in the engineering discipline
- C. Ten common deployment issues and concerns and problems for effective project outcomes
- D. Risks including personnel shortfalls, unrealistic schedules, wrong requirements, and gold plating

Answer: D

Q627. What is risk monitoring?

- A. Continuously tracking identified risks and identifying new risks throughout the project
- B. Monitoring application source code changes and edits as part of the methodology
- C. Monitoring production server health status and uptime in the development process
- D. Monitoring individual team member performance metrics during the software lifecycle

Answer: A

Q628. What is a risk trigger?

- A. A physical gun trigger mechanism device component only
- B. A software testing trigger or activation event and signal
- C. An indicator or symptom that a risk event is about to occur or has occurred
- D. A production deployment trigger or activation signal only

Answer: C

Q629. What is the difference between qualitative and quantitative risk analysis?

- A. Quantitative analysis is always purely subjective in nature for the development team
- B. The two approaches are completely identical in all ways within the project scope
- C. Qualitative analysis always uses only numeric data values throughout the project
- D. Qualitative uses subjective assessment (high/medium/low); quantitative uses numerical probabilities

Answer: D

Q630. What is a risk breakdown structure?

- A. A comprehensive software testing structure and model for quality purposes
- B. A source code structure and organization model layout during implementation
- C. A broken system that needs repair work and fixing in the system context
- D. A hierarchical organization of identified risks categorized by risk source

Answer: D

Q631. What is the OWASP Top 10?

- A. A popular music chart and ranking system and listing
- B. A list of the ten most critical web application security risks
- C. An established coding standard and guideline and rule
- D. A comprehensive software testing framework tool and set

Answer: B

Q632. What is the principle of least privilege?

- A. Maximum access permissions for all system users always across all phases
- B. No access permissions for any user in the system ever in a systematic way
- C. Users should only have the minimum access rights necessary to perform their tasks
- D. Giving everyone full administrator access to everything at every stage

Answer: C

Q633. What is a buffer overflow?

- A. Having too much data stored in a buffer data area for the project goals
- B. A database table overflow and storage issue and error within the system boundary
- C. A vulnerability where data written beyond a buffer's boundary can overwrite adjacent memory
- D. A network traffic overflow and congestion issue event according to best practices

Answer: C

Q634. What is input validation?

- A. Accepting all user input without any validation checks by the development process
- B. Validating only system output and response data values and its related activities
- C. Testing user interface elements for usability and flow over the entire lifecycle
- D. Checking and sanitizing user input to prevent malicious data from entering the system

Answer: D

Q635. What is defense in depth?

- A. A security approach using multiple layers of security controls throughout a system
- B. Defending only the database from attacks and threats within the given constraints
- C. Having one single strong defense mechanism and barrier for all project stakeholders
- D. A military strategy used only in warfare and battles as defined by standards

Answer: A

Q636. What is a security audit?

- A. A financial accounting audit process and procedure type in all development efforts
- B. A systematic evaluation of a system's security by examining compliance with security policies
- C. A system performance load test execution and run process and related components
- D. A formal source code peer review session and process only by the project team members

Answer: B

Q637. What is penetration testing?

- A. Physical building break-in testing attempt and effort
- B. Database query performance testing and benchmarking
- C. Network communication speed testing and measurement
- D. Simulating cyberattacks to identify security vulnerabilities in a system

Answer: D

Q638. What is a denial-of-service (DoS) attack?

- A. A specific type of computer virus or malware and threat in the engineering discipline
- B. Denying customer service requests politely and kindly to achieve project objectives
- C. An attack that overwhelms a system with traffic to make it unavailable to users
- D. A network configuration and setup procedure and process for effective project outcomes

Answer: C

Q639. What is the CIA triad in security?

- A. A government intelligence agency abbreviation and name as part of the methodology
- B. An established coding standard and guideline and rule set in the development process
- C. Confidentiality, Integrity, and Availability — the three core principles of information security
- D. A comprehensive software testing framework and tool suite during the software lifecycle

Answer: C

Q640. What is secure coding?

- A. Writing code in a physically secure room and building
- B. Encrypting all application source code files and folders
- C. Development practices that protect software from security vulnerabilities
- D. Using complex passwords directly in application code

Answer: C

Q641. What is the difference between verification and validation?

- A. Verification writes documentation; validation writes test code
- B. Verification deploys software; validation monitors production
- C. Verification checks correctness; validation checks usefulness
- D. Verification tests performance; validation tests user interface

Answer: C

Q642. Which factor most contributes to the software crisis?

- A. Decreasing cost of modern hardware and peripherals
- B. Growing availability of trained software professionals
- C. Increasing system complexity and changing requirements
- D. Widespread adoption of standardized coding practices

Answer: C

Q643. What is the significance of the NATO 1968 conference?

- A. It launched the initial version of the world wide web
- B. It formally introduced software engineering as a discipline
- C. It created the first commercial operating system product
- D. It established the first programming language standard

Answer: B

Q644. How does software engineering differ from programming?

- A. It focuses only on writing source code in languages
- B. It deals exclusively with database design and queries
- C. It encompasses the entire development lifecycle process
- D. It concerns itself primarily with hardware maintenance

Answer: C

Q645. What is the purpose of a feasibility study in software projects?

- A. To write the final source code for the application
- B. To conduct user acceptance testing after development
- C. To deploy the software to the production environment
- D. To determine if the project is viable and worthwhile

Answer: D

Q646. Which software characteristic ensures it works across platforms?

- A. Obscurity of the source code implementation
- B. Dependency on a single hardware configuration
- C. Portability across different operating environments
- D. Complexity of the underlying algorithm design

Answer: C

Q647. What is meant by 'technical debt' in software engineering?

- A. The monetary budget allocated for purchasing hardware
- B. Revenue generated from software licensing agreements
- C. Total salary expenses for the development team members
- D. Accumulated cost of shortcuts taken during development

Answer: D

Q648. Why are software engineering ethics considered important?

- A. They guide responsible behavior in professional practice
- B. They reduce the physical size of deployed software
- C. They increase the execution speed of the application
- D. They eliminate the need for comprehensive testing

Answer: A

Q649. What is the relationship between software and hardware engineering?

- A. Both disciplines use identical processes and methodologies
- B. Software engineering is a direct subset of hardware engineering
- C. Hardware engineering completely depends on software practices
- D. Software engineering builds on but differs from hardware methods

Answer: D

Q650. What is the primary benefit of using CASE tools?

- A. They automate and support software development activities
- B. They convert hardware specifications into software code
- C. They eliminate all possible defects from the source code
- D. They replace the need for any human software developers

Answer: A

Q651. What is the key difference between incremental and iterative models?

- A. Incremental refines features; iterative adds new functionality
- B. Both approaches are completely identical in every possible way
- C. Neither approach involves any form of planning or documentation
- D. Incremental adds functionality; iterative refines existing features

Answer: D

Q652. In the spiral model, what happens at the end of each spiral loop?

- A. Testing is permanently skipped for all remaining spiral loops
- B. The entire project is immediately deployed to production servers
- C. A review determines whether to continue to the next iteration
- D. All source code is discarded and rewritten from scratch again

Answer: C

Q653. Why might a team choose the RAD model for development?

- A. When no user involvement is needed throughout development
- B. When requirements are completely fixed and will never change
- C. When the project has unlimited budget and timeline available
- D. When rapid delivery of a working system is the top priority

Answer: D

Q654. What is a disadvantage of the waterfall model?

- A. Excessive flexibility leading to uncontrolled scope expansion
- B. Difficulty accommodating requirement changes after phase completion
- C. Lack of any structured phases making progress hard to track
- D. Too many iterative cycles causing confusion among developers

Answer: B

Q655. How does the unified process (UP) organize development activities?

- A. Into four phases: inception, elaboration, construction, transition
- B. Into two phases: planning and coding without any other steps
- C. Into six phases that must always be executed sequentially only
- D. Into a single continuous phase without any distinct milestones

Answer: A

Q656. What role does risk assessment play in the spiral model?

- A. It drives decisions about which activities to perform each cycle
- B. It has no significant impact on how the project is conducted
- C. It replaces all other engineering activities in the entire model
- D. It is performed only once at the very beginning of the project

Answer: A

Q657. When is the evolutionary development model most appropriate?

- A. When initial requirements are unclear and need exploration work
- B. When all requirements are perfectly defined before starting
- C. When the project has a very short and fixed delivery deadline
- D. When the team prefers no stakeholder interaction during work

Answer: A

Q658. What is the main criticism of the code-and-fix development approach?

- A. It requires too much upfront planning and design documentation
- B. It mandates excessive testing before any code is ever written
- C. It leads to poorly structured software that is hard to maintain
- D. It forces teams to follow overly rigid process model guidelines

Answer: C

Q659. What is the purpose of the elaboration phase in the Unified Process?

- A. To deploy the completed software to end users in production now
- B. To analyze the problem domain and establish architectural foundation
- C. To gather initial business case and scope project requirements
- D. To perform final acceptance testing before system goes live now

Answer: B

Q660. How does the component-based development model reduce development effort?

- A. By eliminating all testing and quality assurance activities fully
- B. By avoiding any form of architectural design or documentation
- C. By reusing pre-built and tested software components extensively
- D. By skipping the requirements gathering phase of development work

Answer: C

Q661. What is the difference between Scrum and Kanban?

- A. Scrum avoids visualization; Kanban prohibits all meetings
- B. Scrum has no backlog; Kanban requires sprint planning
- C. Scrum has no roles; Kanban requires a Scrum Master role
- D. Scrum uses time-boxed sprints; Kanban uses continuous flow

Answer: D

Q662. What is velocity in agile project management?

- A. The frequency of deploying code to the production servers
- B. The amount of work a team completes in one iteration period
- C. The speed at which the application executes user requests
- D. The rate at which new developers join the project team

Answer: B

Q663. What is the purpose of a sprint retrospective?

- A. To create the initial project charter and scope document
- B. To identify improvements for the team process going forward
- C. To demonstrate completed features to external stakeholders
- D. To assign blame for any defects found during the sprint

Answer: B

Q664. How does pair programming benefit agile teams?

- A. It allows one developer to do all work while the other rests
- B. It doubles the number of features developed per time unit
- C. It increases code quality through continuous peer review work
- D. It eliminates the need for any automated testing frameworks

Answer: C

Q665. What is the definition of 'done' in Scrum?

- A. A legal document signed by the client at project conclusion
- B. A shared understanding of when a work item is complete enough
- C. A report generated automatically by the build server system
- D. A metric measuring the total number of lines of code written

Answer: B

Q666. What is a burndown chart used for in agile?

- A. Documenting all architectural decisions made during the project
- B. Tracking remaining work against time in a sprint or release
- C. Measuring the total revenue generated by the software product
- D. Recording the number of team members joining or leaving work

Answer: B

Q667. What is the purpose of story points in agile estimation?

- A. To measure the physical size of the application in megabytes
- B. To estimate the relative effort required for completing tasks
- C. To count the exact number of hours each task will take to do
- D. To track the number of bugs reported by end users each week

Answer: B

Q668. How does continuous integration support agile development?

- A. By eliminating the need for version control systems entirely
- B. By delaying all testing until the final sprint of the project
- C. By preventing developers from committing code to the repository
- D. By frequently merging and testing code to detect issues early

Answer: D

Q669. What is the role of acceptance criteria in user stories?

- A. They list the hardware requirements for running the software
- B. They specify the programming language to be used for coding
- C. They define conditions that must be met for story completion
- D. They document the salary expectations of the development team

Answer: C

Q670. What is a spike in agile development?

- A. A formal review process conducted by external quality auditors
- B. A sudden increase in the number of production bugs per release
- C. A time-boxed research task to reduce uncertainty or risk factors
- D. A mandatory overtime period for all team members on a project

Answer: C

Q671. What is the difference between user requirements and system requirements?

- A. User requirements are high-level needs; system requirements are detailed specifications
- B. User requirements are optional; system requirements are always mandatory for the project
- C. User requirements come from developers; system requirements come from end user groups
- D. User requirements are written in code; system requirements are written in plain language

Answer: A

Q672. What is requirements prioritization and why is it necessary?

- A. It ranks requirements by importance to guide development order and resource allocation
- B. It randomly assigns requirements to different sprints without any logical ordering method
- C. It permanently removes low-priority requirements from the project scope and backlog
- D. It ensures all requirements are implemented simultaneously in a single development phase

Answer: A

Q673. What challenges arise during requirements elicitation with multiple stakeholders?

- A. All stakeholders always agree perfectly on every requirement without any discussion
- B. Multiple stakeholders simplify the process by reducing the total number of requirements
- C. Having more stakeholders eliminates the need for formal requirements documentation
- D. Conflicting viewpoints and priorities that must be negotiated and resolved carefully

Answer: D

Q674. How do prototypes help in requirements engineering?

- A. They replace the need for any written requirements documentation in the project
- B. They help stakeholders visualize the system and clarify unclear requirements early
- C. They guarantee that all requirements are correctly implemented in the final system
- D. They eliminate the possibility of any requirements changes during the development

Answer: B

Q675. What is the MoSCoW method in requirements prioritization?

- A. A geographic approach assigning requirements to teams based on physical location
- B. A technique categorizing requirements as Must, Should, Could, and Won't have items
- C. A testing strategy for validating requirements against acceptance criteria only
- D. A programming paradigm for implementing requirements in object-oriented languages

Answer: B

Q676. What is the difference between requirements verification and validation?

- A. Verification writes test cases; validation executes marketing campaigns for launch
- B. Verification checks document consistency; validation checks stakeholder satisfaction
- C. Verification trains users; validation calculates the return on investment figures
- D. Verification deploys the system; validation monitors production performance metrics

Answer: B

Q677. Why is natural language problematic for writing requirements?

- A. It is too precise and does not allow any flexibility in requirement statements
- B. It is only understood by technical staff and not by any business stakeholders
- C. It is inherently ambiguous and can lead to multiple conflicting interpretations
- D. It cannot express complex requirements due to limited vocabulary available

Answer: C

Q678. What is a requirements review and who should participate?

- A. A formal inspection of requirements involving stakeholders and technical staff
- B. A marketing meeting to discuss product positioning and pricing strategies
- C. An informal chat between two developers about their coding preferences only
- D. A hardware procurement session to select servers for the production use

Answer: A

Q679. How does requirements management handle change requests?

- A. By delegating all change decisions to a single junior developer on the team
- B. By rejecting all change requests to maintain the original project scope fully
- C. By immediately implementing all requested changes without any analysis first
- D. Through a formal change control process that evaluates impact before approval

Answer: D

Q680. What is the role of domain analysis in requirements engineering?

- A. It focuses exclusively on selecting the programming language for development
- B. It calculates the exact project budget and timeline before development starts
- C. It determines the number of servers needed for production deployment only
- D. It helps understand the application domain to identify relevant requirements

Answer: D

Q681. What is the purpose of earned value management (EVM)?

- A. To measure project performance by comparing planned versus actual progress and costs
- B. To determine which programming language is most suitable for the project requirements
- C. To calculate the total number of lines of code written by each developer on the team
- D. To design the system architecture and select appropriate technology stack components

Answer: A

Q682. How does the critical path method (CPM) help project managers?

- A. It guarantees that no project will ever experience delays or budget overruns
- B. It identifies tasks that directly impact project completion date if delayed at all
- C. It randomly assigns priorities to tasks without considering their dependencies now
- D. It eliminates the need for any project scheduling or timeline management work

Answer: B

Q683. What is scope creep and how can it be managed?

- A. An issue that resolves itself automatically without any management intervention
- B. A beneficial practice that should be encouraged for maximum project flexibility
- C. A problem that only affects projects using agile development methodologies now
- D. Uncontrolled scope expansion managed through formal change control processes

Answer: D

Q684. What is the difference between effort estimation and duration estimation?

- A. Effort measures code quality; duration measures the number of features implemented
- B. Effort is only relevant for testing; duration is only relevant for coding activities
- C. Effort is total work hours needed; duration is calendar time to complete the task
- D. Effort and duration are identical concepts with no meaningful difference between them

Answer: C

Q685. What is the COCOMO model used for in software project management?

- A. Managing source code versions and branches in the project code repository
- B. Testing software applications for security vulnerabilities and performance issues
- C. Estimating software development effort and cost based on project size parameters
- D. Designing user interfaces for web-based applications and mobile platforms only

Answer: C

Q686. How do project managers handle team conflicts effectively?

- A. By immediately removing the conflicting team members from the project team
- B. By assigning all disputed tasks to a single person to avoid disagreements
- C. By facilitating open communication and finding mutually acceptable solutions
- D. By ignoring conflicts and hoping they resolve themselves without intervention

Answer: C

Q687. What is a risk register in project management?

- A. A source code repository containing all versions of the application being built
- B. A database of all employee records including salary and performance evaluations
- C. A financial ledger tracking all project expenses and revenue over the timeline
- D. A documented list of identified risks with their probability and impact assessments

Answer: D

Q688. What is the purpose of a project post-mortem or lessons learned session?

- A. To calculate the final salary bonuses for the project team members after launch
- B. To assign blame to team members who made mistakes during the project execution
- C. To identify what went well and what can be improved for future project efforts
- D. To permanently archive all project documents and prevent any future access now

Answer: C

Q689. How does function point analysis help in project estimation?

- A. It measures the physical size of the deployed application in storage megabytes
- B. It tracks the number of team members assigned to the project at any given time
- C. It counts the number of programming languages used in the project source code
- D. It measures software size based on functional requirements independent of technology

Answer: D

Q690. What is the triple constraint in project management?

- A. The balance between scope, time, and cost that defines project boundaries
- B. The three phases of testing: unit, integration, and system level testing
- C. The minimum number of developers needed to start any software project
- D. The three programming languages required for every software project build

Answer: A

Q691. What is the Single Responsibility Principle (SRP)?

- A. A class should handle all possible system responsibilities now
- B. A function should always return multiple values simultaneously
- C. A class should have only one reason to change its behavior
- D. A module should depend on as many other modules as possible

Answer: C

Q692. What is the Open-Closed Principle in software design?

- A. Software entities should never be extended or modified after initial release
- B. Software entities should be open for extension but closed for modification
- C. Software entities should be both open and closed for all types of changes
- D. Software entities should be closed for extension and open for modification

Answer: B

Q693. What is the difference between the Strategy and State design patterns?

- A. Strategy and State are identical patterns with no differences between them at all
- B. Strategy selects algorithms; State changes behavior based on internal object state
- C. Strategy manages object creation; State handles object destruction and cleanup work
- D. Strategy is for UI design only; State is exclusively for database operations work

Answer: B

Q694. How does the Observer pattern support loose coupling?

- A. Observers must inherit from the subject class to receive any notification updates
- B. Observers must know the complete internal state of the subject at all times now
- C. Subjects notify observers without knowing their concrete implementation details
- D. The pattern requires tight coupling between all observers and the subject object

Answer: C

Q695. What is the Dependency Inversion Principle?

- A. High-level modules should depend on abstractions not on low-level module details
- B. Dependencies should always flow from abstractions down to concrete implementations
- C. High-level modules should directly depend on the implementation of low-level modules
- D. Low-level modules should control the behavior of all high-level modules in system

Answer: A

Q696. What is the Factory Method pattern used for?

- A. Connecting to external databases and executing queries against stored data records
- B. Sorting collections of objects based on their attributes in ascending or descending order
- C. Destroying objects and freeing memory after they are no longer needed by the program
- D. Creating objects without specifying the exact class to instantiate at compile time

Answer: D

Q697. How does the MVC pattern separate concerns in application design?

- A. It eliminates the need for any user interface by focusing solely on data storage
- B. It only separates the database from the rest of the application into two layers
- C. It separates data (Model), presentation (View), and logic (Controller) into layers
- D. It combines all application logic into a single layer without any separation at all

Answer: C

Q698. What is the Liskov Substitution Principle?

- A. Base types should be substitutable for their subtypes in all program situations
- B. Subtypes should completely change the behavior defined by their base type classes
- C. Subtypes must be substitutable for their base types without altering correctness
- D. Inheritance should be avoided entirely in favor of composition in every case

Answer: C

Q699. What is the purpose of the Adapter design pattern?

- A. To make incompatible interfaces work together through a wrapper component layer
- B. To add new functionality to objects dynamically at runtime without inheritance use
- C. To ensure a class has only one instance throughout the entire application system
- D. To create new objects by cloning existing ones without using constructors directly

Answer: A

Q700. What is the difference between composition and inheritance in design?

- A. Composition is always inferior to inheritance for all software design scenarios today
- B. Composition uses has-a relationships; inheritance uses is-a relationships between types
- C. Composition and inheritance are identical concepts with no meaningful differences at all
- D. Inheritance provides more flexibility than composition in every possible design context

Answer: B

Q701. What is the difference between software architecture and software design?

- A. Architecture and design are identical concepts with no meaningful differences between them
- B. Architecture focuses on code details; design focuses on system-level structural decisions
- C. Architecture defines high-level structure; design details component internals and algorithms
- D. Architecture is only relevant for small systems; design is only for large-scale systems

Answer: C

Q702. How does the Model-View-Controller architecture support separation of concerns?

- A. It eliminates the need for a user interface by focusing exclusively on data processing
- B. It only separates the database from the application without any further decomposition
- C. It separates data management, user interface, and control logic into distinct components
- D. It combines all concerns into a single component for simplicity and ease of maintenance

Answer: C

Q703. What are the trade-offs of microservices versus monolithic architecture?

- A. Microservices offer scalability and independence but add complexity in communication and deployment
- B. There are no meaningful trade-offs because both approaches produce identical system qualities
- C. Microservices are always superior to monolithic architectures in every possible project scenario
- D. Monolithic architectures are always more scalable than microservices in all system contexts today

Answer: A

Q704. What is an event-driven architecture?

- A. Components communicate by producing and consuming events asynchronously via message brokers
- B. All system events are processed in a strictly sequential order without any parallel execution
- C. Components communicate exclusively through synchronous direct function calls without any delay
- D. Event-driven systems cannot handle more than one event at any given point in time today

Answer: A

Q705. How does the service-oriented architecture (SOA) promote reusability?

- A. Services are designed as reusable, self-contained units with well-defined standard interfaces
- B. SOA discourages reusability by requiring unique implementations for every system integration
- C. Services in SOA are always built from scratch and never leverage any existing functionality
- D. Services are tightly coupled and cannot be reused outside their original application context

Answer: A

Q706. What is an architectural decision record (ADR)?

- A. A project management artifact tracking team member assignments and work allocations
- B. A source code file containing the main application entry point and initialization logic
- C. A database schema definition file used for creating tables and relationships in storage
- D. A document capturing the context, decision, and consequences of an architectural choice

Answer: D

Q707. What is the strangler fig pattern in architecture migration?

- A. Running both old and new systems permanently without ever completing the migration work
- B. Immediately shutting down the old system and deploying the new one all at once together
- C. Abandoning the migration and keeping the legacy system unchanged for all future operation
- D. Gradually replacing parts of a legacy system with new components until fully migrated

Answer: D

Q708. How does a message queue improve system architecture?

- A. It tightly couples all components requiring synchronous communication between every service
- B. It decouples producers and consumers allowing asynchronous communication and load leveling
- C. It reduces system reliability by introducing additional points of failure without any benefit
- D. It eliminates the need for any communication between system components or services at all

Answer: B

Q709. What is the CQRS (Command Query Responsibility Segregation) pattern?

- A. Separating read and write operations into different models for optimization flexibility
- B. Using the same data model and access path for both queries and commands in all cases
- C. Combining all read and write operations into a single model for maximum simplicity only
- D. Eliminating all read operations and only allowing write operations in the system design

Answer: A

Q710. What is the role of middleware in a distributed architecture?

- A. It only stores data and has no role in communication or transformation between services
- B. It provides communication, data transformation, and integration between distributed components
- C. It eliminates the need for any networking between distributed system components entirely
- D. It replaces all business logic components and handles every processing requirement directly

Answer: B

Q711. What are Nielsen's ten usability heuristics used for?

- A. Evaluating user interface designs for common usability problems and issues
- B. Configuring network firewalls for protecting against security threats
- C. Designing database schemas for storing application data efficiently now
- D. Writing backend server code for processing user authentication requests

Answer: A

Q712. What is the difference between UI design and UX design?

- A. UI and UX are identical disciplines with no differences in scope or focus areas
- B. UI covers project management; UX handles server infrastructure configuration
- C. UI focuses on visual elements; UX encompasses the entire user experience journey
- D. UI deals with backend logic; UX focuses exclusively on database design work now

Answer: C

Q713. What is Fitts' law and how does it apply to UI design?

- A. Smaller and distant targets are easier to click, so buttons should be minimized always
- B. Fitts' law only applies to physical devices and has no relevance to digital interfaces
- C. Larger and closer targets are faster to select, influencing button size and placement
- D. Target size has no impact on user interaction speed or accuracy in any interface now

Answer: C

Q714. How does the principle of consistency improve user interfaces?

- A. It makes the interface unpredictable so users must think carefully about every action
- B. It allows users to apply learned behaviors across the interface reducing cognitive load
- C. It forces every page to look completely different from all other pages in the system
- D. It increases the time users need to learn how to navigate and use the application

Answer: B

Q715. What is a design system in the context of UI development?

- A. A single page design template that cannot be customized or reused across the application
- B. A collection of reusable components and guidelines ensuring visual and behavioral consistency
- C. A database management system for storing user interface configuration data and settings
- D. A server monitoring tool for tracking application performance metrics and error rates

Answer: B

Q716. What is the purpose of A/B testing in UI design?

- A. Simultaneously releasing both design variants as permanent features for all users
- B. Testing the application's backend server performance under heavy load conditions
- C. Validating the database schema against the documented requirements specification
- D. Comparing two design variants to determine which performs better with real users

Answer: D

Q717. How does progressive disclosure improve complex user interfaces?

- A. It reveals information gradually, showing only what is needed at each step of interaction
- B. It hides all information permanently and never reveals anything to the user at any time
- C. It displays all possible options and information simultaneously on a single crowded screen
- D. It forces users to read complete documentation before they can interact with the system

Answer: A

Q718. What is the importance of color contrast in UI design?

- A. It ensures text and elements are readable for users including those with visual impairments
- B. High contrast should be avoided because it makes interfaces harder for everyone to read
- C. Color contrast only matters for printed materials and is irrelevant for digital interfaces
- D. It is purely decorative and has no impact on readability or accessibility of the interface

Answer: A

Q719. What is a persona in user-centered design?

- A. A software bot that automatically generates user interface layouts without human input
- B. A legal document defining the terms of service between the company and its end users
- C. A real person hired to test the application before it is released to the general public
- D. A fictional character representing a target user group based on research data analysis

Answer: D

Q720. What is the purpose of user journey mapping in UI design?

- A. To create the database schema for storing all application data and configurations
- B. To write the server-side code for processing API requests from the client side
- C. To configure the deployment pipeline for releasing the application to production
- D. To visualize the complete user experience across all touchpoints and interactions

Answer: D

Q721. What is the difference between compiled and interpreted languages?

- A. Compiled languages run slower than interpreted languages in all performance benchmarks and tests
- B. Compiled languages translate code before execution; interpreted languages translate during execution
- C. Compiled and interpreted languages are identical with no differences in execution approach at all
- D. Interpreted languages cannot be used for building any production-grade software applications

Answer: B

Q722. What is continuous integration (CI) in software development?

- A. Manually combining all code at the end of the project without any automated testing or builds
- B. Writing all source code in a single file to avoid any merge conflicts between team members
- C. Deploying code directly to production without any testing or review processes being performed
- D. Frequently merging code changes into a shared repository with automated build and test validation

Answer: D

Q723. How does pair programming improve code quality?

- A. It reduces code quality because two developers disagree and produce inconsistent solutions
- B. It doubles development speed by having two people type simultaneously on the same keyboard
- C. It eliminates the need for any code reviews since the code is already reviewed during writing
- D. Real-time review catches errors immediately and promotes knowledge sharing between developers

Answer: D

Q724. What is technical debt and how does it affect implementation?

- A. Accumulated shortcuts requiring future rework that slows down development and increases costs
- B. A financial investment made by the company to purchase better development tools and hardware
- C. A type of software license that requires payment for each line of code written in the project
- D. A project management metric measuring the total budget remaining for the development effort

Answer: A

Q725. What is the purpose of unit testing during implementation?

- A. To check the project schedule against the planned milestones and delivery date targets
- B. To test the entire application system from end to end including all integrated components
- C. To validate the user interface design against the approved wireframes and mockup designs
- D. To verify individual code components work correctly in isolation from other system parts

Answer: D

Q726. What is dependency injection and why is it useful?

- A. Providing dependencies externally rather than creating them internally for better testability
- B. Creating all dependencies inside the class constructor to simplify initialization logic now
- C. Injecting database records directly into the application without using any query language
- D. Removing all dependencies from a class so it operates completely independently of others

Answer: A

Q727. What is the purpose of a build automation tool?

- A. To create project management reports showing team productivity and budget utilization data
- B. To manually compile each source code file individually without any automated processes at all
- C. To design user interfaces by automatically generating HTML and CSS from wireframe images
- D. To automate compilation, testing, packaging, and deployment of software applications reliably

Answer: D

Q728. How does static code analysis help during implementation?

- A. It analyzes the application user interface for usability problems and accessibility violations
- B. It replaces the need for any manual code review by automatically fixing all detected issues
- C. It identifies potential bugs, security vulnerabilities, and style violations without running code
- D. It only detects errors that occur during runtime execution of the application in production

Answer: C

Q729. What is the difference between a framework and a library?

- A. Frameworks are always superior to libraries for all software development projects and tasks
- B. Frameworks and libraries are identical concepts with no meaningful differences between them
- C. A framework controls the flow and calls your code; a library is called by your code directly
- D. A library controls application flow; a framework provides utility functions called by code

Answer: C

Q730. What is containerization and how does it benefit implementation?

- A. Packaging applications with dependencies into isolated containers ensuring consistent environments
- B. Running applications directly on the host operating system without any isolation or packaging
- C. Manually configuring each server individually to match the development environment settings
- D. Removing all application dependencies to reduce the size of the deployed software package

Answer: A

Q731. What is the difference between black-box and white-box testing?

- A. Black-box testing is always superior to white-box testing for finding all types of software bugs
- B. Black-box tests functionality without code knowledge; white-box tests with code structure knowledge
- C. Black-box and white-box testing are identical approaches with no meaningful differences at all
- D. Black-box testing examines code structure; white-box testing ignores internal implementation fully

Answer: B

Q732. What is boundary value analysis in software testing?

- A. Avoiding all edge cases and testing only the most common inputs that users are expected to use
- B. Testing only the maximum possible input value and ignoring all other boundary conditions now
- C. Testing at the edges of input ranges where defects are most likely to occur in the software
- D. Testing random values from the middle of input ranges without focusing on any specific values

Answer: C

Q733. What is equivalence partitioning?

- A. Testing every possible input value individually to ensure complete coverage of the system
- B. Randomly selecting test inputs without any systematic approach to input space partitioning
- C. Removing all invalid inputs from the test suite to focus only on valid expected scenarios
- D. Dividing inputs into groups where all values in a group are expected to behave identically

Answer: D

Q734. What is code coverage and why does it matter?

- A. It measures the percentage of code exercised by tests indicating thoroughness of test suite
- B. It counts the total number of lines of code in the project regardless of testing activities
- C. It measures the speed at which the application executes under normal operating conditions
- D. It tracks the number of developers who have reviewed each source code file in the project

Answer: A

Q735. What is mutation testing?

- A. Changing the programming language of the application to improve its overall test coverage
- B. Introducing small changes to code to check if tests can detect the introduced modifications
- C. Modifying the project requirements to make them easier to test with existing test suites
- D. Deleting all test cases and relying on manual testing for all quality assurance activities

Answer: B

Q736. What is performance testing?

- A. Checking the visual design of the user interface against approved wireframes and mockups
- B. Validating that the project schedule aligns with the planned milestones and target dates
- C. Verifying that individual functions return correct results for all valid input combinations
- D. Evaluating system behavior under various load conditions to identify bottlenecks and limits

Answer: D

Q737. What is the purpose of test-driven development (TDD)?

- A. Writing tests before code to drive design and ensure comprehensive test coverage from start
- B. Using test results to determine developer salary bonuses at the end of each project phase
- C. Eliminating all testing activities to focus developer time on feature implementation only
- D. Writing code first and then deciding which tests to write based on the bugs found later

Answer: A

Q738. What is exploratory testing?

- A. Simultaneous test design, execution, and learning without predefined scripts or test cases
- B. Following a strictly predefined test script without any deviation or creativity in approach
- C. Running only automated tests without any human involvement in the testing process at all
- D. Exploring the source code without executing the application to find potential defect areas

Answer: A

Q739. What is the testing pyramid concept?

- A. Only unit tests are needed and integration and end-to-end tests should be completely avoided
- B. More end-to-end tests at the base and fewer unit tests at the top of the testing pyramid
- C. More unit tests at the base, fewer integration tests, and fewest end-to-end tests at the top
- D. Equal numbers of unit, integration, and end-to-end tests at every level of the testing pyramid

Answer: C

Q740. What is the difference between verification and validation in testing?

- A. Verification and validation are identical activities with no differences in their purposes
- B. Verification focuses on user satisfaction; validation focuses on technical correctness only
- C. Verification checks if built correctly; validation checks if the right product was built
- D. Verification is done after deployment; validation is done before development starts only

Answer: C

Q741. What is Lehman's law of increasing complexity?

- A. Software complexity naturally decreases over time without any deliberate effort being made
- B. Software complexity increases with each change unless work is done to reduce it actively
- C. Software complexity remains constant throughout the entire lifetime of the application now
- D. Software complexity is only affected by the initial design and never by later modifications

Answer: B

Q742. How does software aging affect system reliability over time?

- A. Aging has no measurable effect on software reliability because code does not physically degrade
- B. Software reliability improves automatically as hardware becomes faster and more powerful now
- C. Software always becomes more reliable over time as more bugs are found and fixed in system
- D. Accumulated changes and environmental drift gradually degrade system reliability and performance

Answer: D

Q743. What is the difference between re-engineering and reverse engineering?

- A. Re-engineering recovers design knowledge; reverse engineering restructures for improvements now
- B. Reverse engineering and re-engineering are identical processes with no differences between them
- C. Reverse engineering adds new features; re-engineering only fixes bugs in the existing codebase
- D. Reverse engineering recovers design; re-engineering restructures the system for improvement work

Answer: D

Q744. What is the impact of code smells on software maintenance effort?

- A. Code smells always improve code quality by making the codebase more interesting to read now
- B. Code smells indicate design problems that increase maintenance difficulty and defect likelihood
- C. Code smells have no impact on maintenance because they do not represent actual defects today
- D. Code smells are only cosmetic issues that never affect functionality or maintenance costs

Answer: B

Q745. How does modular design facilitate software maintenance?

- A. Modular design makes maintenance harder because changes must be applied to every module now
- B. Modular design has no relationship to maintenance effort or quality of the maintenance work
- C. Modules prevent any changes from being made to the software after initial deployment to users
- D. Changes can be isolated to specific modules without affecting the rest of the system at all

Answer: D

Q746. What is the ripple effect in software maintenance?

- A. A technique for efficiently propagating beneficial changes across all system modules quickly
- B. A design pattern that ensures changes in one module are automatically applied everywhere now
- C. Changes in one part of the system causing unintended effects in seemingly unrelated parts
- D. A method for testing software by sending signals through all connected components sequentially

Answer: C

Q747. What is program comprehension and why is it critical for maintenance?

- A. Understanding existing code is essential for making correct modifications without introducing bugs
- B. Program comprehension is unnecessary because maintainers can change code without understanding it
- C. Program comprehension only matters for documentation purposes and not for actual code changes
- D. Understanding code is only important during initial development and never during maintenance work

Answer: A

Q748. What role does impact analysis play in software maintenance?

- A. It identifies all system areas affected by a proposed change before implementation begins now
- B. It only identifies positive impacts and ignores any negative consequences of proposed changes
- C. It is only performed after changes are deployed to assess the damage caused by the change
- D. It has no role in maintenance because changes can be made without considering their effects

Answer: A

Q749. How does automated testing support software maintenance activities?

- A. It eliminates the need for any human involvement in the maintenance decision-making process
- B. It replaces all maintenance activities including code modification and deployment processes
- C. It quickly validates that changes have not broken existing functionality through regression tests
- D. It automatically fixes all bugs found during testing without any developer intervention needed

Answer: C

Q750. What is software rejuvenation?

- A. Adding cosmetic visual updates to the user interface without any functional changes at all
- B. Permanently retiring software and replacing it with an entirely new system from scratch now
- C. Periodically restarting or refreshing software to counteract performance degradation over time
- D. Increasing the hardware resources allocated to the software without changing any code at all

Answer: C

Q751. What is the CMMI (Capability Maturity Model Integration)?

- A. A hardware testing tool for measuring processor speed and memory performance now
- B. A database management system used exclusively for storing quality audit records
- C. A specific programming language designed for building quality management applications
- D. A framework for assessing and improving organizational process maturity and capability

Answer: D

Q752. What are the five maturity levels in CMMI?

- A. Requirements, Design, Implementation, Testing, and Deployment of system products
- B. Planning, Coding, Testing, Deploying, and Maintaining software applications now
- C. Beginning, Intermediate, Advanced, Expert, and Master skill certification levels
- D. Initial, Managed, Defined, Quantitatively Managed, and Optimizing across all processes

Answer: D

Q753. How does statistical process control apply to software quality assurance?

- A. It has no application to software because software processes cannot be measured now
- B. It only applies to manufacturing processes and is irrelevant to software development
- C. It uses statistical methods to monitor and control process performance and variation
- D. It replaces all testing activities with purely statistical models of defect prediction

Answer: C

Q754. What is the cost of quality (CoQ) model?

- A. A pricing strategy for selling software products to customers at premium prices now
- B. A budget allocation method assigning equal funding to all project activities always
- C. A salary structure for paying quality assurance engineers based on defects found
- D. A model categorizing quality costs into prevention, appraisal, and failure categories

Answer: D

Q755. How do formal technical reviews improve software quality?

- A. They replace all automated testing by manually verifying every line of source code now
- B. They systematically examine work products to find defects before they propagate further
- C. They only focus on coding style and have no impact on finding functional defect issues
- D. They are informal conversations without structure that rarely produce useful findings

Answer: B

Q756. What is the relationship between process quality and product quality?

- A. Poor processes always produce high-quality products because developers compensate fully
- B. Good processes increase the likelihood of producing good products consistently over time
- C. Process quality has no correlation with product quality in software engineering at all
- D. Product quality depends solely on individual developer skill and not on process at all

Answer: B

Q757. What is a quality gate in the development process?

- A. A software tool that automatically generates test cases from requirements documents
- B. A checkpoint where quality criteria must be met before proceeding to the next phase
- C. A physical entrance to the quality assurance department office in the building now
- D. A coding standard that restricts the number of lines per function in source code

Answer: B

Q758. How does root cause analysis improve quality assurance?

- A. It identifies underlying causes of defects to prevent similar issues from recurring again
- B. It has no practical application in software quality assurance or defect prevention work
- C. It replaces all testing activities by predicting where defects will occur in source code
- D. It only identifies surface-level symptoms without investigating the deeper reasons for them

Answer: A

Q759. What is the difference between verification and validation in QA?

- A. Verification only applies to code; validation only applies to documentation artifacts
- B. Verification ensures correct construction; validation ensures the right product is built
- C. Verification and validation are identical activities performed at the same project stage
- D. Verification is done by users; validation is done by developers during the development

Answer: B

Q760. What is a software quality assurance plan (SQAP)?

- A. A document defining quality activities, standards, and procedures for a project effort
- B. A hardware procurement list for purchasing testing equipment and tools for the lab
- C. A project schedule showing only the testing phase timeline without any other phases
- D. A source code file containing automated tests for the application being developed now

Answer: A

Q761. How is function point analysis different from LOC as a size metric?

- A. Function points measure functionality delivered; LOC measures physical source code volume size
- B. LOC is technology-independent while function points depend on the programming language used
- C. Function points are less accurate than LOC because they ignore the actual code implementation
- D. Function points and LOC always produce identical size measurements for any given software system

Answer: A

Q762. What is the Halstead complexity metric based on?

- A. The number of operators and operands in the source code of the program being measured today
- B. The number of developers who have contributed to the source code repository over project life
- C. The amount of time required to execute the software on a standard hardware configuration now
- D. The physical size of the compiled executable file measured in megabytes of storage space used

Answer: A

Q763. What is the difference between leading and lagging metrics?

- A. Lagging metrics predict future outcomes; leading metrics only describe what happened previously
- B. Leading and lagging metrics are identical concepts measuring the same things at the same time
- C. Leading metrics predict future outcomes; lagging metrics report on past results already achieved
- D. Leading metrics are less useful than lagging metrics because predictions are always inaccurate

Answer: C

Q764. How does the Goal-Question-Metric (GQM) approach structure measurement programs?

- A. It starts by collecting all possible metrics and then determines if any goals can be derived
- B. It defines goals first, then questions to assess goals, then metrics to answer those questions
- C. It requires implementing all metrics simultaneously before defining any organizational goals
- D. It randomly selects metrics without any connection to organizational goals or questions asked

Answer: B

Q765. What is coupling metrics and how does it relate to maintainability?

- A. Coupling can only be measured for object-oriented systems and not for any other paradigms
- B. Higher coupling always improves maintainability because modules share more common knowledge
- C. Coupling metrics have no relationship with software maintainability or quality in any context
- D. Coupling metrics measure interdependence between modules; higher coupling reduces maintainability

Answer: D

Q766. What is the purpose of software reliability metrics?

- A. To track the number of meetings held by the development team during the project timeline
- B. To measure the visual attractiveness of the user interface design and layout of the system
- C. To count the number of programming languages used in the software project source code now
- D. To quantify the probability of failure-free operation over a specified time period and context

Answer: D

Q767. How does maintainability index combine multiple metrics?

- A. It combines cyclomatic complexity, LOC, and Halstead volume into a single composite score value
- B. It measures only the number of comments in code as the sole indicator of maintainability level
- C. It only uses lines of code without considering any other metrics for maintainability assessment
- D. It counts the number of developers who can understand the code without any other measurements

Answer: A

Q768. What is the difference between objective and subjective software metrics?

- A. Subjective metrics can be fully automated while objective metrics always require human judgment
- B. Objective and subjective metrics are identical and always produce the same measurement results
- C. Objective metrics are less accurate than subjective metrics in all measurement scenarios today
- D. Objective metrics are directly measurable; subjective metrics require human judgment and opinion

Answer: D

Q769. What is technical debt measurement and how can it be quantified?

- A. Technical debt cannot be measured or quantified in any meaningful way using any known methods
- B. Technical debt measurement counts the number of developers who have left the project team
- C. It only measures the financial debt of the company and has no relation to software quality now
- D. It estimates the cost of fixing shortcuts and workarounds accumulated in the codebase over time

Answer: D

Q770. How do dashboard metrics help project managers make decisions?

- A. They automatically make all project decisions without requiring any human judgment or input
- B. They only display historical data and cannot help with current or future decision making work
- C. They replace the need for any communication between project managers and development teams
- D. They provide real-time visibility into project health enabling data-driven decision making today

Answer: D

Q771. What is the difference between centralized and distributed version control?

- A. Centralized systems are always superior to distributed systems for all development scenarios now
- B. Distributed systems require a constant network connection while centralized systems do not need
- C. Centralized uses one server repository; distributed gives each developer a full local repository
- D. Centralized and distributed version control systems are identical in architecture and capability

Answer: C

Q772. What is a merge conflict and how is it resolved?

- A. Merge conflicts only happen in centralized systems and never in distributed version control
- B. It occurs when changes overlap and requires manual resolution by choosing the correct changes
- C. Merge conflicts never occur in modern version control systems due to advanced automation today
- D. Conflicts are always resolved automatically without any human intervention being required now

Answer: B

Q773. What is continuous delivery (CD) in configuration management?

- A. Manually deploying software to production once every year during the scheduled maintenance window
- B. Automating the release process so software can be deployed to production at any time reliably
- C. Delivering hardware components continuously to the data center for server infrastructure setup
- D. Preventing any changes from reaching production until all features are completely implemented

Answer: B

Q774. What is the purpose of tagging in version control?

- A. Labeling hardware components in the server rack for identification during maintenance periods
- B. Assigning developers to specific tasks using labels in the project management tracking system
- C. Adding metadata to database records for improved search and retrieval performance in queries
- D. Marking specific points in the repository history as important like releases or milestones now

Answer: D

Q775. How does GitFlow branching strategy organize development work?

- A. It uses feature, develop, release, and hotfix branches with defined merge workflows for teams
- B. It creates a new repository for each feature instead of using branches within one repository
- C. It uses a single branch for all development without any branching or merging strategies now
- D. It prohibits branching entirely and requires all developers to commit directly to the main line

Answer: A

Q776. What is the role of build automation in configuration management?

- A. It eliminates the need for any testing by guaranteeing that automated builds are always correct
- B. It only manages the visual design of the user interface without any involvement in code builds
- C. It ensures consistent, repeatable builds by automating compilation, testing, and packaging steps
- D. It replaces version control by automatically generating source code from requirements documents

Answer: C

Q777. What is a configuration audit?

- A. A performance test measuring the application response time under peak load conditions only now
- B. A code review focused exclusively on the visual appearance of the user interface elements now
- C. A financial audit of the project budget to ensure money is being spent according to the plan
- D. A review verifying that configuration items conform to their documented specifications and records

Answer: D

Q778. What is trunk-based development?

- A. All development occurs in release branches without any central trunk or main branch at all now
- B. Developers never commit code and instead share changes through email attachments exclusively
- C. All developers commit to a single main branch with short-lived feature branches if needed now
- D. Each developer maintains their own permanent long-lived branch that is never merged with others

Answer: C

Q779. How does semantic versioning (SemVer) communicate change significance?

- A. All version numbers are randomly assigned without any meaning related to the type of changes
- B. Only the major version number is meaningful while minor and patch numbers are decorative only
- C. Semantic versioning uses alphabetical labels instead of numbers to indicate version differences
- D. Major version for breaking changes, minor for features, and patch for bug fixes are indicated

Answer: D

Q780. What is the purpose of a deployment pipeline?

- A. To design the user interface mockups that will be implemented by the development team later
- B. To generate project management reports for stakeholder review at monthly status update meetings
- C. To manually review every line of code before it is committed to the version control repository
- D. To automate and validate the stages between code commit and production deployment reliably

Answer: D

Q781. How is a risk exposure value calculated?

- A. By adding the total project budget to the number of team members assigned
- B. By multiplying the probability of occurrence by the estimated impact value
- C. By subtracting the actual cost from the planned budget at each milestone
- D. By dividing the number of defects found by the total lines of code written

Answer: B

Q782. What is the difference between risk transfer and risk avoidance?

- A. Transfer shifts risk to another party; avoidance eliminates the risk from the project entirely
- B. Transfer and avoidance are identical strategies with no differences in their approaches at all
- C. Neither transfer nor avoidance has any effect on the actual risk profile of the project work
- D. Transfer eliminates risks completely; avoidance shifts them to another responsible party now

Answer: A

Q783. What is a risk-driven development approach?

- A. Prioritizing development activities based on the highest identified risk areas in the project
- B. Using risk management only during the final testing phase and not during development work
- C. Ignoring all risks and developing features in random order without any priority criteria now
- D. Developing only low-risk features and permanently deferring all high-risk items from scope

Answer: A

Q784. How does the Boehm risk management model categorize project risks?

- A. Into top ten risk items that are continuously tracked and mitigated throughout the project
- B. Into risks that only affect the schedule and risks that only affect the budget separately
- C. Into a single list of risks that is created once and never updated during the project life
- D. Into exactly two categories of risks that are either accepted or completely eliminated now

Answer: A

Q785. What is sensitivity analysis in risk management?

- A. Measuring the emotional response of team members to project deadlines and pressure levels
- B. Determining which risks have the greatest potential impact on project outcomes and results
- C. Testing the application's response time under varying network latency and bandwidth levels
- D. Evaluating the sensitivity of hardware components to environmental conditions in data center

Answer: B

Q786. What is the purpose of risk monitoring and control?

- A. Creating the initial risk register at the beginning of the project and never updating it again
- B. Focusing exclusively on positive risks and ignoring all negative risk events in the project
- C. Tracking identified risks, detecting new risks, and evaluating risk response effectiveness now
- D. Eliminating all monitoring activities to reduce overhead and speed up project delivery today

Answer: C

Q787. How do qualitative and quantitative risk analysis differ?

- A. Quantitative analysis does not use any numerical values and relies solely on expert opinion
- B. Qualitative and quantitative analysis produce identical results using the same methods always
- C. Qualitative assesses risks subjectively by category; quantitative assigns numerical probabilities
- D. Qualitative analysis is always more accurate than quantitative analysis in every situation now

Answer: C

Q788. What is a risk response strategy?

- A. A technique for ignoring risks to maintain team morale and project momentum during development
- B. A financial strategy for investing project savings into high-risk stock market opportunities
- C. A planned approach for addressing identified risks through avoidance, mitigation, or transfer
- D. A reactive action taken only after a risk has already materialized and caused project damage

Answer: C

Q789. What is the role of risk communication in project management?

- A. Ensuring all stakeholders are informed about risks and their management throughout the project
- B. Delegating all risk communication to the most junior team member without any oversight given
- C. Communicating only positive project news and avoiding any mention of potential risk events now
- D. Hiding risk information from stakeholders to prevent unnecessary worry about project outcomes

Answer: A

Q790. What is a risk breakdown structure (RBS)?

- A. A technique for splitting the project budget into smaller allocations for each team member
- B. A method for breaking down source code into smaller functions for better risk assessment work
- C. A physical diagram showing the location of server hardware in the data center for risk review
- D. A hierarchical categorization of project risks organized by source and type for clarity now

Answer: D

Q791. What is SQL injection and how can it be prevented?

- A. An approved method for administrators to directly modify production database records quickly
- B. A database optimization technique that improves query performance through code injection method
- C. A testing technique where SQL queries are injected into the test suite for validation work
- D. Inserting malicious SQL through user inputs; prevented by parameterized queries and validation

Answer: D

Q792. What is cross-site scripting (XSS) vulnerability?

- A. A method for testing website compatibility across different web browsers and platforms now
- B. A programming pattern for organizing JavaScript code across multiple source code files today
- C. Injecting malicious scripts into web pages that execute in other users' browsers unexpectedly
- D. A legitimate technique for sharing scripts between different websites for code reuse purposes

Answer: C

Q793. What is the OWASP Top Ten?

- A. A ranking of the ten best programming languages for building secure web applications now
- B. A certification program for security engineers with ten levels of professional expertise
- C. A list of the most critical web application security risks updated periodically by experts
- D. A collection of ten design patterns used exclusively for building user interface components

Answer: C

Q794. What is defense in depth as a security strategy?

- A. Removing all security controls to simplify the application architecture and reduce costs
- B. Implementing security only at the network perimeter without any application-level controls
- C. Relying on a single strong security control to protect all application assets and data now
- D. Using multiple layers of security controls so that if one layer fails others still protect

Answer: D

Q795. What is the purpose of threat modeling?

- A. Creating mathematical models of the project schedule to predict the delivery date precisely
- B. Designing the database schema using entity-relationship diagrams for data storage planning
- C. Modeling the visual appearance of the application user interface in three-dimensional space
- D. Systematically identifying potential threats and vulnerabilities in the system architecture now

Answer: D

Q796. What is secure coding practice?

- A. Writing code as fast as possible without considering any security implications or standards
- B. Writing code that follows security guidelines to prevent common vulnerabilities and exploits
- C. Avoiding all input validation to improve the user experience and reduce form friction now
- D. Using only deprecated libraries because they have been tested longer than newer versions

Answer: B

Q797. What is the role of penetration testing in security engineering?

- A. Replacing all other security measures because penetration testing finds every possible issue
- B. Evaluating the visual design of the user interface for compliance with branding guidelines
- C. Simulating real-world attacks to identify exploitable vulnerabilities before attackers find them
- D. Testing the application performance under heavy network traffic load conditions and stress

Answer: C

Q798. What is a security token used for?

- A. Storing application source code in an encrypted format within the version control system
- B. Designing the database schema with proper normalization and referential integrity rules
- C. Providing a secure method for authenticating and authorizing user sessions and API access
- D. Measuring the performance of the application under concurrent user load conditions now

Answer: C

Q799. What is the difference between symmetric and asymmetric encryption?

- A. There is no difference between symmetric and asymmetric encryption in practice or theory now
- B. Symmetric encryption is always stronger than asymmetric encryption in every possible scenario
- C. Asymmetric encryption uses one shared key; symmetric encryption uses a public-private key pair
- D. Symmetric uses one shared key for both operations; asymmetric uses a public and private key pair

Answer: D

Q800. What is input validation and why is it critical for security?

- A. Input validation is a visual design concern that has no relationship to application security
- B. Input validation slows down the application and should be avoided for performance reasons now
- C. Checking user inputs against expected formats to prevent injection attacks and data corruption
- D. It only applies to database inputs and is not needed for any other type of user interaction

Answer: C

Q801. What is the key difference between software engineering and system engineering?

- A. System engineering only deals with hardware
- B. Software engineering focuses on software; system engineering covers the entire socio-technical system
- C. They are the same discipline
- D. System engineering is a subset of software engineering

Answer: B

Q802. What is the purpose of a software engineering code of ethics?

- A. To enforce programming standards
- B. To guide professional behavior and responsibility toward society
- C. To define coding syntax rules
- D. To set salary standards for engineers

Answer: B

Q803. Which type of software application involves processing large volumes of business data?

- A. Embedded software
- B. System software
- C. Business application software
- D. Real-time software

Answer: C

Q804. What does software evolution refer to?

- A. Rewriting software from scratch
- B. The process of changing software after delivery to correct faults or improve performance
- C. Installing new software
- D. The initial development phase

Answer: B

Q805. Which challenge is specific to web-based software engineering?

- A. Lack of programming languages
- B. Need for scalability, security, and rapid deployment
- C. Inability to use databases
- D. No need for user interfaces

Answer: B

Q806. What is the significance of the NATO Software Engineering Conference of 1968?

- A. It introduced the Java programming language
- B. It formally recognized software engineering as a discipline
- C. It created the internet
- D. It established the first software company

Answer: B

Q807. What is meant by software reuse?

- A. Recycling old hardware
- B. Using existing software components to build new systems
- C. Copying code without permission
- D. Reinstalling software on a different machine

Answer: B

Q808. What is emergent system property?

- A. A property visible in source code
- B. A property that arises from the interaction of system components and cannot be attributed to any single component
- C. A bug that appears randomly
- D. A feature added after release

Answer: B

Q809. Which factor has the MOST influence on software project failure?

- A. Using the wrong programming language
- B. Poor requirements management
- C. Using too many monitors
- D. Team members being in the same office

Answer: B

Q810. What is the relationship between software engineering and computer science?

- A. They are identical fields
- B. Computer science provides theoretical foundations; software engineering applies them practically
- C. Computer science is a branch of software engineering
- D. They have no relationship

Answer: B

Q811. How does the V-model differ from the traditional Waterfall model?

- A. The V-model has no testing phase
- B. The V-model explicitly associates each development phase with a corresponding testing phase
- C. The V-model eliminates design
- D. They are exactly the same

Answer: B

Q812. What is the primary risk addressed by the Spiral model?

- A. Lack of programmers
- B. Project risks identified through repeated risk analysis in each spiral iteration
- C. Poor internet connectivity
- D. Office space constraints

Answer: B

Q813. What is evolutionary prototyping?

- A. A prototype that is immediately discarded
- B. A prototype that is incrementally refined and evolves into the final system
- C. A testing technique
- D. A documentation method

Answer: B

Q814. In RAD (Rapid Application Development), what enables faster development?

- A. Skipping all testing
- B. Using component-based construction and automated tools with intensive user involvement
- C. Writing code without design
- D. Eliminating documentation entirely

Answer: B

Q815. What is the key disadvantage of the Waterfall model?

- A. It is too fast
- B. Difficulty accommodating changes after a phase is complete
- C. It requires no documentation
- D. It has too many iterations

Answer: B

Q816. What is a timeboxed iteration?

- A. An iteration with no deadline
- B. An iteration with a fixed, predetermined duration that cannot be extended
- C. An iteration that lasts forever
- D. A phase that only runs at night

Answer: B

Q817. How does the incremental model handle changing requirements?

- A. It cannot handle changes
- B. Later increments can incorporate new or changed requirements without affecting delivered increments
- C. It restarts from scratch
- D. It ignores changes completely

Answer: B

Q818. What is a process framework in software engineering?

- A. A programming library
- B. A foundation that defines the activities, actions, and tasks for a complete software process
- C. A testing tool
- D. A type of database

Answer: B

Q819. What is the primary advantage of using the Spiral model?

- A. It is the simplest model
- B. It combines iterative development with systematic risk management
- C. It never requires customer involvement
- D. It eliminates all project risks

Answer: B

Q820. What distinguishes a prescriptive process model from an adaptive one?

- A. Prescriptive models have no defined steps
- B. Prescriptive models define a specific set of activities in a defined order; adaptive models allow flexibility
- C. Adaptive models never deliver software
- D. There is no difference

Answer: B

Q821. What is the concept of 'velocity' in Agile?

- A. How fast the team types
- B. The amount of work a team can complete in one iteration, measured in story points or similar units
- C. The speed of the internet connection
- D. The number of meetings per week

Answer: B

Q822. What is pair programming in Extreme Programming (XP)?

- A. Two teams working on separate projects
- B. Two developers working together at one workstation, one writing code and the other reviewing in real time
- C. Two developers in different countries
- D. A code review done after deployment

Answer: B

Q823. What is the purpose of Sprint Planning in Scrum?

- A. To assign blame for past failures
- B. To select items from the Product Backlog and define the work plan for the upcoming Sprint
- C. To write the final project report
- D. To conduct user acceptance testing

Answer: B

Q824. What is a Kanban board used for in Agile?

- A. Drawing architectural diagrams
- B. Visualizing work in progress by showing tasks moving through workflow stages
- C. Tracking employee vacation days
- D. Managing email

Answer: B

Q825. What is continuous refactoring in Agile?

- A. Rewriting the entire system regularly
- B. Ongoing improvement of code structure and design without changing its external behavior
- C. Continuously adding new features
- D. Removing features from the product

Answer: B

Q826. What is the role of the Scrum Master during a Sprint?

- A. Assigning tasks to developers
- B. Facilitating the Scrum process, removing impediments, and shielding the team from external distractions
- C. Writing code exclusively
- D. Approving the final product

Answer: B

Q827. What is an epic in Agile?

- A. A very short user story
- B. A large body of work that can be broken down into smaller user stories
- C. A type of software bug
- D. A deployment milestone

Answer: B

Q828. What is the purpose of a Sprint Backlog?

- A. To list all company projects
- B. To contain the selected Product Backlog items and the plan for delivering them during the Sprint
- C. To track customer complaints
- D. To record team vacation schedules

Answer: B

Q829. What is the MoSCoW prioritization technique?

- A. A Russian programming method
- B. A method categorizing requirements as Must have, Should have, Could have, and Won't have
- C. A testing framework
- D. A deployment strategy

Answer: B

Q830. What is a use case scenario?

- A. A test case for unit testing
- B. A specific sequence of interactions between an actor and the system to achieve a particular goal
- C. A deployment plan
- D. A database schema

Answer: B

Q831. What is the purpose of a requirements traceability matrix?

- A. To trace network packets
- B. To map each requirement to its source, design elements, and test cases
- C. To track employee attendance
- D. To monitor server uptime

Answer: B

Q832. What is requirements ambiguity?

- A. Requirements that are too detailed
- B. Requirements that can be interpreted in more than one way
- C. Requirements that are too short
- D. Requirements written in code

Answer: B

Q833. What is the difference between data flow diagrams (DFDs) and use case diagrams?

- A. They are identical
- B. DFDs show how data moves through the system; use case diagrams show interactions between users and system functions
- C. DFDs are only for databases
- D. Use case diagrams show data flows

Answer: B

Q834. What is a JAD (Joint Application Development) session?

- A. A solo programming activity
- B. A facilitated workshop bringing stakeholders and developers together to define requirements collaboratively
- C. A hardware testing procedure
- D. A deployment meeting

Answer: B

Q835. What is the role of a domain model in requirements engineering?

- A. To model database tables
- B. To represent key concepts, relationships, and rules of the problem domain to facilitate shared understanding
- C. To model network topology
- D. To design user interfaces

Answer: B

Q836. What is the difference between structured and unstructured requirements interviews?

- A. There is no difference
- B. Structured interviews follow a predefined set of questions; unstructured interviews allow open-ended exploration
- C. Structured interviews have no questions prepared
- D. Unstructured interviews use questionnaires

Answer: B

Q837. What is the difference between top-down and bottom-up estimation?

- A. They produce identical results
- B. Top-down estimates the whole project then breaks it down; bottom-up estimates individual tasks then aggregates them
- C. Top-down is always more accurate
- D. Bottom-up ignores individual tasks

Answer: B

Q838. What is Brooks' Law?

- A. Adding more programmers always helps
- B. Adding manpower to a late software project makes it later due to communication overhead and ramp-up time
- C. Projects always finish on time
- D. Larger teams produce fewer bugs

Answer: B

Q839. What is the purpose of a Work Breakdown Structure (WBS)?

- A. To break down the team hierarchy
- B. To decompose the project into smaller, manageable work packages that can be estimated and tracked
- C. To break software into functions
- D. To break hardware into components

Answer: B

Q840. What is analogous estimation?

- A. Estimating by writing code first
- B. Using data from similar past projects to estimate the current project's effort and cost
- C. Random guessing
- D. Estimating based on lines of code only

Answer: B

Q841. What is project tracking and control?

- A. Tracking employee locations
- B. Monitoring project progress against the plan and taking corrective action when deviations occur
- C. Controlling access to the server room
- D. Tracking software downloads

Answer: B

Q842. What is the difference between a Gantt chart and a PERT chart?

- A. They are identical
- B. A Gantt chart shows tasks as horizontal bars on a timeline; a PERT chart shows task dependencies as a network diagram
- C. Gantt charts show only costs
- D. PERT charts cannot show time

Answer: B

Q843. What is the concept of 'slack time' in project scheduling?

- A. Time spent not working
- B. The amount of time an activity can be delayed without delaying the overall project completion date
- C. Time reserved for meetings
- D. Break time for developers

Answer: B

Q844. What is the difference between composition and inheritance in OO design?

- A. They are the same concept
- B. Inheritance creates an 'is-a' relationship; composition creates a 'has-a' relationship by containing objects
- C. Composition is always worse
- D. Inheritance is never used

Answer: B

Q845. What is the Template Method design pattern?

- A. A template for writing documentation
- B. A pattern that defines the skeleton of an algorithm in a superclass, deferring specific steps to subclasses
- C. A method for creating templates
- D. A UI design template

Answer: B

Q846. What is the difference between functional and object-oriented decomposition?

- A. They are identical approaches
- B. Functional decomposition breaks the system into functions; OO decomposition breaks it into objects that encapsulate data and behavior
- C. Functional decomposition is always better
- D. OO decomposition ignores data

Answer: B

Q847. What is the State design pattern?

- A. A pattern for managing US states
- B. A pattern that allows an object to alter its behavior when its internal state changes, appearing to change its class
- C. A pattern for database state management
- D. A pattern for version control

Answer: B

Q848. What is the difference between data-centered and data-flow architecture in design?

- A. They are the same
- B. Data-centered architecture has a central repository accessed by components; data-flow architecture processes data through a sequence of transformations
- C. Data-centered ignores data
- D. Data-flow never processes data

Answer: B

Q849. What is the Proxy design pattern?

- A. A network proxy server
- B. A pattern that provides a surrogate or placeholder for another object to control access to it
- C. A debugging tool
- D. A testing framework

Answer: B

Q850. What is the difference between horizontal and vertical scaling?

- A. They are the same
- B. Horizontal scaling adds more machines; vertical scaling adds more power (CPU, RAM) to existing machines
- C. Horizontal scaling reduces capacity
- D. Vertical scaling always requires new hardware

Answer: B

Q851. What is a message queue in distributed architecture?

- A. A queue for email messages
- B. An asynchronous communication mechanism that stores messages until the receiving component is ready to process them
- C. A task assignment queue
- D. A debugging tool

Answer: B

Q852. What is the Model-View-Controller (MVC) pattern?

- A. A version control model
- B. An architectural pattern that separates an application into Model (data), View (UI), and Controller (input handling)
- C. A testing methodology
- D. A project management framework

Answer: B

Q853. What is an API gateway in microservices architecture?

- A. A physical network gateway
- B. A single entry point that routes client requests to appropriate microservices and handles cross-cutting concerns
- C. A database connector
- D. A code compiler

Answer: B

Q854. What is the difference between SOA and microservices architecture?

- A. They are identical
- B. SOA uses an enterprise service bus and shares data models; microservices use lightweight protocols and each service owns its data
- C. SOA is always better
- D. Microservices never use APIs

Answer: B

Q855. What is a load balancer in software architecture?

- A. A device that weighs servers
- B. A component that distributes incoming network traffic across multiple servers to ensure no single server is overwhelmed
- C. A code optimization tool
- D. A testing utility

Answer: B

Q856. What is a service mesh in microservices?

- A. A physical network mesh
- B. A dedicated infrastructure layer that handles service-to-service communication, including load balancing, encryption, and observability
- C. A type of database
- D. A code generation tool

Answer: B

Q857. What is a containerized architecture?

- A. An architecture stored in shipping containers
- B. An approach where applications are packaged with their dependencies in lightweight containers for consistent deployment across environments
- C. An architecture using physical boxes
- D. A hardware architecture

Answer: B

Q858. What is the difference between a persona and a user profile?

- A. They are the same thing
- B. A persona is a fictional representative character based on research; a user profile is actual data about a specific user
- C. Personas are always inaccurate
- D. User profiles are fictional

Answer: B

Q859. What is the principle of consistency in UI design?

- A. Changing the UI frequently
- B. Using the same design patterns, terminology, and interactions throughout the interface so users can predict behavior
- C. Making each page look different
- D. Randomizing button positions

Answer: B

Q860. What is an A/B test in UI design?

- A. A test with only two answers
- B. A method of comparing two versions of a UI element to determine which performs better based on user metrics
- C. A binary code test
- D. An accessibility test

Answer: B

Q861. What is a card sorting exercise used for?

- A. Sorting playing cards
- B. A user research method where participants organize content into categories to inform information architecture
- C. Sorting database records
- D. Organizing code files

Answer: B

Q862. What is the difference between accessibility and usability?

- A. They are identical
- B. Accessibility ensures the interface is usable by people with disabilities; usability measures how easy and efficient the interface is for all users
- C. Accessibility is optional
- D. Usability is only about speed

Answer: B

Q863. What is the purpose of breadcrumb navigation?

- A. Tracking user cookies
- B. Showing users their current location within the site hierarchy and allowing easy navigation to parent pages
- C. Displaying error logs
- D. Managing user sessions

Answer: B

Q864. What is progressive disclosure in UI design?

- A. Gradually revealing source code
- B. Showing only essential information initially and revealing additional details as the user needs them
- C. Disclosing security vulnerabilities
- D. A type of animation effect

Answer: B

Q865. What are Nielsen's error prevention heuristics about?

- A. Preventing hardware errors
- B. Designing interfaces that prevent errors from occurring in the first place, such as confirmation dialogs and input validation
- C. Preventing network outages
- D. Preventing code compilation errors

Answer: B

Q866. What is code coverage and why is it important?

- A. The number of files in a project
- B. A metric measuring the percentage of code executed during testing, indicating how thoroughly the code is tested
- C. How many developers work on the code
- D. The number of code comments

Answer: B

Q867. What is the difference between static and dynamic code analysis?

- A. They are identical
- B. Static analysis examines code without executing it; dynamic analysis examines code behavior during execution
- C. Static analysis is always slower
- D. Dynamic analysis does not require running the code

Answer: B

Q868. What is dependency injection?

- A. Injecting malicious code
- B. A technique where an object receives its dependencies from external sources rather than creating them internally
- C. Adding new library imports
- D. A database insertion technique

Answer: B

Q869. What is a code smell?

- A. Physical odor from a computer
- B. A surface indication in code that suggests a deeper design problem requiring refactoring
- C. A compilation error
- D. A runtime crash

Answer: B

Q870. What is a linter in software development?

- A. A piece of clothing fabric
- B. A tool that analyzes source code to flag programming errors, bugs, stylistic issues, and suspicious constructs
- C. A compiler optimization
- D. A deployment tool

Answer: B

Q871. What is the YAGNI principle?

- A. You Are Going to Need It
- B. You Aren't Gonna Need It: do not implement functionality until it is actually needed
- C. Yet Another Great New Innovation
- D. Your Application Gets New Issues

Answer: B

Q872. What is technical debt?

- A. Money owed for software licenses
- B. The implied cost of future rework caused by choosing a quick solution now instead of a better approach that would take longer
- C. The cost of hardware
- D. Unpaid developer salaries

Answer: B

Q873. What is a code review and why is it important?

- A. Reviewing the project budget
- B. A systematic examination of source code by peers to identify defects, improve quality, and share knowledge
- C. A customer feedback session
- D. A marketing review

Answer: B

Q874. What is the difference between top-down and bottom-up integration testing?

- A. They are identical approaches
- B. Top-down tests from the main module downward using stubs; bottom-up tests from the lowest modules upward using drivers
- C. Top-down is always better
- D. Bottom-up never requires drivers

Answer: B

Q875. What is statement coverage in testing?

- A. Coverage of requirement statements
- B. A metric measuring the percentage of executable code statements that have been exercised by test cases
- C. The number of comment lines tested
- D. Coverage of variable declarations

Answer: B

Q876. What is branch coverage and how does it differ from statement coverage?

- A. They are the same metric
- B. Branch coverage ensures every branch of every decision point is executed, providing stronger coverage than statement coverage alone
- C. Branch coverage is weaker than statement coverage
- D. Branch coverage only applies to switch statements

Answer: B

Q877. What is the purpose of a test harness?

- A. A horse harness for testing
- B. A framework that provides the infrastructure for automating test execution, including drivers, stubs, and result reporting
- C. A physical testing device
- D. A documentation tool

Answer: B

Q878. What is the difference between smoke testing and sanity testing?

- A. They are the same thing
- B. Smoke testing verifies that critical functions work after a build; sanity testing verifies specific functionality after a minor change
- C. Smoke testing uses fire
- D. Sanity testing tests mental health

Answer: B

Q879. What is the purpose of a test stub?

- A. A ticket stub for testing events
- B. A simplified implementation of a component that a module under test depends on, providing predefined responses
- C. A type of test case
- D. A testing report

Answer: B

Q880. What is the concept of 'test automation'?

- A. Robots performing manual testing
- B. Using software tools and scripts to execute tests automatically, compare results, and report outcomes
- C. Automating the hiring of testers
- D. Automatically generating code

Answer: B

Q881. What is the difference between load testing and stress testing?

- A. They are identical
- B. Load testing measures performance under expected conditions; stress testing pushes the system beyond normal capacity to find its breaking point
- C. Load testing is easier
- D. Stress testing is always done first

Answer: B

Q882. What is impact analysis in software maintenance?

- A. Analyzing the impact of a meteor
- B. Evaluating the consequences of a proposed change on the rest of the system to identify affected components and potential risks
- C. Analyzing market impact
- D. Analyzing team morale

Answer: B

Q883. What is program comprehension in maintenance?

- A. Understanding a TV program
- B. The process by which maintainers understand the existing code's structure, behavior, and intent before making modifications
- C. A reading comprehension test
- D. Understanding user requirements

Answer: B

Q884. What is software migration?

- A. Software moving to another country
- B. The process of transferring a software system from one operating environment to another while preserving functionality
- C. Developers changing jobs
- D. Moving files between folders

Answer: B

Q885. What is the concept of 'maintainability index'?

- A. A measure of building maintenance costs
- B. A composite metric that combines code complexity, volume, and other factors to quantify how easy the software is to maintain
- C. An employee performance metric
- D. A hardware reliability metric

Answer: B

Q886. What is the role of regression testing in maintenance?

- A. It has no role
- B. Ensuring that maintenance changes have not introduced new defects into previously working functionality
- C. Testing only new features
- D. Testing only the user interface

Answer: B

Q887. What is code restructuring?

- A. Moving code files to different folders
- B. Modifying the internal structure of existing code to improve readability and maintainability without changing its external behavior
- C. Rewriting code in a different language
- D. Deleting unused code

Answer: B

Q888. What is the challenge of maintaining undocumented code?

- A. There is no challenge
- B. Maintainers must spend significant time understanding the code's purpose and logic through code reading alone, increasing the risk of introducing errors
- C. Undocumented code runs faster
- D. Undocumented code is easier to maintain

Answer: B

Q889. What is the difference between emergency and scheduled maintenance?

- A. They are the same
- B. Emergency maintenance addresses critical failures requiring immediate fixes; scheduled maintenance is planned changes during designated windows
- C. Emergency maintenance is optional
- D. Scheduled maintenance is never planned

Answer: B

Q890. What is a Service Level Agreement (SLA) in the context of maintenance?

- A. A software license agreement
- B. A contract defining expected maintenance response times, resolution times, and availability targets
- C. A developer employment contract
- D. A hardware warranty

Answer: B

Q891. What is a formal technical review (FTR)?

- A. A review of technical documents by lawyers
- B. A structured review meeting where a team of technical staff evaluates a work product to identify defects and verify quality
- C. A hardware inspection
- D. A user acceptance review

Answer: B

Q892. What is defect density as a quality metric?

- A. The physical density of a computer
- B. The number of confirmed defects found per unit of software size, such as defects per thousand lines of code
- C. The number of defects per developer
- D. The weight of defect reports

Answer: B

Q893. What is the Six Sigma approach in software quality?

- A. A Greek letter used in equations
- B. A data-driven methodology aiming to reduce defects to fewer than 3.4 per million opportunities using DMAIC
- C. A programming framework
- D. A type of testing

Answer: B

Q894. What is root cause analysis in QA?

- A. Analyzing tree roots
- B. A systematic process of identifying the fundamental reason why a defect occurred to prevent similar defects in the future
- C. Analyzing code roots
- D. A type of testing

Answer: B

Q895. What is the purpose of quality gates in a development process?

- A. Physical gates at the office entrance
- B. Checkpoints where work products must meet predefined quality criteria before proceeding to the next phase
- C. Gates in logic circuits
- D. Entrance exams for QA engineers

Answer: B

Q896. What is the Pareto analysis used for in QA?

- A. Analyzing Italian software
- B. Identifying the vital few causes that account for the majority of defects, focusing improvement efforts where they have the most impact
- C. Analyzing parrot behavior
- D. A type of performance testing

Answer: B

Q897. What is the ISO 9001 standard in relation to software quality?

- A. A programming language standard
- B. An international standard for quality management systems that defines requirements for consistent product quality and customer satisfaction
- C. A database standard
- D. A network protocol standard

Answer: B

Q898. What is the role of metrics in quality assurance?

- A. Metrics have no role in QA
- B. Metrics provide objective, quantitative data to measure process effectiveness, product quality, and guide improvement decisions
- C. Metrics only measure project cost
- D. Metrics replace testing

Answer: B

Q899. How is cyclomatic complexity calculated?

- A. By counting lines of code
- B. By counting the number of linearly independent paths through the code, calculated as $V(G) = E - N + 2P$ for the control flow graph
- C. By counting the number of classes
- D. By counting the number of variables

Answer: B

Q900. What does a high cyclomatic complexity value indicate?

- A. Simple, easy-to-test code
- B. Code with many decision paths that is more complex, harder to test, and more error-prone
- C. Fast-running code
- D. Well-documented code

Answer: B

Q901. What is function point analysis used for?

- A. Analyzing mathematical functions
- B. Measuring software size based on the functionality delivered to the user, independent of the programming language
- C. Analyzing function calls in code
- D. Measuring hardware performance

Answer: B

Q902. What are the five components measured in function point analysis?

- A. Classes, methods, variables, loops, conditions
- B. External Inputs, External Outputs, External Inquiries, Internal Logical Files, and External Interface Files
- C. Lines, functions, modules, packages, projects
- D. CPU, RAM, disk, network, display

Answer: B

Q903. What is the Halstead effort metric?

- A. The physical effort of typing code
- B. A measure derived from the number of operators and operands in code that estimates the mental effort required to develop or understand the program
- C. The effort to install software
- D. The effort to run tests

Answer: B

Q904. What is the purpose of a GQM (Goal-Question-Metric) approach in metrics?

- A. A gaming qualification metric
- B. To ensure metrics are aligned with specific goals by defining goals first, then questions to assess goal achievement, then metrics to answer questions
- C. A graphics quality metric
- D. A random metrics selection approach

Answer: B

Q905. What is the difference between subjective and objective metrics?

- A. They are the same
- B. Objective metrics are based on quantifiable measurements; subjective metrics involve human judgment and perception
- C. Subjective metrics are always better
- D. Objective metrics are always inaccurate

Answer: B

Q906. What is a Change Control Board (CCB)?

- A. A circuit board for hardware changes
- B. A group of stakeholders responsible for evaluating, approving, or rejecting proposed changes to configuration items
- C. A board game about changes
- D. A software testing board

Answer: B

Q907. What is the purpose of a build pipeline in configuration management?

- A. Building a physical pipeline
- B. An automated workflow that compiles, tests, and packages software whenever changes are committed to the repository
- C. A water pipeline
- D. An email pipeline

Answer: B

Q908. What is the difference between Git merge and Git rebase?

- A. They are identical operations
- B. Merge creates a merge commit preserving branch history; rebase moves commits to the tip of the target branch creating a linear history
- C. Merge always causes conflicts
- D. Rebase never modifies commit history

Answer: B

Q909. What is semantic versioning (SemVer)?

- A. A versioning system based on how versions sound
- B. A versioning scheme using MAJOR.MINOR.PATCH numbers where each indicates the type and scope of changes made
- C. A random version numbering scheme
- D. Versioning based on release dates

Answer: B

Q910. What is the purpose of a branching strategy?

- A. A gardening technique
- B. A set of rules defining how branches are created, named, and merged to organize parallel development and releases
- C. A marketing strategy
- D. A hiring strategy

Answer: B

Q911. What is GitFlow as a branching strategy?

- A. A water flow monitoring tool
- B. A branching model using main, develop, feature, release, and hotfix branches with defined rules for merging between them
- C. A Git tutorial
- D. A deployment tool

Answer: B

Q912. What is the purpose of configuration status accounting?

- A. Tracking the company's finances
- B. Recording and reporting the status of configuration items and change requests throughout the project lifecycle
- C. Counting lines of code
- D. Accounting for team hours

Answer: B

Q913. What is an artifact repository in CI/CD?

- A. A museum for code artifacts
- B. A centralized storage system for build outputs (compiled code, packages, containers) that can be versioned and deployed
- C. A database for test results
- D. A code hosting platform

Answer: B

Q914. What is a risk probability-impact matrix?

- A. A mathematical equation
- B. A grid that plots risks by their probability and impact to prioritize them and determine appropriate response strategies
- C. A spreadsheet template
- D. A type of decision tree

Answer: B

Q915. What are the common categories of software project risks?

- A. Only technical risks exist
- B. Technology, people, organizational, tools, requirements, and estimation risks among others
- C. Only budget risks
- D. Only schedule risks

Answer: B

Q916. What is risk exposure calculated as?

- A. Risk probability minus risk impact
- B. Risk probability multiplied by risk impact, representing the expected loss from the risk
- C. Risk probability divided by risk impact
- D. Risk probability plus risk impact

Answer: B

Q917. What is a risk trigger (or warning sign)?

- A. A gun trigger
- B. An event or condition that indicates a risk is about to occur or has occurred, prompting activation of the risk response plan
- C. A software trigger
- D. A database trigger

Answer: B

Q918. What is the concept of 'secondary risk'?

- A. A less important risk
- B. A new risk that arises as a direct result of implementing a risk response for a primary risk
- C. The second risk identified
- D. A backup risk plan

Answer: B

Q919. What is the purpose of a risk audit?

- A. Auditing the company's finances
- B. Examining and documenting the effectiveness of risk responses and the accuracy of the risk management process
- C. Auditing employee performance
- D. Auditing code quality

Answer: B

Q920. What is SQL injection and how is it prevented?

- A. Injecting SQL databases with vitamins
- B. An attack where malicious SQL code is inserted into application queries; prevented by using parameterized queries and input validation
- C. A database optimization technique
- D. A method for speeding up queries

Answer: B

Q921. What is the principle of defense in depth?

- A. Building deep bunkers
- B. Implementing multiple layers of security controls so that if one layer fails, others still provide protection
- C. Using only one very strong password
- D. Having one firewall

Answer: B

Q922. What is a session hijacking attack?

- A. Stealing a classroom session plan
- B. An attack where an attacker takes over a legitimate user's active session by stealing or predicting the session identifier
- C. Hijacking a training session
- D. Canceling a meeting

Answer: B

Q923. What is role-based access control (RBAC)?

- A. Controlling roles in a theater play
- B. A security model that restricts system access based on the roles assigned to users rather than individual user identities
- C. A role-playing game
- D. A hiring management system

Answer: B

Q924. What is the purpose of penetration testing?

- A. Testing physical building penetration
- B. Simulating real-world attacks against a system to identify vulnerabilities before malicious attackers can exploit them
- C. Testing code penetration rates
- D. Testing market penetration

Answer: B

Q925. What is a security token?

- A. A subway token
- B. A device or software that generates one-time passwords or cryptographic keys used for authenticating user identity
- C. A casino chip
- D. A gift card

Answer: B

Q926. What is the difference between a product backlog and a sprint backlog in Scrum?

- A. They are the same thing used at different stages of the project
- B. The product backlog contains all desired features for the product while the sprint backlog contains only items selected for the current sprint
- C. The sprint backlog is maintained by management while the product backlog is maintained by developers
- D. The product backlog is created once and never changes while the sprint backlog is updated daily

Answer: B

Q927. What is the Scrum of Scrums technique used for?

- A. Replacing the daily standup meeting in small teams
- B. Coordinating work across multiple Scrum teams working on the same product
- C. Training new Scrum Masters on agile practices
- D. Evaluating individual developer performance within a sprint

Answer: B

Q928. What is the Volere requirements template and what is its primary benefit?

- A. A coding template that generates requirements automatically from source code
- B. A structured template that provides a comprehensive framework for capturing all types of requirements systematically
- C. A UML diagram type used only for non-functional requirements
- D. A testing framework that validates requirements against code

Answer: B

Q929. How do quality function deployment (QFD) techniques apply to requirements engineering?

- A. QFD is only used in manufacturing and has no application in software
- B. QFD translates customer needs into technical requirements by mapping relationships between what customers want and how the system will deliver it
- C. QFD replaces all forms of requirements elicitation with automated tools
- D. QFD is a testing technique that validates requirements after implementation

Answer: B

Q930. What is the purpose of a RACI matrix in project management?

- A. To calculate the project budget using mathematical formulas
- B. To define roles and responsibilities by identifying who is Responsible, Accountable, Consulted, and Informed for each task
- C. To schedule tasks on a calendar view similar to a Gantt chart
- D. To track defects found during software testing

Answer: B

Q931. What is parametric estimation in software project management?

- A. Estimation based entirely on the project manager's intuition and experience
- B. Using statistical relationships between historical data and project parameters to calculate estimates
- C. Asking each developer to guess how long their tasks will take
- D. Copying the schedule from a previous project without any adjustments

Answer: B

Q932. What is the difference between a project baseline and a project plan?

- A. They are the same document used at different project phases
- B. A baseline is the approved version of the plan used to measure project performance against, while the plan is the working document that may be updated
- C. A baseline is created after project completion while a plan is created before
- D. A plan is used only for small projects while a baseline is used for large projects

Answer: B

Q933. What is the Builder design pattern used for?

- A. Ensuring a class has only one instance throughout the application
- B. Separating the construction of a complex object from its representation so the same construction process can create different representations
- C. Defining a one-to-many dependency between objects so that changes in one notify all dependents
- D. Providing a simplified interface to a complex subsystem

Answer: B

Q934. What is the Facade design pattern?

- A. A pattern that adds new responsibilities to an object dynamically
- B. A pattern that provides a simplified, unified interface to a set of interfaces in a subsystem
- C. A pattern that allows incompatible interfaces to work together
- D. A pattern that separates abstraction from implementation

Answer: B

Q935. What is the Interface Segregation Principle (ISP)?

- A. All classes must implement every method defined in any interface they use
- B. Clients should not be forced to depend on interfaces they do not use
- C. Interfaces should contain as many methods as possible for reusability
- D. Only one interface should exist per application module

Answer: B

Q936. What is the Iterator design pattern?

- A. A pattern that converts the interface of a class into another interface clients expect
- B. A pattern that provides a way to access elements of a collection sequentially without exposing its underlying representation
- C. A pattern that defines a family of algorithms and makes them interchangeable
- D. A pattern that composes objects into tree structures to represent part-whole hierarchies

Answer: B

Q937. What is the Broker architectural pattern?

- A. A pattern where all requests go through a single centralized database
- B. A pattern that decouples components by using a broker to coordinate communication between distributed services
- C. A pattern that requires all components to be written in the same programming language
- D. A pattern used exclusively for real-time embedded systems

Answer: B

Q938. What is the blackboard architectural pattern?

- A. A pattern where developers write requirements on a physical whiteboard
- B. A pattern where multiple specialized knowledge sources collaborate by reading from and writing to a shared data structure to solve complex problems
- C. A pattern identical to the client-server model but with a different name
- D. A pattern that restricts access to a single database to one user at a time

Answer: B

Q939. What is the F-pattern layout in UI design?

- A. A layout that arranges all elements in a fixed grid pattern
- B. A layout based on eye-tracking research showing users scan content in an F-shaped pattern, reading horizontally across the top then scanning vertically down the left side
- C. A layout that uses only the letter F as a design element
- D. A layout specifically designed for mobile-first applications

Answer: B

Q940. What is the purpose of user journey mapping?

- A. To map the physical location of users using GPS technology
- B. To visualize the complete experience a user has with a product from initial contact through engagement and into long-term use
- C. To create a route map showing the shortest navigation path in the application
- D. To document the travel expenses of the design team

Answer: B

Q941. What is the difference between a framework and a library in software implementation?

- A. They are the same thing; the terms are used interchangeably
- B. A framework calls your code (inversion of control) while a library is called by your code
- C. A library is always larger than a framework in terms of file size
- D. Frameworks are only used for web development while libraries are used for desktop applications

Answer: B

Q942. What is decision table testing?

- A. A management technique for deciding which tests to skip
- B. A black-box testing technique that uses a table to represent combinations of inputs and their corresponding expected outputs or actions
- C. A method for testing database query performance
- D. A way to schedule testing activities in a project timeline

Answer: B

Q943. What is the difference between a test driver and a test stub?

- A. They are the same thing used at different project phases
- B. A test driver calls the module under test (simulating the caller), while a test stub replaces a module called by the module under test (simulating the dependency)
- C. A test driver is used for black-box testing while a test stub is used for white-box testing
- D. A test driver runs tests automatically while a test stub requires manual execution

Answer: B

Q944. What is Lehman's Law of Continuing Change and its implications for software maintenance?

- A. Software that is never used does not need maintenance
- B. A system used in a real-world environment must be continually adapted or it becomes progressively less satisfactory to users
- C. All software eventually becomes unmaintainable regardless of effort
- D. Software maintenance costs decrease over time as the system stabilizes

Answer: B

Q945. What is the difference between prevention costs and appraisal costs in the cost of quality model?

- A. Prevention costs and appraisal costs are the same category of quality costs
- B. Prevention costs are spent on activities to prevent defects from occurring, while appraisal costs are spent on activities to detect defects that have already been introduced
- C. Appraisal costs prevent defects while prevention costs detect them
- D. Prevention costs only apply to hardware while appraisal costs only apply to software

Answer: B

Q946. How does the ISO/IEC 25010 quality model categorize software quality characteristics?

- A. It defines only two quality characteristics: functionality and performance
- B. It defines eight quality characteristics including functional suitability, performance efficiency, compatibility, usability, reliability, security, maintainability, and portability
- C. It defines quality solely based on the number of defects per thousand lines of code
- D. It categorizes quality only by user satisfaction survey scores

Answer: B

Q947. What is the depth of inheritance tree (DIT) metric and what does a high value indicate?

- A. It measures the number of files in a project; a high value indicates a large project
- B. It measures the maximum length from a class to the root of its inheritance hierarchy; a high value indicates greater complexity and potential for inherited behavior issues
- C. It measures the depth of nested loops in code; a high value indicates faster execution
- D. It measures the number of test cases per class; a high value indicates thorough testing

Answer: B

Q948. What is the fan-in and fan-out metric in software design?

- A. Fan-in counts the number of developers who modified a module while fan-out counts the number of testers who tested it
- B. Fan-in measures the number of modules that call a given module while fan-out measures the number of modules called by a given module
- C. Fan-in measures input file size while fan-out measures output file size
- D. Fan-in and fan-out are terms used only in electrical engineering, not software

Answer: B

Q949. What is the purpose of a deployment pipeline in configuration management?

- A. To physically transport software on USB drives to client locations
- B. To automate the process of building, testing, and deploying software through a series of stages from development to production
- C. To create documentation for each software release
- D. To assign developers to specific configuration management tasks

Answer: B

Q950. What is Infrastructure as Code (IaC) in the context of configuration management?

- A. Writing application code that runs on infrastructure servers
- B. Managing and provisioning computing infrastructure through machine-readable configuration files rather than manual processes
- C. Using hardware components as programming languages
- D. Coding directly on production servers without any version control

Answer: B

Q951. What is the RMMM (Risk Mitigation, Monitoring, and Management) plan?

- A. A financial auditing plan for tracking project expenses
- B. A comprehensive plan that documents risk mitigation strategies, monitoring activities, and management approaches for all identified project risks
- C. A plan for managing team member vacation schedules
- D. A security plan for preventing unauthorized access to the codebase

Answer: B

Q952. What is the difference between a risk and an issue in project management?

- A. There is no difference; the terms are interchangeable
- B. A risk is a potential future event that may or may not occur, while an issue is a current problem that has already materialized and needs immediate action
- C. An issue is less important than a risk and can be ignored
- D. Risks are always technical while issues are always organizational

Answer: B

Q953. What is the purpose of a risk-driven spiral model in software development?

- A. To eliminate all risks before any coding begins
- B. To use risk analysis as the primary driver for iteration planning, addressing the highest risks earliest through prototyping and analysis
- C. To create spiral-shaped project documentation
- D. To assign each developer a specific risk to manage independently

Answer: B

Q954. What are technology risks in software projects?

- A. Risks that only affect non-technical project activities
- B. Risks related to the use of unproven technologies, technical complexity, platform dependencies, or performance uncertainties
- C. Risks that are always impossible to mitigate
- D. Risks that only occur during the maintenance phase of a project

Answer: B

Q955. What is the purpose of threat modeling in software security engineering?

- A. To create 3D models of physical security threats to the building
- B. To systematically identify, enumerate, and prioritize potential security threats to a system so appropriate countermeasures can be designed
- C. To model the performance characteristics of the software under load
- D. To create user interface mockups that look secure to end users

Answer: B

Q956. What is cross-site request forgery (CSRF) and how is it prevented?

- A. An attack where multiple websites share the same database and it cannot be prevented
- B. An attack that tricks a user's browser into making unwanted requests to a trusted site, prevented using anti-CSRF tokens and same-site cookie attributes
- C. An attack that only targets mobile applications and is prevented by app store reviews
- D. An encryption algorithm used to protect data in transit

Answer: B

Q957. What is the CIA triad in information security?

- A. A government intelligence agency classification system for software projects
- B. Three core principles of information security: Confidentiality (data accessible only to authorized parties), Integrity (data is accurate and unaltered), and Availability (data is accessible when needed)
- C. A project management framework with three phases: Create, Implement, Archive
- D. A testing methodology using three levels of test cases

Answer: B

Q958. What is the difference between authentication and authorization in security?

- A. They are the same process and can be used interchangeably
- B. Authentication verifies the identity of a user (who they are), while authorization determines what actions or resources the authenticated user is permitted to access (what they can do)
- C. Authorization happens before authentication in all security systems
- D. Authentication is used only for web applications while authorization is used only for mobile applications

Answer: B

Q959. What is the purpose of an assertion in software implementation?

- A. To display output to the user interface
- B. To verify that a condition the programmer believes to be true actually holds at a specific point in the code, catching logical errors early
- C. To encrypt sensitive data before storing it in the database
- D. To create a backup of the source file before compilation

Answer: B

Q960. What is the Weighted Methods per Class (WMC) metric in object-oriented design?

- A. A metric that counts the total weight of class files in kilobytes
- B. The sum of complexities of all methods defined in a class, indicating the class's overall complexity and effort required to develop and maintain it
- C. The average number of parameters across all methods in a class
- D. A metric that measures how many classes inherit from a given class

Answer: B

Software Engineering — Hard

480 questions

Q961. Which of the following best describes 'socio-technical systems'?

- A. Systems that include both technical and organizational components
- B. Systems that contain only technical components
- C. Web-based social media communication platforms
- D. Internal technical documentation management systems

Answer: A

Q962. What is Lehman's first law of software evolution?

- A. Software systems must continually grow in size or become obsolete in the system context
- B. The inherent complexity of software always decreases over its lifetime during implementation
- C. Well-designed software systems never require updates or modifications at all for quality purposes
- D. A program used in a real-world environment must continually change or become progressively less useful

Answer: D

Q963. In the context of software engineering ethics, what does the ACM/IEEE Code of Ethics emphasize?

- A. Public interest and professional responsibility
- B. Rapid speed of software delivery timelines
- C. Using the minimum documentation possible
- D. Maximizing project profits above all else

Answer: A

Q964. What is the key challenge addressed by Brooks' 'No Silver Bullet' paper?

- A. Network bandwidth and throughput constraints by the organization
- B. A critical lack of modern programming languages as a standard approach
- C. Fundamental hardware performance limitations in practice typically
- D. Essential complexity of software cannot be eliminated by any single technique

Answer: D

Q965. Which concept distinguishes software engineering from ad hoc programming?

- A. Systematic, disciplined, and quantifiable approach
- B. Simply writing more lines of source code
- C. Using a standard keyboard for input tasks
- D. Utilizing more recent hardware component sets

Answer: A

Q966. What is the 'wicked problem' concept in software engineering?

- A. A straightforward and simple coding bug fix across all phases
- B. A problem that is difficult to define and has no definitive solution
- C. A software problem caused by a virus attack at every stage
- D. A recurring hardware malfunction issue type in a systematic way

Answer: B

Q967. What is the primary difference between software engineering and systems engineering?

- A. Software engineering also includes hardware design within the system boundary
- B. Systems engineering exclusively covers testing by the development process
- C. The two disciplines are entirely identical for the project goals according to best practices
- D. Systems engineering covers the entire system including hardware; SE focuses on software

Answer: D

Q968. What does 'accidental complexity' mean in software engineering?

- A. Unexpected failures in hardware components as defined by standards
- B. Complexity introduced by the tools and methods used, not inherent to the problem
- C. Random and unpredictable bugs in source code over the entire lifecycle
- D. Inherent complexity from the problem domain and its related activities

Answer: B

Q969. Which of the following represents a key principle of software engineering according to Sommerville?

- A. Always maximize the total length of source code
- B. Systems should be developed using a managed and understood process
- C. Avoid writing any form of technical documentation
- D. Use only one single programming language always

Answer: B

Q970. What role does abstraction play in software engineering?

- A. It increases the total length of the code
- B. It eliminates the need for software testing
- C. It helps manage complexity by hiding unnecessary details
- D. It completely removes all project documentation

Answer: C

Q971. What is the Rational Unified Process (RUP)?

- A. An iterative framework with four phases: Inception, Elaboration, Construction, Transition
- B. A basic and simple coding technique only as defined by standards for all project stakeholders
- C. A relational database design model type in all development efforts by the project team members
- D. A specialized software testing tool suite within the given constraints

Answer: A

Q972. What distinguishes the concurrent development model from other models?

- A. It only supports a single developer at a time to achieve project objectives
- B. All activities occur simultaneously with states rather than sequential phases
- C. It completely eliminates all development phases and related components
- D. It has absolutely no testing activities at all in the engineering discipline

Answer: B

Q973. In the Spiral model, what happens if a risk cannot be mitigated?

- A. Skip directly to the deployment phase
- B. Continue development regardless of the risk
- C. Ignore the risk and move forward
- D. The project may be terminated

Answer: D

Q974. What is the Personal Software Process (PSP)?

- A. A hardware development process model type as part of the methodology
- B. A standard network communication protocol in the development process
- C. A team management and organizational method for effective project outcomes
- D. A structured framework for individual developers to measure and improve their work

Answer: D

Q975. What is the Team Software Process (TSP)?

- A. A method designed for a single developer only during the software lifecycle
- B. A specific type of software testing process within the project scope
- C. A hardware design and manufacturing method for the development team
- D. A framework that builds on PSP to guide teams in developing software-intensive products

Answer: D

Q976. What does CMMI stand for and what is its purpose?

- A. Capability Maturity Model Integration — a process improvement framework
- B. Central Management Module Index for projects in the system context
- C. Computer Made Machine Interface for hardware throughout the project
- D. Code Maintenance Manual Integration standard during implementation

Answer: A

Q977. What are the five maturity levels of CMMI?

- A. Initial, Managed, Defined, Quantitatively Managed, Optimizing
- B. Code, Test, Deploy, Monitor, Maintain in practice typically
- C. Beginner, Intermediate, Advanced, Expert, Master
- D. Plan, Do, Check, Act, Review for quality purposes

Answer: A

Q978. What is the key difference between prescriptive and adaptive process models?

- A. Prescriptive models do not involve any planning at every stage across all phases
- B. Adaptive models typically require more documentation by the organization
- C. There is absolutely no real difference between them as a standard approach
- D. Prescriptive models define a fixed set of activities; adaptive models adjust based on feedback

Answer: D

Q979. What is the Cleanroom software engineering approach?

- A. A formal methods approach emphasizing defect prevention over defect removal
- B. A hardware testing and validation environment according to best practices
- C. A physical room dedicated to coding activities for the project goals
- D. A model focused on clean code formatting style in a systematic way

Answer: A

Q980. In the context of process models, what is a 'process pattern'?

- A. A software design pattern for code modules within the system boundary
- B. An individual test case for code validation and its related activities
- C. A specific coding style guideline for teams by the development process
- D. A template describing a proven process solution to a recurring problem

Answer: D

Q981. What is the Scaled Agile Framework (SAFe)?

- A. A framework for scaling Agile practices to enterprise level
- B. A framework designed for individual small teams
- C. A comprehensive testing automation framework tool
- D. An established coding standard for all projects

Answer: A

Q982. What is the difference between Scrum and Kanban?

- A. Scrum uses fixed-length sprints; Kanban uses continuous flow with WIP limits
- B. Kanban uses fixed-length sprints; Scrum does not across all phases
- C. The two methodologies are completely identical at every stage
- D. Scrum has no defined roles; Kanban has defined roles in a systematic way

Answer: A

Q983. What is 'technical debt' in Agile context?

- A. Physical hardware equipment purchase expenses according to best practices
- B. The cost of rework caused by choosing quick solutions over better approaches
- C. Annual recurring software licensing fee costs within the system boundary
- D. Financial money owed to the development team for the project goals

Answer: B

Q984. What is the Crystal methodology family?

- A. A family of Agile methodologies sized by team size and criticality
- B. A specialized software testing automation tool by the development process
- C. A general-purpose programming language format and its related activities
- D. A relational database management system design over the entire lifecycle

Answer: A

Q985. What is Feature-Driven Development (FDD)?

- A. A random unstructured development approach only as defined by standards
- B. A comprehensive documentation standard and format within the given constraints
- C. An Agile method that organizes development around building features in two-week iterations
- D. A formal software testing methodology and approach for all project stakeholders

Answer: C

Q986. In Agile estimation, what is 'Planning Poker'?

- A. A recreational team card game activity only in all development efforts
- B. A project planning and scheduling tool suite by the project team members
- C. A formal risk analysis assessment method type and related components
- D. A consensus-based estimation technique using cards with numbers

Answer: D

Q987. What is the purpose of a 'Burndown Chart'?

- A. To track overall project financial expenses
- B. To show remaining work versus time in a sprint or project
- C. To measure and assess overall code quality
- D. To track daily employee attendance records

Answer: B

Q988. What is Dynamic Systems Development Method (DSDM)?

- A. An Agile framework that fixes time and cost, varying features to meet business needs
- B. A standard network communication protocol type for effective project outcomes
- C. A hardware design and manufacturing method only to achieve project objectives
- D. A relational database design methodology approach in the engineering discipline

Answer: A

Q989. What does 'MoSCoW' prioritization stand for?

- A. Monitor, Observe, Scan, Check, Optimize, Watch
- B. Must have, Should have, Could have, Won't have
- C. A Russian city
- D. Manage, Organize, Schedule, Control, Outline, Work

Answer: B

Q990. What is the concept of 'Emergent Design' in Agile?

- A. Designing the entire system completely upfront first
- B. Allowing the design to evolve incrementally as understanding grows
- C. Having absolutely no design process at all ever
- D. Copying designs from existing similar systems only

Answer: B

Q991. What is the Volere requirements template?

- A. A software testing automation template setup within the project scope
- B. A comprehensive template for organizing and documenting requirements with quality gateways
- C. A deployment configuration setup template for the development team throughout the project
- D. A source code implementation template file during the software lifecycle

Answer: B

Q992. What is goal-oriented requirements engineering?

- A. An approach where requirements are derived from stakeholder and system goals
- B. Setting performance and speed benchmarks for quality purposes
- C. Setting rigid project deadline target dates in the system context
- D. Writing only goals instead of actual code during implementation

Answer: A

Q993. What is the KAOS methodology?

- A. A deployment and release methodology guide by the organization
- B. A goal-oriented requirements engineering methodology using formal methods
- C. A specific software testing methodology only as a standard approach
- D. A random unstructured development approach in practice typically

Answer: B

Q994. What is requirements volatility?

- A. Requirements that remain perfectly stable always at every stage
- B. A type of volatile computer memory hardware across all phases
- C. A recurring issue with hardware component sets in a systematic way
- D. The tendency of requirements to change during the development process

Answer: D

Q995. What is viewpoint-oriented requirements engineering?

- A. Collecting requirements from multiple stakeholder viewpoints to ensure completeness
- B. Only considering developer technical viewpoints within the system boundary
- C. Deliberately ignoring all stakeholder views given according to best practices
- D. Using only a single stakeholder perspective view for the project goals

Answer: A

Q996. What is the difference between 'shall' and 'should' in requirements documents?

- A. 'Shall' indicates mandatory requirements; 'should' indicates desirable but optional
- B. The two terms mean exactly the same thing always by the development process
- C. Neither term is used in requirements documents ever over the entire lifecycle
- D. 'Should' is mandatory and 'shall' is always optional and its related activities

Answer: A

Q997. What is formal specification in requirements engineering?

- A. Drawing informal pictures of system requirements
- B. Using mathematical notation to precisely define system requirements
- C. Using programming code as the requirements source
- D. Writing requirements in an informal manner only

Answer: B

Q998. What are cross-cutting concerns in requirements?

- A. Requirements that are very easy to implement fast as defined by standards
- B. Requirements that are considered not important for all project stakeholders
- C. Requirements that affect multiple modules and cannot be cleanly decomposed
- D. Requirements from only one single stakeholder within the given constraints

Answer: C

Q999. What is the i* (i-star) framework?

- A. A numerical system for rating software products in all development efforts
- B. A goal-oriented and agent-oriented modeling framework for requirements engineering
- C. A general-purpose application programming framework by the project team members
- D. A comprehensive software testing automation framework and related components

Answer: B

Q1000. What is the difference between derived and imposed requirements?

- A. Derived requirements are always considered optional in the development process during the software lifecycle
- B. Derived requirements come from higher-level requirements; imposed requirements come from external constraints
- C. They are fundamentally the same concept entirely to achieve project objectives in the engineering discipline
- D. Imposed requirements are always derived from code for effective project outcomes as part of the methodology

Answer: B

Q1001. What is the COCOMO II model's key improvement over COCOMO I?

- A. It uses significantly simpler mathematical formulas within the system boundary
- B. It provides much faster calculation processing speed for the project goals
- C. It produces much better visual graphics output according to best practices
- D. It accounts for modern development practices like reuse and object-oriented development

Answer: D

Q1002. What is the Delphi estimation technique?

- A. A specific programming implementation technique only
- B. A comprehensive software testing methodology type
- C. A production deployment automation technique type
- D. An expert-based estimation method using anonymous iterative rounds

Answer: D

Q1003. What is the Putnam model (SLIM)?

- A. A personal health and diet improvement plan only by the development process
- B. A comprehensive software testing process model type and its related activities
- C. A software architecture and design model for teams over the entire lifecycle
- D. A software estimation model relating effort to delivery time using the Rayleigh curve

Answer: D

Q1004. What is the difference between bottom-up and top-down estimation?

- A. Top-down estimation is always much more accurate in all development efforts by the project team members
- B. Bottom-up estimation is always significantly faster within the given constraints
- C. Bottom-up estimates individual tasks then aggregates; top-down estimates the whole project then decomposes
- D. Both approaches always give identical final results as defined by standards for all project stakeholders

Answer: C

Q1005. What is the concept of 'Brooks' Law'?

- A. Adding people to a late software project makes it later
- B. A specific programming coding law and its rules
- C. Established laws about code formatting standards
- D. More developers always mean faster project work

Answer: A

Q1006. What is the Schedule Performance Index (SPI) in EVM?

- A. A comprehensive software testing progress index in the engineering discipline
- B. A specific source code quality coding metric only to achieve project objectives
- C. The ratio of earned value to planned value, indicating schedule efficiency
- D. A generic system processing speed measurement and related components

Answer: C

Q1007. What is the Cost Performance Index (CPI) in EVM?

- A. A general consumer price comparison index only for effective project outcomes
- B. A specific source code quality coding metric only as part of the methodology
- C. The ratio of earned value to actual cost, indicating cost efficiency
- D. A hardware system performance rating metric in the development process

Answer: C

Q1008. What is Monte Carlo simulation used for in project management?

- A. A recreational casino gambling game activity only during the software lifecycle
- B. Simulating project outcomes using probability distributions to assess risk
- C. A specific software coding implementation technique within the project scope
- D. A software architecture and design method guide for the development team

Answer: B

Q1009. What is the concept of 'crashing' in project scheduling?

- A. An unplanned system failure or complete breakdown
- B. Adding resources to critical path tasks to reduce project duration
- C. Permanently removing tasks from the project plan
- D. Completely cancelling the entire project scope

Answer: B

Q1010. What is fast tracking in project management?

- A. Reducing the total number of project requirements during implementation
- B. Requiring the team to work overtime every day throughout the project
- C. Skipping all software testing activities entirely in the system context
- D. Performing sequential activities in parallel to compress the schedule

Answer: D

Q1011. What is the SOLID acronym in object-oriented design?

- A. Single Responsibility, Open/Closed, Liskov Substitution, Interface Segregation, Dependency Inversion
- B. A comprehensive software testing framework set for effective project outcomes
- C. A specific general-purpose coding language type in the engineering discipline
- D. A classification of physical building materials and related components to achieve project objectives

Answer: A

Q1012. What is the Dependency Inversion Principle?

- A. All dependencies should always point downward only as part of the methodology
- B. All module dependencies should be completely removed in the development process
- C. High-level modules should not depend on low-level modules; both should depend on abstractions
- D. Dependencies between modules should be circular during the software lifecycle

Answer: C

Q1013. What is the Interface Segregation Principle?

- A. Avoid defining all interfaces in the system entirely
- B. Use one single large monolithic interface always
- C. Clients should not be forced to depend on interfaces they don't use
- D. Combine all interfaces into a single large one

Answer: C

Q1014. What is the Decorator design pattern?

- A. A pattern that attaches additional responsibilities to an object dynamically
- B. A user interface visual styling pattern only within the project scope
- C. A relational database schema design pattern type for the development team
- D. A comprehensive software testing design pattern throughout the project

Answer: A

Q1015. What is the difference between composition and inheritance?

- A. The two concepts are completely identical always in the system context
- B. Inheritance is never used in modern source code for quality purposes
- C. Composition is always the wrong approach to use during implementation
- D. Inheritance creates an 'is-a' relationship; composition creates a 'has-a' relationship

Answer: D

Q1016. What is the Adapter design pattern?

- A. A comprehensive software testing adapter tool
- B. A relational database connection driver and tool
- C. A physical electrical power adapter device unit
- D. A pattern that allows incompatible interfaces to work together

Answer: D

Q1017. What is the Command design pattern?

- A. A pattern that encapsulates a request as an object, allowing parameterization and queuing
- B. A production deployment automation command set by the organization at every stage
- C. A command-line interface terminal command only in practice typically
- D. A comprehensive software testing command suite as a standard approach

Answer: A

Q1018. What is the Template Method pattern?

- A. A source code boilerplate template file format across all phases in a systematic way
- B. A software testing test case plan template set according to best practices
- C. A comprehensive project documentation template for the project goals
- D. A pattern that defines the skeleton of an algorithm, deferring some steps to subclasses

Answer: D

Q1019. What is the concept of 'design debt'?

- A. Financial debt for purchasing design tools only within the system boundary
- B. The accumulated cost of design shortcuts that will require future rework
- C. A specific type of design pattern category name by the development process
- D. A concept related only to software testing work and its related activities

Answer: B

Q1020. What is the difference between architectural design and detailed design?

- A. They are fundamentally identical concepts entirely over the entire lifecycle as defined by standards
- B. Architectural design only involves UI layout work in all development efforts by the project team members
- C. Detailed design always comes before architectural for all project stakeholders within the given constraints
- D. Architectural design defines system structure; detailed design specifies algorithms and data structures within components

Answer: D

Q1021. What is the TOGAF framework?

- A. The Open Group Architecture Framework for enterprise architecture
- B. A production deployment automation framework for effective project outcomes
- C. A general-purpose source code framework tool to achieve project objectives
- D. A comprehensive software testing framework type in the engineering discipline

Answer: A

Q1022. What is the Architecture Tradeoff Analysis Method (ATAM)?

- A. A method for evaluating architectural decisions against quality attribute requirements
- B. A mathematical formula for doing calculations as part of the methodology
- C. A comprehensive software testing methodology during the software lifecycle
- D. A specific source code writing methodology only in the development process

Answer: A

Q1023. What is the concept of 'architectural erosion'?

- A. The gradual degradation of architecture as implementation deviates from the intended design
- B. A specific category of reported software defect for the development team
- C. A concept related to software testing only throughout the project in the system context
- D. Physical decay of building materials over time within the project scope

Answer: A

Q1024. What is a Domain-Specific Software Architecture (DSSA)?

- A. A generic all-purpose architecture template type during implementation
- B. A network infrastructure architecture blueprint in practice typically
- C. An architecture tailored to a specific application domain with reusable components
- D. A comprehensive software testing architecture for quality purposes

Answer: C

Q1025. What is the CQRS pattern?

- A. A specific source code implementation pattern by the organization
- B. A standard database query language command type as a standard approach
- C. A comprehensive software testing pattern type at every stage
- D. Command Query Responsibility Segregation — separating read and write operations

Answer: D

Q1026. What is the Strangler Fig pattern?

- A. A migration pattern that incrementally replaces a legacy system by gradually routing traffic to a new system
- B. An application security protection pattern type within the system boundary by the development process
- C. A comprehensive software testing pattern approach for the project goals according to best practices
- D. A botanical plant species classification category across all phases in a systematic way

Answer: A

Q1027. What is the concept of 'fitness functions' in evolutionary architecture?

- A. Physical exercise routines for the team members and its related activities
- B. User interface design metrics and score values as defined by standards
- C. System performance benchmarks and baselines set over the entire lifecycle
- D. Automated tests that verify architectural characteristics are maintained

Answer: D

Q1028. What is the hexagonal architecture (ports and adapters)?

- A. A building shaped with six equal sides design for all project stakeholders
- B. A relational database schema design method type within the given constraints
- C. An architecture that isolates the core logic from external concerns using ports and adapters
- D. A network topology and routing structure layout in all development efforts

Answer: C

Q1029. What is the difference between architectural patterns and architectural styles?

- A. Styles are more specific than patterns overall in the engineering discipline
- B. Patterns are broader in scope than styles are and related components to achieve project objectives
- C. Styles are broader design philosophies; patterns are specific solutions to recurring problems
- D. The two concepts are completely identical overall by the project team members

Answer: C

Q1030. What is the concept of 'Conway's Law' in software architecture?

- A. A specific legal regulatory requirement and law for effective project outcomes
- B. A standard source code formatting law and rule as part of the methodology
- C. A comprehensive software testing principle type in the development process
- D. Organizations design systems that mirror their own communication structure

Answer: D

Q1031. What is the difference between formative and summative usability evaluation?

- A. Formative evaluation only occurs after launch date within the system boundary
- B. The two types of evaluation are the same thing according to best practices
- C. Summative evaluation occurs during development by the development process
- D. Formative evaluates during development to improve; summative evaluates the finished product

Answer: D

Q1032. What is cognitive load theory in UI design?

- A. A database theory about query optimization work within the given constraints in all development efforts
- B. A programming concept about memory management as defined by standards for all project stakeholders
- C. The theory that users have limited mental processing capacity, and designs should minimize unnecessary cognitive effort
- D. Brain scanning technology for development teams and its related activities over the entire lifecycle

Answer: C

Q1033. What is the Gestalt principle of proximity?

- A. Physical distance between computer workstations by the project team members
- B. A security principle about access proximity level to achieve project objectives
- C. A networking concept about node proximity range and related components
- D. Elements placed close together are perceived as belonging to the same group

Answer: D

Q1034. What is WCAG?

- A. Web Content Accessibility Guidelines — standards for making web content accessible
- B. A creational object-oriented design pattern type as part of the methodology
- C. A comprehensive software testing framework tool for effective project outcomes
- D. A general-purpose programming language type only in the engineering discipline

Answer: A

Q1035. What is the concept of 'dark patterns' in UI design?

- A. Security patterns for data protection only within the project scope
- B. Night mode designs for reducing eye strain during the software lifecycle
- C. Dark color themes for user interface screens in the development process
- D. Deceptive design practices that trick users into unintended actions

Answer: D

Q1036. What is card sorting in UX research?

- A. A method where users organize topics into categories to inform information architecture
- B. Sorting records stored in a database table only throughout the project
- C. Sorting a deck of standard playing cards only for the development team
- D. A specific software testing automation technique in the system context

Answer: A

Q1037. What is the System Usability Scale (SUS)?

- A. A performance scale for rating hardware speed in practice typically
- B. A standardized questionnaire for measuring perceived usability of a system
- C. A musical scale for composing melody pieces during implementation
- D. A weight scale for measuring device components for quality purposes

Answer: B

Q1038. What is the difference between learnability and memorability in usability?

- A. Learnability is considered less important overall for the project goals according to best practices
- B. Memorability always comes first in any evaluation at every stage across all phases in a systematic way
- C. The two concepts are fundamentally the same thing as a standard approach by the organization
- D. Learnability is how easy it is to learn initially; memorability is how easy it is to reuse after a period of not using

Answer: D

Q1039. What is the concept of 'information scent' in UI design?

- A. Visual and textual cues that help users predict what they'll find by following a link or path
- B. Data encryption and protection techniques used by the development process
- C. The physical fragrance of a commercial product within the system boundary
- D. File compression and archiving algorithms used and its related activities

Answer: A

Q1040. What is the difference between user-centered design (UCD) and activity-centered design (ACD)?

- A. User-centered design completely ignores all users for all project stakeholders
- B. UCD focuses on user needs and preferences; ACD focuses on the activities users perform
- C. Activity-centered design is entirely obsolete now as defined by standards
- D. The two approaches are completely identical overall over the entire lifecycle

Answer: B

Q1041. What is the concept of 'clean code'?

- A. Code that has absolutely no comments at all as defined by standards
- B. Source code that has been fully minimized down for all project stakeholders
- C. Source code that has been fully obfuscated over within the given constraints
- D. Code that is easy to read, understand, and maintain, following best practices

Answer: D

Q1042. What is the Boy Scout Rule in coding?

- A. A comprehensive software testing protocol type
- B. Write source code in an outdoor setting always
- C. Always leave the code cleaner than you found it
- D. A recreational camping and outdoors activity rule

Answer: C

Q1043. What is the Law of Demeter?

- A. A relational database normalization rule set type and related components
- B. A fundamental law of classical physics principles by the project team members
- C. An ancient Greek legal and civil law code rule in all development efforts
- D. A design guideline stating that an object should only talk to its immediate friends

Answer: D

Q1044. What is technical debt and how does it relate to implementation?

- A. Annual recurring software licensing fee cost totals for effective project outcomes
- B. The cost of shortcuts in implementation that will need to be fixed later
- C. Monetary financial debt owed by a company entity to achieve project objectives
- D. Physical hardware equipment purchase cost amounts in the engineering discipline

Answer: B

Q1045. What is the difference between defensive programming and offensive programming?

- A. Offensive programming is always incorrect to use during the software lifecycle
- B. The two approaches are completely identical overall in the development process
- C. Defensive handles errors gracefully; offensive fails fast to expose bugs early
- D. Sports programming for athletic events coverage as part of the methodology

Answer: C

Q1046. What is code obfuscation?

- A. A specific debugging and tracing technique tool for the development team
- B. A comprehensive software testing method approach throughout the project
- C. Deliberately making code difficult to understand to prevent reverse engineering
- D. Making source code more readable for developers within the project scope

Answer: C

Q1047. What is the concept of 'separation of concerns' in implementation?

- A. Separating test code from production code files during implementation
- B. Organizing code so each section addresses a distinct concern or functionality
- C. Physical separation of developer workstations area in the system context
- D. Separating frontend code from backend code only for quality purposes

Answer: B

Q1048. What is a design smell versus a code smell?

- A. Design smells are always much worse than code smells as a standard approach
- B. The two concepts are completely identical and same in practice typically
- C. Code smells are always much worse than design smells by the organization
- D. Code smells are implementation-level issues; design smells are higher-level structural problems

Answer: D

Q1049. What is the 'broken window theory' in software development?

- A. A user interface visual design theory and concept in a systematic way
- B. A theory about physical broken windows in homes at every stage across all phases
- C. Neglecting small code quality issues leads to progressively worse code quality over time
- D. A comprehensive software testing theory approach for the project goals

Answer: C

Q1050. What is the principle of least astonishment in programming?

- A. Deliberately surprising users with behavior changes according to best practices
- B. Minimizing features for simplicity above all else within the system boundary
- C. A component should behave in a way that most users expect it to behave
- D. Maximizing performance above all other attributes by the development process

Answer: C

Q1051. What is mutation testing?

- A. Performing genetic and biological testing samples
- B. Testing software for computer virus threats only
- C. Introducing small changes to code to check if tests can detect them
- D. Testing for mutations in stored database data only

Answer: C

Q1052. What is the difference between structural and functional testing?

- A. Structural testing completely ignores the code base during implementation for quality purposes
- B. Functional testing examines internal code structure throughout the project in the system context
- C. Structural testing is based on internal code structure; functional testing is based on specifications
- D. The two approaches are fundamentally the same thing for the development team

Answer: C

Q1053. What is path testing?

- A. Testing all possible execution paths through the code
- B. Testing GPS navigation system paths and routes
- C. Testing operating system file paths and path names
- D. Testing network routing paths and protocol flows

Answer: A

Q1054. What is cyclomatic complexity and how does it relate to testing?

- A. A metric related to bicycle complexity and speed in practice typically as a standard approach
- B. A relational database complexity metric and score by the organization at every stage
- C. A code complexity metric that indicates the minimum number of test cases needed for full branch coverage
- D. A network topology complexity metric and rating across all phases in a systematic way

Answer: C

Q1055. What is fuzz testing?

- A. Testing using fuzzy logic-based algorithm systems for the project goals
- B. Providing random, invalid, or unexpected data as input to find vulnerabilities
- C. Testing audio and sound reproduction quality level within the system boundary
- D. Testing with fuzzy and blurred test image inputs according to best practices

Answer: B

Q1056. What is the concept of 'test coverage criteria'?

- A. The total file size of all test script source files
- B. Rules that define what aspects of the software must be tested
- C. The total number of testers on the project team
- D. Simply how many test scripts currently exist total

Answer: B

Q1057. What is property-based testing?

- A. Testing real estate management software systems by the development process
- B. Testing that specified properties or invariants hold for all valid inputs
- C. Testing CSS stylesheet property values and styles and its related activities
- D. Testing object property and getter method values over the entire lifecycle

Answer: B

Q1058. What is the pesticide paradox in software testing?

- A. Testing agricultural management software systems within the given constraints
- B. Running the same tests repeatedly will eventually stop finding new defects
- C. Using pesticides on actual computer bugs and pests as defined by standards
- D. A chemical testing methodology approach and method for all project stakeholders

Answer: B

Q1059. What is the difference between fault, error, and failure?

- A. The three concepts are fundamentally the same thing in all development efforts
- B. An error is always immediately visible to all users to achieve project objectives
- C. A fault is a defect in code; an error is an incorrect state; a failure is observable incorrect behavior
- D. A failure is what always causes a fault to happen by the project team members and related components

Answer: C

Q1060. What is model-based testing?

- A. Testing fashion model runway performance quality in the engineering discipline
- B. Generating test cases automatically from a model of the system's behavior
- C. Testing relational database data model structures for effective project outcomes
- D. Testing three-dimensional rendering model objects as part of the methodology

Answer: B

Q1061. What is Lehman's Law of Self-Regulation?

- A. Software evolution processes are self-regulating with statistically determinable trends
- B. Software automatically regulates itself without help in practice typically
- C. Programs never need any updates or patches applied as a standard approach
- D. Developers regulate themselves without any guidance by the organization

Answer: A

Q1062. What is the concept of 'software archaeology'?

- A. Digging up old physical computer equipment devices at every stage across all phases
- B. A museum exhibit about computing history artifacts in a systematic way for the project goals
- C. Physical hardware recovery and data retrieval work according to best practices
- D. The study and recovery of knowledge about legacy systems through code analysis and documentation

Answer: D

Q1063. What is the difference between wrapping and re-engineering legacy systems?

- A. Re-engineering is always significantly faster overall and its related activities
- B. Wrapping is always significantly more expensive work by the development process
- C. The two approaches are completely identical overall within the system boundary
- D. Wrapping adds a new interface around the legacy system; re-engineering restructures its internals

Answer: D

Q1064. What is the concept of 'feature interaction' in maintenance?

- A. Comprehensive feature testing and validation plans for all project stakeholders
- B. Features physically meeting one another in person over the entire lifecycle
- C. Formal feature documentation and specification docs as defined by standards
- D. Unexpected behavior when independently developed features conflict or interfere

Answer: D

Q1065. What is the ripple effect in software maintenance?

- A. Physical water ripples in a pond surface area within the given constraints
- B. A user interface animation and transition effect by the project team members
- C. Audio sound effects in the user interface design in all development efforts
- D. The propagation of changes through the system, causing unintended side effects

Answer: D

Q1066. What is the Lehman-Belady model of software evolution?

- A. A creational object-oriented design pattern type to achieve project objectives
- B. A comprehensive software testing model and plan in the engineering discipline
- C. A purely mathematical model for calculation work and related components
- D. A set of laws describing the behavior and evolution of large software systems

Answer: D

Q1067. What is technical debt in the context of maintenance?

- A. Accumulated shortcuts and suboptimal decisions that increase future maintenance cost
- B. Financial debt for purchasing hardware equipment for effective project outcomes
- C. Monthly developer salary payments and wage costs as part of the methodology
- D. Annual recurring software licensing fee cost totals in the development process

Answer: A

Q1068. What is the concept of 'design recovery' in maintenance?

- A. Using reverse engineering to reconstruct higher-level design abstractions from code
- B. Recovering from catastrophic design errors quickly within the project scope
- C. Recovering accidentally deleted design documents during the software lifecycle
- D. Creating design backup copies and archive storage for the development team

Answer: A

Q1069. What is software rejuvenation?

- A. Periodically restarting or reinitializing software to prevent degradation from accumulated errors
- B. Making software visually look brand new and fresh throughout the project in the system context
- C. Completely rewriting the entire software system over during implementation
- D. Updating only the user interface visual design look for quality purposes in practice typically

Answer: A

Q1070. What is the relationship between maintainability and other quality attributes?

- A. Maintainability is completely independent of everything at every stage
- B. Maintainability often trades off with performance but supports reliability and portability
- C. There is absolutely no relationship at all between them as a standard approach
- D. Maintainability conflicts with all other quality attributes by the organization

Answer: B

Q1071. What is the GQM (Goal-Question-Metric) approach?

- A. A recreational video gaming strategy method approach in all development efforts by the project team members
- B. A source code implementation coding approach method and related components to achieve project objectives
- C. A systematic approach to defining goals, deriving questions, and identifying metrics for quality measurement
- D. A comprehensive software testing approach method only in the engineering discipline

Answer: C

Q1072. What is Statistical Process Control (SPC) in software QA?

- A. A source code implementation coding technique method as part of the methodology
- B. A software architecture and design method guide book in the development process
- C. Using statistical methods to monitor and control software processes to ensure they operate predictably
- D. A statistical report generated for project managers for effective project outcomes

Answer: C

Q1073. What is the concept of 'process maturity' in QA?

- A. The overall size of the development process and scope for the development team throughout the project
- B. Processes that have become outdated and old over time during the software lifecycle
- C. The execution speed of all development processes running within the project scope
- D. The extent to which an organization's processes are defined, managed, measured, and continuously improved

Answer: D

Q1074. What is Root Cause Analysis (RCA)?

- A. A systematic process for identifying the underlying causes of defects or problems
- B. Finding the roots of a physical plant in soil in the system context
- C. A production deployment automation process method for quality purposes
- D. A source code implementation coding technique only during implementation

Answer: A

Q1075. What is the difference between product quality and process quality?

- A. Product quality is entirely not measurable or assessable by the organization
- B. The two concepts are completely identical to each other in practice typically
- C. Product quality measures the software itself; process quality measures the development process
- D. Process quality is completely irrelevant to all outcomes as a standard approach

Answer: C

Q1076. What is a causal analysis meeting?

- A. An informal casual meeting with team colleagues at every stage
- B. A meeting to analyze the root causes of defects and identify preventive actions
- C. A recreational team building social activity event in a systematic way
- D. A project planning and scheduling meeting session across all phases

Answer: B

Q1077. What is the concept of 'quality gates' in software development?

- A. A type of network firewall configuration and setup according to best practices
- B. Physical security gates at building entrance areas for the project goals
- C. Checkpoints in the development process where quality criteria must be met before proceeding
- D. Security gates for data access control setup only within the system boundary

Answer: C

Q1078. What is the Clean Room approach to quality?

- A. A physically tidy and organized workspace and area by the development process
- B. A hardware manufacturing clean room facility space and its related activities
- C. A software development approach using formal verification to prevent defects rather than test for them
- D. A specific testing environment setup and space area over the entire lifecycle

Answer: C

Q1079. What is the relationship between CMMI and software quality?

- A. CMMI only measures physical hardware quality metrics for all project stakeholders
- B. There is absolutely no relationship between the two as defined by standards
- C. CMMI provides a framework for improving processes, which directly impacts software quality
- D. CMMI completely replaces all software testing types within the given constraints

Answer: C

Q1080. What is the concept of 'zero defect' philosophy?

- A. Deliberately ignoring all reported defect reports and related components
- B. Having absolutely no tests in the entire project by the project team members
- C. A quality approach emphasizing prevention and doing things right the first time
- D. A goal that is impossible to ever achieve at all in all development efforts

Answer: C

Q1081. What is the Chidamber and Kemerer (CK) metrics suite?

- A. A collection of design patterns for modules and code
- B. A comprehensive software testing tool suite and set
- C. An established coding standard and guideline set only
- D. A set of six object-oriented metrics: WMC, DIT, NOC, CBO, RFC, LCOM

Answer: D

Q1082. What is the Response For a Class (RFC) metric?

- A. A network communication protocol metric and measure during the software lifecycle
- B. A relational database performance metric and measure within the project scope
- C. The count of all methods that can be invoked in response to a message to the class
- D. A comprehensive software testing metric and measure for the development team

Answer: C

Q1083. What is the Lack of Cohesion of Methods (LCOM) metric?

- A. A production deployment readiness metric and measure during implementation
- B. A metric measuring how dissimilar methods are in a class based on the instance variables they use
- C. A comprehensive software testing metric and measure in the system context
- D. A measure of total source code line length and size throughout the project

Answer: B

Q1084. What is the Coupling Between Objects (CBO) metric?

- A. A relational database join performance metric and score as a standard approach
- B. A network bandwidth and latency metric and measurement in practice typically
- C. A physical coupling measurement between parts and things for quality purposes
- D. The count of classes to which a class is coupled through method calls, variables, or inheritance

Answer: D

Q1085. What is the concept of 'measurement dysfunction'?

- A. Broken physical measurement tools and device parts by the organization
- B. Errors in hardware measurement instruments and tools across all phases
- C. When metrics are gamed or misused, leading to counterproductive behavior
- D. Dysfunctional software that crashes frequently daily at every stage

Answer: C

Q1086. What is GQM+ Strategies?

- A. A comprehensive software testing strategy and plan according to best practices
- B. An extension of GQM that aligns measurement goals with organizational business goals
- C. A recreational video gaming strategy guide and plan in a systematic way
- D. A source code implementation coding strategy and plan for the project goals

Answer: B

Q1087. What is the concept of 'metric validation' in software engineering?

- A. Validating application source code for errors and bugs by the development process
- B. Testing software requirements for completeness and scope and its related activities
- C. Ensuring that a metric actually measures what it claims to measure and is useful
- D. Testing physical measurement tools for their accuracy within the system boundary

Answer: C

Q1088. What is the Number of Children (NOC) metric?

- A. The total number of comments in the source code base
- B. The total number of source code files in the project
- C. The number of child processes currently running now
- D. The count of immediate subclasses of a class in the inheritance tree

Answer: D

Q1089. What is the difference between size-oriented and function-oriented metrics?

- A. Size-oriented uses LOC as the basis; function-oriented uses function points
- B. Function-oriented metrics use LOC as the main basis as defined by standards
- C. Size-oriented metrics use function points as basis for all project stakeholders
- D. The two metric types are fundamentally identical overall over the entire lifecycle

Answer: A

Q1090. What is the concept of a 'balanced scorecard' in software metrics?

- A. A scorecard for athletic sports competition events within the given constraints
- B. A formal source code peer review evaluation and form by the project team members
- C. A comprehensive software testing checklist form sheet in all development efforts
- D. A strategic management framework measuring performance across multiple perspectives

Answer: D

Q1091. What is the concept of 'configuration identification'?

- A. Identifying individual automated test case scenarios in a systematic way
- B. Selecting and labeling configuration items and documenting their characteristics
- C. Identifying specific software bugs and defect reports across all phases
- D. Identifying individual team member profile records at every stage

Answer: B

Q1092. What is the difference between configuration management and change management?

- A. CM only involves application source code files and code by the development process
- B. Change management is always much broader in its scope within the system boundary
- C. CM manages all configuration items; change management specifically handles the change request process
- D. The two concepts are completely identical in all ways for the project goals according to best practices

Answer: C

Q1093. What is a Software Bill of Materials (SBOM)?

- A. A project budget and financial document and report over the entire lifecycle
- B. A grocery shopping list for the team members only and its related activities
- C. A team member roster and directory listing sheet as defined by standards
- D. A formal record of the components and dependencies in a piece of software

Answer: D

Q1094. What is Infrastructure as Code (IaC)?

- A. Building physical infrastructure roads and buildings for all project stakeholders
- B. A general-purpose coding language definition and spec within the given constraints
- C. A comprehensive software testing framework and tool set in all development efforts
- D. Managing and provisioning computing infrastructure through machine-readable configuration files

Answer: D

Q1095. What is the concept of 'immutable infrastructure'?

- A. An approach where infrastructure components are replaced rather than modified, ensuring consistency
- B. Permanent physical hardware installations and setups and related components
- C. Infrastructure that physically cannot ever change form by the project team members
- D. A specific type of database storage system and service to achieve project objectives

Answer: A

Q1096. What is semantic versioning?

- A. Alphabetical versioning of all software release names for effective project outcomes
- B. Using random numbering for all software version names in the engineering discipline
- C. A versioning scheme using MAJOR.MINOR.PATCH to convey meaning about underlying changes
- D. Date-based versioning of all software release versions as part of the methodology

Answer: C

Q1097. What is a monorepo strategy?

- A. Multiple separate repos per each single project type
- B. Storing multiple projects in a single version control repository
- C. One separate repository per individual project file
- D. Having absolutely no repository at all for the code

Answer: B

Q1098. What is the concept of 'configuration status accounting'?

- A. Recording and reporting the status of configuration items and change requests throughout the project
- B. Financial accounting and bookkeeping tasks and work in the development process
- C. Tracking developer working hours per task and activity within the project scope
- D. Counting total source code lines in the whole project during the software lifecycle

Answer: A

Q1099. What is a feature flag (feature toggle)?

- A. A physical flag or banner for signaling and marking for the development team
- B. A test indicator for pass or fail status result only in the system context
- C. A technique allowing features to be enabled or disabled without deploying new code
- D. A marker for identifying software bugs and issues only throughout the project

Answer: C

Q1100. What is the concept of 'GitOps'?

- A. A comprehensive software testing approach and method only in practice typically as a standard approach
- B. An operational framework where Git is the single source of truth for infrastructure and application deployment
- C. An established coding standard and guideline set for teams by the organization at every stage
- D. Only performing basic Git operations and nothing else during implementation for quality purposes

Answer: B

Q1101. What is the Expected Monetary Value (EMV) in risk analysis?

- A. An employee salary expectation and forecast amount in practice typically
- B. A project budget and financial metric and measurement as a standard approach
- C. A product pricing strategy and approach and methodology by the organization
- D. The product of probability and monetary impact of a risk, used in decision trees

Answer: D

Q1102. What is the concept of 'risk-driven development'?

- A. Deliberately ignoring risks in the development process in a systematic way for the project goals
- B. A comprehensive software testing approach and method only according to best practices
- C. Developing intentionally risky software applications at every stage across all phases
- D. A development approach that uses risk analysis to prioritize and guide architecture and design decisions

Answer: D

Q1103. What is a decision tree in risk management?

- A. A test hierarchy and organization structure and setup and its related activities
- B. A diagram showing decision choices, chance events, probabilities, and outcomes for risk analysis
- C. A physical tree growing in a garden area outdoors within the system boundary
- D. A source code tree and directory structure and layout by the development process

Answer: B

Q1104. What is sensitivity analysis in risk management?

- A. An emotional sensitivity analysis technique approach over the entire lifecycle
- B. A source code analysis technique and tool and method for all project stakeholders
- C. A security vulnerability analysis technique and method as defined by standards
- D. A technique that determines which risks have the greatest potential impact on project outcomes

Answer: D

Q1105. What is the concept of 'risk appetite' vs 'risk tolerance'?

- A. The two concepts are completely identical in every way within the given constraints in all development efforts
- B. Risk appetite is the level of risk an organization is willing to pursue; risk tolerance is the acceptable variation in outcomes
- C. Risk appetite is always smaller than risk tolerance level by the project team members and related components
- D. Risk tolerance always means absolutely zero risk accepted to achieve project objectives in the engineering discipline

Answer: B

Q1106. What is Monte Carlo simulation in risk management?

- A. A technique using random sampling to simulate project outcomes and assess risk probability
- B. A comprehensive software testing simulation and approach in the development process
- C. A source code implementation coding simulation and test as part of the methodology
- D. A recreational casino gambling game activity and event for effective project outcomes

Answer: A

Q1107. What is residual risk?

- A. The risk that remains after risk responses have been implemented
- B. A production deployment issue and concern and problem
- C. No risk at all remaining after response is applied
- D. A specific type of source code error found in the code

Answer: A

Q1108. What is secondary risk?

- A. A risk that is considered less important than others during the software lifecycle
- B. A specific type of reported software bug and defect for the development team
- C. A new risk that arises as a direct result of implementing a risk response
- D. A backup risk for contingency planning purposes only within the project scope

Answer: C

Q1109. What is the concept of 'risk-based testing'?

- A. A testing approach that uses risk analysis to prioritize test cases and allocate testing effort
- B. Testing software without a formal plan or schedule during implementation
- C. Random and unstructured software testing approaches in the system context
- D. Testing software with risky input data and scenarios throughout the project

Answer: A

Q1110. What is the Failure Mode and Effects Analysis (FMEA) in software?

- A. A failure analysis report document summary and overview for quality purposes in practice typically
- B. A systematic technique for identifying potential failure modes, their causes, and effects on the system
- C. A production deployment analysis and report and summary by the organization at every stage
- D. A source code implementation coding technique and method as a standard approach

Answer: B

Q1111. What is threat modeling?

- A. Creating detailed threat assessment reports and summaries for the development team
- B. A systematic approach to identifying, quantifying, and addressing security threats to a system
- C. Modeling threats in three-dimensional space and models within the project scope
- D. A specific type of software testing approach and method throughout the project

Answer: B

Q1112. What is the STRIDE threat model?

- A. A source code implementation coding framework and library for quality purposes in practice typically
- B. A comprehensive software testing model and approach only as a standard approach by the organization
- C. A threat classification model: Spoofing, Tampering, Repudiation, Information Disclosure, DoS, Elevation of Privilege
- D. A physical walking gait analysis technique and method in the system context during implementation

Answer: C

Q1113. What is the concept of 'security by design'?

- A. Integrating security considerations into every phase of the software development lifecycle
- B. Designing security logos and brand imagery and assets at every stage
- C. Adding security features only after deployment to production across all phases
- D. Writing security documentation exclusively and nothing else in a systematic way

Answer: A

Q1114. What is a zero-day vulnerability?

- A. A vulnerability that is only one day old at most today within the system boundary
- B. A previously unknown vulnerability that is exploited before a patch is available
- C. A vulnerability with absolutely zero impact on the system according to best practices
- D. A vulnerability that was fixed on day zero of discovery for the project goals

Answer: B

Q1115. What is the DREAD risk assessment model?

- A. A comprehensive software testing model and approach only and its related activities
- B. An established coding standard and guideline and rule set over the entire lifecycle
- C. An assessment of fear and dread feelings and emotions by the development process
- D. A model rating threats by Damage, Reproducibility, Exploitability, Affected users, Discoverability

Answer: D

Q1116. What is secure software development lifecycle (SSDLC)?

- A. A comprehensive software testing lifecycle and approach for all project stakeholders
- B. A production deployment lifecycle plan and schedule doc within the given constraints
- C. An approach that integrates security practices into each phase of the traditional SDLC
- D. A brand new programming language created from scratch as defined by standards

Answer: C

Q1117. What is the difference between symmetric and asymmetric encryption?

- A. Asymmetric encryption uses only one single key for all by the project team members
- B. The two encryption types are fundamentally the same thing in all development efforts
- C. Symmetric encryption uses two different keys always now and related components
- D. Symmetric uses the same key for encryption and decryption; asymmetric uses a key pair

Answer: D

Q1118. What is a Common Vulnerabilities and Exposures (CVE)?

- A. A standardized system for identifying and naming publicly known cybersecurity vulnerabilities
- B. A comprehensive software testing framework and tool suite for effective project outcomes
- C. An established coding standard and guideline and rule set in the engineering discipline
- D. A specific type of computer virus or malware and threat to achieve project objectives

Answer: A

Q1119. What is the concept of 'attack surface'?

- A. The physical surface of a computer case and housing as part of the methodology
- B. A network configuration and topology setup and structure during the software lifecycle
- C. A specific type of user interface design and layout only in the development process
- D. The total number of points where an unauthorized user can try to enter or extract data

Answer: D

Q1120. What is the principle of 'fail secure' vs 'fail open'?

- A. The two concepts are fundamentally identical in all ways within the project scope
- B. Fail secure allows all access on any failure or error event throughout the project
- C. Fail open is always the more secure approach and method for the development team
- D. Fail secure denies access by default on failure; fail open allows access on failure

Answer: D

Q1121. A company is experiencing frequent project delays and cost overruns. Which fundamental software engineering principle would most directly address this?

- A. Hiring additional developers without changing methodology
- B. Reducing documentation to accelerate coding activities
- C. Adopting structured process models with clear milestones
- D. Purchasing more powerful servers for the development team

Answer: C

Q1122. In Lehman's laws of software evolution, what does the law of continuing change state?

- A. Software quality improves automatically without any effort
- B. Software maintenance effort reduces with each new release
- C. Software complexity decreases naturally over time periods
- D. Software must continually adapt or become less satisfactory

Answer: D

Q1123. A team finds that fixing one bug consistently introduces two new defects. Which concept best explains this phenomenon?

- A. Software entropy and increasing system complexity over time
- B. Effective regression testing preventing all defect propagation
- C. Proper documentation reducing overall maintenance difficulty
- D. Successful modular design isolating component dependencies

Answer: A

Q1124. When applying the 'separation of concerns' principle, what is the primary architectural benefit achieved?

- A. Documentation requirements are completely eliminated from work
- B. Each module addresses a distinct feature independently of others
- C. Testing becomes unnecessary due to simplified code structure
- D. All system functionality is consolidated into a single module

Answer: B

Q1125. A startup must deliver a product quickly with uncertain requirements. Which combination of software engineering principles is most appropriate?

- A. Comprehensive upfront documentation with rigid phase milestones
- B. Iterative development with frequent stakeholder feedback cycles
- C. Big bang integration testing after all modules are completed
- D. Waterfall model with complete requirements before any coding

Answer: B

Q1126. What is Brooks' law and how does it impact late software projects?

- A. Late projects benefit most from adding experienced engineers
- B. Doubling the team size will exactly halve the delivery time
- C. Adding people to a late project makes it even later overall
- D. Project delays are always caused by insufficient team members

Answer: C

Q1127. In the context of sociotechnical systems, why must software engineers consider organizational factors?

- A. Organizational factors have no measurable impact on software quality
- B. Technical solutions must align with organizational processes and culture
- C. Software operates independently of any human or organizational context
- D. Engineering decisions should be based solely on technical merit alone

Answer: B

Q1128. A legacy system handles critical operations but uses obsolete technology. What is the recommended engineering approach?

- A. Ignoring the system until it fails completely in production
- B. Complete system rewrite without referencing existing functionality
- C. Immediate shutdown followed by building from scratch entirely
- D. Incremental modernization while maintaining system availability

Answer: D

Q1129. What distinguishes emergent system properties from designed properties in software engineering?

- A. Emergent properties arise from component interactions not individual parts
- B. Emergent properties can be fully predicted from individual components
- C. Designed properties only appear after system deployment to production
- D. Emergent properties are explicitly defined in requirements documentation

Answer: A

Q1130. How does Conway's law relate software architecture to organizational structure?

- A. Technical architecture solely determines how teams are organized
- B. Software architecture is always independent of team organization
- C. Organizational hierarchy has no influence on system module design
- D. System designs mirror the communication structure of the organization

Answer: D

Q1131. A government agency requires extensive documentation and formal sign-offs at each development stage. Which process model best fits this environment?

- A. Waterfall model with formal reviews and documentation at each phase
- B. Extreme programming with minimal documentation and rapid iterations
- C. Scrum framework with two-week sprints and daily standup meetings
- D. Kanban method with continuous flow and no predefined phase gates

Answer: A

Q1132. A team is building a safety-critical system for an aircraft. Why would the V-model be preferred over agile approaches?

- A. V-model ensures rigorous verification and validation at each level
- B. V-model eliminates the need for any form of requirements analysis
- C. Agile approaches always produce higher quality safety-critical code
- D. Agile methods provide more thorough documentation for regulators

Answer: A

Q1133. In the spiral model, how does the team determine the scope of each iteration?

- A. By implementing all remaining features in every single spiral loop
- B. By evaluating identified risks and prioritizing their mitigation efforts
- C. By following a fixed predetermined schedule regardless of any risks
- D. By randomly selecting features from the product backlog for building

Answer: B

Q1134. A project started with the waterfall model but requirements keep changing. What is the most pragmatic transition strategy?

- A. Shift to an incremental model preserving completed phase artifacts
- B. Continue with waterfall and reject all incoming change requests
- C. Abandon process models entirely and use ad hoc development now
- D. Restart the entire project from scratch using a different language

Answer: A

Q1135. What is the primary challenge of using evolutionary prototyping for large-scale enterprise systems?

- A. Enterprise systems cannot use any iterative development technique
- B. Large systems never benefit from any prototyping approach at all
- C. Prototypes may evolve into poorly architected production systems
- D. Evolutionary prototyping always produces perfectly structured code

Answer: C

Q1136. How does the Rational Unified Process (RUP) handle changing requirements compared to traditional plan-driven approaches?

- A. RUP accommodates changes through iterative development within structured phases
- B. RUP completely prevents any requirement changes after the inception phase ends
- C. RUP requires a complete project restart whenever any requirement changes occur
- D. RUP has no mechanism for handling requirements changes during development work

Answer: A

Q1137. A medical device company must comply with FDA validation requirements. How does this constraint affect process model selection?

- A. It favors models with traceable verification and validation documentation
- B. It mandates that no testing be performed until final system delivery
- C. It eliminates all possible process models from consideration entirely
- D. It requires using only agile methods without any formal documentation

Answer: A

Q1138. What is the fundamental trade-off between plan-driven and agile process models in terms of project governance?

- A. Plan-driven offers more control and predictability; agile offers more flexibility and speed
- B. Plan-driven and agile models provide identical levels of governance and predictability
- C. Plan-driven models are always inferior to agile in every project context and scenario
- D. Agile models provide more formal governance and control than plan-driven approaches do

Answer: A

Q1139. When applying the DevOps model, how does continuous integration change the traditional process model structure?

- A. It separates development and operations into completely independent workflows
- B. It requires all code to be written before any integration testing takes place
- C. It merges development and operations phases into a continuous automated pipeline
- D. It completely eliminates the need for any testing or quality assurance activities

Answer: C

Q1140. A startup pivots its product direction every three months based on market feedback. Which process model characteristic is most essential?

- A. Fixed scope defined entirely at project start without any later changes
- B. Long sequential phases with comprehensive documentation at every stage
- C. Short iteration cycles with frequent delivery and customer feedback loops
- D. Complete architecture designed before any implementation work begins

Answer: C

Q1141. A team's velocity has been declining over the past five sprints despite no personnel changes. What is the most likely root cause to investigate?

- A. The team has become too skilled and experienced for the project work
- B. Increasing technical debt making new development progressively harder
- C. The product backlog has become too small with too few remaining items
- D. Sprint duration has been too short for any meaningful work to occur

Answer: B

Q1142. How should a Scrum team handle a situation where the Product Owner frequently changes priorities mid-sprint?

- A. Remove the Product Owner from the team to prevent further disruption to the process flow
- B. Educate the Product Owner on sprint commitment and defer changes to next sprint planning
- C. Immediately abandon current sprint work and start on the new priorities without question
- D. Ignore all priority changes and continue working on the original plan without communication

Answer: B

Q1143. In SAFe (Scaled Agile Framework), what is the purpose of a Program Increment planning event?

- A. To eliminate the need for individual team sprint planning sessions throughout the increment
- B. To replace all Scrum ceremonies with a single comprehensive monthly planning meeting event
- C. To align multiple agile teams on shared objectives and dependencies for a planning period
- D. To assign specific tasks to individual developers across all teams in the entire organization

Answer: C

Q1144. A distributed agile team across three time zones is struggling with communication. Which practice would most effectively address this challenge?

- A. Requiring all team members to work the same hours regardless of their local time zone
- B. Establishing overlapping core hours and using asynchronous communication tools effectively
- C. Eliminating all meetings and relying exclusively on email for all team communications
- D. Splitting the team into independent groups that never need to communicate with each other

Answer: B

Q1145. What is the relationship between the Agile Manifesto values and the twelve agile principles?

- A. The values replace the principles and make them unnecessary for any agile team practice
- B. The values and principles are completely unrelated documents with different authors entirely
- C. The principles contradict the values and should be followed instead of the manifesto values
- D. The principles provide specific guidance for applying the four abstract manifesto values

Answer: D

Q1146. When transitioning from waterfall to agile, what is the most significant organizational challenge?

- A. Shifting from command-and-control management to servant leadership and team autonomy
- B. Purchasing new software development tools and IDE licenses for all team members now
- C. Reducing the number of meetings from weekly status updates to no meetings at all
- D. Renaming existing project roles to match agile terminology without changing practices

Answer: A

Q1147. How does technical debt impact agile teams differently than plan-driven teams?

- A. Agile teams are immune to technical debt because they refactor code in every single sprint
- B. Technical debt affects plan-driven teams more because they have longer development cycles
- C. Agile teams feel the impact sooner due to shorter iteration cycles and continuous delivery
- D. Plan-driven teams never accumulate technical debt due to their thorough upfront planning

Answer: C

Q1148. A team is practicing Scrum but the sprint goal is never met. The team completes individual stories but lacks cohesion. What is the underlying issue?

- A. The sprint goal is not well-defined or the team is not collaborating toward a shared objective
- B. The Product Owner is providing too few user stories for the team to work on each sprint
- C. The sprint duration is too long and the team runs out of meaningful work before it ends
- D. Individual team members are too skilled and complete work too quickly without coordination

Answer: A

Q1149. In Lean software development, what does 'eliminating waste' specifically refer to?

- A. Removing activities that do not add value to the customer from the development process
- B. Reducing the physical waste produced by the office including paper and plastic materials
- C. Firing underperforming team members to improve the overall productivity of the team now
- D. Deleting all source code comments and documentation to reduce the size of the codebase

Answer: A

Q1150. What is the difference between adaptive and predictive project management approaches in the context of agile?

- A. Both approaches are identical in how they handle project scope and requirement changes fully
- B. Adaptive approaches fix all requirements at start; predictive approaches change constantly now
- C. Adaptive approaches embrace change and evolve plans; predictive approaches fix scope upfront
- D. Predictive approaches are more responsive to change than adaptive approaches in all cases

Answer: C

Q1151. A healthcare system must comply with HIPAA regulations. How should these regulatory constraints be captured in requirements?

- A. As project management constraints affecting only the delivery timeline and budget
- B. As functional requirements describing the user interface layout and color scheme
- C. As non-functional requirements specifying security, privacy, and audit trail standards
- D. As optional features that can be implemented if time and budget allow during work

Answer: C

Q1152. During elicitation, stakeholders express contradictory requirements. What is the most effective resolution approach?

- A. Implement all contradictory requirements simultaneously without resolving the conflicts
- B. Facilitate negotiation sessions to find compromises and document agreed-upon priorities
- C. Ignore the less senior stakeholder's requirements and implement only the manager's view
- D. Postpone the entire project until all stakeholders naturally reach unanimous agreement

Answer: B

Q1153. What is the relationship between requirements volatility and project risk in software engineering?

- A. Requirements volatility has no measurable impact on project risk or delivery outcomes
- B. Requirements stability increases project risk because it prevents creative innovation work
- C. Volatile requirements always reduce project risk by keeping the team adaptable and ready
- D. Higher requirements volatility increases project risk through scope creep and rework costs

Answer: D

Q1154. How should safety-critical requirements be specified differently from standard functional requirements?

- A. Using informal natural language descriptions without any additional precision or detail
- B. With formal notation, rigorous verification criteria, and detailed failure mode analysis
- C. Exactly the same way as any other functional requirement without special treatment given
- D. By omitting them from documentation and relying on developer intuition during coding

Answer: B

Q1155. A team discovers during implementation that a key requirement is technically infeasible. What is the appropriate requirements engineering response?

- A. Conduct impact analysis, negotiate alternatives with stakeholders, and update the SRS document
- B. Cancel the entire project because a single requirement cannot be implemented as specified
- C. Continue attempting to implement the infeasible requirement regardless of technical limitations
- D. Silently remove the requirement from the SRS without informing any stakeholders about it

Answer: A

Q1156. What is the 'requirements gap' and how does it affect software projects?

- A. It is the physical distance between the development team and the client office locations
- B. It is the difference between documented requirements and actual stakeholder needs and expectations
- C. It is the time delay between writing requirements and implementing them in source code only
- D. It is the salary difference between requirements analysts and software development engineers

Answer: B

Q1157. How do goal-oriented requirements engineering approaches differ from traditional approaches?

- A. They focus exclusively on technical implementation details rather than business-level objectives
- B. They eliminate the need for any stakeholder communication during the requirements phase entirely
- C. They focus on stakeholder goals and derive requirements from high-level objectives systematically
- D. They produce identical results to traditional approaches but use different terminology and tools

Answer: C

Q1158. In a large enterprise system with hundreds of requirements, how should traceability be managed effectively?

- A. By assigning one developer to memorize all requirement-to-code mappings without any tools
- B. By avoiding traceability entirely since it adds overhead without providing any project value
- C. By manually maintaining paper documents that cross-reference every requirement to code lines
- D. Using automated traceability tools with bidirectional links between requirements and artifacts

Answer: D

Q1159. What is the impact of cultural differences on requirements elicitation in global software development projects?

- A. Cultural differences affect communication styles, expectations, and interpretation of requirements
- B. Cultural differences have no impact on requirements because software is a universal language
- C. All cultures have identical approaches to expressing needs and defining system requirements
- D. Cultural factors only affect project management and have no relevance to requirements work

Answer: A

Q1160. How does viewpoint-oriented requirements engineering handle the challenge of multiple perspectives?

- A. It combines all viewpoints into one without distinguishing their sources or resolving conflicts
- B. It selects a single viewpoint and ignores all other perspectives throughout the entire project
- C. It systematically captures and reconciles requirements from different stakeholder viewpoints
- D. It eliminates the need for stakeholder involvement by relying solely on developer assumptions

Answer: C

Q1161. A project is showing a Cost Performance Index (CPI) of 0.8 and Schedule Performance Index (SPI) of 0.9. What does this indicate?

- A. The project is under budget by 20% and ahead of schedule by 10% of planned work
- B. The project is over budget by 20% and behind schedule by 10% of planned progress
- C. The project is exactly on budget and on schedule according to the baseline plan
- D. The project has been completed successfully with all deliverables meeting standards

Answer: B

Q1162. How should a project manager handle a situation where the estimated effort exceeds the available budget?

- A. Cancel the project immediately without exploring any alternative approaches or solutions
- B. Proceed with the full scope and hope the team can work faster than the estimates suggest
- C. Add more developers to reduce the schedule without adjusting the budget or scope at all
- D. Negotiate scope reduction with stakeholders while maintaining core functionality intact

Answer: D

Q1163. In Brooks' Mythical Man-Month, why does adding developers to a late project make it later?

- A. New developers instantly become productive and reduce the workload on existing team members
- B. Projects always finish on time regardless of team size changes during the development period
- C. Adding developers has no measurable effect on project schedule in any known situation today
- D. Communication overhead grows quadratically and new members need ramp-up training time

Answer: D

Q1164. A team uses PERT estimation with optimistic=2 weeks, most likely=4 weeks, and pessimistic=12 weeks. What is the expected duration?

- A. Five weeks based on the weighted average formula used in PERT estimation technique
- B. Two weeks because PERT always selects the most optimistic estimate for planning work
- C. Twelve weeks because PERT always uses the pessimistic estimate for safety margin only
- D. Four weeks because the most likely estimate is always the final expected duration value

Answer: A

Q1165. How does the theory of constraints apply to software project management?

- A. It requires constraining all team members to work at exactly the same speed and pace
- B. It identifies and focuses improvement efforts on the bottleneck limiting overall throughput
- C. It suggests adding constraints to every activity to improve project discipline overall
- D. It eliminates all project constraints by removing deadlines and budget limitations now

Answer: B

Q1166. A project manager discovers that two critical team members plan to leave mid-project. What proactive measures should be taken?

- A. Ignore the risk and assume the remaining team can absorb all additional workload easily
- B. Immediately cancel the project since replacing team members is impossible to accomplish
- C. Reduce product quality standards so the remaining team can deliver with less total effort
- D. Document knowledge, cross-train team members, and plan for replacement hiring immediately

Answer: D

Q1167. What is the relationship between project size and defect density in software engineering?

- A. Project size has absolutely no correlation with defect density in any published research data
- B. Defect density remains perfectly constant regardless of project size or complexity levels
- C. Smaller projects always have more defects than larger projects due to less thorough testing
- D. Larger projects tend to have higher defect density due to increased complexity and coupling

Answer: D

Q1168. How should a project manager balance the competing demands of multiple stakeholders with different priorities?

- A. Randomly select which stakeholder requirements to implement without any systematic approach
- B. Ignore all stakeholder input and make decisions based solely on the development team opinion
- C. Use stakeholder analysis to understand influence and interest, then negotiate compromises
- D. Always prioritize the requirements of the most senior stakeholder without any negotiation

Answer: C

Q1169. What is Monte Carlo simulation used for in project management and how does it improve estimation accuracy?

- A. It eliminates all uncertainty from project estimates by using a fixed mathematical formula only
- B. It provides a single deterministic estimate that is always accurate for every project situation
- C. It replaces the need for expert judgment by using random numbers without any project data
- D. It runs thousands of simulations with varying inputs to produce probability-based schedule forecasts

Answer: D

Q1170. In agile project management, how does the concept of 'servant leadership' change the traditional project manager role?

- A. The manager delegates all responsibility and has no involvement in the project activities at all
- B. The manager increases direct control over all individual tasks and decisions made by the team
- C. The manager role is completely eliminated and no leadership exists within agile project teams
- D. The manager focuses on removing impediments and empowering the team rather than directing work

Answer: D

Q1171. A system needs to support multiple database backends (MySQL, PostgreSQL, MongoDB) without changing business logic. Which design approach is most appropriate?

- A. Hardcoding database queries directly into business logic classes for maximum performance
- B. Abstract Factory pattern with database-specific factory implementations for each backend
- C. Using global variables to store database connection strings throughout the application
- D. Writing separate copies of the business logic for each database backend independently

Answer: B

Q1172. How does the SOLID principles violation manifest in a God class anti-pattern?

- A. The class violates SRP by handling too many responsibilities and having many reasons to change
- B. The class follows SRP perfectly by focusing on a single well-defined responsibility only
- C. The class demonstrates ideal OCP by being completely closed to any future extensions work
- D. The class exemplifies LSP by being perfectly substitutable for all of its subtype classes

Answer: A

Q1173. A real-time trading system must process millions of events per second. How should the design balance performance with maintainability?

- A. Sacrifice all code readability and maintainability to achieve maximum raw processing speed
- B. Implement all processing in a single monolithic function for maximum execution throughput
- C. Use the simplest possible design without considering performance requirements at any point
- D. Use event-driven architecture with optimized hot paths while keeping non-critical paths clean

Answer: D

Q1174. What is the relationship between design patterns and anti-patterns in software engineering?

- A. Anti-patterns are always better than design patterns for solving complex engineering problems
- B. Design patterns cause problems while anti-patterns provide effective solutions for all cases
- C. Design patterns solve recurring problems; anti-patterns are commonly used but ineffective solutions
- D. Design patterns and anti-patterns are identical concepts with interchangeable names and usage

Answer: C

Q1175. How does the Hexagonal Architecture (Ports and Adapters) improve testability of business logic?

- A. It isolates business logic from external dependencies through ports allowing easy mock injection
- B. It embeds external dependencies directly into business logic making testing straightforward now
- C. It makes testing harder by creating multiple layers of indirection between all components now
- D. It eliminates the need for any testing by ensuring the business logic is always correct already

Answer: A

Q1176. A development team is debating between using inheritance hierarchies and composition for code reuse. What factors should guide this decision?

- A. Always use composition because inheritance should never be used in any software system today
- B. Use inheritance for genuine is-a relationships; prefer composition for flexible behavior reuse
- C. Always use inheritance because it is fundamentally superior to composition in every scenario
- D. The choice is purely aesthetic and has no impact on system flexibility or maintainability

Answer: B

Q1177. How does the Command pattern enable undo functionality in software applications?

- A. The Command pattern only supports redo operations and cannot implement undo functionality now
- B. Undo is implemented by restarting the entire application from its initial state each time needed
- C. The Command pattern prevents any actions from being undone once they have been executed fully
- D. Each command object encapsulates an action and its inverse allowing execution reversal on demand

Answer: D

Q1178. What is the impact of circular dependencies on software design quality and maintainability?

- A. They simplify the build process by reducing the number of modules that need compilation work
- B. They have no measurable impact on software design quality or long-term maintainability at all
- C. They increase coupling, complicate builds, and make modules impossible to test in isolation easily
- D. They improve design quality by ensuring all modules are tightly integrated with each other now

Answer: C

Q1179. In domain-driven design, how does the Bounded Context pattern help manage complexity in large systems?

- A. It requires a single unified domain model used identically across all parts of the entire system
- B. It eliminates the need for any domain modeling by using generic data structures everywhere now
- C. It defines clear boundaries where specific domain models apply preventing model conflicts globally
- D. It increases complexity by requiring every team to understand all domain models in the system

Answer: C

Q1180. How should a designer handle the tension between the DRY principle and the need for module independence?

- A. Accept controlled duplication when shared abstractions would create inappropriate coupling between modules
- B. Always eliminate every instance of duplication regardless of the coupling it introduces between parts
- C. Force all modules to share a single implementation even when their requirements diverge significantly
- D. Ignore the DRY principle entirely because code duplication has no negative consequences on quality

Answer: A

Q1181. A company needs to migrate a monolithic e-commerce platform to microservices. What is the recommended architectural migration strategy?

- A. Identify bounded contexts, extract services incrementally, and use an API gateway for routing
- B. Rewrite the entire system from scratch in a new language without referencing existing code
- C. Keep the monolith exactly as is and simply rename it as a microservices architecture now
- D. Split the monolith randomly into services without analyzing domain boundaries or dependencies

Answer: A

Q1182. How does the CAP theorem constrain the design of distributed database architectures?

- A. The CAP theorem only applies to relational databases and not to any NoSQL database systems
- B. A distributed system can guarantee at most two of consistency, availability, and partition tolerance
- C. Partition tolerance is optional in distributed systems and can be safely ignored in all designs
- D. A distributed system can easily achieve all three properties simultaneously without any trade-offs

Answer: B

Q1183. A streaming analytics platform must process ten million events per second with sub-second latency. Which architectural pattern is most suitable?

- A. Single-threaded monolithic application processing events sequentially one at a time in order
- B. Batch processing architecture that collects events for hourly processing in large bulk operations
- C. Traditional request-response architecture with synchronous database queries for each single event
- D. Event sourcing with partitioned stream processing and in-memory computation for hot data paths

Answer: D

Q1184. What are the architectural implications of choosing eventual consistency over strong consistency?

- A. Eventual consistency has no implications and behaves identically to strong consistency in all cases
- B. Strong consistency always provides better performance than eventual consistency in every scenario
- C. Eventual consistency eliminates all data inconsistency problems permanently without any trade-offs
- D. The system gains availability and performance but must handle temporary data inconsistencies gracefully

Answer: D

Q1185. How should an architect design a system to be resilient against cascading failures in a microservices environment?

- A. Remove all error handling to reduce code complexity and improve overall system performance metrics
- B. Implement circuit breakers, bulkheads, and graceful degradation patterns between all service boundaries
- C. Use a single shared database for all services to eliminate any communication failures between them
- D. Make every service synchronously dependent on every other service to ensure data consistency always

Answer: B

Q1186. What is the architectural significance of Conway's law when designing large-scale distributed systems?

- A. Conway's law has been disproven and has no relevance to modern software architecture decisions
- B. System architecture should be designed without any consideration of team organization structure
- C. Team structure should align with desired system architecture to avoid communication mismatches
- D. Conway's law only applies to monolithic systems and is irrelevant for distributed architectures

Answer: C

Q1187. A healthcare system requires 99.999% availability. How does this requirement influence the architectural decisions?

- A. It requires a single centralized server to minimize complexity and potential points of failure in system
- B. It mandates redundancy, automatic failover, geographic distribution, and elimination of single points of failure
- C. It means the system should avoid any redundancy to reduce the number of components that can fail
- D. It has no impact on architecture because availability is purely an operational and infrastructure concern

Answer: B

Q1188. How does the saga pattern handle distributed transactions across microservices?

- A. It uses traditional two-phase commit protocol locking all services until the transaction completes fully
- B. It coordinates a sequence of local transactions with compensating actions for failure rollback scenarios
- C. It requires all microservices to share a single database to ensure transactional consistency always
- D. It avoids any form of transaction management and accepts data corruption as an acceptable outcome

Answer: B

Q1189. What architectural considerations are necessary when designing a multi-tenant SaaS application?

- A. Multi-tenant applications should use a separate deployed instance for every individual tenant always
- B. All tenants must share identical configurations with no customization options available for any tenant
- C. Data isolation strategies, per-tenant customization, scalability, and fair resource allocation mechanisms
- D. Multi-tenancy requires no special architectural considerations beyond a standard single-user application

Answer: C

Q1190. How does the sidecar pattern enhance service mesh architectures in cloud-native applications?

- A. It deploys supporting functionality alongside each service without modifying the service code itself
- B. It embeds all infrastructure concerns directly into business logic code of every service instance
- C. It requires every service to implement its own service discovery and load balancing logic fully
- D. It eliminates the need for any networking between services by running everything in one process

Answer: A

Q1191. A healthcare application is used by elderly patients with limited technical experience. Which UI design principles should be prioritized?

- A. Large touch targets, high contrast, simple navigation, clear typography, and minimal cognitive load
- B. Advanced keyboard shortcuts, minimal visual feedback, and hidden navigation behind icon-only menus
- C. Small fonts, complex multi-level menus, gesture-only navigation, and low contrast color schemes
- D. Dense information displays, small buttons, animation-heavy interfaces, and technical terminology use

Answer: A

Q1192. How does cognitive load theory influence the number of options presented in a UI at one time?

- A. The number of options has no measurable impact on user performance or satisfaction in any context
- B. Cognitive load theory suggests options should never be limited because users can process infinite items
- C. Too many options increase cognitive load and decision time, following Hick's law principles closely
- D. Users always prefer having maximum options displayed simultaneously regardless of task complexity

Answer: C

Q1193. A team is designing a dashboard for data analysts who monitor real-time metrics. What design pattern best supports their workflow?

- A. A slideshow that automatically rotates through metrics without any user control or interaction
- B. Full-screen modal dialogs for each individual metric requiring sequential manual navigation
- C. A single fixed text-based report with no interactive elements or visualization capabilities
- D. Overview plus detail pattern with drill-down capabilities and customizable widget arrangements

Answer: D

Q1194. How should error messages be designed to minimize user frustration and support error recovery?

- A. Cryptic error codes without any explanation or guidance for users on how to resolve the problem
- B. Blaming the user for causing the error and demanding they contact technical support immediately
- C. Clear language explaining what went wrong, why it happened, and specific steps to fix the issue
- D. Hiding all errors silently without any notification so the user does not experience any frustration

Answer: C

Q1195. What is the impact of animation and micro-interactions on perceived application performance?

- A. All animations slow down perceived performance and should be completely eliminated from every app
- B. Animations should only be used for decorative purposes and never for functional feedback to users
- C. Animations have no measurable impact on how users perceive the speed of the application interface
- D. Well-designed animations mask loading times and provide continuity making the app feel faster overall

Answer: D

Q1196. A multi-language application serves users across twenty countries. What UI design challenges must be addressed?

- A. Text expansion and contraction, RTL layout support, cultural color meanings, and locale-specific formats
- B. Internationalization only requires translating text strings and has no impact on layout or design work
- C. All languages and cultures use identical UI conventions so no design adaptations are ever necessary
- D. Multi-language support only affects backend code and has no visible impact on the user interface

Answer: A

Q1197. How does the concept of 'dark patterns' in UI design undermine user trust?

- A. Dark patterns refer exclusively to using dark color themes and have no ethical implications at all
- B. Dark patterns manipulate users into unintended actions through deceptive design techniques intentionally
- C. Dark patterns are always beneficial because they guide users toward the best possible decisions
- D. Dark patterns have no impact on user trust because most users cannot detect manipulative design

Answer: B

Q1198. A financial trading application must display rapidly changing data without overwhelming the user. How should the UI handle this?

- A. Use identical visual treatment for all data regardless of importance or rate of change observed
- B. Use visual prioritization, controlled update frequencies, and highlight only significant data changes
- C. Remove all real-time data and only show daily summary reports to reduce information overload
- D. Display every data change immediately with full-screen alerts for each individual price movement

Answer: B

Q1199. What is the relationship between information architecture and UI design in creating effective digital products?

- A. Information architecture defines content structure and organization that UI design then visualizes
- B. UI design determines information architecture since visual layout always precedes content structure
- C. Information architecture only applies to physical spaces and has no relevance to digital products
- D. Information architecture and UI design are completely unrelated disciplines with no overlap at all

Answer: A

Q1200. How should a design team approach creating an inclusive design that works for users with motor, visual, cognitive, and auditory disabilities?

- A. Design only for the average user and provide a separate simplified version for disabled users later
- B. Assistive technologies handle all accessibility needs so designers do not need to consider them now
- C. Follow WCAG guidelines, test with assistive technologies, and involve users with disabilities in testing
- D. Accessibility is a legal requirement only and does not require any changes to the actual design work

Answer: C

Q1201. A team is experiencing frequent merge conflicts in a large codebase. What implementation practices would most effectively reduce this problem?

- A. Larger infrequent commits combining many changes to reduce the total number of merge operations
- B. Smaller frequent commits, feature branching strategies, and modular code with clear ownership areas
- C. Having all developers work on the same branch and file simultaneously without any coordination
- D. Avoiding version control entirely and using shared network drives for all source code storage

Answer: B

Q1202. How does test-driven development (TDD) change the implementation workflow compared to traditional development?

- A. Tests are completely eliminated from the development process to accelerate feature delivery speed
- B. TDD and traditional development follow identical workflows with no differences in approach at all
- C. Implementation is completed fully before any tests are considered or written for the codebase
- D. Tests are written before implementation code, driving design decisions and ensuring test coverage

Answer: D

Q1203. A legacy codebase has no automated tests. What is the safest approach to introduce testing?

- A. Delete all existing code and replace it with test stubs that will be implemented later on
- B. Skip testing entirely since the codebase has worked without tests for its entire lifetime so far
- C. Write characterization tests capturing current behavior before making any code changes to system
- D. Rewrite the entire codebase from scratch with tests rather than adding tests to existing code

Answer: C

Q1204. How does feature flag implementation enable continuous deployment while managing risk?

- A. Feature flags completely prevent any bugs from reaching the production environment automatically
- B. Feature flags are only useful for UI changes and cannot be applied to backend logic or services
- C. Flags allow deploying code to production with features disabled, enabling gradual controlled rollout
- D. Flags eliminate the need for any testing since features can be toggled off if problems occur now

Answer: C

Q1205. What is the impact of choosing a monorepo versus polyrepo strategy on implementation workflow?

- A. Monorepos are only suitable for small projects and cannot scale to large enterprise codebases
- B. Monorepos and polyrepos have identical workflow implications with no meaningful differences at all
- C. Monorepos simplify cross-project changes but require sophisticated build and CI tooling at scale
- D. Polyrepos are always superior because they eliminate all cross-project dependency management needs

Answer: C

Q1206. A performance-critical system component is a bottleneck. How should the team approach optimization?

- A. Apply every known optimization technique to all code regardless of whether it is a bottleneck
- B. Rewrite the entire codebase in assembly language without profiling or measuring performance first
- C. Profile to identify actual bottlenecks, optimize measured hot paths, and benchmark improvements
- D. Avoid any optimization since premature optimization is the root of all evil in every situation

Answer: C

Q1207. How does clean code philosophy address the trade-off between code readability and cleverness?

- A. It treats readability and cleverness as identical qualities that never conflict with each other
- B. It suggests that code readability is irrelevant since compilers handle all code interpretation
- C. It encourages maximally clever code because shorter code is always better regardless of clarity
- D. It prioritizes readability over cleverness because code is read far more often than it is written

Answer: D

Q1208. What are the implementation challenges of handling distributed system failures gracefully?

- A. All distributed failures can be prevented entirely through proper implementation techniques alone
- B. Distributed systems never experience failures because modern networks are perfectly reliable now
- C. Network partitions, partial failures, and timeout handling require careful idempotent retry design
- D. Failure handling is identical in distributed and single-machine systems with no added complexity

Answer: C

Q1209. How does immutable infrastructure change the deployment and implementation practices?

- A. Immutable infrastructure prevents any updates or patches from being applied to the system ever
- B. Immutable infrastructure is identical to traditional mutable server management in all aspects
- C. Servers are continuously patched and modified in place to apply updates and configuration changes
- D. Servers are never modified after creation; changes require building and deploying new instances

Answer: D

Q1210. What is the role of code complexity metrics like cyclomatic complexity in guiding implementation decisions?

- A. Complexity metrics should only be used for documentation purposes and never influence coding work
- B. Higher complexity always means better code because it handles more edge cases and scenarios now
- C. Cyclomatic complexity has no correlation with defect rates or maintenance difficulty in any study
- D. High complexity indicates code that is harder to test, maintain, and more likely to contain defects

Answer: D

Q1211. A team has 90% code coverage but still experiences production bugs. What does this reveal about their testing strategy?

- A. High coverage does not guarantee test quality; tests may lack meaningful assertions and edge cases
- B. Code coverage is meaningless and should be completely ignored as a testing quality metric now
- C. The remaining ten percent of uncovered code contains all bugs and coverage should reach exactly full
- D. Ninety percent coverage guarantees that ninety percent of all possible bugs have been detected

Answer: A

Q1212. How does property-based testing complement example-based testing?

- A. It generates hundreds of random inputs to test properties that should hold for all valid inputs
- B. It is identical to example-based testing and provides no additional value to the test suite now
- C. It only tests a single predefined example and is less thorough than example-based approaches
- D. It replaces example-based testing entirely and provides complete coverage of all possibilities

Answer: A

Q1213. A safety-critical aviation system requires DO-178C compliance. How does this affect the testing approach?

- A. It allows the team to choose any testing approach without following any specific testing standards
- B. It only requires basic unit testing without any structural coverage or formal verification work
- C. It mandates structural coverage analysis, requirements-based testing, and formal verification methods
- D. It eliminates the need for any testing because certification replaces all quality activities now

Answer: C

Q1214. What is the oracle problem in software testing and how does it affect test automation?

- A. The oracle problem has been completely solved and no longer affects any testing activities today
- B. The oracle problem only applies to manual testing and has no impact on automated testing work
- C. Difficulty in determining expected outputs for complex scenarios limits automated test effectiveness
- D. It refers to the challenge of selecting which database system to use for storing test data only

Answer: C

Q1215. How does chaos engineering differ from traditional testing approaches?

- A. It replaces all traditional testing and eliminates the need for unit and integration test suites
- B. It intentionally introduces failures in production to verify system resilience and recovery capability
- C. It follows traditional scripted test cases executed in a controlled staging environment only today
- D. It avoids any deliberate failure injection and relies on monitoring to detect issues passively

Answer: B

Q1216. A microservices architecture has complex service interactions. What testing strategy best addresses integration risks?

- A. Full end-to-end testing of every possible service interaction path for complete coverage goal
- B. Contract testing verifying service interfaces plus consumer-driven contracts between service pairs
- C. Skipping all testing and relying on production monitoring to detect integration failures only
- D. Only unit testing individual services without any integration or contract testing between them

Answer: B

Q1217. What is the relationship between testability and software design quality?

- A. Poorly designed code is always easier to test than well-designed code due to simpler structure
- B. Highly testable code typically exhibits good design qualities like loose coupling and high cohesion
- C. Testability has no relationship with design quality and they are completely independent concerns
- D. Testability should never influence design decisions because it compromises performance always

Answer: B

Q1218. How should a team prioritize test automation efforts when resources are limited?

- A. Automate high-value repetitive tests first: smoke tests, regression suites, and critical path scenarios
- B. Automate only the tests that are easiest to write regardless of their value to the project now
- C. Avoid all automation and rely entirely on manual testing regardless of the available resources
- D. Automate random tests without considering their value or frequency of execution by the team

Answer: A

Q1219. What is the impact of flaky tests on development team productivity and confidence?

- A. Flaky tests are beneficial because they simulate real-world conditions and improve test coverage
- B. Flaky tests improve team productivity by adding unpredictability that keeps developers alert now
- C. Flaky tests erode confidence in the test suite and cause teams to ignore legitimate test failures
- D. Flaky tests have no measurable impact on team productivity or confidence in the testing suite

Answer: C

Q1220. How does shift-left testing change the economics of defect detection in software projects?

- A. Testing earlier increases costs because more comprehensive testing infrastructure is needed upfront
- B. Finding defects earlier in development is significantly cheaper than finding them in production later
- C. Shift-left testing has no impact on the cost of defect detection at any stage of development
- D. Defects found in production are always cheaper to fix than those found during early development

Answer: B

Q1221. A legacy system with no documentation or original developers must be maintained. What is the recommended approach?

- A. Make changes randomly and deploy them immediately without understanding the system structure
- B. Use reverse engineering and program comprehension techniques to recover design knowledge first
- C. Refuse to maintain the system and recommend shutting it down immediately without replacement
- D. Rewrite the entire system from scratch without studying the existing system behavior at all

Answer: B

Q1222. How does Lehman's law of conservation of organizational stability affect maintenance planning?

- A. Adding more developers always proportionally increases the rate of maintenance activity and output
- B. The rate of development activity tends to remain constant over a system's lifetime regardless of resources
- C. Organizational stability has no measurable effect on maintenance planning or resource allocation
- D. Maintenance effort always decreases over time as the system becomes more stable and mature now

Answer: B

Q1223. A system experiences performance degradation every few months requiring manual restarts. What maintenance strategy addresses this systematically?

- A. Add more hardware resources each time degradation occurs without investigating the root cause
- B. Ignore the degradation until the system completely fails and then perform emergency maintenance
- C. Manually restart the system only when users complain about noticeable performance problems now
- D. Implement proactive software rejuvenation with automated scheduled restarts and resource cleanup

Answer: D

Q1224. What is the relationship between software architecture erosion and increasing maintenance costs?

- A. Architecture erosion increases coupling and decreases cohesion making changes progressively harder
- B. Architecture erosion has no impact on maintenance costs because architecture is only relevant initially
- C. Erosion decreases maintenance costs by simplifying the system structure through organic evolution now
- D. Architecture quality always improves over time through maintenance activities without deliberate effort

Answer: A

Q1225. How should a maintenance team prioritize between corrective, adaptive, perfective, and preventive maintenance requests?

- A. Preventive maintenance should always have lowest priority since it addresses only future problems
- B. Prioritize critical corrections first, then assess adaptive, perfective, and preventive by business value
- C. All maintenance types should be treated with equal priority without any systematic prioritization
- D. Always complete all corrective maintenance before considering any other type of maintenance request

Answer: B

Q1226. What is the economic justification for investing in preventive maintenance of software systems?

- A. Preventing defects is significantly cheaper than fixing them after they manifest in production use
- B. There is no economic basis for preventive maintenance since all software eventually needs replacing
- C. Preventive maintenance never provides any return on investment and should always be avoided now
- D. The cost of preventive maintenance always exceeds the cost of fixing defects after they occur

Answer: A

Q1227. How does microservices architecture change the maintenance approach compared to monolithic systems?

- A. Individual services can be maintained, deployed, and scaled independently reducing maintenance scope
- B. Microservices and monolithic systems require identical maintenance approaches without differences
- C. Microservices eliminate all maintenance needs because services are small enough to rewrite quickly
- D. Monolithic systems are always easier to maintain than microservices in every possible scenario now

Answer: A

Q1228. A company wants to decide whether to maintain or replace a legacy system. What factors should drive this decision?

- A. Business value, maintenance cost trajectory, technical risk, and availability of replacement options
- B. Legacy systems should always be maintained indefinitely regardless of costs or technical risks
- C. Only the age of the system should be considered since older systems should always be replaced now
- D. The decision should be based solely on the programming language used regardless of other factors

Answer: A

Q1229. What is the difference between software maintenance and software evolution from a theoretical perspective?

- A. Maintenance implies keeping software functional; evolution implies continuous adaptation and growth
- B. Maintenance and evolution are identical concepts with no theoretical distinction between them now
- C. Maintenance is a proactive process while evolution is purely reactive to environmental changes
- D. Evolution only occurs during initial development while maintenance happens exclusively after release

Answer: A

Q1230. How do maintenance metrics like Mean Time to Repair (MTTR) guide maintenance process improvement?

- A. MTTR measures repair speed, identifying bottlenecks in diagnosis, implementation, and deployment phases
- B. MTTR has no practical value for improving maintenance processes and should not be tracked at all
- C. Lower MTTR values always indicate worse maintenance performance and should be increased over time
- D. MTTR only measures the time to find bugs and does not include the time to fix and deploy them now

Answer: A

Q1231. How does the Deming cycle (PDCA) apply to continuous quality improvement in software?

- A. PDCA requires completing all four steps simultaneously without any sequential ordering of them
- B. The cycle should only be executed once and never repeated for continuous improvement purposes
- C. The Deming cycle only applies to manufacturing and has no relevance to software quality at all
- D. Plan improvements, Do implement them, Check results, Act to standardize or adjust the approach

Answer: D

Q1232. A company at CMMI Level 2 wants to reach Level 3. What fundamental change is required?

- A. Reducing the number of quality activities to simplify the overall process framework at the org
- B. Transitioning from project-level managed processes to organization-wide defined standard processes
- C. Maintaining the same project-level processes without any standardization across the organization
- D. Only purchasing more expensive quality assurance tools without changing any existing processes now

Answer: B

Q1233. What is the relationship between technical debt and software quality degradation over time?

- A. Technical debt accumulates quality compromises that progressively degrade system quality over time
- B. Accumulating technical debt always improves software quality by simplifying the system structure
- C. Technical debt only affects development speed and never impacts the quality of the software now
- D. Technical debt has no relationship with software quality and can be safely ignored by all teams

Answer: A

Q1234. How should an organization measure the return on investment of quality assurance activities?

- A. Calculate ROI based solely on the number of QA engineers hired regardless of their actual output
- B. Only measure the number of defects found without considering the cost of finding or preventing them
- C. ROI of QA cannot be measured because quality improvements are intangible and subjective in all cases
- D. Compare prevention and appraisal costs against reduction in failure costs and customer satisfaction gains

Answer: D

Q1235. A software product consistently fails in production despite passing all quality gates. What systemic issue might explain this?

- A. Quality gates always guarantee production quality and any failures must be caused by hardware now
- B. The quality gates are too strict and should be relaxed to allow more defects through to production
- C. Quality gates may not adequately represent real-world conditions and usage patterns of the system
- D. The development team is too skilled and the quality gates cannot keep up with their code changes

Answer: C

Q1236. How do organizational culture and management commitment affect quality assurance effectiveness?

- A. Management commitment has no impact on QA because quality is solely the responsibility of testers
- B. Strong management commitment and quality culture are essential for effective QA adoption and practice
- C. Excessive management involvement always reduces QA effectiveness by creating bureaucratic overhead
- D. Organizational culture is irrelevant to quality outcomes since only tools and processes matter now

Answer: B

Q1237. What is the Six Sigma approach and how does it apply to software quality management?

- A. It aims to reduce process variation to achieve fewer than 3.4 defects per million opportunities made
- B. Six Sigma only works for hardware manufacturing and has no proven application in software at all
- C. It requires eliminating all defects completely with zero tolerance for any imperfection in product
- D. Six Sigma increases process variation intentionally to improve creativity in software development

Answer: A

Q1238. How does model-based testing support quality assurance for complex software systems?

- A. It eliminates the need for any testing by mathematically proving software correctness from models
- B. It replaces quality assurance entirely by generating defect-free code directly from the models
- C. It only works for simple systems and cannot handle the complexity of real-world applications now
- D. It generates test cases from system models ensuring systematic coverage of modeled behaviors fully

Answer: D

Q1239. What is the impact of shifting quality responsibility to the entire development team rather than a separate QA group?

- A. It doubles the quality effort because both developers and QA testers do identical redundant work
- B. It has no impact on quality outcomes because only dedicated QA teams can effectively ensure quality
- C. It integrates quality thinking into all activities leading to earlier defect detection and prevention
- D. It eliminates quality entirely because developers do not have the skills to perform QA activities

Answer: C

Q1240. How should quality requirements be quantified and measured for a performance-critical real-time system?

- A. Quality requirements for real-time systems cannot be quantified and must remain purely qualitative
- B. Only measure response time and ignore all other quality attributes for real-time system evaluation
- C. Define measurable SLAs for latency, throughput, and availability with continuous monitoring infrastructure
- D. Use the same quality metrics as batch processing systems without any adaptation for real-time needs

Answer: C

Q1241. A team is using LOC as the primary productivity metric. What are the fundamental problems with this approach?

- A. LOC is technology-independent and measures delivered value perfectly for all project contexts
- B. LOC is the most accurate and comprehensive metric for measuring developer productivity always
- C. LOC penalizes efficient code, varies by language, and does not measure delivered business value
- D. There are no problems with using LOC as a productivity metric in any development environment

Answer: C

Q1242. How should metrics be used to avoid Goodhart's law in software development teams?

- A. Set aggressive metric targets and penalize teams that fail to meet them to ensure compliance
- B. Goodhart's law does not apply to software metrics and can be safely ignored by all managers
- C. Use metrics for insight rather than targets because optimizing for metrics distorts the behavior
- D. Use a single metric for all performance evaluations to ensure simplicity and consistency now

Answer: C

Q1243. A project shows decreasing defect density but increasing customer complaints. What does this discrepancy reveal?

- A. Testing may miss requirement-level defects that affect user experience but not code-level quality
- B. Customer complaints are irrelevant to software quality and should be ignored by the team always
- C. The metrics system is working perfectly and no investigation is needed for this discrepancy at all
- D. Decreasing defect density always means improved customer satisfaction without any exceptions now

Answer: A

Q1244. How does the Balanced Scorecard approach apply to software engineering measurement?

- A. It measures performance across financial, customer, process, and learning dimensions holistically
- B. It only measures financial metrics and ignores all other aspects of software project performance
- C. It measures a single dimension of performance and provides a narrow view of project health only
- D. It is exclusively a hardware manufacturing tool with no application to software engineering now

Answer: A

Q1245. What is the relationship between code churn metrics and defect prediction in software projects?

- A. Code churn has no correlation with defect rates and provides no predictive value for quality now
- B. Lower code churn always indicates more defects because unchanged code accumulates hidden bugs
- C. Code churn only measures developer activity and has no relationship to code quality whatsoever
- D. High code churn in specific files correlates with higher defect probability in those areas later

Answer: D

Q1246. How should an organization establish a metrics program without creating a dysfunctional measurement culture?

- A. Publicly rank individual developers by all metrics and reward the highest performers exclusively
- B. Use metrics exclusively for performance reviews and salary decisions without any other purpose
- C. Focus on team-level process improvement metrics rather than individual performance punishment data
- D. Collect as many metrics as possible regardless of their relevance to organizational goals now

Answer: C

Q1247. What is the role of benchmarking in software metrics and what are its limitations?

- A. Benchmarking provides perfectly comparable results across all organizations without any limitations
- B. It is impossible to benchmark software organizations because no two projects are ever similar now
- C. Benchmarking compares performance against peers but context differences limit direct comparisons
- D. Benchmarking only works for hardware measurements and has no application in software contexts

Answer: C

Q1248. How do object-oriented metrics like CK metrics suite differ from traditional complexity metrics?

- A. CK metrics and traditional metrics measure identical properties with identical calculation methods
- B. CK metrics only apply to procedural programming and cannot be used for object-oriented systems
- C. Traditional metrics are always superior to CK metrics for assessing object-oriented code quality
- D. CK metrics measure class-level properties like coupling, cohesion, inheritance, and method complexity

Answer: D

Q1249. A manager wants to compare productivity across teams using different technologies. What measurement approach is most fair?

- A. Compare teams solely on lines of code produced regardless of the programming languages they use
- B. Use technology-independent metrics like function points delivered per unit of effort for comparison
- C. Use identical metrics thresholds for all teams regardless of their technology stack differences
- D. Avoid any cross-team comparison because different technologies make all comparisons meaningless

Answer: B

Q1250. What is the statistical validity concern when using small sample sizes for software metrics?

- A. Software metrics do not follow statistical distributions so sample size is completely irrelevant
- B. Small sample sizes always produce more accurate statistics than large sample sizes in all cases
- C. Sample size has no impact on the statistical validity of software metrics or their conclusions
- D. Small samples produce unreliable statistics with wide confidence intervals limiting conclusion validity

Answer: D

Q1251. A large distributed team experiences frequent integration failures. How should their CM practices be improved?

- A. Eliminate automated testing to speed up the integration process and reduce pipeline execution time
- B. Have each developer maintain a separate repository that is never integrated with other team work
- C. Reduce commit frequency to monthly batches so integration issues can be resolved all at once now
- D. Implement CI with automated builds and tests, smaller commits, and trunk-based development workflow

Answer: D

Q1252. How does infrastructure as code (IaC) extend traditional configuration management principles?

- A. It replaces all software configuration management with manual server setup and configuration work
- B. It applies version control, reproducibility, and automation principles to infrastructure provisioning
- C. It eliminates the need for version control by automating all infrastructure changes automatically
- D. IaC has no relationship with configuration management principles or practices in any context now

Answer: B

Q1253. What are the trade-offs between feature branching and trunk-based development strategies?

- A. Trunk-based development cannot work with more than three developers on any given project team
- B. Feature branching is always superior to trunk-based development in every project context scenario
- C. Feature branches isolate work but delay integration; trunk-based enables faster integration but needs discipline
- D. Feature branching and trunk-based development produce identical outcomes with no trade-offs at all

Answer: C

Q1254. A production incident requires an emergency fix while a major release is in progress. How should configuration management handle this?

- A. Create a hotfix branch from the production release tag, apply the fix, merge to both main and release branches
- B. Apply the fix directly to the production server without any version control tracking or review
- C. Cancel the major release entirely and restart the development from scratch to include the fix
- D. Delay the emergency fix until the major release is complete to avoid any branching complexity

Answer: A

Q1255. How does GitOps extend configuration management principles to infrastructure and deployment operations?

- A. GitOps eliminates the need for any version control in infrastructure management and operations
- B. GitOps requires manual deployment processes without any automation or version control involvement
- C. GitOps only applies to application code and has no relevance to infrastructure or operations work
- D. GitOps uses Git as the single source of truth for infrastructure and deployment configurations now

Answer: D

Q1256. What is the impact of poor configuration management on software project outcomes?

- A. It leads to integration failures, lost changes, deployment errors, and inability to reproduce builds
- B. Poor CM has no measurable impact on project outcomes because CM is purely administrative overhead
- C. Only large projects are affected by poor CM while small projects are completely immune to problems
- D. Poor CM only affects the testing phase and has no impact on development or deployment activities

Answer: A

Q1257. How should database schema changes be managed within a configuration management framework?

- A. Use versioned migration scripts tracked in version control with automated application during deployment
- B. Store schema documentation in email threads rather than in the version control repository system
- C. Database schemas should never change after initial deployment regardless of evolving requirements
- D. Apply schema changes directly to production databases without any tracking or version control work

Answer: A

Q1258. What is the relationship between configuration management and reproducible builds?

- A. CM has no impact on build reproducibility since builds are determined solely by compiler versions
- B. Reproducible builds are impossible regardless of how thorough the configuration management practices
- C. CM ensures all build inputs are versioned and tracked enabling identical build reproduction every time
- D. Reproducible builds only matter for open-source projects and are irrelevant for commercial software

Answer: C

Q1259. How does artifact management complement source code version control in a complete CM strategy?

- A. Artifact management replaces source code version control entirely making repositories unnecessary
- B. Only source code needs version control; built artifacts never need tracking or management at all
- C. Artifact management and source code control serve identical purposes and using both is redundant
- D. It tracks versioned build outputs, dependencies, and deployable packages alongside source code control

Answer: D

Q1260. A team needs to maintain multiple product versions simultaneously for different customers. What CM strategy supports this?

- A. Long-lived release branches with selective backporting of changes between supported version branches
- B. Maintain separate codebases for each customer version without any shared source code between them
- C. Use a single branch and deploy different versions by modifying configuration at deployment time only
- D. Force all customers to use the same version and reject any requests for version-specific support

Answer: A

Q1261. A project manager discovers that the team's key architect is considering leaving. How should this personnel risk be managed?

- A. Ignore the risk because the architect has not officially resigned from the project team yet now
- B. Immediately terminate the architect to control the timing of their departure from the team work
- C. Prevent the architect from communicating with other team members to reduce knowledge dependency
- D. Document critical knowledge, cross-train team members, and develop a succession plan immediately

Answer: D

Q1262. How does Monte Carlo simulation enhance risk assessment compared to deterministic estimation methods?

- A. It models uncertainty by running thousands of simulations to produce probability distributions of outcomes
- B. Monte Carlo simulation only works for financial risk assessment and not for software project risks
- C. It provides a single exact answer that is always more accurate than any probabilistic approach used
- D. It eliminates all uncertainty from risk assessment by computing the exact outcome every single time

Answer: A

Q1263. A project depends on a third-party API that may be deprecated. How should this dependency risk be assessed and managed?

- A. Build the entire application tightly coupled to the API without any abstraction or fallback plans
- B. Ignore the deprecation risk because third-party providers never actually remove their APIs from use
- C. Wait until the API is actually deprecated before taking any action to address the dependency risk
- D. Create abstraction layers, monitor API provider communications, and plan migration alternatives early

Answer: D

Q1264. What is the relationship between risk appetite and risk tolerance in organizational risk management?

- A. Risk appetite and risk tolerance are identical concepts with no difference in their definitions at all
- B. Risk appetite refers to specific measurable thresholds while tolerance is a general attitude toward risk
- C. Risk appetite is the overall willingness to take risk; tolerance is the acceptable variation around objectives
- D. Organizations should have zero risk appetite and zero risk tolerance to ensure project success always

Answer: C

Q1265. How should risk management be adapted for agile projects compared to traditional plan-driven projects?

- A. Agile projects have no risks because the iterative nature eliminates all uncertainty automatically now
- B. Apply identical heavyweight risk management processes regardless of whether the project is agile
- C. Integrate risk identification into sprint planning and retrospectives with continuous lightweight assessment
- D. Perform risk management only once at project start and never revisit risks throughout agile sprints

Answer: C

Q1266. A software product must launch on a fixed date for a regulatory deadline. How does this constraint affect risk management?

- A. It elevates schedule risks to critical priority and may require scope negotiation as the main lever
- B. Schedule constraints only affect the budget and have no impact on scope or quality risk factors
- C. The regulatory deadline should be ignored if the team determines it is not technically achievable
- D. Fixed deadlines eliminate all risks because the team will naturally work harder to meet the date

Answer: A

Q1267. What is the difference between known risks, unknown risks, and unknowable risks in project management?

- A. Known risks are identified; unknown risks are unidentified but identifiable; unknowable risks cannot be anticipated
- B. Unknowable risks are the only category worth managing since known and unknown risks resolve themselves
- C. Unknown risks do not exist because thorough analysis will always identify every possible risk event
- D. All three categories are identical because every risk can be identified with sufficient analysis effort

Answer: A

Q1268. How does the concept of 'risk budgeting' help project managers allocate resources effectively?

- A. Risk budgeting wastes project resources on events that may never occur and should be avoided always
- B. All project budget should be allocated to development activities with nothing reserved for risk events
- C. It reserves specific time and budget for managing identified risks proportional to their exposure values
- D. Risk budgeting only applies to financial institutions and has no relevance to software project work

Answer: C

Q1269. What is the impact of cognitive biases on risk assessment accuracy in software projects?

- A. Cognitive biases always improve risk assessment by providing diverse perspectives on potential risks
- B. Cognitive biases only affect individual contributors and never influence management risk decisions
- C. Project managers are immune to cognitive biases due to their training and professional experience
- D. Biases like optimism, anchoring, and groupthink lead to systematic underestimation of project risks

Answer: D

Q1270. A distributed development team faces geopolitical risks across multiple countries. How should these be incorporated into the risk management framework?

- A. Only consider geopolitical risks if a team member specifically raises a concern during a meeting
- B. Assume all regions have identical risk profiles and apply a single uniform risk assessment globally
- C. Assess regulatory, political, and infrastructure risks per region and create contingency plans for each
- D. Geopolitical risks are outside the scope of software project risk management and should be ignored

Answer: C

Q1271. A web application stores user passwords in plaintext in the database. What is the proper remediation approach?

- A. Encrypt passwords with a symmetric key stored alongside the passwords in the same database table
- B. Store passwords in a separate plaintext file on the server instead of in the database tables
- C. Continue storing passwords in plaintext because hashing adds unnecessary system complexity now
- D. Hash passwords using bcrypt or Argon2 with per-user salts and migrate all existing user records

Answer: D

Q1272. How does the STRIDE threat model categorize security threats?

- A. Scalability, Traceability, Reusability, Interoperability, Durability, and Extensibility of design
- B. Spoofing, Tampering, Repudiation, Information disclosure, Denial of service, Elevation of privilege
- C. Speed, Testing, Reliability, Integration, Deployment, and Efficiency of the system components
- D. Storage, Transmission, Retrieval, Indexing, Deletion, and Encryption of application data now

Answer: B

Q1273. A company discovers that a critical zero-day vulnerability affects their production system. What is the recommended incident response?

- A. Shut down all company systems permanently until the vulnerability is fixed by the software vendor
- B. Post details of the vulnerability publicly to warn other companies before applying any patches
- C. Isolate affected systems, assess impact, apply temporary mitigations, develop and deploy a permanent fix
- D. Ignore the vulnerability because zero-day means no exploit exists yet in the wild for it now

Answer: C

Q1274. How does the principle of 'security by design' differ from 'security by obscurity'?

- A. Security by design has been proven ineffective and all modern systems rely on obscurity instead
- B. Security by design builds protection into architecture; obscurity relies on hiding implementation details
- C. Security by obscurity is more effective because attackers cannot exploit what they cannot find now
- D. Security by design and security by obscurity are identical approaches producing equivalent protection

Answer: B

Q1275. What is the impact of the DevSecOps approach on traditional security engineering practices?

- A. It delays all security testing until after production deployment to avoid slowing down development
- B. It eliminates all security activities because DevOps automation makes applications inherently secure
- C. DevSecOps has no meaningful impact on security practices compared to traditional approaches now
- D. It integrates security into every stage of the CI/CD pipeline rather than treating it as a gate only

Answer: D

Q1276. How should an organization implement a zero-trust security architecture?

- A. Verify every request regardless of source, enforce least privilege, and assume breach at all times
- B. Implement a single perimeter firewall and trust everything inside the corporate network boundary
- C. Trust all internal network traffic and only verify requests coming from external network sources
- D. Remove all authentication and authorization controls to achieve maximum system simplicity now

Answer: A

Q1277. What is the relationship between security requirements and functional requirements in software engineering?

- A. Functional requirements always take priority and security requirements can be ignored if needed
- B. Security requirements are completely independent of functional requirements with no interaction now
- C. Security requirements constrain how functional requirements are implemented to protect system assets
- D. Security requirements only apply to the network layer and never affect application functionality

Answer: C

Q1278. How does supply chain security affect modern software development practices?

- A. Supply chain security is irrelevant because all third-party libraries are thoroughly vetted already
- B. Only first-party code can contain vulnerabilities since third-party libraries are always secure now
- C. Third-party dependencies can introduce vulnerabilities requiring continuous monitoring and auditing
- D. Supply chain attacks only target hardware and have no relevance to software development practices

Answer: C

Q1279. What is the role of security testing throughout the software development lifecycle?

- A. Early security testing is wasteful because most vulnerabilities are introduced during deployment
- B. Security testing should only occur during the final phase before deployment to production servers
- C. Security testing at every phase catches vulnerabilities earlier when they are cheaper to fix overall
- D. Security testing is unnecessary if the development team follows secure coding guidelines properly

Answer: C

Q1280. How should cryptographic key management be implemented in enterprise software systems?

- A. Store encryption keys in plaintext files alongside the encrypted data for easy access and retrieval
- B. Use hardware security modules, automated key rotation, and strict access controls for all key materials
- C. Use a single encryption key for all data across the entire organization without any rotation ever
- D. Hardcode encryption keys directly into the application source code for convenience and reliability

Answer: B

Q1281. What does Lehman's Law of Continuing Growth state?

- A. Software always decreases in size
- B. Software must continuously grow in functionality to remain satisfactory to users
- C. Software never changes after release
- D. Growth always improves quality

Answer: B

Q1282. In the context of socio-technical systems, what is an organizational system?

- A. A system made only of hardware
- B. A broader system that includes social and organizational policies and rules governing how people interact with the technical system
- C. A database management system
- D. An operating system

Answer: B

Q1283. What is the 'no silver bullet' argument by Fred Brooks?

- A. That all software should use silver encryption
- B. That there is no single technique that will dramatically improve software productivity by an order of magnitude
- C. That only one programming language should be used
- D. That testing alone can guarantee quality

Answer: B

Q1284. What distinguishes 'essential complexity' from 'accidental complexity' in software?

- A. Essential complexity can be eliminated; accidental cannot
- B. Essential complexity is inherent to the problem; accidental complexity arises from the chosen solution approach
- C. They are the same concept
- D. Essential complexity relates only to hardware

Answer: B

Q1285. What is the Standish Group's CHAOS report primarily known for?

- A. Evaluating programming languages
- B. Analyzing software project success and failure rates
- C. Rating software companies
- D. Benchmarking hardware performance

Answer: B

Q1286. Which of the following best describes the concept of 'wicked problems' in software engineering?

- A. Problems that involve malicious code
- B. Problems that are inherently ill-defined and have no definitive solution
- C. Simple problems with obvious solutions
- D. Problems caused by poor coding practices

Answer: B

Q1287. What is the principle of 'separation of concerns' in software engineering?

- A. Keeping developers separate from testers
- B. Dividing a program into distinct sections that each address a separate concern or functionality
- C. Separating the budget from the schedule
- D. Using different computers for different tasks

Answer: B

Q1288. What is Lehman's Law of Declining Quality?

- A. Software quality always improves
- B. Software will be perceived as declining in quality unless rigorously maintained and adapted to its operational environment
- C. Quality is unrelated to maintenance
- D. Only hardware quality declines

Answer: B

Q1289. What role does abstraction play in managing software complexity?

- A. It makes software run faster
- B. It hides unnecessary details so developers can focus on relevant aspects at each level
- C. It eliminates all bugs
- D. It replaces the need for testing

Answer: B

Q1290. What is the 'Pareto Principle' as applied to software defects?

- A. All modules have equal defect rates
- B. Roughly 80% of defects are found in approximately 20% of the modules
- C. Defects can never be found
- D. Testing eliminates 100% of defects

Answer: B

Q1291. What are the four phases of the Rational Unified Process (RUP)?

- A. Plan, Code, Test, Deploy
- B. Inception, Elaboration, Construction, Transition
- C. Analysis, Design, Code, Maintain
- D. Gather, Build, Verify, Release

Answer: B

Q1292. What is the cleanroom software engineering process?

- A. Development done in a physically clean room
- B. A process emphasizing formal specification, incremental development, and statistical testing to produce near-zero-defect software
- C. A process that only uses one programmer
- D. A process that avoids all documentation

Answer: B

Q1293. What is the concept of 'process tailoring'?

- A. Designing new programming languages
- B. Adapting a standard process model to fit specific project needs, constraints, and organizational culture
- C. Ignoring all processes
- D. Writing code without any process

Answer: B

Q1294. In the Spiral model, what happens during the 'planning' quadrant?

- A. Code is written
- B. Project scope, schedule, and cost estimates are reviewed and the next iteration is planned based on risk analysis results
- C. The software is deployed
- D. Users are trained

Answer: B

Q1295. What is the difference between verification and validation in process models?

- A. They are the same activity
- B. Verification checks if the product is built correctly per specification; validation checks if the right product is built for the user
- C. Verification is done after deployment; validation is done before coding
- D. Neither involves testing

Answer: B

Q1296. What is a stage-gate process in software development?

- A. A process with no checkpoints
- B. A process where each phase ends with a formal review (gate) that must be passed before proceeding to the next stage
- C. A process that only uses one language
- D. An automated deployment pipeline

Answer: B

Q1297. What is the key criticism of prescriptive process models in modern software development?

- A. They are too flexible
- B. They can be too rigid and document-heavy, failing to adapt to rapidly changing requirements and technologies
- C. They produce software too quickly
- D. They never include testing

Answer: B

Q1298. What is the Capability Maturity Model Integration (CMMI) and how does it relate to process models?

- A. A programming language
- B. A framework for assessing and improving organizational process maturity across five levels
- C. A type of database
- D. A testing tool

Answer: B

Q1299. What is the Cynefin framework and how does it relate to Agile?

- A. A programming framework
- B. A sense-making model that categorizes problems into domains (simple, complicated, complex, chaotic) to guide the appropriate management approach
- C. A database management system
- D. A version control system

Answer: B

Q1300. What is the difference between Scrum and Scrumban?

- A. There is no difference
- B. Scrumban combines Scrum's structure with Kanban's flow-based approach, using WIP limits instead of strict Sprint commitments
- C. Scrumban eliminates all Scrum ceremonies
- D. Scrumban is only for hardware development

Answer: B

Q1301. What is the concept of 'swarming' in Agile?

- A. The team working on many tasks simultaneously
- B. Multiple team members collaborating on a single high-priority item to complete it quickly
- C. A technique for writing documentation
- D. A method for deploying software

Answer: B

Q1302. What is Large-Scale Scrum (LeSS)?

- A. A version of Scrum for small teams
- B. A framework for applying Scrum principles to multiple teams working on a single product with minimal additional roles or artifacts
- C. A testing methodology
- D. A documentation standard

Answer: B

Q1303. What is the 'iron triangle' trade-off in Agile versus traditional project management?

- A. Agile fixes scope and varies time/cost
- B. In traditional management scope is fixed while in Agile time and cost are fixed and scope varies
- C. They handle trade-offs identically
- D. Agile ignores all constraints

Answer: B

Q1304. What is Behavior-Driven Development (BDD) and how does it extend TDD?

- A. BDD replaces all testing
- B. BDD extends TDD by using natural language specifications that describe system behavior from the user's perspective
- C. BDD is unrelated to testing
- D. BDD only tests database operations

Answer: B

Q1305. What is the concept of 'Minimum Viable Product' (MVP) in Agile?

- A. The cheapest product possible
- B. The smallest version of a product that delivers enough value to early adopters and provides validated learning
- C. A product with no features
- D. The final release version

Answer: B

Q1306. What is the Spotify model in Agile?

- A. A music streaming app
- B. An organizational model using Squads, Tribes, Chapters, and Guilds to balance team autonomy with cross-functional alignment
- C. A testing framework
- D. A deployment strategy

Answer: B

Q1307. What is the Agile concept of 'sustainable pace'?

- A. Working overtime every day
- B. Maintaining a work rhythm that the team can sustain indefinitely without burnout
- C. Releasing software once a year
- D. Working only 2 hours per day

Answer: B

Q1308. What are Agile release trains (ARTs) in the Scaled Agile Framework (SAFe)?

- A. Physical trains that deliver software
- B. Long-lived teams of Agile teams that plan, commit, and execute together in Program Increments
- C. A type of version control
- D. A deployment tool

Answer: B

Q1309. What is the KAOS methodology in requirements engineering?

- A. A methodology for causing chaos
- B. A goal-oriented requirements engineering approach that derives requirements from high-level organizational goals
- C. A testing technique
- D. A coding standard

Answer: B

Q1310. What is the difference between safety requirements and security requirements?

- A. They are the same
- B. Safety requirements prevent harm to people or environment; security requirements protect against malicious threats
- C. Safety is about passwords
- D. Security is about physical safety

Answer: B

Q1311. What is the problem of 'requirements creep'?

- A. Requirements that are too small
- B. The uncontrolled expansion of project scope as new requirements are continuously added without proper change management
- C. Requirements that are well-managed
- D. A beneficial increase in features

Answer: B

Q1312. What is the i* (iStar) framework in requirements engineering?

- A. A programming language
- B. An agent-oriented modeling framework that captures stakeholder goals, dependencies, and relationships
- C. A testing framework
- D. A deployment tool

Answer: B

Q1313. How does ethnography contribute to requirements elicitation?

- A. It replaces all other elicitation techniques
- B. It reveals implicit requirements by observing users in their actual work environment to understand real practices
- C. It only studies ancient cultures
- D. It is a testing technique

Answer: B

Q1314. What is the Kano model in requirements analysis?

- A. A database model
- B. A model that classifies features into must-be, one-dimensional, attractive, indifferent, and reverse categories based on customer satisfaction
- C. A process model
- D. A testing model

Answer: B

Q1315. What is the concept of 'requirements engineering for self-adaptive systems'?

- A. Systems that never change
- B. Specifying requirements that allow a system to monitor itself and dynamically adjust its behavior to meet goals
- C. Requirements written by AI
- D. Systems without any requirements

Answer: B

Q1316. What is the role of natural language processing (NLP) in modern requirements engineering?

- A. It has no role
- B. NLP tools help detect ambiguities, inconsistencies, and missing information in requirements documents
- C. NLP replaces all requirements activities
- D. NLP is only used for coding

Answer: B

Q1317. What is the Putnam model (SLIM) used for in software estimation?

- A. Estimating physical weight of hardware
- B. Using a Rayleigh curve to relate project effort, development time, and software size for effort estimation
- C. Estimating employee satisfaction
- D. Predicting market trends

Answer: B

Q1318. What is the difference between COCOMO I and COCOMO II?

- A. There is no difference
- B. COCOMO II accounts for modern development practices including reuse, object-oriented development, and iterative processes
- C. COCOMO I is newer
- D. COCOMO II only estimates hardware costs

Answer: B

Q1319. What is the Wideband Delphi estimation technique?

- A. A single expert making all estimates
- B. A consensus-based estimation method where experts independently estimate, discuss differences, and re-estimate iteratively
- C. A database query optimization method
- D. An automated code generation technique

Answer: B

Q1320. What is the concept of 'planning poker' in Agile estimation?

- A. A card game for entertainment
- B. A consensus-based estimation technique where team members simultaneously reveal their estimates using cards to avoid anchoring bias
- C. A method for assigning tasks randomly
- D. A technique for prioritizing bug fixes

Answer: B

Q1321. What is the concept of 'cone of uncertainty' in estimation?

- A. A physical cone used in meetings
- B. The principle that estimation accuracy improves as the project progresses, with early estimates having 4x variability
- C. Uncertainty never decreases
- D. Estimates are always accurate from the start

Answer: B

Q1322. What is the Theory of Constraints (TOC) as applied to software project management?

- A. A theory about hardware limitations
- B. A management philosophy that identifies the most critical limiting factor (bottleneck) and systematically improves it
- C. A programming paradigm
- D. A database optimization theory

Answer: B

Q1323. What is the concept of 'project velocity' in iterative estimation?

- A. The speed of code compilation
- B. Using historical throughput data from past iterations to forecast how much work can be completed in future iterations
- C. The network speed of the team
- D. How fast code is deployed

Answer: B

Q1324. What is Goldratt's Critical Chain Project Management (CCPM)?

- A. Managing chains of emails
- B. A method that accounts for resource constraints and uses project buffers instead of task-level buffers to protect the schedule
- C. A version control strategy
- D. A code review technique

Answer: B

Q1325. What is the purpose of post-mortem analysis in project management?

- A. Analyzing deceased team members
- B. Reviewing a completed project to identify lessons learned, successes, and areas for improvement
- C. Analyzing legacy code
- D. Testing production systems

Answer: B

Q1326. What is the Visitor design pattern?

- A. A pattern for tracking website visitors
- B. A pattern that separates an algorithm from the object structure it operates on, allowing new operations without modifying the objects
- C. A pattern for user authentication
- D. A pattern for logging

Answer: B

Q1327. What is the Abstract Factory design pattern?

- A. A factory building blueprint
- B. A pattern that provides an interface for creating families of related objects without specifying their concrete classes
- C. An abstract art design tool
- D. A database abstraction layer

Answer: B

Q1328. What is the Law of Demeter and why is it important?

- A. A mathematical law
- B. A design principle stating that a method should only call methods on its own object, parameters, created objects, or direct components, reducing coupling
- C. A law about documentation
- D. A law about data encryption

Answer: B

Q1329. What is the difference between the Bridge and Adapter patterns?

- A. They are identical
- B. The Bridge pattern separates abstraction from implementation by design; the Adapter makes existing incompatible interfaces work together after the fact
- C. Bridge is for databases; Adapter is for files
- D. Neither involves interfaces

Answer: B

Q1330. What is the concept of 'design debt' in software engineering?

- A. The financial cost of design tools
- B. The accumulated cost of shortcuts and suboptimal design decisions that will require future refactoring
- C. Debt incurred by buying design software
- D. The cost of hiring designers

Answer: B

Q1331. What is the Mediator design pattern?

- A. A legal mediation tool
- B. A pattern that defines an object that encapsulates how a set of objects interact, promoting loose coupling by preventing direct references
- C. A middleware framework
- D. A database connector

Answer: B

Q1332. What is the concept of 'design for testability'?

- A. Making the UI look like a test
- B. Structuring software so that individual components can be easily isolated and tested through techniques like dependency injection
- C. Writing tests before design
- D. Testing the design document

Answer: B

Q1333. What is the Chain of Responsibility design pattern?

- A. An organizational hierarchy chart
- B. A pattern that passes a request along a chain of handlers, where each handler decides whether to process it or pass it to the next handler
- C. A supply chain management tool
- D. A blockchain pattern

Answer: B

Q1334. What is the Architecture Tradeoff Analysis Method (ATAM) used for?

- A. Analyzing stock trades
- B. Evaluating software architectures against quality attributes by identifying sensitivity points, tradeoff points, and risks
- C. Analyzing code performance
- D. Trading software licenses

Answer: B

Q1335. What is the concept of 'eventual consistency' in distributed systems?

- A. Systems that are always consistent
- B. A model where, given enough time without new updates, all replicas of data will converge to the same value
- C. Systems that are never consistent
- D. A database locking mechanism

Answer: B

Q1336. What does the CAP theorem state?

- A. All distributed systems are perfect
- B. A distributed system can provide at most two of three guarantees: Consistency, Availability, and Partition tolerance simultaneously
- C. Distributed systems have no limitations
- D. CAP stands for Code, Application, Program

Answer: B

Q1337. What is the Strangler Fig pattern for migrating legacy systems?

- A. A pattern for growing plants
- B. A migration strategy that gradually replaces parts of a legacy system with new components until the old system is completely replaced
- C. A security vulnerability pattern
- D. A testing pattern

Answer: B

Q1338. What is the concept of 'architectural fitness functions'?

- A. Exercise routines for architects
- B. Automated tests that verify whether an architecture meets its intended quality attributes and constraints over time
- C. A measure of code readability
- D. A design pattern

Answer: B

Q1339. What is the Saga pattern in microservices?

- A. A storytelling framework
- B. A pattern for managing distributed transactions across multiple services using a sequence of local transactions with compensating actions
- C. A logging framework
- D. A deployment pattern

Answer: B

Q1340. What is the concept of 'domain-driven design' (DDD) in architecture?

- A. Designing domain names for websites
- B. An approach that models software structure and behavior around the business domain using bounded contexts, aggregates, and ubiquitous language
- C. A database design approach
- D. A UI design methodology

Answer: B

Q1341. What is the Bulkhead pattern in resilient architecture?

- A. A ship construction pattern
- B. A pattern that isolates system components into pools so that failure in one does not cascade and bring down the entire system
- C. A database partitioning strategy
- D. A UI layout pattern

Answer: B

Q1342. What is a cell-based architecture?

- A. An architecture inspired by biological cells
- B. An architecture that groups related microservices into independently deployable and scalable cells, each containing a complete stack
- C. A spreadsheet-based architecture
- D. A hardware design approach

Answer: B

Q1343. What is the difference between summative and formative usability evaluation?

- A. They are the same
- B. Formative evaluation identifies problems during design to improve the product; summative evaluation measures overall usability of the finished product
- C. Summative is done first
- D. Formative evaluation cannot find problems

Answer: B

Q1344. What is the GOMS model in HCI?

- A. A graphics rendering model
- B. A cognitive modeling method that predicts user performance by analyzing Goals, Operators, Methods, and Selection rules
- C. A database model
- D. A project management model

Answer: B

Q1345. What is the concept of 'cognitive walkthrough' in usability evaluation?

- A. Walking while thinking
- B. A usability inspection method where evaluators step through task scenarios to identify learnability problems from a new user's perspective
- C. A physical exercise program
- D. A code review technique

Answer: B

Q1346. What is Hick's Law and its implication for UI design?

- A. A law about screen resolution
- B. The time to make a decision increases logarithmically with the number of choices, implying designers should minimize options
- C. A law about animation speed
- D. A law about data transfer

Answer: B

Q1347. What is the ISO 9241-210 standard about?

- A. Database design
- B. An international standard providing requirements and recommendations for human-centered design of interactive systems
- C. Network protocols
- D. Software licensing

Answer: B

Q1348. What is the concept of 'design thinking' in UI/UX?

- A. Thinking about design while sleeping
- B. A human-centered innovation approach using empathy, ideation, prototyping, and testing to solve complex design problems iteratively
- C. A method for writing code
- D. A database design technique

Answer: B

Q1349. What is the Weber-Fechner Law in the context of UI design?

- A. A law about network latency
- B. A psychophysical law stating that the perceived difference between stimuli is proportional to their ratio, affecting how users notice UI changes
- C. A database normalization rule
- D. A coding standard

Answer: B

Q1350. What is the concept of 'emotional design' as described by Don Norman?

- A. Designing software that makes users cry
- B. A design philosophy addressing three levels of user experience: visceral (appearance), behavioral (usability), and reflective (self-image)
- C. Designing emoticons
- D. A psychological test

Answer: B

Q1351. What is the concept of 'defensive programming'?

- A. Programming while on defense in sports
- B. Writing code that anticipates and handles unexpected inputs, states, and errors gracefully to improve robustness
- C. Programming in a secure facility
- D. Programming with antivirus software

Answer: B

Q1352. What is the difference between optimistic and pessimistic concurrency control?

- A. They produce identical results
- B. Optimistic assumes conflicts are rare and checks at commit time; pessimistic locks resources preemptively to prevent conflicts
- C. Optimistic always uses locks
- D. Pessimistic never uses locks

Answer: B

Q1353. What is the concept of 'immutability' and why is it valuable in implementation?

- A. Code that cannot be read
- B. Objects whose state cannot be modified after creation, reducing bugs from unintended state changes and simplifying concurrent programming
- C. Variables that can change freely
- D. A database locking mechanism

Answer: B

Q1354. What is the 'fail-fast' principle in implementation?

- A. Making software crash as often as possible
- B. Detecting and reporting errors immediately at the point of failure rather than allowing them to propagate and cause obscure failures later
- C. Deploying quickly without testing
- D. Skipping error handling

Answer: B

Q1355. What is aspect-oriented programming (AOP)?

- A. Programming from different angles
- B. A programming paradigm that separates cross-cutting concerns like logging, security, and transactions from business logic
- C. Programming for aspect ratios
- D. A type of object-oriented programming

Answer: B

Q1356. What is the concept of 'continuous delivery' pipeline?

- A. A pipe for delivering water
- B. An automated software release pipeline that ensures code changes are always in a deployable state through build, test, and staging automation
- C. A continuous email notification system
- D. A hardware delivery system

Answer: B

Q1357. What is the concept of 'feature flags' in implementation?

- A. Physical flags on servers
- B. Conditional switches in code that enable or disable features at runtime without deploying new code
- C. Flags in a debugging tool
- D. Country flags in the UI

Answer: B

Q1358. What is the concept of 'contract-based programming'?

- A. Legal contracts for developers
- B. A programming approach where functions define preconditions, postconditions, and invariants as formal contracts
- C. Freelance programming
- D. A licensing scheme

Answer: B

Q1359. What is the strangler pattern applied to codebase modernization?

- A. A gardening technique
- B. Gradually replacing legacy code by wrapping it with new implementations and redirecting calls until the old code can be safely removed
- C. Strangling competition
- D. A compression algorithm

Answer: B

Q1360. What is the concept of 'trunk-based development'?

- A. Developing software on a tree trunk
- B. A branching strategy where all developers commit to a single main branch frequently, using short-lived feature branches
- C. Using elephant trunks as input devices
- D. A storage management technique

Answer: B

Q1361. What is mutation testing and how does it assess test quality?

- A. Testing with mutated viruses
- B. A technique that introduces small changes (mutants) to the source code and checks whether existing tests detect these changes
- C. Genetic testing of software
- D. Testing software mutations over time

Answer: B

Q1362. What is the concept of 'combinatorial testing' (pairwise testing)?

- A. Testing combinations of locks
- B. A technique that tests interactions between parameters by covering all pairwise combinations, significantly reducing the number of test cases needed
- C. Combining two test suites
- D. Testing with two testers

Answer: B

Q1363. What is symbolic execution in testing?

- A. Testing with symbols instead of code
- B. A technique that analyzes programs by using symbolic values instead of concrete inputs to explore multiple execution paths simultaneously
- C. A type of code signing
- D. Writing tests using special symbols

Answer: B

Q1364. What is the concept of 'chaos engineering' in testing?

- A. Creating chaos in the testing team
- B. Deliberately injecting failures into a production system to test its resilience and identify weaknesses before real failures occur
- C. Disorganized testing practices
- D. Testing without any plan

Answer: B

Q1365. What is the oracle problem in software testing?

- A. A problem with Oracle databases
- B. The difficulty of determining the correct expected output for a given test input, especially for complex or novel systems
- C. A licensing issue
- D. A performance problem

Answer: B

Q1366. What is metamorphic testing?

- A. Testing software transformation
- B. A technique that addresses the oracle problem by defining relationships between inputs and outputs across multiple test executions
- C. Testing software evolution
- D. Testing user interface transitions

Answer: B

Q1367. What is the concept of 'shift-left testing'?

- A. Moving test results to the left column
- B. Integrating testing activities earlier in the software development lifecycle to find defects sooner when they are cheaper to fix
- C. Testing only left-aligned text
- D. A specific testing tool

Answer: B

Q1368. What is fuzzing (fuzz testing)?

- A. Making software fuzzy
- B. An automated testing technique that provides invalid, unexpected, or random data as inputs to discover vulnerabilities and crashes
- C. Testing with blurred images
- D. A type of performance test

Answer: B

Q1369. What is Lehman's Law of Increasing Complexity and how does it affect maintenance?

- A. Complexity always decreases
- B. As software evolves, its complexity increases unless deliberate effort is made to reduce it, making maintenance progressively harder
- C. Complexity has no impact on maintenance
- D. Only new software is complex

Answer: B

Q1370. What is the concept of 'software rejuvenation'?

- A. Making old software look new visually
- B. Proactively restarting or refreshing software systems to prevent failures caused by accumulated degradation such as memory leaks
- C. Celebrating a software's anniversary
- D. Installing software updates

Answer: B

Q1371. What is the 'ripple effect' in software maintenance?

- A. An animation effect in the UI
- B. The phenomenon where a change to one part of the system causes unintended changes or failures in other parts
- C. A water-themed design pattern
- D. A network propagation technique

Answer: B

Q1372. What is the concept of 'technical debt management' in maintenance?

- A. Managing financial debt
- B. Strategically identifying, measuring, and prioritizing the repayment of accumulated design and code shortcuts to maintain system health
- C. Managing team debt
- D. Managing hardware debt

Answer: B

Q1373. What is the difference between big-bang and incremental migration for legacy systems?

- A. They are the same approach
- B. Big-bang replaces the entire legacy system at once; incremental migration gradually replaces parts while both systems run in parallel
- C. Big-bang is always safer
- D. Incremental migration is never used

Answer: B

Q1374. What is the concept of 'software archeology' in maintenance?

- A. Digging up old hardware
- B. The practice of investigating and understanding legacy code through code reading, tooling, and historical analysis when documentation is missing
- C. Collecting vintage software
- D. Building a software museum

Answer: B

Q1375. What is the concept of 'planned obsolescence' versus 'unplanned obsolescence' in software?

- A. They are identical
- B. Planned obsolescence is an intentional end-of-life strategy; unplanned obsolescence occurs when external changes make the software unusable unexpectedly
- C. Neither affects maintenance
- D. Obsolescence never happens in software

Answer: B

Q1376. What is the concept of 'evolution-aware software design'?

- A. Designing software inspired by biological evolution
- B. Designing software from the start with the expectation of future changes, making modification points explicit and changes easier
- C. Using evolutionary algorithms
- D. Designing without any plan

Answer: B

Q1377. What is the challenge of maintaining systems with undocumented dependencies?

- A. There is no challenge
- B. Hidden dependencies can cause unexpected cascading failures when changes are made, as maintainers cannot anticipate which components will be affected
- C. Undocumented dependencies improve performance
- D. Dependencies do not affect maintenance

Answer: B

Q1378. What is the concept of 'continuous maintenance' in DevOps?

- A. Maintenance done once a year
- B. An approach where maintenance activities are integrated into daily development workflows through automation, monitoring, and continuous improvement
- C. Maintaining only during business hours
- D. Outsourcing all maintenance

Answer: B

Q1379. What is the GQM (Goal-Question-Metric) paradigm and how is it applied?

- A. A gaming metric
- B. A structured approach where quality goals are defined, questions identify what needs measurement, and metrics provide the answers
- C. A graphics quality metric
- D. A database query method

Answer: B

Q1380. What is the concept of 'quality culture' in an organization?

- A. A culture of testing everything
- B. An organizational environment where quality is valued by everyone, built into processes, and continuously improved as a shared responsibility
- C. A culture of writing documentation
- D. A culture of using expensive tools

Answer: B

Q1381. What is the Rayleigh model used for in defect prediction?

- A. Predicting weather patterns
- B. A statistical model that describes the expected distribution of defect discovery rates over time during development and testing
- C. Predicting stock prices
- D. Predicting network traffic

Answer: B

Q1382. What is the concept of 'defect amplification' in the software process?

- A. Making defects louder
- B. The phenomenon where undetected defects in one phase generate additional defects in subsequent phases, multiplying the total defect count
- C. Amplifying error messages
- D. Increasing test coverage

Answer: B

Q1383. What is Cleanroom software engineering in the context of QA?

- A. Developing in a sterile room
- B. A quality-focused approach using formal specification, structured programming, and statistical usage testing to achieve near-zero-defect software
- C. A method of cleaning code
- D. Developing with air purifiers

Answer: B

Q1384. What is the concept of 'quality attribute scenarios' in quality assessment?

- A. Movie scripts about quality
- B. Structured descriptions that specify quality attribute requirements through source, stimulus, environment, artifact, response, and response measure
- C. Testing scenarios only
- D. User story templates

Answer: B

Q1385. What is the relationship between process maturity and defect rates?

- A. There is no relationship
- B. Higher process maturity levels are generally associated with lower defect rates and more predictable quality outcomes
- C. Higher maturity means more defects
- D. Process maturity is irrelevant to defects

Answer: B

Q1386. What is the concept of 'total quality management' (TQM) applied to software?

- A. A testing management tool
- B. A management philosophy emphasizing continuous improvement, customer focus, and involvement of all employees in quality across the entire organization
- C. A quality certification
- D. A project management methodology

Answer: B

Q1387. What is the Coupling Between Objects (CBO) metric in the CK suite?

- A. The number of physical connections between servers
- B. The count of other classes to which a class is coupled through method calls, variable access, or inheritance, indicating its dependency level
- C. The number of database connections
- D. The number of API calls

Answer: B

Q1388. What is the concept of 'measurement dysfunction' in software metrics?

- A. Broken measurement tools
- B. The phenomenon where measuring a specific attribute causes people to optimize for that metric at the expense of actual goals
- C. Metrics that produce wrong numbers
- D. Dysfunction in the measurement team

Answer: B

Q1389. What is Halstead's concept of 'program vocabulary' and 'program length'?

- A. The number of English words in comments
- B. Vocabulary is the number of distinct operators and operands; length is the total number of operators and operands used in the program
- C. The number of variable names
- D. The number of code files

Answer: B

Q1390. What is the concept of 'technical debt ratio' as a metric?

- A. The company's financial debt ratio
- B. The ratio of the cost to fix all code issues to the total cost of developing the code, indicating the relative amount of accumulated technical shortcuts
- C. The ratio of developers to managers
- D. The ratio of tests to code

Answer: B

Q1391. What is the concept of 'object-oriented design metrics' and how do they differ from traditional metrics?

- A. They are the same as traditional metrics
- B. OO metrics measure class-specific attributes like inheritance depth, coupling, and cohesion that traditional metrics like LOC and cyclomatic complexity do not capture
- C. OO metrics only measure code size
- D. Traditional metrics are always superior

Answer: B

Q1392. What is the concept of 'code churn' as a metric?

- A. The sound of a hard drive
- B. The frequency and volume of code changes over time, where high churn in a module often correlates with higher defect rates
- C. The number of developers who leave
- D. The compilation time

Answer: B

Q1393. What is the purpose of 'software reliability growth models'?

- A. Growing software like plants
- B. Mathematical models that use defect discovery data to predict remaining defects and estimate when software will reach a target reliability level
- C. Models for increasing server capacity
- D. Models for team growth

Answer: B

Q1394. What is the concept of 'metric validation' in software measurement?

- A. Checking if numbers add up correctly
- B. The process of ensuring that a metric actually measures what it claims to measure and is useful for its intended purpose
- C. Validating test results
- D. Checking code syntax

Answer: B

Q1395. What is the concept of 'configuration identification' in SCM?

- A. Identifying configuration files
- B. The process of selecting configuration items, defining their relationships, and establishing a naming and labeling scheme for unique identification
- C. Identifying team members
- D. Identifying hardware components

Answer: B

Q1396. What is the concept of 'infrastructure as code' (IaC) in configuration management?

- A. Building physical infrastructure
- B. Managing and provisioning computing infrastructure through machine-readable definition files rather than manual configuration
- C. Writing code on paper
- D. A type of programming language

Answer: B

Q1397. What is the concept of 'immutable infrastructure' in modern configuration management?

- A. Infrastructure that is impossible to change
- B. A practice where servers are never modified after deployment; any change requires building and deploying new instances from scratch
- C. Infrastructure made of unbreakable materials
- D. A type of hardware

Answer: B

Q1398. What is a Software Bill of Materials (SBOM) and why is it important?

- A. A bill for software purchases
- B. A formal, machine-readable inventory of all components, libraries, and dependencies in a software product for security and compliance tracking
- C. A financial document
- D. An employee roster

Answer: B

Q1399. What is the concept of 'GitOps' as a configuration management approach?

- A. Using Git for social media
- B. An operational model where Git repositories serve as the single source of truth for declarative infrastructure and application configuration
- C. A Git tutorial series
- D. A Git plugin

Answer: B

Q1400. What is the difference between 'feature toggles' and 'feature branches' as configuration strategies?

- A. They are identical
- B. Feature branches isolate work in separate code branches; feature toggles allow incomplete features to exist in the main branch but be disabled at runtime
- C. Feature toggles never work
- D. Feature branches are always better

Answer: B

Q1401. What is the concept of 'configuration drift' and how is it managed?

- A. Physical movement of servers
- B. The gradual divergence of actual system configurations from their intended state, managed through automated monitoring and remediation
- C. Network signal drift
- D. Time zone changes

Answer: B

Q1402. What is the concept of 'dependency management' in configuration management?

- A. Managing employee dependencies
- B. Systematically tracking, resolving, and updating third-party libraries and components that a software project depends on
- C. Managing database dependencies
- D. Managing hardware dependencies

Answer: B

Q1403. What is the concept of 'blue-green deployment' in release management?

- A. Using blue and green color themes
- B. A deployment strategy using two identical production environments where traffic is switched from the current (blue) to the new (green) version
- C. A testing strategy using colors
- D. A UI design technique

Answer: B

Q1404. What is canary deployment and how does it reduce release risk?

- A. Deploying software to canary birds
- B. Gradually rolling out changes to a small subset of users before deploying to the entire infrastructure, allowing early detection of issues
- C. A type of load testing
- D. A security scanning technique

Answer: B

Q1405. What is the Expected Monetary Value (EMV) technique in risk analysis?

- A. The expected salary of the project manager
- B. A quantitative technique that calculates the average outcome by multiplying each possible outcome's value by its probability and summing all results
- C. The expected project budget
- D. The expected revenue from the project

Answer: B

Q1406. What is a decision tree in the context of risk management?

- A. A tree used for making physical decisions
- B. A graphical tool that models decision options, chance events, probabilities, and outcomes to evaluate the expected value of different risk response strategies
- C. A type of data structure
- D. A tree in a garden used for thinking

Answer: B

Q1407. What is Boehm's Top 10 Risk Items approach?

- A. A list of the top 10 most expensive software products
- B. A risk management method that continuously tracks the top 10 project risks, ensuring management attention is focused on the most critical risks
- C. A list of the top 10 programming languages
- D. A ranking of the top 10 developers

Answer: B

Q1408. What is the concept of 'risk appetite' versus 'risk tolerance'?

- A. They are identical concepts
- B. Risk appetite is the broad level of risk an organization is willing to accept to achieve goals; risk tolerance is the specific acceptable variation from a particular objective
- C. Risk appetite is about food preferences
- D. Risk tolerance is about physical pain

Answer: B

Q1409. What is the concept of 'anti-fragile' systems in risk management?

- A. Systems that break easily
- B. Systems that actually improve and become stronger when exposed to stressors, volatility, and disorder
- C. Fragile systems that are not working
- D. Systems with no risk

Answer: B

Q1410. What is the concept of 'risk burndown' in Agile projects?

- A. Burning risk documents
- B. A chart tracking the total risk exposure over time, showing whether the project's overall risk is decreasing as planned
- C. A risk that causes burnout
- D. Deleting risk entries from the backlog

Answer: B

Q1411. What is the Monte Carlo simulation used for in risk analysis?

- A. Simulating casino gambling
- B. Running thousands of simulations with randomly varied risk parameters to produce a probability distribution of possible project outcomes
- C. Simulating weather patterns
- D. Simulating network traffic

Answer: B

Q1412. What is the concept of 'residual risk' in risk management?

- A. Risk that has been completely eliminated
- B. The remaining level of risk after risk response strategies have been applied, which must be documented and monitored
- C. Risk from restaurant software
- D. The first risk identified

Answer: B

Q1413. What is the STRIDE threat model and how is each element addressed?

- A. A walking exercise program
- B. A framework categorizing threats as Spoofing, Tampering, Repudiation, Information Disclosure, Denial of Service, and Elevation of Privilege, each with specific countermeasures
- C. A software development methodology
- D. A testing framework

Answer: B

Q1414. What is the concept of 'zero trust architecture'?

- A. Trusting no one in the office
- B. A security model that never implicitly trusts any entity inside or outside the network and requires continuous verification of every access request
- C. An architecture with zero features
- D. An architecture that trusts everything

Answer: B

Q1415. What is a supply chain attack in software security?

- A. Attacking a shipping company
- B. An attack that compromises a trusted third-party component, library, or tool in the software supply chain to inject malicious code into dependent systems
- C. Attacking a grocery store chain
- D. A logistics attack

Answer: B

Q1416. What is the concept of 'security by design' (Secure SDLC)?

- A. Designing secure buildings
- B. Integrating security practices and considerations into every phase of the software development lifecycle rather than adding them as an afterthought
- C. Designing security guard uniforms
- D. A type of physical security

Answer: B

Q1417. What is the concept of 'least privilege escalation paths' in security analysis?

- A. The shortest path to a promotion
- B. Analyzing how an attacker with minimal initial access could chain together vulnerabilities or misconfigurations to escalate their privileges to a higher level
- C. Walking the shortest path in an office
- D. A career development path

Answer: B

Q1418. What is the concept of 'attack surface' in security engineering?

- A. The physical surface of a computer
- B. The total set of points in a system where an attacker could potentially enter, extract data, or cause damage
- C. A type of computer monitor
- D. A mouse pad surface

Answer: B

Q1419. What is homomorphic encryption?

- A. Encryption that makes all data look the same
- B. A form of encryption that allows computations to be performed on encrypted data without decrypting it first, preserving privacy during processing
- C. Simple symmetric encryption
- D. A type of hash function

Answer: B

Q1420. What is the concept of 'secure coding guidelines' like CERT and CWE?

- A. Guidelines for physical building security
- B. Standardized catalogs of coding vulnerabilities (CWE) and best practices (CERT) that help developers write code resistant to common security flaws
- C. Guidelines for writing fast code
- D. Guidelines for team management

Answer: B

Q1421. What is the concept of 'DevSecOps' and how does it differ from traditional security approaches?

- A. A type of firewall
- B. An approach that integrates security practices directly into the DevOps pipeline, making security automated, continuous, and a shared responsibility rather than a late-stage gate
- C. A developer social network
- D. A security certification

Answer: B

Q1422. What is the Unified Software Development Process and how does it differ from the Rational Unified Process (RUP)?

- A. The Unified Process is a generic framework while RUP is a specific commercial implementation with detailed guidance and tools
- B. RUP is a generic framework while the Unified Process is a commercial product
- C. They are identical processes with different names used by different companies
- D. The Unified Process supports only agile methods while RUP supports only plan-driven methods

Answer: A

Q1423. How does the concept of 'technical debt' influence the selection and adaptation of software process models over time?

- A. Technical debt has no effect on process model selection since it is a coding-level concern
- B. Process models should never be changed once selected regardless of technical debt
- C. Accumulated technical debt may force teams to adopt more structured processes that include explicit refactoring and quality improvement phases
- D. Technical debt only affects waterfall projects and has no impact on iterative processes

Answer: C

Q1424. How does the problem frames approach by Michael Jackson differ from traditional requirements analysis methods?

- A. It focuses on identifying recurring problem structures in the real world rather than modeling solutions directly
- B. It eliminates the need for stakeholder involvement in requirements
- C. It is identical to use case modeling but with different terminology
- D. It only works for web-based applications and cannot be applied to embedded systems

Answer: A

Q1425. What role does requirements prioritization using the Wiegers' method play in managing conflicting stakeholder demands?

- A. It eliminates all conflicts by automatically removing low-priority requirements
- B. It uses relative weighting of benefit, penalty, cost, and risk to create an objective priority score that facilitates negotiation
- C. It assigns priority based solely on the seniority of the stakeholder who proposed the requirement
- D. It defers all prioritization decisions until after implementation is complete

Answer: B

Q1426. How does Little's Law apply to software project management for predicting delivery timelines?

- A. It states that adding more people always reduces delivery time proportionally
- B. It establishes that average cycle time equals work in progress divided by throughput, helping teams predict delivery based on current workflow
- C. It proves that all software projects will exceed their initial estimates by exactly 50%
- D. It only applies to manufacturing and has no relevance to software projects

Answer: B

Q1427. What is the Flyweight design pattern and when is it most beneficial?

- A. A pattern that ensures a class has only one instance with global access
- B. A pattern that uses sharing to support large numbers of fine-grained objects efficiently by separating intrinsic and extrinsic state
- C. A pattern that defines a skeleton algorithm in a base class with steps deferred to subclasses
- D. A pattern for creating families of related objects without specifying concrete classes

Answer: B

Q1428. How does the concept of 'connascence' extend the traditional understanding of coupling in software design?

- A. Connascence is simply another name for coupling with no additional insight
- B. Connascence categorizes coupling into static and dynamic forms with varying strengths, providing a more nuanced framework for evaluating design quality
- C. Connascence eliminates the need to consider cohesion in design evaluation
- D. Connascence only applies to functional programming and not object-oriented design

Answer: B

Q1429. What is the concept of 'architectural quanta' in evolutionary architecture and how does it affect deployment?

- A. It refers to the smallest unit of source code that can be compiled independently
- B. It is an independently deployable artifact with high functional cohesion and synchronous connascence, defining the boundary for architectural characteristics
- C. It is a measurement unit for counting the number of microservices in an architecture
- D. It is a quantum computing concept that has no relevance to software architecture

Answer: B

Q1430. How does the KLM-GOMS (Keystroke-Level Model) predict user task completion time?

- A. It measures the actual time users take and averages the results across a sample group
- B. It sums estimated times for basic operations including keystrokes, pointing, homing, drawing, mental preparation, and system response
- C. It uses machine learning algorithms trained on historical user data
- D. It relies solely on subjective user satisfaction surveys

Answer: B

Q1431. How does the concept of 'satisficing' in UI design differ from 'optimizing' and what are its implications?

- A. Satisficing means users always find the best option while optimizing means they settle for less
- B. Users often choose the first option that meets their minimum criteria rather than evaluating all options for the best one, which means interfaces should make good-enough options easy to find
- C. Satisficing and optimizing are identical concepts in UI design
- D. Satisficing only applies to expert users while novice users always optimize their choices

Answer: B

Q1432. What is concolic testing and how does it combine concrete and symbolic execution?

- A. It is a form of manual testing that combines interviews and observations
- B. It simultaneously performs concrete execution with actual inputs and symbolic execution with symbolic values to systematically explore execution paths
- C. It tests only the user interface using both automated and manual approaches
- D. It is an obsolete testing technique replaced entirely by fuzz testing

Answer: B

Q1433. What is the 'all-pairs' or pairwise testing technique and why is it effective for combinatorial testing?

- A. It requires testing every possible combination of all input parameters exhaustively
- B. It ensures that every pair of input parameter values is tested together at least once, significantly reducing test cases while catching most interaction faults
- C. It tests only two input parameters and ignores all others
- D. It is a technique where two testers review the same test case for accuracy

Answer: B

Q1434. What is the Orthogonal Defect Classification (ODC) system and how does it improve quality analysis?

- A. It is a tool for automatically fixing defects in source code
- B. It classifies defects along independent dimensions (type, trigger, impact) to provide actionable feedback about the development process
- C. It is a testing technique that replaces all other forms of quality assurance
- D. It measures only the number of defects without any classification

Answer: B

Q1435. How does the concept of 'quality attributes trade-off' affect architectural decisions in quality assurance?

- A. Quality attributes never conflict with each other, so trade-offs are unnecessary
- B. Improving one quality attribute (e.g., security) can negatively impact another (e.g., performance), requiring deliberate architectural trade-off analysis
- C. Trade-offs only apply during testing and have no effect on architecture
- D. All quality attributes can be maximized simultaneously with sufficient budget

Answer: B

Q1436. What is the Response for a Class (RFC) metric in the CK metrics suite and what are its implications?

- A. It counts the number of HTTP responses a web class can generate
- B. It counts the set of methods that can potentially be executed in response to a message received by an object of the class, indicating testing complexity
- C. It measures the average response time of a class in milliseconds
- D. It counts the number of comment lines in a class file

Answer: B

Q1437. How does the concept of 'metric entropy' relate to software measurement programs?

- A. Metric entropy means all metrics become more accurate over time as data accumulates
- B. As measurement programs mature, collected metrics can become stale, gamed, or lose their diagnostic power, requiring periodic reassessment of what is measured and why
- C. Metric entropy is a thermodynamic law that has no application to software engineering
- D. It ensures that all metrics remain stable and never need to be updated or replaced

Answer: B

Q1438. How does the concept of 'black swan events' challenge traditional risk management approaches in software projects?

- A. Black swan events are easily predicted by standard risk identification techniques
- B. These are highly improbable, high-impact events that lie outside normal expectations and cannot be predicted by historical data, requiring resilience-based rather than prediction-based risk strategies
- C. Black swan events only affect financial industries and have no relevance to software
- D. Traditional risk management already fully accounts for black swan events through contingency planning

Answer: B

Q1439. What is the difference between inherent risk and residual risk, and why is this distinction critical for risk management?

- A. Inherent and residual risk are synonymous terms used interchangeably in all contexts
- B. Inherent risk is the risk level before any controls or mitigations are applied, while residual risk is the remaining risk after mitigation measures are implemented
- C. Residual risk is always zero after proper mitigation strategies are applied
- D. Inherent risk only applies to new projects while residual risk applies only to maintenance projects

Answer: B

Q1440. What is the DREAD risk assessment model and how does it quantify security threats?

- A. DREAD is a psychological assessment of how much developers fear certain vulnerabilities
- B. DREAD rates threats on five dimensions: Damage potential, Reproducibility, Exploitability, Affected users, and Discoverability, each scored to calculate an overall threat rating
- C. DREAD is a network protocol for secure data transmission
- D. DREAD is a testing framework that automatically detects all security vulnerabilities

Answer: B

Web Development

1,530 Multiple Choice Questions

Web Development — Easy

510 questions

Q1. What does HTML stand for?

- A. Hyper Transfer Markup Language
- B. High Tech Modern Language
- C. Home Tool Markup Language
- D. Hyper Text Markup Language

Answer: D

Q2. Which language is primarily used for styling web pages?

- A. HyperText Markup
- B. JavaScript Logic
- C. Python Scripting
- D. Cascading Styles

Answer: D

Q3. What is a web browser?

- A. Software that displays web pages
- B. A system for managing databases
- C. A tool for compiling source code
- D. A backend application framework

Answer: A

Q4. Which of the following is a web browser?

- A. Google Chrome
- B. Apache HTTP
- C. MySQL Shell
- D. Node.js CLI

Answer: A

Q5. What does URL stand for?

- A. Uniform Reference Locator
- B. Uniform Resource Locator
- C. Universal Resource Locator
- D. Universal Reference Link

Answer: B

Q6. Which language adds interactivity to web pages?

- A. HTML markup
- B. JavaScript
- C. SQL queries
- D. CSS styling

Answer: B

Q7. What is a website?

- A. A single standalone web page
- B. A program that runs web servers
- C. A plugin installed in browsers
- D. A collection of related web pages

Answer: D

Q8. What is the role of a web server?

- A. To browse and view the internet
- B. To write and compile source code
- C. To design visual page layouts
- D. To store and serve web pages

Answer: D

Q9. Which file extension is used for HTML files?

- A. .py
- B. .html
- C. .js
- D. .css

Answer: B

Q10. What is front-end development?

- A. Configuring the network settings
- B. Managing and querying databases
- C. Building the user-visible interface
- D. Programming logic on the server

Answer: C

Q11. What does HTTP stand for?

- A. Hyper Text Transport Protocol
- B. High Tech Transfer Protocol
- C. Hyper Text Transfer Protocol
- D. Home Transfer Text Protocol

Answer: C

Q12. What is a client in web architecture?

- A. The web server that hosts content
- B. The database that stores records
- C. The network cable carrying signals
- D. The device or browser making requests

Answer: D

Q13. What is the default port for HTTP?

- A. Port 443
- B. Port 21
- C. Port 8080
- D. Port 80

Answer: D

Q14. What does DNS stand for?

- A. Dynamic Network Server
- B. Data Network Service
- C. Digital Naming Standard
- D. Domain Name System

Answer: D

Q15. Which HTTP method is used to retrieve data from a server?

- A. POST
- B. DELETE
- C. PUT
- D. GET

Answer: D

Q16. What is an IP address?

- A. A human-readable domain website name
- B. A server-side scripting language for web
- C. A software application like a web browser
- D. A numerical label assigned to each device

Answer: D

Q17. What does the status code 200 mean in HTTP?

- A. OK (Success)
- B. Not Found Error
- C. Redirect Response
- D. Internal Server Error

Answer: A

Q18. What is the role of a web server in the client-server model?

- A. To store only the user password data
- B. To forward requests to other clients
- C. To process requests and send responses
- D. To display web pages to the end user

Answer: C

Q19. Which protocol is used for sending emails?

- A. SMTP
- B. DNS
- C. HTTP
- D. FTP

Answer: A

Q20. What is a web API?

- A. An interface for applications to communicate
- B. A CSS framework for responsive design
- C. A relational database management system
- D. An HTML element used for page layout

Answer: A

Q21. Which HTML tag is used to create a paragraph?

- A. <pg>
- B. <para>
- C. <p>
- D. <text>

Answer: C

Q22. What is the correct HTML tag for the largest heading?

- A. <head> tag
- B. <heading>
- C. <h6> tag
- D. <h1> tag

Answer: D

Q23. Which HTML tag is used to create a hyperlink?

- A. <a>
- B. <url>
- C. <link>
- D. <href>

Answer: A

Q24. Which attribute specifies the URL in an anchor tag?

- A. href
- B. url
- C. link
- D. src

Answer: A

Q25. What is the correct HTML tag for inserting an image?

- A. <photo>
- B. <image>
- C. <pic>
- D.

Answer: D

Q26. Which HTML tag creates an unordered list?

- A. <list>
- B.
- C.
- D.

Answer: B

**Q27. What does the
 tag do?**

- A. Creates a border
- B. Makes text bigger
- C. Creates bold text
- D. Inserts a line break

Answer: D

Q28. Which HTML tag makes text bold?

- A. Only the tag
- B. Only the tag
- C. The <bold> tag only
- D. Both and

Answer: D

Q29. What is the root element of an HTML document?

- A. <html>
- B. <head>
- C. <doctype>
- D. <body>

Answer: A

Q30. Which tag defines a table row in HTML?

- A. <td> tag
- B. <tr> tag
- C. <th> tag
- D. <table> tag

Answer: B

Q31. What does CSS stand for?

- A. Colorful Style Sheets
- B. Computer Style Sheets
- C. Creative Style System
- D. Cascading Style Sheets

Answer: D

Q32. Which CSS property changes the text color?

- A. text-color
- B. color
- C. font-color
- D. fg-color

Answer: B

Q33. How do you select an element with the ID 'header' in CSS?

- A. #header
- B. header
- C. .header
- D. *header

Answer: A

Q34. Which CSS property sets the background color?

- A. color-property
- B. back-color-css
- C. background-color
- D. bgcolor-attr

Answer: C

Q35. How do you select elements with the class 'active' in CSS?

- A. active
- B. *active
- C. #active
- D. .active

Answer: D

Q36. Which property changes the font size?

- A. text-font
- B. text-size
- C. font-size
- D. text-style

Answer: C

Q37. What is the correct CSS syntax to change font to Arial?

- A. text-font: Arial;
- B. font-family: Arial;
- C. family-font: Arial;
- D. font: Arial;

Answer: B

Q38. Which property adds space inside an element's border?

- A. padding
- B. spacing
- C. margin
- D. gap

Answer: A

Q39. Which property adds space outside an element's border?

- A. spacing
- B. margin
- C. padding
- D. outer-space

Answer: B

Q40. How do you add a comment in CSS?

- A. <!-- comment -->
- B. /* comment */
- C. // comment
- D. # comment

Answer: B

Q41. What is CSS Flexbox?

- A. A JavaScript library for DOM element manipulation
- B. A CSS keyframe animation type for effects
- C. A third-party CSS framework for styling pages
- D. A layout model for one-dimensional rows or columns

Answer: D

Q42. Which CSS property creates a flex container?

- A. display: flex
- B. flex: true
- C. layout: flex
- D. container: flex

Answer: A

Q43. What is CSS Grid?

- A. A JavaScript grid plugin for data tables
- B. A third-party CSS component library
- C. A replacement exclusively for HTML tables
- D. A two-dimensional layout for rows and columns

Answer: D

Q44. Which property defines grid columns?

- A. column-template
- B. grid-template-columns
- C. display-columns
- D. grid-columns

Answer: B

Q45. What is a media query in CSS?

- A. A query for fetching database records
- B. A technique applying styles based on device traits
- C. An HTML element for embedding external content
- D. A JavaScript API for browser feature detection

Answer: B

Q46. Which property controls the direction of flex items?

- A. flex-align
- B. flex-direction
- C. flex-orient
- D. flex-flow

Answer: B

Q47. What does justify-content do in Flexbox?

- A. Distributes space between items along main axis
- B. Sets the font family for text inside items
- C. Aligns items along the cross axis vertically
- D. Changes the text alignment within flex items

Answer: A

Q48. What is a CSS transition?

- A. A JavaScript event triggered by user action
- B. A smooth change between CSS property values
- C. An HTML animation tag for visual effects
- D. A page redirect to a new URL location

Answer: B

Q49. Which property creates a CSS animation?

- A. transition
- B. animation
- C. motion
- D. animate

Answer: B

Q50. What does align-items do in Flexbox?

- A. Sets item width
- B. Aligns items along the main axis
- C. Aligns items along the cross axis
- D. Changes item order

Answer: C

Q51. Which keyword declares a variable in JavaScript?

- A. variable
- B. var
- C. declare
- D. let

Answer: B

Q52. What is the correct way to write a single-line comment in JavaScript?

- A. <!-- comment -->
- B. /* comment */
- C. // comment
- D. # comment

Answer: C

Q53. Which operator is used for strict equality in JavaScript?

- A. ===
- B. ==
- C. =
- D. !=

Answer: A

Q54. What does console.log() do?

- A. Creates a modal dialog box on screen
- B. Outputs a message to the browser console
- C. Logs the user into a website account
- D. Creates a new log file on disk

Answer: B

Q55. Which data type represents true or false?

- A. Number
- B. Undefined
- C. String
- D. Boolean

Answer: D

Q56. How do you create a function in JavaScript?

- A. create myFunc() {}
- B. def myFunc() {}
- C. func myFunc() {}
- D. function myFunc() {}

Answer: D

Q57. What is an array in JavaScript?

- A. An ordered collection of values
- B. A type of reusable function
- C. A single primitive value in memory
- D. A CSS property declaration

Answer: A

Q58. How do you write an if statement in JavaScript?

- A. if (x > 5) {}
- B. if x > 5 {}
- C. when (x > 5) {}
- D. if x > 5 then

Answer: A

Q59. Which method adds an element to the end of an array?

- A. add()
- B. insert()
- C. append()
- D. push()

Answer: D

Q60. What does the typeof operator return?

- A. The CSS type selector for an HTML element
- B. A string indicating the data type of a value
- C. The file type extension of a source file
- D. The element type in an HTML document

Answer: B

Q61. What is a Promise in JavaScript?

- A. A looping construct for iterating over arrays
- B. A type of variable for storing constant values
- C. A guarantee of optimal performance metrics
- D. An object representing an async operation result

Answer: D

Q62. What keyword makes a function asynchronous?

- A. defer
- B. await
- C. promise
- D. async

Answer: D

Q63. What does the await keyword do?

- A. Stops the program from running permanently
- B. Pauses async execution until a Promise settles
- C. Creates a timed delay between code statements
- D. Waits for CSS stylesheets to fully load

Answer: B

Q64. What is the spread operator in JavaScript?

- A. The ... operator expanding iterables into elements
- B. The => operator for defining arrow function bodies
- C. The ** operator for exponentiation calculations
- D. The -> operator for creating arrow function syntax

Answer: A

Q65. What is an arrow function?

- A. A function that draws arrow graphics on canvas
- B. A built-in math function for calculations
- C. A recursive function that calls itself repeatedly
- D. A shorter syntax for writing functions using =>

Answer: D

Q66. What does fetch() do in JavaScript?

- A. Makes HTTP requests to retrieve network resources
- B. Downloads files directly to the local disk
- C. Imports CSS files into a JavaScript module
- D. Fetches DOM elements by their CSS selectors

Answer: A

Q67. What is a JavaScript module?

- A. A debugging tool for inspecting runtime state
- B. A browser plugin for extending functionality
- C. A testing framework for unit test execution
- D. A file that exports and imports reusable code

Answer: D

Q68. Which keyword is used to export from a module?

- A. output
- B. export
- C. module
- D. send

Answer: B

Q69. What is the rest parameter in JavaScript?

- A. A sleep function that pauses code execution
- B. Syntax (...args) collecting remaining arguments
- C. A default parameter value for function calls
- D. A parameter specifically for REST API calls

Answer: B

Q70. What is try...catch used for?

- A. Testing CSS styles in the browser
- B. Importing modules from external files
- C. Handling errors and exceptions in code
- D. Creating loops that iterate over data

Answer: C

Q71. What is React?

- A. A CSS framework for responsive page design
- B. A relational database management system tool
- C. A server-side backend application framework
- D. A JavaScript library for building user interfaces

Answer: D

Q72. What is a component in React?

- A. A reusable piece of UI with its own logic
- B. A server route for handling requests
- C. A CSS class for styling HTML elements
- D. A database table for storing records

Answer: A

Q73. What is Vue.js?

- A. A video player for streaming content
- B. A testing tool for browser automation
- C. A CSS library for animation effects
- D. A progressive framework for building UIs

Answer: D

Q74. What is Angular?

- A. A distributed version control system tool
- B. A CSS grid system for page layout design
- C. A TypeScript-based web framework by Google
- D. A NoSQL document-oriented database system

Answer: C

Q75. What is JSX?

- A. A new standalone programming language
- B. A CSS preprocessor like Sass or Less
- C. A syntax extension for HTML-like code in JS
- D. A JSON alternative data exchange format

Answer: C

Q76. What are props in React?

- A. Database properties for configuring schemas
- B. Browser settings for rendering preferences
- C. Data passed from parent to child components
- D. CSS properties applied to styled elements

Answer: C

Q77. What is state in React?

- A. A geographical US state name string value
- B. An object holding data that triggers re-renders
- C. A CSS state like hover or focus pseudo-class
- D. A server state for managing session data

Answer: B

Q78. What is npm?

- A. A server-side programming language runtime
- B. Node Package Manager for managing dependencies
- C. A CSS framework for responsive web design
- D. A relational database management system

Answer: B

Q79. What does npm install do?

- A. Installs CSS styles into browser cache
- B. Installs dependencies from package.json
- C. Installs a new browser on the system
- D. Installs a new operating system update

Answer: B

Q80. What is a Single Page Application (SPA)?

- A. A mobile app built with native platform-specific tools
- B. A static HTML page with no interactive features at all
- C. A web app that loads once and dynamically updates content
- D. A website containing only a single paragraph of text

Answer: C

Q81. What is a server?

- A. A computer providing services to clients
- B. A type of relational database system
- C. A CSS framework for styling web layouts
- D. A web browser for viewing internet pages

Answer: A

Q82. What is Node.js?

- A. A JavaScript runtime on V8 for server-side code
- B. A CSS preprocessor for advanced styling
- C. A NoSQL document-oriented database system
- D. A frontend JavaScript UI framework library

Answer: A

Q83. What is an API endpoint?

- A. A CSS selector for targeting page elements
- B. A database connection string configuration
- C. The final termination point of an API
- D. A specific URL where an API receives requests

Answer: D

Q84. What is Express.js?

- A. A frontend library for building user interfaces
- B. A CSS framework for responsive page layouts
- C. A minimal web application framework for Node.js
- D. A NoSQL database for document-based storage

Answer: C

Q85. What is a database?

- A. An organized collection of structured data
- B. A CSS file for styling web page elements
- C. A web server for hosting application files
- D. A programming language for writing scripts

Answer: A

Q86. What does CRUD stand for?

- A. Create, Read, Update, Delete
- B. Compile, Run, Upload, Debug
- C. Connect, Retrieve, Upload, Download
- D. Cache, Route, Update, Deploy

Answer: A

Q87. What is middleware in backend development?

- A. Software between request and response for processing
- B. A CSS framework for building page component layouts
- C. A frontend component for rendering user interfaces
- D. A type of relational database engine system

Answer: A

Q88. What is JSON?

- A. A relational database management system tool
- B. JavaScript Object Notation for data interchange
- C. A CSS extension for advanced style features
- D. A server-side programming language runtime

Answer: B

Q89. What is a route in backend development?

- A. A URL pattern mapped to a handler function
- B. A database query for fetching records
- C. A CSS path for selecting nested elements
- D. A physical network cable routing path

Answer: A

Q90. What is the purpose of a package.json file?

- A. To store database records in JSON format
- B. To configure CSS preprocessor build steps
- C. To style web pages with CSS declarations
- D. To define project metadata and dependencies

Answer: D

Q91. What is server-side rendering?

- A. A database operation for aggregating records
- B. A CSS technique for optimizing visual layout
- C. Rendering CSS on the server before delivery
- D. Generating HTML on the server before sending it

Answer: D

Q92. Which language is commonly used for server-side programming?

- A. HTML
- B. Python
- C. CSS
- D. SVG

Answer: B

Q93. What is PHP?

- A. A relational database management system
- B. A CSS framework for responsive web layouts
- C. A server-side scripting language for web dev
- D. A JavaScript library for building interfaces

Answer: C

Q94. What is Django?

- A. A CSS framework for responsive component design
- B. A NoSQL database for storing document collections
- C. A high-level Python web framework for rapid dev
- D. A JavaScript library for building front-end UIs

Answer: C

Q95. What is a template engine?

- A. A database tool for managing schema migrations
- B. A JavaScript framework for reactive UI development
- C. Software combining templates with data for HTML
- D. A CSS generator for building style sheets

Answer: C

Q96. What is the purpose of a controller in server-side MVC?

- A. To control the browser rendering engine
- B. To control CSS styles of page elements
- C. To handle requests, process data, and respond
- D. To control the database schema directly

Answer: C

Q97. What is a server-side session?

- A. Data stored on server to maintain user state
- B. A database backup for disaster recovery
- C. A CSS animation effect with keyframes
- D. A JavaScript variable in the global scope

Answer: A

Q98. What is Flask?

- A. A JavaScript runtime built on V8 engine
- B. A CSS container element for layouts
- C. A NoSQL database for document storage
- D. A lightweight Python web framework for apps

Answer: D

Q99. What is a request object in server-side programming?

- A. A database query for retrieving record sets
- B. A CSS class for styling specific elements
- C. An object containing incoming HTTP request data
- D. A JavaScript event fired by user interactions

Answer: C

Q100. What does npm start typically do?

- A. Starts CSS compilation for the build process
- B. Opens a browser window to the application URL
- C. Creates a new project with boilerplate code
- D. Runs the start script in package.json for server

Answer: D

Q101. What is MySQL?

- A. A CSS framework for responsive web page layouts
- B. A web server for hosting application endpoints
- C. An open-source relational database management system
- D. A JavaScript library for building web interfaces

Answer: C

Q102. What is MongoDB?

- A. A NoSQL document database storing JSON-like data
- B. A CSS framework for building styled components
- C. A web server for serving static content files
- D. A SQL relational database using table schemas

Answer: A

Q103. What does SQL stand for?

- A. Simple Query Language
- B. Structured Query Language
- C. Server Query Logic
- D. Standard Question Language

Answer: B

Q104. Which SQL command retrieves data?

- A. RETRIEVE
- B. FETCH
- C. GET
- D. SELECT

Answer: D

Q105. What is a primary key?

- A. The first column created in a database table
- B. A password used for database authentication
- C. A unique identifier for each record in a table
- D. A foreign key linking to another related table

Answer: C

Q106. What SQL command inserts new data?

- A. CREATE INTO
- B. ADD INTO
- C. INSERT INTO
- D. PUT INTO

Answer: C

Q107. What is a table in a relational database?

- A. A JavaScript object for storing key-value pairs
- B. A CSS grid for laying out page components
- C. An HTML table element for displaying data
- D. A structured collection of rows and columns

Answer: D

Q108. What is PostgreSQL?

- A. A CSS preprocessor for advanced style features
- B. An advanced open-source relational database system
- C. A JavaScript framework for building web apps
- D. A web browser for viewing internet content

Answer: B

Q109. What SQL command deletes data?

- A. DESTROY
- B. DELETE
- C. DROP DATA
- D. REMOVE

Answer: B

Q110. What is a database schema?

- A. The structure defining data organization and relations
- B. An HTML template for rendering dynamic page content
- C. A JavaScript object for storing config data
- D. A CSS layout blueprint for page structure

Answer: A

Q111. What is HTTPS?

- A. HTTP with encryption using TLS/SSL for security
- B. A database protocol for encrypted connections
- C. A faster version of HTTP for static content
- D. A programming language for server applications

Answer: A

Q112. What is a password hash?

- A. A one-way transformation into a fixed-length string
- B. A password hint for helping users remember
- C. A password reset link sent via email notification
- D. An encrypted password stored with a cipher key

Answer: A

Q113. What is XSS (Cross-Site Scripting)?

- A. A JavaScript framework for building secure apps
- B. A CSS extension for adding custom properties
- C. A vulnerability where malicious scripts are injected
- D. A database attack targeting stored procedures

Answer: C

Q114. What is a firewall?

- A. A NoSQL database for storing security records
- B. A JavaScript library for client-side validation
- C. A CSS border property for styling elements
- D. A system monitoring and controlling network traffic

Answer: D

Q115. What is authentication?

- A. A JavaScript function for data validation
- B. The process of verifying a user's identity
- C. A CSS technique for styling form elements
- D. Authorizing access to protected resources

Answer: B

Q116. What is a cookie in web security?

- A. A CSS property for styling decorated elements
- B. A small data piece stored for session management
- C. A browser game for entertainment purposes
- D. A JavaScript variable stored in local memory

Answer: B

Q117. What does SSL stand for?

- A. Secure Socket Layer
- B. Simple Security Layer
- C. Secure Server Link
- D. Server Side Logic

Answer: A

Q118. What is a CAPTCHA?

- A. A test distinguishing humans from automated bots
- B. A type of database for storing user accounts
- C. A JavaScript function for validating form data
- D. A CSS framework for building secure page layouts

Answer: A

Q119. What is two-factor authentication (2FA)?

- A. Using two passwords for login authentication
- B. Using two browsers for testing compatibility
- C. Having two accounts for backup and recovery
- D. A method requiring two forms of identification

Answer: D

Q120. Why should user input be validated?

- A. To improve SEO ranking in search engine results
- B. To improve CSS styling across different browsers
- C. To speed up the database query execution time
- D. To prevent malicious data and protect against attacks

Answer: D

Q121. What is web performance optimization?

- A. A CSS framework for building optimized page layouts
- B. A JavaScript library for animation performance
- C. Making websites look visually better with design
- D. Techniques to make websites load and respond faster

Answer: D

Q122. What is caching?

- A. Storing data copies for faster subsequent access
- B. A type of database for key-value storage
- C. A payment method for online transactions
- D. A CSS property for visual element styling

Answer: A

Q123. What is image compression?

- A. Permanently deleting images from the server
- B. Reducing image file size while keeping quality
- C. A JavaScript function for image manipulation
- D. A CSS filter for applying visual image effects

Answer: B

Q124. What is minification?

- A. A CSS technique for reducing selector specificity
- B. Making fonts smaller on the rendered page
- C. Removing unnecessary characters without changing function
- D. A database optimization for reducing table sizes

Answer: C

Q125. What is lazy loading?

- A. A database query that runs in the background
- B. A CSS animation with a slow timing function
- C. Deferring non-critical resource loading until needed
- D. Loading pages intentionally at a slower speed

Answer: C

Q126. What is a CDN used for in web performance?

- A. A database network for distributed data storage
- B. Creating dynamically generated HTML pages
- C. Distributing content across global servers for speed
- D. A CSS framework for building responsive layouts

Answer: C

Q127. Why are large images bad for web performance?

- A. They look bad on high-resolution displays
- B. They break CSS layouts on mobile devices
- C. They increase page load time and bandwidth use
- D. They cause JavaScript runtime errors in browsers

Answer: C

Q128. What is page load time?

- A. A server uptime metric for availability
- B. The time to write the application code
- C. The total time for a web page to fully load
- D. A CSS duration for transition animations

Answer: C

Q129. What does the async attribute do on a script tag?

- A. Makes CSS load asynchronously in parallel
- B. Downloads script without blocking HTML parsing
- C. Makes the script execute synchronously in order
- D. Delays the script loading permanently from page

Answer: B

Q130. What is browser caching?

- A. Storing resources locally for faster repeat access
- B. A JavaScript method for storing session data
- C. A CSS property for caching computed style values
- D. A browser plugin for extending capabilities

Answer: A

Q131. What is unit testing?

- A. Testing individual functions of code in isolation
- B. Testing the entire application end to end
- C. Testing only the database layer and queries
- D. Testing CSS styles across different browsers

Answer: A

Q132. What is a bug in software?

- A. A planned feature in the software design
- B. A CSS property that is incorrectly applied
- C. An error in code causing unexpected behavior
- D. A computer virus that damages system files

Answer: C

Q133. What is the browser developer console used for?

- A. Writing CSS styles for page elements
- B. Managing database records and schemas
- C. Debugging JavaScript and inspecting elements
- D. Designing web page visual layouts

Answer: C

Q134. What is console.log() used for in debugging?

- A. Creating a user activity log in the database
- B. Outputting values to the console for inspection
- C. Sending logs to the remote server for storage
- D. Creating log files on the server disk

Answer: B

Q135. What is a test case?

- A. Conditions to verify a feature works correctly
- B. A computer case for housing hardware
- C. A CSS container for grouping styled elements
- D. A JavaScript class for creating object types

Answer: A

Q136. What is manual testing?

- A. Testing with reference to user documentation
- B. Testing only the documentation for accuracy
- C. Testing performed using automated tools
- D. Testing software by hand without automation

Answer: D

Q137. What does a breakpoint do in debugging?

- A. Pauses code execution at a specific line for inspection
- B. Breaks the code permanently so it stops running
- C. Breaks the CSS layout causing elements to misalign
- D. Creates a responsive breakpoint for media queries

Answer: A

Q138. What is the Network tab in browser DevTools for?

- A. Managing network configuration settings in browser
- B. Creating network topology diagrams for documentation
- C. Connecting to WiFi network for internet access
- D. Monitoring HTTP requests, responses, and their timing

Answer: D

Q139. What is regression testing?

- A. Re-testing features after changes to check nothing broke
- B. Testing CSS regression across different browsers
- C. Testing database regression after schema updates
- D. Testing a feature for the very first time

Answer: A

Q140. What is a linter?

- A. A debugger for stepping through code execution
- B. A CSS framework for responsive page layouts
- C. A testing framework for automated unit testing
- D. A tool analyzing code for errors and style violations

Answer: D

Q141. What is web hosting?

- A. A service making a website accessible on the internet
- B. A database service for storing application records
- C. A CSS framework for building web page layouts
- D. A JavaScript library for reactive user interfaces

Answer: A

Q142. What is a domain name?

- A. A server name assigned during initial configuration
- B. A database name for identifying data collections
- C. A human-readable address used to access a website
- D. A numerical IP address for server identification

Answer: C

Q143. What is FTP?

- A. A CSS framework for styled web page components
- B. File Transfer Protocol for transferring files over networks
- C. A JavaScript function for processing user form data
- D. A database query for retrieving and filtering records

Answer: B

Q144. What is GitHub Pages?

- A. A database service for cloud-based data storage
- B. A social media platform for sharing content
- C. A free static site hosting service from GitHub
- D. A JavaScript framework for building web apps

Answer: C

Q145. What is a production environment?

- A. A coding environment for writing application code
- B. A testing environment for verifying bug fixes
- C. The live environment where users access the application
- D. A staging environment for pre-release validation

Answer: C

Q146. What does deploy mean in web development?

- A. To write application source code in an IDE
- B. To debug code and find programming errors
- C. To make an application accessible on a server
- D. To test code for correctness and reliability

Answer: C

Q147. What is Netlify?

- A. A JavaScript framework for building web applications
- B. A cloud platform for deploying sites and serverless
- C. A CSS framework for building responsive web layouts
- D. A NoSQL database for storing document collections

Answer: B

Q148. What is a staging environment?

- A. The production server running the live application
- B. A development computer for writing application code
- C. A CSS staging area for previewing style changes
- D. A pre-production environment mirroring production

Answer: D

Q149. What is version control?

- A. A database version for tracking schema migrations
- B. A CSS versioning system for managing style updates
- C. Controlling which browser version users run
- D. A system tracking and managing code changes over time

Answer: D

Q150. What is a build process?

- A. Transforming source code into optimized deploy files
- B. Building HTML pages manually without any tools
- C. A CSS compilation step for preprocessing styles
- D. Building a physical server room infrastructure

Answer: A

Q151. What is a Web API?

- A. A JavaScript variable for storing temporary data
- B. An interface allowing software to communicate via HTTP
- C. A CSS framework for building styled web layouts
- D. A NoSQL database for storing document records

Answer: B

Q152. What is JSON used for in Web APIs?

- A. Storing CSS variables for theming and customization
- B. Styling web pages with CSS declarations and rules
- C. A lightweight data format for client-server exchange
- D. Creating HTML elements for dynamic page rendering

Answer: C

Q153. What is a GET request?

- A. Getting database access for read operations
- B. Getting CSS styles for an HTML element
- C. An HTTP request that retrieves data without modifying
- D. Getting HTML templates from the server cache

Answer: C

Q154. What is a POST request?

- A. An HTTP request sending data to create a resource
- B. Posting database queries for batch execution
- C. Posting CSS updates to a remote style server
- D. Posting content on a social media platform

Answer: A

Q155. What is an API key?

- A. A physical key for server room access control
- B. A CSS key for targeting specific styled elements
- C. A unique identifier used to authenticate API requests
- D. A keyboard shortcut for developer tool actions

Answer: C

Q156. What does REST stand for?

- A. Remote Execution of Server Tasks
- B. Real-time Event Streaming Technology
- C. Responsive State Transition
- D. Representational State Transfer

Answer: D

Q157. What is an API response?

- A. Data sent back by server after processing a request
- B. A CSS file for styling page components
- C. An HTML page always returned from the server
- D. A JavaScript function for handling async events

Answer: A

Q158. What is Postman used for?

- A. Managing database records through a visual tool
- B. Sending physical mail through the postal service
- C. Testing and debugging APIs by sending requests
- D. Writing CSS stylesheets for web page elements

Answer: C

Q159. What is an HTTP status code?

- A. A JavaScript error code thrown during execution
- B. A database error code from failed query operations
- C. A numerical code indicating the result of a request
- D. A CSS class name applied to styled elements

Answer: C

Q160. What is a query parameter in a URL?

- A. A CSS query for selecting styled page elements
- B. A key-value pair after ? to send data with requests
- C. A database query for filtering stored records
- D. A JavaScript query for searching DOM tree nodes

Answer: B

Q161. What is TypeScript?

- A. A CSS preprocessor for advanced style syntax
- B. A typed superset of JavaScript compiling to JS
- C. A new unrelated programming language for web
- D. A database language for structured query access

Answer: B

Q162. What is a package manager?

- A. A database manager for schema and migration control
- B. A CSS framework for responsive component-based design
- C. A tool automating installing and managing dependencies
- D. A delivery service for shipping physical packages

Answer: C

Q163. What is Sass/SCSS?

- A. A database language for writing structured queries
- B. A web server for hosting static and dynamic content
- C. A JavaScript library for building reactive interfaces
- D. A CSS preprocessor adding variables, nesting, mixins

Answer: D

Q164. What is a linter?

- A. A CSS animation for transition visual effects
- B. A database tool for query optimization and profiling
- C. A testing framework for automated unit test execution
- D. A tool analyzing code to flag errors and enforce standards

Answer: D

Q165. What is Git?

- A. A NoSQL database for storing document collections
- B. A CSS framework for building responsive layouts
- C. A web browser for viewing internet content
- D. A distributed version control system for code

Answer: D

Q166. What is a code formatter?

- A. A CSS beautifier for styling elements only
- B. A database formatter for prettifying query output
- C. A JavaScript compiler for transpiling modern syntax
- D. A tool automatically formatting code to consistent style

Answer: D

Q167. What is Tailwind CSS?

- A. A utility-first CSS framework with low-level classes
- B. A database tool for managing schema migrations
- C. A testing framework for end-to-end browser tests
- D. A JavaScript framework for building user interfaces

Answer: A

Q168. What is a component library?

- A. A CSS file for global application style definitions
- B. A book library for reading documentation offline
- C. A collection of pre-built reusable UI components
- D. A JavaScript runtime for executing server code

Answer: C

Q169. What is Markdown?

- A. A JavaScript library for DOM manipulation events
- B. A lightweight markup language for formatted text
- C. A database query language for structured access
- D. A CSS framework for responsive component styling

Answer: B

Q170. What is an environment variable?

- A. A variable set outside the app configuring behavior
- B. A CSS variable defined with custom property syntax
- C. A database field for storing record attribute values
- D. A JavaScript global variable accessible from any scope

Answer: A

Q171. What does CSS stand for?

- A. Colorful Style Sheets
- B. Cascading Style Sheets
- C. Computer Style Sheets
- D. Creative Style Systems

Answer: B

Q172. What is the purpose of a text editor in web development?

- A. To write and edit source code
- B. To compile server-side programs
- C. To manage database table records
- D. To browse and navigate websites

Answer: A

Q173. Which protocol is used to load web pages?

- A. HTTP protocol
- B. FTP protocol
- C. SSH protocol
- D. SMTP protocol

Answer: A

Q174. What is a web page?

- A. A database query statement
- B. A server configuration file
- C. A single document on the web
- D. A network routing protocol

Answer: C

Q175. What does a back-end developer do?

- A. Designs the visual user interface
- B. Creates graphic assets for the site
- C. Writes server-side application logic
- D. Tests the browser compatibility only

Answer: C

Q176. Which tool is used to inspect web page elements?

- A. Terminal emulator
- B. Browser DevTools
- C. Package installer
- D. Database manager

Answer: B

Q177. What is a hyperlink?

- A. A styling rule for text decoration
- B. A script that validates user input
- C. A method for storing session data
- D. A clickable reference to another page

Answer: D

Q178. What is the main function of DNS?

- A. To validate HTML page structure
- B. To encrypt data during transfer
- C. To compile source code on servers
- D. To translate domain names to IPs

Answer: D

Q179. What does IDE stand for?

- A. Internal Data Encryption
- B. Integrated Development Environment
- C. Interactive Design Editor
- D. Internet Development Engine

Answer: B

Q180. Which language is used for web page structure?

- A. JavaScript
- B. HTML markup
- C. Python lang
- D. Cascading SS

Answer: B

Q181. What does HTTP stand for?

- A. Hyper Terminal Text Program
- B. HyperText Transfer Protocol
- C. High Transfer Text Protocol
- D. Home Text Transfer Protocol

Answer: B

Q182. What is an IP address?

- A. A programming language for building web applications
- B. A unique numerical label for devices on a network
- C. A type of database used to store website content
- D. A visual design tool for creating page mockup files

Answer: B

Q183. What is the default port number for HTTP?

- A. Port 443
- B. Port 80
- C. Port 25
- D. Port 21

Answer: B

Q184. What does HTTPS add to HTTP?

- A. Encryption via SSL/TLS
- B. Faster data transfer
- C. Database connectivity
- D. Image optimization

Answer: A

Q185. What is a client in client-server architecture?

- A. The device that stores all website data files
- B. The protocol that encodes data for safe transfer
- C. The cable that connects computers on a network
- D. The software that requests resources from servers

Answer: D

Q186. Which HTTP method is used to retrieve data?

- A. DELETE method
- B. POST method
- C. PUT method
- D. GET method

Answer: D

Q187. What is a web host?

- A. A browser extension for ad blocking
- B. A language for scripting web pages
- C. A service that stores website files
- D. A tool for debugging CSS layouts

Answer: C

Q188. What does a 404 status code mean?

- A. Resource not found
- B. Server internal error
- C. Redirect to new URL
- D. Successful request

Answer: A

Q189. What is bandwidth in web context?

- A. The number of users currently accessing a specific web server
- B. The maximum data transfer rate of a network connection link
- C. The visual width of a web page displayed in the browser window
- D. The total storage space available on a web hosting server disk

Answer: B

Q190. What is latency in networking?

- A. The delay before data transfer begins between two endpoints
- B. The maximum number of connections a server can handle at once
- C. The total storage capacity available on a remote file server
- D. The encryption strength used to protect data during transfers

Answer: A

Q191. Which HTML tag creates a paragraph?

- A.
 tag
- B. tag
- C. <div> tag
- D. <p> tag

Answer: D

Q192. What does the <a> tag create?

- A. An image element
- B. A paragraph block
- C. A table row item
- D. A hyperlink element

Answer: D

Q193. Which attribute specifies the URL in an anchor tag?

- A. type attribute
- B. alt attribute
- C. src attribute
- D. href attribute

Answer: D

Q194. What is the purpose of the <head> element?

- A. To display the main visible content of the page
- B. To contain metadata and links to external resources
- C. To create a navigation menu across the top of site
- D. To define a footer section at the bottom of a page

Answer: B

Q195. Which tag is used for the largest heading?

- A. <h6> tag
- B. <h2> tag
- C. <h3> tag
- D. <h1> tag

Answer: D

Q196. What does the tag do?

- A. Generates a table layout
- B. Inserts an image element
- C. Creates a hyperlink to page
- D. Defines a text paragraph

Answer: B

Q197. Which HTML tag creates a line break?

- A. <lb> tag
- B.
 tag
- C. <hr> tag
- D. <nl> tag

Answer: B

Q198. What is the purpose of the <title> tag?

- A. To add a tooltip on hover state
- B. To set the browser tab title text
- C. To display a heading on the page
- D. To create bold text in the body

Answer: B

Q199. Which tag creates an unordered list?

- A. tag
- B. tag
- C. tag
- D. <dl> tag

Answer: B

Q200. What does the <body> tag contain?

- A. Visible content of the page
- B. Page metadata and style links
- C. Server configuration settings
- D. External script file references

Answer: A

Q201. Which CSS property changes text color?

- A. background-color
- B. border
- C. color
- D. font-size

Answer: C

Q202. How do you select an element by its ID in CSS?

- A. Using a hash prefix
- B. Using a dot prefix
- C. Using an at symbol
- D. Using a tilde prefix

Answer: A

Q203. Which property sets the background color?

- A. font-color
- B. text-background
- C. color property
- D. background-color

Answer: D

Q204. What does the font-size property control?

- A. The size of the text characters shown
- B. The weight or boldness of the text
- C. The spacing between lines of text
- D. The font family used for the element

Answer: A

Q205. How do you add a CSS comment?

- A. /* comment text */
- B. # comment text here
- C. <!-- comment here -->
- D. // comment text here

Answer: A

Q206. Which property controls element width?

- A. width
- B. size
- C. length
- D. height

Answer: A

Q207. What value makes text bold?

- A. text-weight: bold
- B. text-style: bold
- C. font-weight: bold
- D. font-style: bold

Answer: C

Q208. Which property adds space inside an element's border?

- A. border property
- B. padding property
- C. spacing property
- D. margin property

Answer: B

Q209. How do you select all paragraph elements?

- A. #p selector
- B. p selector
- C. *p selector
- D. .p selector

Answer: B

Q210. Which property controls text alignment?

- A. text-position
- B. align-text
- C. font-align
- D. text-align

Answer: D

Q211. What does a media query do in CSS?

- A. Embeds media files like videos
- B. Creates multimedia animations
- C. Applies styles based on conditions
- D. Queries a media database server

Answer: C

Q212. What CSS property creates a flexible container?

- A. display: flex
- B. display: table
- C. display: inline
- D. display: block

Answer: A

Q213. What unit is relative to the viewport width?

- A. cm unit
- B. em unit
- C. vw unit
- D. px unit

Answer: C

Q214. What does the flex-direction property control?

- A. The direction of flex items
- B. The color of flex items
- C. The opacity of container
- D. The border of flex items

Answer: A

Q215. What is CSS Grid used for?

- A. Adding animations to pages
- B. Creating two-dimensional layouts
- C. Validating form input fields
- D. Styling text fonts and colors

Answer: B

Q216. What does the gap property do in Grid?

- A. Sets the grid background color
- B. Sets the font size of grid text
- C. Sets spacing between grid items
- D. Sets the border of grid items

Answer: C

Q217. What is a breakpoint in responsive design?

- A. A screen width where the layout changes its presentation style
- B. A point where the code stops executing during debugging mode
- C. A network point where data packets are inspected for threats
- D. A JavaScript error that breaks the page rendering completely

Answer: A

Q218. What does justify-content do in flexbox?

- A. Removes all padding and margin from the flex container element
- B. Aligns items vertically along the cross axis of the container
- C. Changes the font justification to monospaced character spacing
- D. Aligns items horizontally along the main axis of the container

Answer: D

Q219. What is the rem unit relative to?

- A. Root element font size
- B. Device pixel density
- C. Parent element font size
- D. Viewport total height

Answer: A

Q220. What does align-items do in flexbox?

- A. It sets the text alignment for content inside each flex item child
- B. It aligns flex items along the cross axis of the flex container
- C. It defines the number of items that can fit on a single flex row
- D. It adds animated alignment transitions between flex item positions

Answer: B

Q221. What keyword declares a variable that can be reassigned?

- A. const keyword
- B. final keyword
- C. var keyword
- D. let keyword

Answer: D

Q222. What is the result of typeof null in JavaScript?

- A. 'boolean' val
- B. 'object' type
- C. 'undefined'
- D. 'null' string

Answer: B

Q223. Which operator checks strict equality?

- A. === operator
- B. != operator
- C. = operator
- D. == operator

Answer: A

Q224. What does console.log() do?

- A. Outputs to the console
- B. Sends data to server
- C. Writes to a log file
- D. Displays an alert box

Answer: A

Q225. How do you write a single-line comment?

- A. <!-- comment -->
- B. # comment here
- C. // comment here
- D. /* comment */

Answer: C

Q226. What is an array in JavaScript?

- A. A CSS property for arranging page elements
- B. A function that processes text strings only
- C. A single numeric value stored in memory
- D. An ordered collection of values in a list

Answer: D

Q227. What does the push() method do to an array?

- A. Adds an element to end
- B. Removes the last element
- C. Sorts elements in order
- D. Reverses array elements

Answer: A

Q228. What is a function in JavaScript?

- A. A reusable block of code that performs a task
- B. A network protocol for exchanging data between nodes
- C. A database query that retrieves stored information
- D. A CSS selector that targets specific HTML elements

Answer: A

Q229. What value does a variable have before assignment?

- A. zero value
- B. undefined
- C. null value
- D. empty string

Answer: B

Q230. Which method converts a string to a number?

- A. parseInt() method
- B. toString() method
- C. concat() method
- D. stringify() method

Answer: A

Q231. What is a Promise in JavaScript?

- A. A guaranteed synchronous operation result value
- B. A CSS animation timing function for elements
- C. A method for declaring global variables only
- D. An object representing a future async outcome

Answer: D

Q232. What keyword makes a function asynchronous?

- A. defer keyword
- B. await keyword
- C. yield keyword
- D. async keyword

Answer: D

Q233. What does the await keyword do?

- A. Pauses async function execution until a Promise settles
- B. Creates a new thread for parallel processing of data
- C. Stops all JavaScript execution on the current web page
- D. Delays code execution by a specific number of milliseconds

Answer: A

Q234. What is the DOM?

- A. A database object model for SQL queries
- B. A design optimization module for CSS
- C. A disk operating mechanism for files
- D. A document object model for web pages

Answer: D

Q235. What does JSON stand for?

- A. JavaScript Object Notation
- B. Joint System Object Network
- C. JavaScript Oriented Namespace
- D. Java Standard Object Naming

Answer: A

Q236. What is an arrow function?

- A. A shorter syntax for writing function expressions
- B. A function that draws arrows on a canvas element
- C. A special function that handles keyboard arrow keys
- D. A function that only works with array operations

Answer: A

Q237. What is the purpose of try-catch?

- A. To test network speed before loading page resources
- B. To test CSS styles before applying them to elements
- C. To handle errors gracefully without crashing the code
- D. To catch mouse click events on specific HTML elements

Answer: C

Q238. What does the fetch API do?

- A. Makes network requests to get or send data
- B. Retrieves CSS styles from a stylesheet file
- C. Downloads and installs browser plugin extensions
- D. Fetches DOM elements by their class name value

Answer: A

Q239. What is localStorage?

- A. A CSS property for element positioning
- B. Client-side persistent key-value storage
- C. A method for caching DNS query results
- D. Server-side database for user data

Answer: B

Q240. What is an event listener?

- A. A function that waits for and responds to a specific event trigger
- B. A CSS property that detects hover and focus states on an element
- C. A server that listens for incoming network connections from clients
- D. A debugging tool that records all console output to a log file

Answer: A

Q241. What is React primarily used for?

- A. Server-side database management
- B. Operating system development work
- C. Network protocol implementation
- D. Building user interface components

Answer: D

Q242. What is a component in frontend frameworks?

- A. A database table configuration file
- B. A reusable piece of user interface
- C. A CSS file that styles a single page
- D. A server route handler for requests

Answer: B

Q243. What is Vue.js?

- A. A mobile operating system app
- B. A database query language spec
- C. A backend server framework
- D. A progressive frontend framework

Answer: D

Q244. What does Angular use for templates?

- A. Python template syntax
- B. Ruby ERB template files
- C. Enhanced HTML with directives
- D. Plain JavaScript strings

Answer: C

Q245. What is JSX in React?

- A. A JSON schema extension for validation
- B. A CSS preprocessor for React styles
- C. A JavaScript testing framework tool
- D. A syntax extension mixing HTML with JS

Answer: D

Q246. What is state in a frontend framework?

- A. Data that determines how a component renders and behaves
- B. The geographic location of the server hosting the application
- C. The CSS styling applied to an element at any given moment
- D. The HTTP status code returned by the server for each request

Answer: A

Q247. What is npm used for?

- A. Managing JavaScript packages
- B. Running database migrations
- C. Compiling TypeScript to JS
- D. Styling web page elements

Answer: A

Q248. What is a Single Page Application?

- A. An app that works only on single monitor setup
- B. A website with only one paragraph
- C. A web page that disables all user scrolling
- D. An app that updates without full page reloads

Answer: D

Q249. What is the virtual DOM?

- A. A database for storing HTML template files
- B. A lightweight copy of the real DOM tree
- C. A physical server that stores DOM data
- D. A CSS framework for virtual reality pages

Answer: B

Q250. What is Svelte?

- A. A compiler-based frontend framework
- B. A backend REST API framework tool
- C. A CSS animation library for web pages
- D. A database migration utility script

Answer: A

Q251. What is a server in web development?

- A. A computer that serves resources
- B. A browser extension for debugging
- C. A CSS framework for styling
- D. A front-end layout component

Answer: A

Q252. What is an API?

- A. A database management system tool
- B. An interface for software communication
- C. A visual design tool for web pages
- D. A type of web browser extension

Answer: B

Q253. What does REST stand for?

- A. Remote Execution Server Tool
- B. Real-time Event Stream Technology
- C. Representational State Transfer
- D. Responsive Element Style Template

Answer: C

Q254. What is a database used for?

- A. Creating user interface layouts
- B. Compiling source code files
- C. Storing and retrieving data
- D. Styling web page elements

Answer: C

Q255. What is Node.js?

- A. A CSS preprocessor tool
- B. A browser testing framework
- C. A JavaScript server runtime
- D. A database query language

Answer: C

Q256. What is a route in backend development?

- A. A URL pattern mapped to a handler
- B. A database table relationship link
- C. A network cable connecting servers
- D. A CSS path for animation movement

Answer: A

Q257. What does CRUD stand for?

- A. Compile, Run, Upload, Deploy
- B. Cache, Route, Update, Debug
- C. Create, Read, Update, Delete
- D. Connect, Render, Update, Drop

Answer: C

Q258. What is middleware in backend development?

- A. The physical hardware between client and server machines in the network
- B. Software that processes requests between receiving and sending response
- C. The CSS styles applied between two animation keyframes in a transition
- D. A database layer that sits between the raw data files and the queries

Answer: B

Q259. What is Express.js?

- A. A database query builder
- B. A CSS animation library
- C. A frontend testing suite
- D. A Node.js web framework

Answer: D

Q260. What format is commonly used for API responses?

- A. HTML format
- B. XML format
- C. CSV format
- D. JSON format

Answer: D

Q261. What is server-side rendering?

- A. Compiling JavaScript into machine code on the server for faster speed
- B. Rendering CSS animations on the server before sending them to client
- C. Processing database queries on the client side instead of the server
- D. Generating HTML on the server before sending it to the browser client

Answer: D

Q262. What is PHP primarily used for?

- A. Mobile app development
- B. Desktop GUI applications
- C. Server-side web scripting
- D. Database engine creation

Answer: C

Q263. What is a session in web development?

- A. A JavaScript testing framework function
- B. A CSS animation sequence that plays once
- C. A way to store user data across requests
- D. A type of database join operation query

Answer: C

Q264. What is a cookie?

- A. A small data piece stored in the browser
- B. A CSS property for styling form inputs
- C. A server configuration file for caching
- D. A database table for user preferences

Answer: A

Q265. What does MVC stand for?

- A. Managed-Virtual-Cache
- B. Main-View-Component
- C. Model-View-Controller
- D. Module-Variable-Class

Answer: C

Q266. What is a template engine?

- A. A tool that generates CSS from design files automatically
- B. A tool that combines templates with data to produce HTML output
- C. A tool that creates database schemas from visual diagram models
- D. A tool that compiles TypeScript into standard JavaScript code

Answer: B

Q267. What is Django?

- A. A database management system
- B. A CSS preprocessor language
- C. A JavaScript runtime environment
- D. A Python-based web framework

Answer: D

Q268. What is Ruby on Rails?

- A. A database visualization platform
- B. A Ruby-based web framework tool
- C. A CSS grid framework for layouts
- D. A JavaScript package manager app

Answer: B

Q269. What is a request-response cycle?

- A. The process of compiling source code and deploying it to a production box
- B. The cycle of backing up and restoring database records on a fixed schedule
- C. The time it takes CSS to render on screen after being parsed by browser
- D. A client sends a request and the server returns a corresponding response

Answer: D

Q270. What does a web framework provide?

- A. Only visual design tools for creating page mockups and wireframes easily
- B. Hardware drivers for connecting web servers to network switch devices
- C. Pre-built tools and structure for building web applications efficiently
- D. Browser extensions that enhance the user experience of any website

Answer: C

Q271. What is SQL?

- A. A server configuration format
- B. A JavaScript testing framework
- C. A styling language for web pages
- D. A language for managing databases

Answer: D

Q272. What is a primary key in a database?

- A. The main index for text search
- B. The first column in every table
- C. The password for database access
- D. A unique identifier for each row

Answer: D

Q273. What does SELECT do in SQL?

- A. Creates new database tables
- B. Deletes specified records
- C. Updates existing row values
- D. Retrieves data from tables

Answer: D

Q274. What is MongoDB?

- A. A CSS styling framework
- B. A JavaScript build tool
- C. A relational SQL database
- D. A NoSQL document database

Answer: D

Q275. What is a table in a relational database?

- A. A JavaScript data structure for key-value pairs used in code
- B. A CSS property that creates grid-like layouts on web page elements
- C. A collection of related data organized in rows and columns format
- D. A server configuration file that maps URLs to handler functions

Answer: C

Q276. What does INSERT do in SQL?

- A. Removes rows from a table
- B. Adds new rows to a table
- C. Searches for text patterns
- D. Modifies existing row data

Answer: B

Q277. What is a foreign key?

- A. A temporary key generated during database backup process
- B. A field that references a primary key in another table
- C. A key used to encrypt database files for security
- D. A key that allows foreign users to access the database

Answer: B

Q278. What is MySQL?

- A. A relational SQL database
- B. A CSS preprocessor tool
- C. A JavaScript framework
- D. A NoSQL document store

Answer: A

Q279. What does UPDATE do in SQL?

- A. Modifies existing data in the database table rows
- B. Deletes the entire database from the server storage
- C. Creates a new table in the database schema file
- D. Retrieves all records matching a specified condition

Answer: A

Q280. What is PostgreSQL?

- A. A command-line tool for managing server deployment pipelines
- B. An advanced open-source relational database management system
- C. A frontend CSS framework for web layout design styling
- D. A JavaScript library for building user interface components

Answer: B

Q281. What is HTTPS?

- A. A CSS styling standard
- B. HTTP with TLS encryption
- C. A faster version of HTML
- D. A database access protocol

Answer: B

Q282. What is a password hash?

- A. A one-way encrypted form of password
- B. A method for generating passwords
- C. A visible password shown on screen
- D. A type of password recovery email

Answer: A

Q283. What is XSS?

- A. A database query optimizer
- B. A server-side language tool
- C. Cross-site scripting attack
- D. A CSS framework for styling

Answer: C

Q284. What is a firewall?

- A. A JavaScript error handling method
- B. A CSS property for styling borders
- C. A database backup recovery process
- D. A system that filters network traffic

Answer: D

Q285. What does SSL stand for?

- A. System Security Level
- B. Server Side Language
- C. Secure Sockets Layer
- D. Standard Style Library

Answer: C

Q286. What is two-factor authentication?

- A. Logging in from two different devices at the same time for redundancy
- B. Using two different browsers to log in to the same account simultaneously
- C. Creating two separate passwords for a single user account on the site
- D. Requiring two forms of identity verification for accessing an account

Answer: D

Q287. What is a CAPTCHA used for?

- A. To style form input fields
- B. To verify a user is human
- C. To encrypt form submissions
- D. To speed up page loading

Answer: B

Q288. What is malware?

- A. A CSS animation framework
- B. A type of web server software
- C. A database storage format
- D. Software designed to cause harm

Answer: D

Q289. What is phishing?

- A. A process for optimizing database queries for faster execution time
- B. A performance testing method for measuring page load speed metrics
- C. A technique for compressing images to reduce file size on servers
- D. A fraudulent attempt to obtain sensitive information by deception

Answer: D

Q290. What is encryption?

- A. Creating backup copies of important files on the server
- B. Deleting sensitive data from the database permanently
- C. Compressing files to reduce their storage size on disk
- D. Converting data into an unreadable format for protection

Answer: D

Q291. What is page load time?

- A. Time to write the page code
- B. Time to deploy the page code
- C. Time for a page to fully display
- D. Time for DNS to resolve domain

Answer: C

Q292. What does minification do?

- A. Encrypts the source code files
- B. Adds comments to the code
- C. Compiles code to machine code
- D. Removes unnecessary characters

Answer: D

Q293. What is caching?

- A. Encrypting data in the database
- B. Storing data for faster future access
- C. Deleting old files from server
- D. Compiling code before deployment

Answer: B

Q294. What does image compression do?

- A. Converts images to HTML format
- B. Adds metadata to image files
- C. Increases image resolution quality
- D. Reduces image file size for web

Answer: D

Q295. What is lazy loading?

- A. Slowing down the server to reduce power usage
- B. Loading resources only on the server side cache
- C. Deferring resource loading until they are needed
- D. Loading all resources immediately on page start

Answer: C

Q296. What does a CDN help with?

- A. Writing server code
- B. Database management
- C. Code compilation speed
- D. Faster content delivery

Answer: D

Q297. What is browser caching?

- A. Encrypting browser data for privacy and security use
- B. Compiling web pages into native apps for offline use
- C. Deleting browser history to free up disk space now
- D. Storing web resources locally in the browser for reuse

Answer: D

Q298. What does the defer attribute do on a script tag?

- A. It loads the script after HTML parsing is complete first
- B. It delays the script execution by a fixed time in seconds
- C. It defers CSS loading until after JavaScript execution
- D. It prevents the script from running in production builds

Answer: A

Q299. What is bandwidth?

- A. The maximum file size a server can store on disk
- B. The number of pages a website has in its sitemap
- C. The visual width of a web page layout in pixels
- D. The data transfer capacity of a network connection

Answer: D

Q300. What is a performance bottleneck?

- A. A CSS property that controls animation speed on a page
- B. A feature that limits the overall performance of a system
- C. A tool used to measure the speed of a web application
- D. A server configuration for limiting maximum user connections

Answer: B

Q301. What is unit testing?

- A. Testing network connectivity and speed
- B. Testing individual components in isolation
- C. Testing the user interface visual layout
- D. Testing the entire application end to end

Answer: B

Q302. What is a bug in software?

- A. A planned software enhancement
- B. A CSS styling improvement idea
- C. An error or defect in the code
- D. A feature request from the user

Answer: C

Q303. What is the purpose of the browser console?

- A. To design database table structures
- B. To view logs, errors, and run JavaScript
- C. To create new web pages from templates
- D. To manage web server configurations

Answer: B

Q304. What does a linter do?

- A. It removes lint from clothing images
- B. It generates test cases from source
- C. It compresses files for deployment
- D. It checks code for style and errors

Answer: D

Q305. What is debugging?

- A. Deploying code to production
- B. Finding and fixing code errors
- C. Writing documentation for code
- D. Adding new features to software

Answer: B

Q306. What is a test case?

- A. A special case statement in JavaScript switch expressions
- B. A container for storing test data in the database table
- C. A set of conditions to verify expected software behavior
- D. A type of briefcase used by quality assurance engineers

Answer: C

Q307. What tool is commonly used for JavaScript testing?

- A. Nginx server
- B. MySQL server
- C. Photoshop
- D. Jest framework

Answer: D

Q308. What is a breakpoint in debugging?

- A. A network point where data packets are split for transfer
- B. A point in code where execution pauses for inspection work
- C. A CSS property that breaks text into multiple lines on page
- D. A screen width where the responsive layout changes its form

Answer: B

Q309. What is integration testing?

- A. Testing individual functions completely isolated from others
- B. Testing the application under extreme load conditions only
- C. Testing how different modules or components work together
- D. Testing CSS integration with HTML elements on the web page

Answer: C

Q310. What is a test suite?

- A. A single test case for one function
- B. A collection of related test cases
- C. A CSS framework for test pages
- D. A hotel suite for QA team members

Answer: B

Q311. What is deployment in web development?

- A. Writing the initial source code for a new feature in the application
- B. Designing the user interface mockups in a visual design tool app
- C. Making a website available on a server for users to access online
- D. Testing the application for bugs before releasing it to the public

Answer: C

Q312. What is a domain name?

- A. A server-side scripting language
- B. A database management system tool
- C. A human-readable web address name
- D. A CSS layout framework for grids

Answer: C

Q313. What does FTP stand for?

- A. File Transfer Protocol
- B. Front Template Page
- C. Full Type Platform
- D. Fast Text Processing

Answer: A

Q314. What is shared hosting?

- A. Hosting where you own the entire physical server exclusively for your site
- B. Hosting where multiple websites share a single server and its resources
- C. Hosting where files are shared across multiple CDN edge server locations
- D. Hosting where developers share code through version control repositories

Answer: B

Q315. What is a SSL certificate?

- A. A certificate showing a website passed all accessibility compliance tests
- B. A certification for web developers from an accredited training institution
- C. A license required to operate a web hosting business in certain countries
- D. A digital certificate that enables HTTPS encryption for a website domain

Answer: D

Q316. What is GitHub Pages?

- A. A backend API framework tool
- B. A static site hosting service
- C. A CSS component library app
- D. A database hosting service

Answer: B

Q317. What is a VPS?

- A. Virtual Private Server
- B. Variable Processing System
- C. Visual Page Styling
- D. Virtual Protocol Service

Answer: A

Q318. What does DNS do?

- A. Compiles JavaScript for production use
- B. Translates domain names to IP addresses
- C. Styles web page elements with colors
- D. Creates database tables automatically

Answer: B

Q319. What is cloud hosting?

- A. Hosting in a weather station
- B. Hosting through email services
- C. Hosting files on a local computer
- D. Hosting on virtual cloud servers

Answer: D

Q320. What is Netlify used for?

- A. Hosting and deploying web applications
- B. Writing server-side Python programs
- C. Managing SQL databases for web apps
- D. Creating mobile applications for iOS

Answer: A

Q321. What is a REST API?

- A. A database query language spec
- B. A CSS framework for styling
- C. A JavaScript testing framework
- D. An API following REST principles

Answer: D

Q322. What HTTP method retrieves data?

- A. DELETE method
- B. PUT method
- C. POST method
- D. GET method

Answer: D

Q323. What is JSON used for in APIs?

- A. Exchanging data between client and server systems
- B. Styling web page elements with colors and fonts
- C. Compiling JavaScript code for production deployment
- D. Creating database tables and defining their schemas

Answer: A

Q324. What does an API endpoint represent?

- A. A JavaScript variable type name
- B. A CSS selector targeting elements
- C. A database table column value
- D. A specific URL for a resource

Answer: D

Q325. What HTTP method creates a new resource?

- A. GET method
- B. DELETE method
- C. PUT method
- D. POST method

Answer: D

Q326. What is an API key?

- A. A database encryption algorithm name
- B. A CSS property for keyboard events
- C. A token for authenticating API requests
- D. A physical key for server room access

Answer: C

Q327. What does HTTP status 200 mean?

- A. OK / Success
- B. Unauthorized
- C. Not found
- D. Server error

Answer: A

Q328. What is a request header?

- A. A database table column header
- B. The first line of HTML on a page
- C. A CSS header styling property
- D. Metadata sent with an HTTP request

Answer: D

Q329. What does CORS stand for?

- A. Cache Optimized Resource Store
- B. Cross-Origin Resource Sharing
- C. Central Origin Response System
- D. Client Object Request Service

Answer: B

Q330. What is a webhook?

- A. A CSS animation hook for elements
- B. An automated HTTP callback notification
- C. A JavaScript debugging hook method
- D. A hook for hanging server cables

Answer: B

Q331. What is a Progressive Web App?

- A. A web app that requires progressive download of all assets before loading
- B. A web app that only works on desktop computers and not on mobile devices
- C. A web app with native-like features such as offline support and installability
- D. A web app that progressively removes features as more users access the site

Answer: C

Q332. What is TypeScript?

- A. A CSS preprocessor for styling
- B. A database query language spec
- C. A server hosting platform tool
- D. A typed superset of JavaScript

Answer: D

Q333. What is a static site generator?

- A. A tool that generates dynamic server-rendered pages on every request received
- B. A tool that creates static CSS styles without any responsive design support
- C. A tool that builds HTML pages at build time from templates and data sources
- D. A tool that generates static IP addresses for web server hosting purposes

Answer: C

Q334. What is a headless CMS?

- A. A CMS with no user interface for content editors or administrators to use
- B. A CMS that only supports headless browser testing and not content editing
- C. A CMS that runs without a server and stores content in browser storage
- D. A CMS that provides content via APIs without a fixed presentation layer

Answer: D

Q335. What is serverless computing?

- A. Computing without any servers involved in the entire application stack
- B. Computing that only works when the server is completely turned off today
- C. Running code in cloud functions without managing server infrastructure
- D. A deployment model where code runs directly in the user browser client

Answer: C

Q336. What is WebAssembly?

- A. A JavaScript framework for building web applications with assembly patterns
- B. A binary format for running compiled code in the browser at near-native speed
- C. A new CSS layout system for assembling web page components together
- D. A server-side assembly language for writing high-performance API endpoints

Answer: B

Q337. What is a monorepo?

- A. A server configuration where all services run on one physical machine only
- B. A single repository containing multiple related projects or packages together
- C. A database that stores all data in a single table without any relationships
- D. A single repository containing only one small microservice application code

Answer: B

Q338. What is Jamstack?

- A. Java, Angular, and MongoDB for building enterprise web applications stack
- B. JavaScript, APIs, and Markup for building modern web applications stack
- C. jQuery, Apache, and MariaDB for building traditional web application stack
- D. JSON, AJAX, and MySQL for building data-driven web applications stack

Answer: B

Q339. What is a design system?

- A. A system for automatically generating web page designs from text descriptions
- B. A tool for designing database schemas using visual drag-and-drop interfaces
- C. A CSS framework that generates design tokens from Figma files automatically
- D. A collection of reusable components and guidelines for consistent user interfaces

Answer: D

Q340. What are web components?

- A. Server-side components that generate HTML on the server before sending
- B. Components built exclusively using React or Vue frontend framework libraries
- C. CSS animation components that add visual effects to web page elements
- D. Custom reusable HTML elements using native browser APIs and standards

Answer: D

Q341. What is a domain name in web development?

- A. A human-readable address for a website
- B. A programming language for servers
- C. A type of database management system
- D. A tool for editing HTML files

Answer: A

Q342. Which of the following is an example of a markup language?

- A. Python
- B. Java
- C. HTML
- D. C++

Answer: C

Q343. What is the purpose of JavaScript in web development?

- A. To structure web page content
- B. To define database schemas
- C. To add interactivity and dynamic behavior
- D. To manage server hardware

Answer: C

Q344. What is the purpose of an SSL certificate on a website?

- A. To speed up JavaScript execution
- B. To encrypt data transmitted between the browser and the server
- C. To store user passwords
- D. To compress CSS files

Answer: B

Q345. What is a search engine?

- A. A tool that finds and displays web pages based on user queries
- B. A server that stores website files
- C. A programming language for building websites
- D. A device that connects computers to the internet

Answer: A

Q346. Which file extension is commonly used for CSS files?

- A. .html
- B. .js
- C. .css
- D. .php

Answer: C

Q347. What is the World Wide Web?

- A. A system of interlinked hypertext documents accessed via the internet
- B. A type of programming language
- C. A hardware component inside computers
- D. A local network connecting two computers

Answer: A

Q348. What does a text editor do in web development?

- A. Compiles code into machine language
- B. Allows developers to write and edit code
- C. Hosts websites on the internet
- D. Manages database records

Answer: B

Q349. What is an internet browser's primary function?

- A. To compile programming languages
- B. To render and display web pages
- C. To store website databases
- D. To write server-side code

Answer: B

Q350. What is the difference between the internet and the World Wide Web?

- A. They are the same thing
- B. The internet is the network infrastructure while the web is a service that runs on it
- C. The web is a type of hardware device
- D. The internet only supports email

Answer: B

Q351. What is a server in web architecture?

- A. A computer that provides resources or services to other computers
- B. A type of web browser
- C. A CSS framework
- D. A programming language

Answer: A

Q352. What is a URL used for?

- A. To style web pages
- B. To locate and access a specific resource on the web
- C. To compile JavaScript
- D. To manage database tables

Answer: B

Q353. What does the status code 500 indicate in HTTP?

- A. Successful request
- B. Page not found
- C. Internal server error
- D. Redirect to another page

Answer: C

Q354. What is a request in the client-server model?

- A. Data sent from the client to the server asking for a resource or action
- B. A CSS rule applied to a web page
- C. A JavaScript function call
- D. A database table definition

Answer: A

Q355. What is a response in the client-server model?

- A. A CSS animation effect
- B. Data sent from the server back to the client after processing a request
- C. A type of JavaScript variable
- D. A method of creating HTML elements

Answer: B

Q356. What protocol does HTTPS use for encryption?

- A. FTP
- B. TLS/SSL
- C. SMTP
- D. DNS

Answer: B

Q357. What is the default port for HTTPS?

- A. 80
- B. 21
- C. 443
- D. 8080

Answer: C

Q358. What does the HTTP DELETE method do?

- A. Creates a new resource
- B. Retrieves data from the server
- C. Removes a specified resource
- D. Updates part of a resource

Answer: C

Q359. What is a domain name system (DNS) record?

- A. An entry in a DNS database that maps a domain to information like an IP address
- B. A JavaScript variable declaration
- C. A CSS property for fonts
- D. An HTML form element

Answer: A

Q360. What is the purpose of an HTTP header?

- A. To display visible content on the page
- B. To provide metadata about the request or response
- C. To create database connections
- D. To compile source code

Answer: B

Q361. What does the `<!DOCTYPE html>` declaration do?

- A. It creates a new paragraph
- B. It declares the document type as HTML5
- C. It adds a comment to the page
- D. It links a CSS stylesheet

Answer: B

Q362. Which HTML tag is used for creating a numbered list?

- A. `<ul>`
- B. `<ol>`
- C. `<li>`
- D. `<dl>`

Answer: B

Q363. What is the purpose of the `<hr>` tag in HTML?

- A. To create a heading
- B. To insert a horizontal rule (line)
- C. To make text italic
- D. To add a hyperlink

Answer: B

Q364. Which HTML tag is used to display an image?

- A. `<picture>`
- B. `<photo>`
- C. `<img>`
- D. `<image>`

Answer: C

Q365. What does the `<em>` tag do in HTML?

- A. Creates a line break
- B. Emphasizes text, typically displayed in italics
- C. Makes text bold
- D. Adds a hyperlink

Answer: B

Q366. Which attribute specifies the source of an image in the `<img>` tag?

- A. href
- B. link
- C. src
- D. url

Answer: C

Q367. What is the purpose of the `<footer>` tag in HTML5?

- A. To create a navigation menu
- B. To define the footer section of a document or section
- C. To insert a form
- D. To add a heading

Answer: B

Q368. Which HTML element is used to define a table header cell?

- A. <td>
- B. <th>
- C. <tr>
- D. <thead>

Answer: B

Q369. What does the <header> tag represent in HTML5?

- A. The main content area
- B. Introductory content or a group of navigational aids
- C. A form input field
- D. A table column

Answer: B

Q370. Which tag is used to create a text input field in a form?

- A. <textarea>
- B. <input>
- C. <select>
- D. <button>

Answer: B

Q371. Which CSS property controls the size of text?

- A. text-size
- B. font-weight
- C. font-size
- D. text-height

Answer: C

Q372. What does the display: block property do?

- A. Hides the element
- B. Makes the element take up the full width available
- C. Makes the element inline
- D. Removes the element from the page

Answer: B

Q373. How do you apply CSS styles directly to an HTML element?

- A. Using an external stylesheet
- B. Using the style attribute on the element
- C. Using a JavaScript file
- D. Using a server-side script

Answer: B

Q374. Which property changes the background image of an element?

- A. bg-image
- B. background-image
- C. image-bg
- D. back-img

Answer: B

Q375. What does the border property do in CSS?

- A. Adds space inside the element
- B. Creates a line around the element
- C. Changes the text color
- D. Sets the element's width

Answer: B

Q376. Which CSS property makes text italic?

- A. text-decoration
- B. font-weight
- C. font-style
- D. text-transform

Answer: C

Q377. What does the color property in CSS affect?

- A. The background color of an element
- B. The text color of an element
- C. The border color
- D. The shadow color

Answer: B

Q378. How do you link an external CSS file to an HTML document?

- A. Using the <style> tag
- B. Using the <link> tag in the <head> section
- C. Using the <script> tag
- D. Using the <css> tag

Answer: B

Q379. Which CSS property sets the height of an element?

- A. size
- B. height
- C. tall
- D. length

Answer: B

Q380. What is a CSS class selector?

- A. A selector that targets elements by their tag name
- B. A selector that targets elements by a class name using a dot prefix
- C. A selector that targets elements by their ID
- D. A selector that targets all elements

Answer: B

Q381. What is a CSS animation?

- A. A way to gradually change CSS property values over time
- B. A method for compressing images
- C. A server-side rendering technique
- D. A type of HTML element

Answer: A

Q382. What does the flex-grow property do?

- A. Shrinks a flex item
- B. Specifies how much a flex item should grow relative to other items
- C. Sets the item's fixed width
- D. Changes the flex direction

Answer: B

Q383. What does the grid-gap property do in CSS Grid?

- A. Adds padding inside grid items
- B. Sets the space between grid rows and columns
- C. Changes the grid background color
- D. Defines the number of grid columns

Answer: B

Q384. What is a CSS transform?

- A. A way to change an element's shape, size, or position visually
- B. A method for loading CSS files
- C. A type of CSS variable
- D. A database operation

Answer: A

Q385. What does the overflow: hidden property do?

- A. Shows all content regardless of size
- B. Clips content that exceeds the element's boundaries
- C. Adds a scrollbar to the element
- D. Makes the element transparent

Answer: B

Q386. What does the vh unit represent in CSS?

- A. Virtual height of the parent element
- B. One percent of the viewport height
- C. The height of the HTML element
- D. A fixed pixel value

Answer: B

Q387. What is the purpose of the z-index property in CSS?

- A. To set the font size
- B. To control the stacking order of overlapping elements
- C. To change the text color
- D. To set the element width

Answer: B

Q388. What does the flex-shrink property control?

- A. How much a flex item grows
- B. How much a flex item shrinks relative to other items when space is limited
- C. The direction of flex items
- D. The gap between flex items

Answer: B

Q389. What does the grid-template-rows property define?

- A. The number of columns in a grid
- B. The sizes and structure of the grid rows
- C. The gap between grid items
- D. The alignment of grid items

Answer: B

Q390. What is a CSS gradient?

- A. A type of HTML element
- B. A smooth transition between two or more colors used as a background
- C. A JavaScript animation technique
- D. A method for compressing CSS files

Answer: B

Q391. What is a string in JavaScript?

- A. A number value
- B. A sequence of characters enclosed in quotes
- C. A boolean value
- D. An HTML element

Answer: B

Q392. What does the + operator do with two numbers in JavaScript?

- A. Subtracts them
- B. Concatenates them as strings
- C. Adds them together
- D. Multiplies them

Answer: C

Q393. What is a for loop used for in JavaScript?

- A. Declaring variables
- B. Repeating a block of code a specified number of times
- C. Defining functions
- D. Creating objects

Answer: B

Q394. What does the length property return on an array?

- A. The first element
- B. The last element
- C. The number of elements in the array
- D. The data type of the array

Answer: C

Q395. What is an object in JavaScript?

- A. A type of loop
- B. A collection of key-value pairs
- C. A CSS selector
- D. A type of comment

Answer: B

Q396. What does the return statement do in a function?

- A. Logs a message to the console
- B. Ends the function execution and returns a value to the caller
- C. Creates a new variable
- D. Starts a loop

Answer: B

Q397. What is the purpose of the else keyword in JavaScript?

- A. To declare a variable
- B. To provide an alternative block of code when the if condition is false
- C. To create a loop
- D. To define a function

Answer: B

Q398. How do you declare a constant in JavaScript?

- A. Using the var keyword
- B. Using the let keyword
- C. Using the const keyword
- D. Using the constant keyword

Answer: C

Q399. What does the pop() method do to an array?

- A. Adds an element to the beginning
- B. Removes and returns the last element
- C. Sorts the array
- D. Reverses the array

Answer: B

Q400. What is a boolean value in JavaScript?

- A. A text string
- B. A decimal number
- C. A value that is either true or false
- D. An array of numbers

Answer: C

Q401. What is the purpose of the setTimeout() function?

- A. To repeat code indefinitely
- B. To execute a function after a specified delay in milliseconds
- C. To stop all JavaScript execution
- D. To create a new variable

Answer: B

Q402. What is the setInterval() function used for?

- A. To run a function only once
- B. To repeatedly execute a function at specified time intervals
- C. To clear all timers
- D. To pause JavaScript execution

Answer: B

Q403. What does the map object store in JavaScript?

- A. Only string values
- B. Key-value pairs where keys can be any type
- C. Only number values
- D. Only boolean values

Answer: B

Q404. What is the purpose of the catch block in error handling?

- A. To throw new errors
- B. To handle and respond to errors that occur in the try block
- C. To prevent all errors
- D. To log messages to the console

Answer: B

Q405. What does the finally block do in error handling?

- A. It replaces the catch block
- B. It executes code after try and catch regardless of whether an error occurred
- C. It prevents errors from happening
- D. It only runs when there is no error

Answer: B

Q406. What is a callback function?

- A. A function that is never called
- B. A function passed as an argument to another function to be executed later
- C. A function that returns HTML
- D. A function that only works with arrays

Answer: B

Q407. What is the difference between let and const?

- A. They are identical keywords
- B. let allows reassignment while const does not allow reassignment after initialization
- C. const is faster than let
- D. let cannot be used in loops

Answer: B

Q408. What does the typeof operator return for an array?

- A. 'array'
- B. 'object'
- C. 'list'
- D. 'collection'

Answer: B

Q409. What is template literal syntax used for?

- A. Creating HTML templates
- B. Embedding expressions inside strings using backticks and `${}` syntax
- C. Defining CSS templates
- D. Creating database templates

Answer: B

Q410. What does the spread operator (...) do when used with an array?

- A. Deletes the array
- B. Expands the array elements into individual values
- C. Sorts the array
- D. Reverses the array

Answer: B

Q411. What is the purpose of a frontend framework?

- A. To manage database connections
- B. To provide structure and tools for building user interfaces efficiently
- C. To handle server-side routing
- D. To compress images

Answer: B

Q412. What is a prop in frontend frameworks?

- A. A CSS property
- B. Data passed from a parent component to a child component
- C. A database query
- D. A server configuration

Answer: B

Q413. What is component-based architecture?

- A. A server deployment strategy
- B. Building UIs from small, reusable, self-contained pieces called components
- C. A database schema design
- D. A CSS layout method

Answer: B

Q414. What is Next.js used for?

- A. Managing databases
- B. Building React applications with server-side rendering and static generation
- C. Styling web pages
- D. Testing JavaScript code

Answer: B

Q415. What is the purpose of routing in a frontend framework?

- A. To style elements
- B. To navigate between different pages or views within the application
- C. To manage database connections
- D. To compile JavaScript

Answer: B

Q416. What is Nuxt.js?

- A. A CSS framework
- B. A framework built on top of Vue.js for server-side rendering and static generation
- C. A database management tool
- D. A testing library

Answer: B

Q417. What is a template in frontend frameworks?

- A. A database schema
- B. The markup that defines the visual structure of a component
- C. A server configuration file
- D. A build tool

Answer: B

Q418. What is event handling in frontend frameworks?

- A. Sending emails
- B. Responding to user interactions like clicks, input changes, or form submissions
- C. Managing server events
- D. Processing database queries

Answer: B

Q419. What is conditional rendering in frontend frameworks?

- A. Rendering CSS conditions
- B. Showing or hiding UI elements based on conditions in the application state
- C. Conditionally loading databases
- D. Applying conditional server rules

Answer: B

Q420. What is a lifecycle method in a component?

- A. A CSS animation phase
- B. A function that runs at specific stages of a component's existence such as mounting, updating, or unmounting
- C. A database migration step
- D. A server restart procedure

Answer: B

Q421. What is an API route in a backend application?

- A. A CSS selector path
- B. A URL pattern that maps to a specific handler function on the server
- C. A JavaScript import path
- D. A database table name

Answer: B

Q422. What is the purpose of environment variables in backend development?

- A. To style web pages
- B. To store configuration values like API keys and database URLs outside the codebase
- C. To create HTML elements
- D. To define CSS variables

Answer: B

Q423. What is a database connection string?

- A. A CSS selector
- B. A string containing the information needed to connect to a database, including host, port, and credentials
- C. An HTML attribute
- D. A JavaScript string method

Answer: B

Q424. What is the purpose of a controller in the MVC pattern?

- A. To render CSS styles
- B. To handle incoming requests, process them, and return appropriate responses
- C. To store data in the database
- D. To create HTML templates

Answer: B

Q425. What is a model in the MVC pattern?

- A. A CSS layout model
- B. The component responsible for data management, business logic, and database interaction
- C. An HTML template
- D. A routing mechanism

Answer: B

Q426. What is the purpose of a view in the MVC pattern?

- A. To manage the database
- B. To present data to the user in a formatted output
- C. To handle routing
- D. To process API requests

Answer: B

Q427. What is a backend framework?

- A. A CSS grid system
- B. A software tool that provides structure and utilities for building server-side applications
- C. A browser extension
- D. A frontend testing library

Answer: B

Q428. What does the HTTP POST method do?

- A. Retrieves a resource
- B. Submits data to the server to create a new resource
- C. Deletes a resource
- D. Updates part of a resource

Answer: B

Q429. What is a status code in the 4xx range?

- A. A successful response
- B. A server error
- C. A client error indicating the request was invalid or unauthorized
- D. A redirect response

Answer: C

Q430. What is npm used for in backend development?

- A. To style web pages
- B. To manage packages and dependencies for Node.js projects
- C. To create databases
- D. To design user interfaces

Answer: B

Q431. What is a request handler in server-side programming?

- A. A CSS class
- B. A function that processes incoming HTTP requests and sends back responses
- C. An HTML element
- D. A database table

Answer: B

Q432. What is middleware in Express.js?

- A. A CSS preprocessor
- B. Functions that execute during the request-response cycle with access to request and response objects
- C. A database middleware layer
- D. A frontend component

Answer: B

Q433. What is the purpose of a response status code?

- A. To style the response
- B. To indicate the result of the server's attempt to process the request
- C. To create database entries
- D. To compile JavaScript

Answer: B

Q434. What is a REST endpoint?

- A. A CSS property
- B. A specific URL path on a server that accepts HTTP requests for a particular resource
- C. A JavaScript function
- D. A database connection point

Answer: B

Q435. What is the purpose of the response body in HTTP?

- A. To set HTTP headers
- B. To contain the actual data being sent back to the client, such as HTML, JSON, or files
- C. To define the URL
- D. To establish database connections

Answer: B

Q436. What is Node.js primarily used for?

- A. Styling web pages
- B. Running JavaScript on the server side to build scalable network applications
- C. Creating CSS animations
- D. Managing databases visually

Answer: B

Q437. What is the purpose of routing in server-side applications?

- A. To style navigation menus
- B. To map incoming request URLs and methods to specific handler functions
- C. To route database queries
- D. To manage CSS imports

Answer: B

Q438. What is a JSON response?

- A. A CSS format
- B. Data sent from the server formatted as a JavaScript Object Notation string
- C. An HTML template
- D. A database query result only

Answer: B

Q439. What is the purpose of a static file server?

- A. To generate dynamic content
- B. To serve unchanging files like images, CSS, and JavaScript directly to clients
- C. To manage database connections
- D. To process form submissions

Answer: B

Q440. What is an error handler in server-side applications?

- A. A CSS error page
- B. A function that catches and processes errors, returning appropriate error responses to clients
- C. A JavaScript lint rule
- D. A database recovery tool

Answer: B

Q441. What is a database record?

- A. A CSS rule
- B. A single entry or row in a database table containing related data
- C. An HTML element
- D. A JavaScript variable

Answer: B

Q442. What is the purpose of the WHERE clause in SQL?

- A. To create a new table
- B. To filter results based on specified conditions
- C. To sort query results
- D. To join two tables

Answer: B

Q443. What is a collection in MongoDB?

- A. A CSS class collection
- B. A group of related documents, similar to a table in relational databases
- C. An array in JavaScript
- D. A set of HTML elements

Answer: B

Q444. What does the ORDER BY clause do in SQL?

- A. Creates a new order
- B. Sorts the query results based on one or more columns
- C. Orders database tables
- D. Reorders table columns

Answer: B

Q445. What is the purpose of the LIMIT clause in SQL?

- A. To limit database size
- B. To restrict the number of rows returned by a query
- C. To limit the number of tables
- D. To limit column types

Answer: B

Q446. What is a document in MongoDB?

- A. A text file
- B. A JSON-like record that stores data as field-value pairs
- C. A CSS stylesheet
- D. An HTML page

Answer: B

Q447. What does the DELETE statement do in SQL?

- A. Removes the entire database
- B. Removes one or more rows from a table based on a condition
- C. Deletes a column from a table
- D. Removes an index

Answer: B

Q448. What is the purpose of the GROUP BY clause in SQL?

- A. To group CSS styles
- B. To group rows with the same values in specified columns, often used with aggregate functions
- C. To group database tables
- D. To create column groups

Answer: B

Q449. What is SQLite?

- A. A CSS framework
- B. A lightweight, file-based relational database that requires no separate server process
- C. A JavaScript library
- D. An HTML template engine

Answer: B

Q450. What does the UPDATE statement do in SQL?

- A. Creates a new table
- B. Modifies existing data in one or more rows of a table
- C. Updates the database software
- D. Changes the table name

Answer: B

Q451. What is the purpose of a strong password?

- A. To make logging in faster
- B. To make unauthorized access difficult by using a complex combination of characters
- C. To improve website performance
- D. To style user profiles

Answer: B

Q452. What is a security vulnerability?

- A. A CSS layout issue
- B. A weakness in a system that can be exploited by attackers to gain unauthorized access or cause harm
- C. A JavaScript error
- D. A slow database query

Answer: B

Q453. What does the HTTPS padlock icon in a browser indicate?

- A. The website loads faster
- B. The connection between the browser and server is encrypted
- C. The website has no bugs
- D. The website uses CSS

Answer: B

Q454. What is a security patch?

- A. A CSS design pattern
- B. A software update that fixes a known security vulnerability
- C. A JavaScript library
- D. A database backup

Answer: B

Q455. What is social engineering in the context of security?

- A. A web development technique
- B. Manipulating people into divulging confidential information or performing actions that compromise security
- C. A CSS framework
- D. A database design method

Answer: B

Q456. What is the purpose of logging out of a web application?

- A. To clear the CSS cache
- B. To end the user session and prevent unauthorized access to the account
- C. To delete the user account
- D. To clear the browser history

Answer: B

Q457. What is a denial-of-service (DoS) attack?

- A. A CSS rendering technique
- B. An attack that overwhelms a server with excessive traffic to make it unavailable to legitimate users
- C. A JavaScript debugging method
- D. A database indexing technique

Answer: B

Q458. Why should software and libraries be kept up to date?

- A. To change the website design
- B. To patch known security vulnerabilities and protect against recently discovered threats
- C. To improve CSS performance
- D. To add more JavaScript features

Answer: B

Q459. What is the purpose of an access control list (ACL)?

- A. To control CSS access
- B. To define which users or systems are allowed or denied access to specific resources
- C. To manage database access speed
- D. To control HTML rendering

Answer: B

Q460. What is data backup important for in web security?

- A. To style web pages
- B. To ensure data can be recovered in case of attacks, hardware failures, or accidental deletion
- C. To speed up the website
- D. To create new databases

Answer: B

Q461. What is website performance?

- A. The visual design of a website
- B. How quickly a website loads and responds to user interactions
- C. The number of pages on a website
- D. The programming language used

Answer: B

Q462. Why do large files slow down a website?

- A. Large files improve performance
- B. Large files take longer to download over the network, increasing page load time
- C. Large files are more secure
- D. Large files use less bandwidth

Answer: B

Q463. What is the purpose of compressing images for the web?

- A. To increase image quality
- B. To reduce file size so images load faster without significantly impacting visual quality
- C. To change the image format
- D. To add filters to images

Answer: B

Q464. What is a content delivery network (CDN) used for?

- A. Creating website content
- B. Delivering website content from servers geographically closer to users for faster loading
- C. Managing databases
- D. Writing CSS styles

Answer: B

Q465. What does code minification do?

- A. Makes code easier to read
- B. Removes whitespace, comments, and shortens variable names to reduce file size
- C. Adds comments to code
- D. Encrypts the code

Answer: B

Q466. What is render time in web performance?

- A. The time to write code
- B. The time the browser takes to display content on the screen after receiving the data
- C. The time to deploy a website
- D. The time to create a database

Answer: B

Q467. Why is reducing HTTP requests important for performance?

- A. More requests make a site faster
- B. Each request adds network overhead, so fewer requests mean faster page loads
- C. Requests improve security
- D. Requests have no impact on speed

Answer: B

Q468. What is the purpose of using responsive images?

- A. To make images move on the page
- B. To serve appropriately sized images based on the device screen size, avoiding unnecessarily large downloads
- C. To add image filters
- D. To create image slideshows

Answer: B

Q469. What does the term 'above the fold' mean in web performance?

- A. A CSS folding technique
- B. The content visible on screen without scrolling, which should load as quickly as possible
- C. A JavaScript function
- D. A database technique

Answer: B

Q470. What is the impact of web fonts on page performance?

- A. Web fonts have no impact
- B. Custom web fonts add extra file downloads that can delay text rendering
- C. Web fonts make pages load faster
- D. Web fonts reduce file size

Answer: B

Q471. What is automated testing?

- A. Testing done by a human tester
- B. Using software to run tests automatically and compare results to expected outcomes
- C. A type of CSS animation
- D. A database backup method

Answer: B

Q472. What is a test assertion?

- A. A CSS declaration
- B. A statement that checks whether a specific condition is true in a test
- C. A JavaScript variable
- D. A database constraint

Answer: B

Q473. What is a test runner?

- A. A CSS preprocessor
- B. A tool that executes test files and reports the results
- C. A database migration tool
- D. An HTML validator

Answer: B

Q474. What is the purpose of the describe block in testing?

- A. To describe CSS properties
- B. To group related test cases together under a descriptive label
- C. To describe database tables
- D. To describe HTML elements

Answer: B

Q475. What is the purpose of the it or test function in testing?

- A. To iterate over arrays
- B. To define an individual test case with a description and test logic
- C. To create CSS iterations
- D. To iterate database records

Answer: B

Q476. What is an expected value in testing?

- A. A CSS expected property
- B. The correct result that a test verifies the actual output against
- C. A database expected row
- D. An HTML expected element

Answer: B

Q477. What is a test failure?

- A. A CSS rendering error
- B. When the actual output of code does not match the expected result in a test assertion
- C. A server crash
- D. A database timeout

Answer: B

Q478. What does the term 'green test' mean?

- A. A test with green CSS styling
- B. A test that passes, indicating the code behaves as expected
- C. A test for environmental websites
- D. A test that runs slowly

Answer: B

Q479. What is the Elements panel in browser DevTools used for?

- A. To write JavaScript code
- B. To inspect and modify the HTML structure and CSS styles of a web page in real time
- C. To manage databases
- D. To run automated tests

Answer: B

Q480. What is a smoke test?

- A. A test for browser smoke effects
- B. A basic test that verifies the most critical functionality works, ensuring the application is stable enough for further testing
- C. A performance stress test
- D. A CSS animation test

Answer: B

Q481. What is continuous integration (CI)?

- A. A CSS integration method
- B. The practice of automatically building and testing code every time changes are pushed to the repository
- C. A database integration technique
- D. An HTML template system

Answer: B

Q482. What is continuous deployment (CD)?

- A. Continuously designing CSS
- B. Automatically deploying code to production after it passes all tests in the CI pipeline
- C. Continuously deleting files
- D. Continuously creating databases

Answer: B

Q483. What is a build process in web development?

- A. Building HTML elements manually
- B. The automated process of transforming source code into optimized production-ready files
- C. Building database tables
- D. Building CSS manually

Answer: B

Q484. What is the difference between development, staging, and production environments?

- A. They are all the same
- B. Development is for coding, staging is for pre-release testing, and production serves real users
- C. Only production is important
- D. Staging replaces production

Answer: B

Q485. What is Vercel used for?

- A. Writing CSS
- B. Deploying and hosting web applications, particularly those built with Next.js and other frontend frameworks
- C. Managing databases
- D. Testing JavaScript

Answer: B

Q486. What is the purpose of a .gitignore file?

- A. To ignore CSS files
- B. To specify files and directories that Git should not track, like node_modules and environment files
- C. To ignore HTML files
- D. To ignore all JavaScript files

Answer: B

Q487. What is a deployment pipeline in web development?

- A. A physical pipe for network cables
- B. An automated sequence of steps that builds, tests, and deploys code to production
- C. A tool for managing CSS stylesheets
- D. A method for compressing image files

Answer: B

Q488. What does the npm build command typically do?

- A. Builds a database
- B. Compiles and bundles the application's source code into optimized production-ready files
- C. Builds CSS from scratch
- D. Builds HTML templates

Answer: B

Q489. What happens during a typical deployment workflow?

- A. CSS files are manually uploaded
- B. Code is built, tested, and published to a server so users can access the updated application
- C. Databases are deleted and recreated
- D. HTML files are emailed to users

Answer: B

Q490. What is the purpose of a CDN in deployment?

- A. To create databases
- B. To distribute static assets across global servers for faster delivery to users worldwide
- C. To compile code
- D. To manage version control

Answer: B

Q491. What is an API in simple terms?

- A. A CSS framework
- B. A set of rules that allows different software applications to communicate with each other
- C. A JavaScript library
- D. A database management tool

Answer: B

Q492. What is a request body in an API call?

- A. The visual body of a web page
- B. The data sent along with an API request, typically in JSON format
- C. The HTML body element
- D. A CSS body selector

Answer: B

Q493. What does an API response contain?

- A. Only HTML content
- B. The data returned by the server, typically including a status code, headers, and a response body
- C. Only CSS styles
- D. Only JavaScript code

Answer: B

Q494. What is the purpose of the Authorization header in API requests?

- A. To authorize CSS styles
- B. To send authentication credentials like tokens or API keys to prove the requester's identity
- C. To authorize HTML elements
- D. To authorize database access

Answer: B

Q495. What is a path parameter in a REST API URL?

- A. A CSS path property
- B. A variable embedded in the URL path that identifies a specific resource, like /users/123
- C. A file system path
- D. A database path

Answer: B

Q496. What does the HTTP PUT method do in a REST API?

- A. Retrieves a resource
- B. Replaces an entire existing resource with the provided data
- C. Creates a new database
- D. Deletes a resource

Answer: B

Q497. What is the Content-Type header used for?

- A. To set the page title
- B. To specify the format of the data in the request or response body, such as application/json
- C. To define CSS content
- D. To specify HTML content

Answer: B

Q498. What is the purpose of the HTTP status code 201?

- A. Resource not found
- B. A new resource was successfully created
- C. Server error
- D. Redirect to another page

Answer: B

Q499. What tool is commonly used to test API endpoints?

- A. A CSS editor
- B. Postman or similar API testing tools
- C. An image editor
- D. A database viewer

Answer: B

Q500. What is the difference between a query parameter and a path parameter?

- A. They are identical
- B. Path parameters identify specific resources in the URL path while query parameters filter or modify the response and appear after a question mark
- C. Query parameters are faster
- D. Path parameters are optional

Answer: B

Q501. What is Vite used for in modern web development?

- A. Managing databases
- B. A fast build tool and development server that uses native ES modules for quick startup
- C. Styling web pages
- D. Testing JavaScript code

Answer: B

Q502. What is ESLint used for?

- A. Styling web pages
- B. Analyzing JavaScript code for potential errors and enforcing coding standards
- C. Managing databases
- D. Creating HTML templates

Answer: B

Q503. What is the purpose of Prettier in modern development?

- A. To make images prettier
- B. To automatically format code according to consistent style rules, eliminating formatting debates
- C. To improve database performance
- D. To create prettier HTML

Answer: B

Q504. What is a headless CMS in modern web development?

- A. A CMS without a database backend
- B. A content management system that provides content via APIs without a built-in frontend
- C. A CMS that only supports text content
- D. A CMS that runs without a server

Answer: B

Q505. What is a package.json file used for?

- A. To package CSS files
- B. To define project metadata, dependencies, scripts, and configuration for Node.js projects
- C. To package HTML files
- D. To define database packages

Answer: B

Q506. What is GitHub Actions used for?

- A. Styling GitHub pages
- B. Automating workflows like testing, building, and deploying code directly from a GitHub repository
- C. Managing databases on GitHub
- D. Creating GitHub themes

Answer: B

Q507. What is a .env file used for?

- A. To style environments with CSS
- B. To store environment-specific configuration variables like API keys and database URLs
- C. To define HTML environments
- D. To create JavaScript environments

Answer: B

Q508. What is Storybook used for in modern web development?

- A. Creating digital storybooks
- B. Developing, documenting, and testing UI components in isolation outside the main application
- C. Managing server stories
- D. Creating database stories

Answer: B

Q509. What is the purpose of a code formatter?

- A. To format database records
- B. To automatically apply consistent formatting rules to code, ensuring uniform style across a project
- C. To format CSS colors
- D. To format HTML templates

Answer: B

Q510. What is pnpm?

- A. A CSS preprocessor
- B. A fast, disk-space-efficient package manager that uses a content-addressable store to share packages
- C. A JavaScript framework
- D. A database tool

Answer: B

Web Development — Medium

510 questions

Q511. What is the difference between static and dynamic websites?

- A. Static sites load faster but always have fewer total features
- B. Static sites rely on databases while dynamic ones do not
- C. Dynamic sites are completely unable to use HTML markup
- D. Static sites have fixed content while dynamic sites generate it

Answer: D

Q512. Which technology stack is referred to by the term MERN?

- A. MongoDB, Express, React, Node.js
- B. MySQL, Express, React, Node
- C. MariaDB, Ember, React, Nginx
- D. MongoDB, Electron, Redux, Node.js

Answer: A

Q513. What is the purpose of a domain name?

- A. To compile JavaScript code for production
- B. To store website files on a server
- C. To provide a human-readable web address
- D. To encrypt website data during transfer

Answer: C

Q514. What does IDE stand for in web development?

- A. Internal Data Exchange
- B. Integrated Development Environment
- C. Internet Development Engine
- D. Interactive Design Editor

Answer: B

Q515. Which of the following is a version control system?

- A. Docker
- B. Jenkins
- C. Webpack
- D. Git

Answer: D

Q516. What is responsive web design?

- A. Designing websites for one single device
- B. Designing websites that adapt to screen sizes
- C. Designing websites that include animations
- D. Designing websites that respond very quickly

Answer: B

Q517. What is the role of a back-end developer?

- A. Designing the visual user interface
- B. Creating front-end CSS animations
- C. Testing cross-browser compatibility
- D. Managing server-side logic and data

Answer: D

Q518. What is a CMS?

- A. Central Monitoring Service
- B. Client Module Setup
- C. Code Management System
- D. Content Management System

Answer: D

Q519. Which protocol is used for secure communication on the web?

- A. HTTPS
- B. FTP
- C. HTTP
- D. SMTP

Answer: A

Q520. What is a wireframe in web development?

- A. A type of client-side JavaScript framework
- B. A server-side configuration settings file
- C. A basic visual guide for web page layout
- D. A CSS grid system for responsive design

Answer: C

Q521. What is the difference between HTTP and HTTPS?

- A. HTTPS delivers content more quickly
- B. HTTPS encrypts data using TLS/SSL
- C. HTTP provides stronger security features
- D. There is no practical difference at all

Answer: B

Q522. Which HTTP status code indicates a resource was not found?

- A. 200
- B. 500
- C. 404
- D. 301

Answer: C

Q523. What is a RESTful API?

- A. An API built solely with the React library
- B. An API that always requires authentication
- C. An API that exclusively uses GET requests
- D. An API that follows REST design constraints

Answer: D

Q524. What is the purpose of the HTTP POST method?

- A. To retrieve existing data from a resource
- B. To submit data for processing by the server
- C. To delete a specific resource from storage
- D. To update only the HTTP request headers

Answer: B

Q525. What is a proxy server?

- A. A specialized type of relational database
- B. A redundant backup server for data recovery
- C. An intermediary server between client and target
- D. A domain name resolution DNS server system

Answer: C

Q526. What is latency in web architecture?

- A. The total download size of a given web page
- B. The processing speed of the server CPU
- C. The number of concurrent users currently online
- D. The delay between a request and a response

Answer: D

Q527. Which HTTP header specifies the content type of a response?

- A. Cache-Control
- B. Content-Type
- C. Accept-Type
- D. Authorization

Answer: B

Q528. What does a CDN do?

- A. Manages relational database connections
- B. Compiles source code into machine language
- C. Distributes content across global servers
- D. Designs web page layouts automatically

Answer: C

Q529. What is WebSocket used for?

- A. Managing relational database schemas and queries
- B. Full-duplex real-time client-server communication
- C. Applying visual styles to web page elements
- D. Compressing files to reduce transfer size

Answer: B

Q530. What is the purpose of the HTTP PUT method?

- A. To update or replace a resource at a URL
- B. To delete an existing resource completely
- C. To retrieve existing data from a resource
- D. To establish a new connection to a server

Answer: A

Q531. What is the purpose of the <meta> tag?

- A. To provide metadata about the document to browser
- B. To link external CSS files to the HTML document
- C. To display visible metadata on the page directly
- D. To create a navigation menu within the header area

Answer: A

Q532. Which HTML5 tag is used for navigation links?

- A. <links> element
- B. <nav> element
- C. <navigation> tag
- D. <menu> element

Answer: B

Q533. What is the difference between <div> and ?

- A. They are identical in every behavior
- B. is not able to contain any text
- C. <div> is inline, is block-level
- D. <div> is block-level, is inline

Answer: D

Q534. Which attribute provides alternative text for an image?

- A. label
- B. desc
- C. title
- D. alt

Answer: D

Q535. What is the purpose of the <form> tag?

- A. To create a form for user input
- B. To format and style text content
- C. To create a page footer section
- D. To add mathematical formulas

Answer: A

Q536. Which input type creates a checkbox?

- A. type='checkbox'
- B. type='box'
- C. type='check'
- D. type='tick'

Answer: A

Q537. What is the purpose of the action attribute in a form?

- A. To apply CSS styles to the form
- B. To specify where form data is sent
- C. To validate the form input fields
- D. To add a JavaScript event handler

Answer: B

Q538. Which HTML5 element is used for self-contained content like a blog post?

- A. <article>
- B. <div>
- C. <section>
- D. <aside>

Answer: A

Q539. What does target='_blank' do in an anchor tag?

- A. Closes the current browser tab
- B. Opens the link in a new tab
- C. Downloads the linked file
- D. Opens the link in the same tab

Answer: B

Q540. Which tag embeds a video in HTML5?

- A. <embed>
- B. <movie>
- C. <video>
- D. <media>

Answer: C

Q541. What is the CSS Box Model?

- A. A responsive layout framework for components
- B. A model of content, padding, border, margin
- C. A 3D modeling technique for page effects
- D. A CSS animation model for element transitions

Answer: B

Q542. What is the difference between display: none and visibility: hidden?

- A. display: none only hides text content but keeps the element
- B. visibility: hidden removes elements from the document flow
- C. display: none removes from flow; visibility: hidden keeps space
- D. They behave identically in every rendering situation

Answer: C

Q543. Which CSS property is used to float an element?

- A. position
- B. align
- C. float
- D. display

Answer: C

Q544. What does position: relative do?

- A. Makes element fixed on scroll
- B. Positions element relative to the viewport
- C. Positions element relative to its normal position
- D. Removes element from document flow

Answer: C

Q545. What is specificity in CSS?

- A. The algorithm determining which CSS rule applies when multiple match
- B. The order in which CSS properties are declared
- C. The speed at which the browser renders CSS styles
- D. The total number of CSS files loaded on the page

Answer: A

Q546. Which CSS pseudo-class applies when the user hovers over an element?

- A. :focus
- B. ::hover
- C. :hover
- D. :active

Answer: C

Q547. What is the z-index property used for?

- A. Setting the zoom level of an element
- B. Setting the total width of an element
- C. Creating 3D visual effects on elements
- D. Controlling the stack order of elements

Answer: D

Q548. What does box-sizing: border-box do?

- A. Sets the box model back to the content-box
- B. Adds a shadow effect around the element box
- C. Includes padding and border in total dimensions
- D. Removes the border from around the element

Answer: C

Q549. Which selector targets the first child element?

- A. :first
- B. ::first-child
- C. :first-child
- D. :child(1)

Answer: C

Q550. What is the inherit value in CSS?

- A. A reserved keyword in the JavaScript language
- B. Takes the same computed value as parent element
- C. A CSS variable declared with a custom property
- D. Resets the property to its initial default value

Answer: B

Q551. What is the difference between Flexbox and Grid?

- A. They behave identically in all layout situations
- B. Flexbox was introduced after Grid in the spec
- C. Flexbox is one-dimensional, Grid is two-dimensional
- D. Grid is designed exclusively for table layouts

Answer: C

Q552. What does grid-template-areas do?

- A. Creates content for individual grid items
- B. Defines named grid areas for placing items
- C. Creates decorative borders around grid cells
- D. Sets the color scheme for the grid layout

Answer: B

Q553. What is a CSS pseudo-element?

- A. An HTML5 semantic element like header or footer
- B. A fake HTML element added via JavaScript
- C. A keyword styling a specific part of an element
- D. A JavaScript component for building interfaces

Answer: C

Q554. What is the fr unit in CSS Grid?

- A. A frequency measurement unit for media queries
- B. A font ratio measurement unit for sizing
- C. A fraction of available space in the container
- D. A frame rate measurement unit for animations

Answer: C

Q555. How do you create a responsive breakpoint for tablets?

- A. @responsive (tablet)
- B. @tablet { max-width }
- C. @breakpoint (tablet)
- D. @media (max-width: 768px)

Answer: D

Q556. What does flex-wrap: wrap do?

- A. Creates a decorative border around all items
- B. Prevents items from wrapping to new lines
- C. Wraps the text content within each flex item
- D. Allows flex items to wrap onto multiple lines

Answer: D

Q557. What is the gap property in CSS Grid?

- A. A gap in browser support for older versions
- B. A grid rendering error in certain browsers
- C. Sets the spacing between grid rows and columns
- D. The outer margin space around the entire grid

Answer: C

Q558. What does @keyframes define in CSS?

- A. Key events handled in JavaScript listeners
- B. The stages of a CSS animation sequence
- C. Keyboard shortcut bindings for the browser
- D. Database primary and foreign key definitions

Answer: B

Q559. What is the object-fit CSS property?

- A. A flexbox property for controlling item alignment
- B. Specifies how an image resizes to fit its container
- C. A grid alignment property for placing grid items
- D. Fits text content into its parent containers

Answer: B

Q560. What is a mobile-first design approach?

- A. Using only mobile-specific CSS frameworks
- B. Designing websites for desktop screens first
- C. Designing for small screens first then enhancing
- D. Designing websites for mobile devices only

Answer: C

Q561. What is the difference between let and var?

- A. var has block scope; let has function scope
- B. let has block scope; var has function scope
- C. They are identical in scoping behavior
- D. let is significantly slower in performance

Answer: B

Q562. What is a closure in JavaScript?

- A. A type of loop for iterating over arrays
- B. A built-in method to end a running program
- C. A method for closing the browser window
- D. A function accessing its outer scope variables

Answer: D

Q563. What is the purpose of the 'this' keyword?

- A. Refers to the previously declared variable value
- B. Refers to the current CSS style being applied
- C. Refers to the object executing current function
- D. Creates a new object instance in current scope

Answer: C

Q564. What is hoisting in JavaScript?

- A. Moving declarations to the top of their scope
- B. Uploading files from the client to the server
- C. Raising and throwing runtime error exceptions
- D. Lifting DOM elements higher in the page layout

Answer: A

Q565. What is the difference between null and undefined?

- A. undefined always indicates a runtime error occurred
- B. They are identical in meaning and behavior
- C. null is intentional absence; undefined means not assigned
- D. null is for numbers; undefined is for string values

Answer: C

Q566. What does the map() method do on an array?

- A. Creates a geographic map data visualization
- B. Sorts the array elements in ascending order
- C. Creates a new array by applying a function to each item
- D. Maps array indices to their corresponding values

Answer: C

Q567. What is event bubbling in JavaScript?

- A. A CSS animation effect using keyframe transitions
- B. A memory leak issue caused by circular references
- C. Creating animated bubble visual effects on screen
- D. When an event on a child propagates up through parents

Answer: D

Q568. What is the purpose of JSON.parse()?

- A. Compresses JSON data to reduce its file size
- B. Creates a new JSON file on the server disk
- C. Converts a JSON string into a JavaScript object
- D. Validates JSON syntax for correctness and errors

Answer: C

Q569. What is template literal syntax in JavaScript?

- A. Using single quotes around string literals
- B. Using double quotes around string values
- C. Using the + operator for concatenation
- D. Using backticks with \${} for interpolation

Answer: D

Q570. What is destructuring in JavaScript?

- A. Permanently deleting JavaScript objects from memory
- B. Unpacking values from arrays or objects into variables
- C. Breaking code into smaller modules and files
- D. Removing DOM elements from the document tree

Answer: B

Q571. What is Promise.all() used for?

- A. Running multiple promises and waiting for all
- B. Creating a sequential promise chain
- C. Resolving only a single individual promise
- D. Canceling all pending promises at once

Answer: A

Q572. What is the difference between Promise.all() and Promise.allSettled()?

- A. Promise.allSettled() also fails immediately on rejection
- B. Promise.all() is always slower in execution speed
- C. Promise.all() fails on rejection; allSettled() waits for all
- D. They are identical in their behavior

Answer: C

Q573. What is optional chaining (?.) in JavaScript?

- A. Safely accesses nested properties without errors
- B. A ternary operator for conditional expressions
- C. A loop syntax for iterating over object entries
- D. A regex operator for pattern matching in strings

Answer: A

Q574. What is the nullish coalescing operator (??)?

- A. A ternary for inline conditional expressions
- B. Returns right operand when left is null/undefined
- C. A logical OR for boolean expressions
- D. A strict equality check comparing type and value

Answer: B

Q575. What is a Proxy in JavaScript?

- A. A web proxy server for routing network traffic
- B. An object wrapping another to intercept operations
- C. A network library for making HTTP request calls
- D. A design pattern used only in OOP code contexts

Answer: B

Q576. What is the purpose of Object.entries()?

- A. To merge multiple objects into a combined one
- B. To return an array of [key, value] pairs
- C. To create new entries within an object literal
- D. To check if a specific object reference exists

Answer: B

Q577. What is a Set in JavaScript?

- A. A type of map for key-value pair storage
- B. An array method for modifying element order
- C. A function to set values on object properties
- D. A collection of unique values with no duplicates

Answer: D

Q578. What is dynamic import in JavaScript?

- A. Using import() to load modules on demand at runtime
- B. Importing CSS styles dynamically at runtime
- C. Importing all application modules simultaneously
- D. A feature exclusive to the Webpack bundler tool

Answer: A

Q579. What is the for...of loop used for?

- A. Iterating over the keys of an object
- B. Executing queries against a database
- C. A C-style for loop with index counters
- D. Iterating over values of iterable objects

Answer: D

Q580. What does Object.assign() do?

- A. Compares two objects for deep structural equality
- B. Assigns type annotations to JavaScript objects
- C. Creates a deep copy of all nested objects
- D. Copies enumerable own properties to a target (shallow)

Answer: D

Q581. What is the Virtual DOM in React?

- A. A browser API for accessing device hardware and sensors
- B. A lightweight copy of the real DOM for efficient updates
- C. A virtual reality feature for immersive web experiences
- D. A hidden HTML element that is invisible to the end user

Answer: B

Q582. What is React's useState hook?

- A. A database hook for managing query results
- B. A function adding state to functional components
- C. A CSS hook for applying dynamic styles
- D. A routing hook for handling URL navigation

Answer: B

Q583. What is the useEffect hook used for?

- A. Creating CSS effects through JavaScript manipulation
- B. Performing side effects like data fetching in components
- C. Managing component state with reactive data binding
- D. Adding visual effects like shadows and gradients

Answer: B

Q584. What is Vue's reactivity system based on?

- A. Manual DOM manipulation with vanilla JavaScript
- B. JavaScript Proxies that track and trigger updates
- C. Web Workers running in separate background threads
- D. CSS variables with automatic browser recalculation

Answer: B

Q585. What is Angular's two-way data binding?

- A. CSS binding between stylesheets and HTML elements
- B. A database connection pool for managing active queries
- C. Changes in model automatically update the view and vice versa
- D. Server-client binding for real-time data synchronization

Answer: C

Q586. What is React Router?

- A. A server framework for building backend APIs
- B. A library for handling navigation in React apps
- C. A CSS router for switching between stylesheets
- D. A physical network router for internet traffic

Answer: B

Q587. What is a Higher-Order Component (HOC) in React?

- A. A component rendering at the top of a page
- B. A function that takes and returns an enhanced component
- C. A CSS wrapper element for styling child elements
- D. A parent component wrapping all child components

Answer: B

Q588. What is Vuex/Pinia used for in Vue?

- A. Managing CSS styles across Vue applications
- B. Centralized state management for Vue applications
- C. Managing database connections in Vue projects
- D. Server-side routing configuration for Vue apps

Answer: B

Q589. What is the purpose of Angular's NgModule?

- A. A CSS module for scoped component styling
- B. A testing module for automated browser tests
- C. A class organizing components, directives, and services
- D. A database module for connection management

Answer: C

Q590. What is Next.js?

- A. A testing tool for automated end-to-end browser tests
- B. A NoSQL document-oriented database management tool
- C. A CSS framework for responsive web design layouts
- D. A React framework supporting SSR and static generation

Answer: D

Q591. What is the difference between SQL and NoSQL databases?

- A. SQL is designed exclusively for web apps only
- B. They are identical in data model and usage
- C. NoSQL is always faster in every situation
- D. SQL uses tables with schemas; NoSQL uses flexible models

Answer: D

Q592. What is RESTful routing?

- A. A CSS routing system for navigating style sheets
- B. Organizing endpoints around resources via HTTP methods
- C. A database query method for retrieving records
- D. Random URL patterns without any convention

Answer: B

Q593. What is authentication vs authorization?

- A. Authentication verifies identity; authorization controls access
- B. Authentication controls access; authorization verifies identity
- C. Neither is required for modern web application security
- D. They are the same process with different names

Answer: A

Q594. What is an ORM?

- A. A testing tool for automated browser tests
- B. Object-Relational Mapping for querying via objects
- C. A CSS framework for responsive page layouts
- D. A type of relational database engine

Answer: B

Q595. What is the purpose of environment variables?

- A. To store config values like API keys outside code
- B. To create and render HTML elements dynamically
- C. To style web pages with dynamic CSS rules
- D. To define CSS variables for theming support

Answer: A

Q596. What is a session in web development?

- A. A server-side mechanism storing user data across requests
- B. A CSS class applied to styled HTML elements
- C. A database table for persisting application records
- D. A JavaScript function for handling user interactions

Answer: A

Q597. What is rate limiting?

- A. Limiting the speed of CSS animations
- B. Limiting the page load speed for mobile users
- C. Restricting API requests a client can make per period
- D. Limiting the total size of a database instance

Answer: C

Q598. What is the MVC pattern?

- A. A JavaScript library for DOM manipulation tasks
- B. A type of database for NoSQL document storage
- C. A CSS framework for responsive styling layouts
- D. Model-View-Controller, separating data and logic

Answer: D

Q599. What is a webhook?

- A. A CSS hook for attaching dynamic styles
- B. A database trigger running stored procedures
- C. A JavaScript hook for managing component state
- D. An HTTP callback sending data on events

Answer: D

Q600. What is the purpose of CORS middleware?

- A. To style HTTP responses with CSS formatting
- B. To handle CORS headers allowing cross-domain requests
- C. To log errors for debugging server-side issues
- D. To compress data for faster network transfer

Answer: B

Q601. What is the difference between SSR and CSR?

- A. They are identical in every rendering aspect
- B. SSR generates HTML on server; CSR generates in browser
- C. CSR is always faster in initial page load performance
- D. SSR is unable to use any JavaScript on the page

Answer: B

Q602. What is a REST controller?

- A. A component handling HTTP requests for REST endpoints
- B. A database controller for managing query execution
- C. A sleep controller for pausing execution
- D. A CSS component for building styled page layouts

Answer: A

Q603. What is server-side validation?

- A. Validating HTML syntax for standards compliance
- B. Validating CSS on the server for correctness
- C. Checking browser compatibility for CSS features
- D. Checking data on server to ensure requirements

Answer: D

Q604. What is the purpose of a .env file?

- A. To define HTML entities for special character display
- B. To style web pages with dynamic CSS variables
- C. To store environment-specific config like API keys
- D. To configure CSS preprocessor compilation options

Answer: C

Q605. What is a cron job?

- A. A scheduled task running automatically at intervals
- B. A database backup run at a specific time point
- C. A JavaScript timeout for delaying code execution
- D. A CSS animation timer for scheduling effects

Answer: A

Q606. What is the purpose of logging in server-side applications?

- A. Displaying logs visually in the browser console
- B. Recording events and errors for debugging and monitoring
- C. Creating log files that track CSS style changes
- D. Logging into user accounts through authentication

Answer: B

Q607. What is SSR hydration?

- A. A database operation for replicating table data
- B. A CSS technique for fluid responsive layout design
- C. Attaching JS event handlers to server-rendered HTML
- D. Adding water to servers for cooling systems

Answer: C

Q608. What is a reverse proxy in server-side programming?

- A. A database proxy for managing connection pools
- B. A backwards web server that inverts requests
- C. A CSS preprocessor for compiling style files
- D. A server forwarding requests to backend servers

Answer: D

Q609. What is the purpose of body parsing middleware?

- A. To parse CSS files for style extraction
- B. To parse HTML body elements for rendering content
- C. To parse database queries for execution planning
- D. To extract and parse HTTP request bodies into objects

Answer: D

Q610. What is the difference between stateless and stateful server-side apps?

- A. Stateless is always better for every use case scenario
- B. Stateless apps store no session data; stateful apps maintain it
- C. Stateful apps are completely unable to scale horizontally
- D. They are identical in session management behavior

Answer: B

Q611. What is a foreign key?

- A. A column linking two tables via another primary key
- B. A key imported from another country or locale
- C. An encrypted key used for securing data at rest
- D. A backup key for recovering lost database records

Answer: A

Q612. What is database indexing?

- A. Creating structures that speed up data retrieval
- B. Numbering database rows in sequential order
- C. Organizing files on disk for better storage
- D. A CSS technique for ordering layout elements

Answer: A

Q613. What is a JOIN in SQL?

- A. A JavaScript method for merging arrays together
- B. Combining multiple CSS files into a single bundle
- C. A string concatenation operator for joining text
- D. A clause combining rows from tables based on columns

Answer: D

Q614. What is the difference between INNER JOIN and LEFT JOIN?

- A. LEFT JOIN returns only the matching rows from both sources
- B. They are identical in their result sets
- C. INNER JOIN includes NULL values from non-matching entries
- D. INNER returns matches only; LEFT returns all left rows plus matches

Answer: D

Q615. What is database normalization?

- A. Normalizing CSS values for cross-browser consistency
- B. Formatting JSON data for human-readable pretty output
- C. Making data look normal in the display output
- D. Organizing data to reduce redundancy via normal forms

Answer: D

Q616. What is an ODM?

- A. A JavaScript operator for object comparison
- B. A CSS framework for responsive layout design
- C. A type of relational database engine
- D. Object-Document Mapper for objects and NoSQL docs

Answer: D

Q617. What is a transaction in databases?

- A. A CSS transition for animating property changes
- B. A data transfer between server and client machines
- C. A sequence of operations treated as a single unit
- D. A financial payment between two bank accounts

Answer: C

Q618. What are ACID properties?

- A. A type of document-oriented database engine system for storing data
- B. A security protocol for encrypting network traffic between services
- C. Atomicity, Consistency, Isolation, Durability for reliable transactions
- D. A chemistry concept related to pH levels

Answer: C

Q619. What is Redis commonly used for?

- A. As a primary database for all application data
- B. As an in-memory store for caching and sessions
- C. As a CSS preprocessor for compiling styles
- D. As a web server for hosting static content

Answer: B

Q620. What is SQL injection?

- A. A vulnerability where malicious SQL is inserted into queries
- B. A database optimization technique for faster lookups
- C. A JavaScript technique for dynamically building queries
- D. Injecting CSS styles into SQL query statements

Answer: A

Q621. What is CSRF (Cross-Site Request Forgery)?

- A. An attack tricking users into actions on authenticated sites
- B. A CSS framework for building styled web components
- C. A JavaScript error caused by invalid syntax in code
- D. A database attack targeting table join vulnerabilities

Answer: A

Q622. How is CSRF typically prevented?

- A. Disabling JavaScript execution in the browser
- B. Using anti-CSRF tokens to verify request origin
- C. Using CSS styles to hide form submission buttons
- D. Using longer and more complex user passwords

Answer: B

Q623. What is Content Security Policy (CSP)?

- A. A database policy for query execution permissions
- B. A JavaScript policy for variable access control
- C. A CSS policy for restricting style inheritance
- D. An HTTP header restricting which resources load

Answer: D

Q624. What is JWT (JSON Web Token)?

- A. A database token for authenticating query access
- B. A compact self-contained token for secure data transfer
- C. A CSS token for custom property values
- D. A JavaScript variable for storing session data

Answer: B

Q625. What is the principle of least privilege?

- A. Disabling all non-essential application features
- B. Giving admin access to every application user
- C. Granting users only the minimum needed permissions
- D. Using the simplest possible password for accounts

Answer: C

Q626. What is input sanitization?

- A. Compressing HTML to reduce the total page size
- B. Formatting JSON data for consistent key ordering
- C. Removing or encoding dangerous characters from input
- D. Cleaning CSS code by removing unused selectors

Answer: C

Q627. What is CORS and why is it a security concern?

- A. A JavaScript library for making HTTP request calls
- B. Cross-Origin Resource Sharing; misconfiguration exposes data
- C. A CSS framework for cross-browser styling consistency
- D. A NoSQL database system for document-based storage

Answer: B

Q628. What is a brute force attack?

- A. A CSS technique for overriding existing style rules
- B. Systematically trying all possible password combinations
- C. A physical attack on server hardware infrastructure
- D. A network protocol for secure data transmission

Answer: B

Q629. What is the purpose of the HttpOnly cookie flag?

- A. To encrypt the cookie data using symmetric encryption
- B. To prevent JavaScript from accessing the cookie
- C. To make cookies only work over HTTP connections
- D. To make the cookie persistent across browser sessions

Answer: B

Q630. What is OWASP?

- A. A web framework for building server applications
- B. A CSS standard for defining stylesheet specifications
- C. A relational database system for enterprise apps
- D. The Open Web Application Security Project guidelines

Answer: D

Q631. What is the difference between FCP and LCP?

- A. LCP measures only the first pixel painted on screen
- B. FCP is always slower than LCP in page loading time
- C. FCP is when first content appears; LCP is when largest renders
- D. They are identical metrics measuring the same event

Answer: C

Q632. What is code splitting?

- A. Breaking JavaScript bundles into on-demand chunks
- B. Dividing CSS files into smaller partial imports
- C. Database partitioning for distributing table rows
- D. Splitting HTML files across different server endpoints

Answer: A

Q633. What is the purpose of loading='lazy' on images?

- A. To defer loading off-screen images until scrolled to
- B. To load images using CSS background properties
- C. To compress images for smaller file sizes
- D. To slow down image rendering on the page

Answer: A

Q634. What is GZIP compression?

- A. A JavaScript minifier for reducing bundle sizes
- B. A CSS compression tool for minifying stylesheets
- C. Image compression for reducing file sizes
- D. A server-side method reducing transferred file sizes

Answer: D

Q635. What are Core Web Vitals?

- A. A CSS framework for building optimized page layouts
- B. A testing tool for measuring code quality metrics
- C. Google metrics for UX: LCP, INP, and CLS scores
- D. Core JavaScript functions built into the language

Answer: C

Q636. What is render-blocking CSS?

- A. CSS that blocks images from loading on page
- B. CSS that blocks JavaScript from executing code
- C. CSS preventing rendering until fully downloaded
- D. CSS that blocks individual element visibility

Answer: C

Q637. What is prefetching?

- A. A CSS property for preloading font resources
- B. A JavaScript fetch method for making API requests
- C. Fetching data from databases in advance
- D. Loading resources in advance the user will likely need

Answer: D

Q638. What is Cumulative Layout Shift (CLS)?

- A. A CSS layout property for element positioning
- B. A database migration for moving records between tables
- C. A metric measuring unexpected visual shifts during loading
- D. A JavaScript shift operation for bitwise manipulation

Answer: C

Q639. What is the purpose of a service worker in performance?

- A. To minify JavaScript bundles for production
- B. To manage CSS stylesheets and style rules
- C. To compress images for reduced file sizes
- D. To cache assets and serve them offline for speed

Answer: D

Q640. What is tree shaking?

- A. A CSS technique for optimizing selector performance
- B. Removing tree images from web page content
- C. Eliminating unused code from JavaScript bundles
- D. A database optimization for removing unused indexes

Answer: C

Q641. What is integration testing?

- A. Testing CSS integration across page components
- B. Testing only the user interface visual appearance
- C. Testing individual functions in complete isolation
- D. Testing how multiple modules work together as a group

Answer: D

Q642. What is end-to-end (E2E) testing?

- A. Testing from start to finish of the codebase
- B. Testing exclusively the backend server logic only
- C. Testing the complete application from user perspective
- D. Testing only a single API endpoint in isolation

Answer: C

Q643. What is Jest?

- A. A JavaScript testing framework for unit and integration tests
- B. A web server for hosting test environments and staging
- C. A database tool for testing query performance and accuracy
- D. A CSS framework for responsive web design

Answer: A

Q644. What is Cypress used for?

- A. API testing only without any browser interaction
- B. End-to-end testing of web apps in a real browser
- C. CSS processing and compilation of style files
- D. Database testing for query performance and accuracy

Answer: B

Q645. What is mocking in testing?

- A. Making fun of poorly written source code
- B. Creating fake implementations to isolate tested code
- C. A debugging method tracking variable value changes
- D. A CSS technique simulating dynamic state changes

Answer: B

Q646. What is code coverage?

- A. Covering code with explanatory inline comments
- B. A security feature for protecting sensitive source code files
- C. A metric measuring what percentage of code tests execute
- D. A CSS overlay property for stacking visual layer elements

Answer: C

Q647. What is Test-Driven Development (TDD)?

- A. Writing tests before code, then implementing to pass
- B. Developing tests after all code is fully written
- C. A debugging technique for tracing execution flow
- D. A testing framework for running automated test suites

Answer: A

Q648. What is a test suite?

- A. A hotel suite used for testing software
- B. A debugging tool for inspecting test output data
- C. A collection of related test cases grouped together
- D. A CSS test framework for visual regression testing

Answer: C

Q649. What is snapshot testing?

- A. Comparing current output against a stored reference
- B. A database backup for point-in-time recovery
- C. A version control feature for branching code
- D. Taking screenshots of the application pages

Answer: A

Q650. What is the purpose of assertion libraries?

- A. To assert database values match expected outputs
- B. To create assertions within HTML for validation
- C. To provide methods verifying expected code results
- D. To assert CSS values match the design mockups

Answer: C

Q651. What is CI/CD?

- A. A JavaScript library for building interactive web interfaces
- B. A CSS framework for rapid web development workflow
- C. Continuous Integration and Deployment with automated testing
- D. A relational database system for web application data

Answer: C

Q652. What is Docker?

- A. A platform for running apps in isolated containers
- B. A database tool for managing data migrations
- C. A JavaScript runtime for server-side execution
- D. A CSS framework for building grid-based layouts

Answer: A

Q653. What is a container in deployment?

- A. A CSS container element for grouping content
- B. A JavaScript object for storing config values
- C. A database container for grouping related tables
- D. A standalone package with everything to run an app

Answer: D

Q654. What is the purpose of a Dockerfile?

- A. To document CSS style guidelines for the team
- B. To configure a database connection and schema
- C. To define instructions for building a Docker image
- D. To create documentation for the project codebase

Answer: C

Q655. What is AWS?

- A. Amazon Web Services, a cloud platform for hosting
- B. A CSS framework for responsive web design layouts
- C. A JavaScript library for building user interfaces
- D. A web browser for viewing internet content

Answer: A

Q656. What is the difference between PaaS and IaaS?

- A. PaaS provides a platform; IaaS provides raw infrastructure
- B. PaaS provides infrastructure; IaaS provides platforms
- C. They are identical in their service model
- D. IaaS provides a platform for application deployment

Answer: A

Q657. What is an SSL/TLS certificate?

- A. A JavaScript license for commercial software distribution
- B. A CSS certification for web design professionals
- C. A certificate enabling HTTPS by authenticating the server
- D. A database certificate for verifying data integrity

Answer: C

Q658. What are environment variables used for in deployment?

- A. Defining CSS variables for different color schemes
- B. Styling web pages with environment-specific themes
- C. Creating HTML elements for different layout contexts
- D. Storing config values like API keys per environment

Answer: D

Q659. What is a reverse proxy in deployment?

- A. A testing tool for simulating server-side behavior
- B. A CSS technique for reversing element rendering order
- C. A backwards server that inverts incoming requests
- D. A server forwarding requests with load balancing and SSL

Answer: D

Q660. What is a rollback in deployment?

- A. Reverting to a previous version when deploy fails
- B. Rolling back CSS changes to a previous version
- C. A database operation for undoing transaction changes
- D. A JavaScript method for reverting variable values

Answer: A

Q661. What is the difference between REST and GraphQL?

- A. REST uses fixed endpoints; GraphQL uses one for exact data
- B. They are identical in data fetching approach
- C. GraphQL is always faster than REST in every scenario
- D. REST is a newer technology than GraphQL overall

Answer: A

Q662. What is API rate limiting?

- A. Restricting requests a client can make per time period
- B. Limiting the available API features and endpoints
- C. Limiting the number of available API endpoints
- D. Limiting the maximum API response payload size

Answer: A

Q663. What is API versioning?

- A. A JavaScript version number for runtime environments
- B. Updating CSS versions for browser compatibility
- C. A database version for tracking schema migrations
- D. Managing API versions for backward compatibility

Answer: D

Q664. What is OAuth used for with Web APIs?

- A. Delegated authorization for third-party app access
- B. A CSS framework for responsive web page layouts
- C. A JavaScript library for building authentication forms
- D. A database protocol for encrypted connection management

Answer: A

Q665. What is a webhook?

- A. A CSS hook for attaching dynamic style rules
- B. A JavaScript event listener for DOM interactions
- C. A database trigger firing on record changes
- D. A callback URL receiving HTTP POST on events

Answer: D

Q666. What is pagination in APIs?

- A. A JavaScript page event for tracking navigation
- B. Dividing large result sets into smaller pages
- C. Page layout and formatting for print media
- D. A CSS page break controlling print output layout

Answer: B

Q667. What is HATEOAS in REST?

- A. A database concept for relating tables together
- B. A CSS framework for building grid layouts
- C. Responses include links to related resources
- D. A JavaScript pattern for managing app state

Answer: C

Q668. What is API documentation?

- A. Writing CSS comments for code documentation
- B. Database documentation for schema design decisions
- C. Detailed descriptions of endpoints and parameters
- D. HTML documentation for browser compatibility

Answer: C

Q669. What is the purpose of request headers in API calls?

- A. Database headers for defining column schema types
- B. Providing metadata like auth tokens and content type
- C. Styling the request with CSS formatting rules
- D. Creating HTML headers for page title and navigation

Answer: B

Q670. What is a RESTful resource?

- A. A server resource like CPU or memory allocation
- B. A CSS resource like a stylesheet or font file
- C. A JavaScript resource loaded via script elements
- D. An entity identified by URL manipulated via HTTP

Answer: D

Q671. What is a monorepo?

- A. A type of database for centralized data storage
- B. A CSS methodology for organizing style declarations
- C. Multiple related projects stored in one repository
- D. A single repository for one individual project

Answer: C

Q672. What is Jamstack?

- A. A music stack for audio processing applications
- B. An architecture using JavaScript, APIs, and Markup
- C. A CSS framework for building styled web components
- D. A database stack for managing data storage layers

Answer: B

Q673. What is a headless CMS?

- A. A CMS providing content via API without a frontend
- B. A CSS framework for headless browser rendering
- C. A CMS without advanced content management features
- D. A CMS without a header section in the layout

Answer: A

Q674. What is Web Assembly (WASM)?

- A. A binary format enabling near-native browser performance
- B. A JavaScript engine for parsing and executing scripts
- C. A web framework for server-side rendering pages
- D. A CSS assembler for compiling stylesheet syntax

Answer: A

Q675. What is the purpose of ESLint?

- A. Managing databases through a graphical admin interface
- B. Compiling JavaScript into optimized machine code
- C. Minifying CSS files for reduced production bundle sizes
- D. Analyzing JavaScript to find problems and enforce standards

Answer: D

Q676. What is Prettier?

- A. A testing framework for automated end-to-end testing
- B. A CSS framework for responsive web design layouts
- C. An opinionated code formatter enforcing consistent style
- D. A database tool for formatting query output results

Answer: C

Q677. What is a design system?

- A. A testing framework for running automated test suites
- B. A CSS file for global application styling needs
- C. A database schema for normalized table structure design
- D. A comprehensive set of reusable components and guidelines

Answer: D

Q678. What is Storybook?

- A. A CSS framework for styling web page component layouts
- B. A tool for building and documenting UI components in isolation
- C. A book reading app for digital publications
- D. A database tool for visual query builder access and management

Answer: B

Q679. What is a micro-frontend architecture?

- A. A component library for sharing reusable UI element sets
- B. A small frontend with limited feature scope overall
- C. Independently deployable micro apps composing the frontend
- D. A CSS grid layout for building responsive page designs

Answer: C

Q680. What is Deno?

- A. A modern JS/TS runtime with built-in security and TypeScript
- B. A dinosaur-themed web application framework library
- C. A CSS preprocessor for compiling advanced style syntax
- D. A NoSQL database for document-based data storage systems

Answer: A

Q681. What distinguishes a full-stack developer from a front-end developer?

- A. Full-stack only handles database design and server administration
- B. Front-end developers also write all the server-side application code
- C. Full-stack developers exclusively focus on mobile app development work
- D. Full-stack works on both client and server sides of applications

Answer: D

Q682. What is the purpose of version control in web development?

- A. To track changes and enable collaboration among developers
- B. To validate HTML and CSS against web standard guidelines
- C. To minify and compress files for better site performance
- D. To automatically deploy code to production servers quickly

Answer: A

Q683. Which of the following best describes a Content Management System?

- A. A tool for writing and compiling programming language code
- B. A framework for building real-time communication applications
- C. A platform for creating and managing digital content easily
- D. A service for monitoring web server performance and uptime

Answer: C

Q684. What is the role of a package manager in web development?

- A. To host and serve static web pages on a remote cloud server
- B. To encrypt and secure data transmitted between client nodes
- C. To install, update, and manage project dependency libraries
- D. To design responsive layouts for mobile devices and tablets

Answer: C

Q685. What does the term responsive web design mean?

- A. Websites that only function properly on the latest browser versions
- B. Websites that respond to voice commands from the user quickly
- C. Websites that automatically adapt layout to different screen sizes
- D. Websites that load within two seconds on any connection speed

Answer: C

Q686. What is the purpose of a wireframe in web development?

- A. To outline the basic structure and layout of a page visually
- B. To define the database schema for back-end data persistence
- C. To compress images for faster loading times on web servers
- D. To encrypt user authentication tokens stored in the browser

Answer: A

Q687. Which LAMP stack component serves as the web server?

- A. Linux operating system
- B. PHP scripting lang
- C. MySQL data storage
- D. Apache HTTP server

Answer: D

Q688. What does the term single-page application refer to?

- A. An app that dynamically rewrites the page without full reloads
- B. A website that contains only one static HTML landing page total
- C. A web app that can only be accessed on a single device at once
- D. A site designed exclusively for mobile phone portrait view only

Answer: A

Q689. What is the main benefit of using a CSS preprocessor?

- A. It replaces JavaScript entirely for adding interactivity logic
- B. It automatically generates accessible HTML from plain text input
- C. It eliminates the need for any media queries in responsive work
- D. It adds variables, nesting, and functions to standard CSS code

Answer: D

Q690. What is web accessibility primarily concerned with?

- A. Ensuring websites are usable by people with various disabilities
- B. Optimizing search engine rankings through keyword meta tag usage
- C. Preventing unauthorized access to web server admin panel areas
- D. Making websites load faster on slow network connections today

Answer: A

Q691. What is the difference between HTTP GET and POST methods?

- A. GET encrypts data automatically while POST sends it in plain text
- B. GET retrieves data via URL while POST submits data in the body
- C. GET is used only for images while POST is used only for text data
- D. GET sends data in the body while POST appends it to the URL path

Answer: B

Q692. What is the purpose of an HTTP status code in the 3xx range?

- A. To report that the server encountered an internal processing error
- B. To signal that the requested resource has moved or needs redirect
- C. To confirm that the client request was malformed or unauthorized
- D. To indicate a successful operation completed without any errors

Answer: B

Q693. What role does TCP play in web communication?

- A. It ensures reliable ordered delivery of data between two hosts
- B. It encrypts all data packets before they leave the sender device
- C. It compresses image files to reduce bandwidth usage on transfers
- D. It assigns human-readable names to numerical server IP addresses

Answer: A

Q694. What is the purpose of a CDN in web architecture?

- A. To write server-side code for dynamic page generation logic
- B. To provide database replication between primary and backup nodes
- C. To manage version control repositories for development teams
- D. To distribute content across servers closer to end users globally

Answer: D

Q695. What does a reverse proxy server do?

- A. It sits before origin servers and forwards client requests to them
- B. It directly serves web pages to the user browser without caching
- C. It translates domain names into IP addresses for DNS resolution
- D. It compiles source code into executable binaries on the server

Answer: A

Q696. What is the purpose of the HTTP OPTIONS method?

- A. To describe the communication options available for a resource
- B. To upload a new file or document to the server storage location
- C. To establish a persistent WebSocket connection with the server
- D. To delete a specified resource from the server permanently today

Answer: A

Q697. What does stateless mean in the context of HTTP?

- A. The client must re-authenticate for every single page navigation
- B. Each request is independent and carries no memory of prior ones
- C. The server cannot store any files on its local disk permanently
- D. The connection between client and server is never encrypted once

Answer: B

Q698. What is the role of a load balancer in web architecture?

- A. To encrypt all stored database records using advanced hash algorithms
- B. To minify JavaScript files before serving them to client browsers
- C. To distribute incoming traffic across multiple backend server nodes
- D. To automatically generate SSL certificates for domain name hosting

Answer: C

Q699. What is the difference between HTTP/1.1 and HTTP/2?

- A. HTTP/1.1 supports server push while HTTP/2 completely removed it
- B. HTTP/2 removes support for HTTPS and only allows plain HTTP usage
- C. HTTP/2 requires a different port number than HTTP/1.1 for access
- D. HTTP/2 introduces multiplexing allowing multiple parallel requests

Answer: D

Q700. What is a WebSocket and how does it differ from HTTP?

- A. WebSocket is a one-way protocol that only allows server to client data
- B. WebSocket replaces TCP entirely with a new custom transport protocol
- C. WebSocket enables persistent two-way communication between endpoints
- D. WebSocket only works with static HTML pages and cannot handle JSON

Answer: C

Q701. What is the difference between the <div> and elements?

- A. <div> can only contain text while can contain any HTML element
- B. <div> is deprecated in HTML5 while is the recommended replacement
- C. <div> is block-level and is inline in default display behavior
- D. <div> is inline and is block-level in default display behavior

Answer: C

Q702. What is the purpose of semantic HTML elements like <article> and <section>?

- A. They enable JavaScript functionality without writing any script code
- B. They provide meaning to content structure for accessibility and SEO
- C. They replace all div elements and are required for valid HTML5 pages
- D. They apply automatic CSS styling without needing any stylesheet rules

Answer: B

Q703. What does the required attribute do on a form input element?

- A. It automatically formats the input data into proper currency notation
- B. It sets a default placeholder text value inside the input field area
- C. It prevents the form from submitting until the field has been filled
- D. It hides the input field until the user clicks a reveal toggle button

Answer: C

Q704. How does the <picture> element differ from a standard tag?

- A. It automatically applies image filters like blur and grayscale effects
- B. It creates an image gallery carousel with built-in navigation controls
- C. It provides multiple sources for responsive image selection by browser
- D. It only supports SVG format images and cannot display any raster type

Answer: C

Q705. What is the purpose of the data-* attribute in HTML5?

- A. To automatically bind JavaScript event handlers to specific elements
- B. To define database connection strings directly within HTML elements
- C. To store custom data private to the page or application on elements
- D. To encrypt sensitive user information within the DOM tree structure

Answer: C

Q706. What does the <template> element do in HTML5?

- A. It defines email templates for automated notification sending tasks
- B. It holds client-side content not rendered until activated by scripts
- C. It applies a predefined visual theme to the entire web page document
- D. It creates a reusable server-side component for backend rendering

Answer: B

Q707. What is the role of the <meta charset='UTF-8'> tag?

- A. It sets the background color of the web page to a default value
- B. It links an external font library to the current page for styling
- C. It defines the viewport width for mobile responsive design layouts
- D. It specifies the character encoding used for the HTML document text

Answer: D

Q708. What is the difference between the and tags?

- A. indicates semantic importance while is only visual bold
- B. Both tags are completely identical with no semantic differences at all
- C. is deprecated in HTML5 and is the recommended replacement
- D. indicates importance while is only for visual bold style

Answer: A

Q709. What attribute makes an input field read-only but still submittable?

- A. readonly attribute
- B. disabled attribute
- C. hidden attribute
- D. required attribute

Answer: A

Q710. What is the purpose of the <fieldset> and <legend> elements in forms?

- A. They group related form controls and provide a caption for the group
- B. They add animated transitions between different form sections on page
- C. They create dropdown menus and label each option with descriptive text
- D. They define hidden input fields that store session token values only

Answer: A

Q711. What is the difference between margin and padding?

- A. Padding is inside the border while margin is outside the border area
- B. Padding is only for horizontal spacing while margin is only vertical
- C. Margin only applies to inline elements while padding applies to blocks
- D. Margin is inside the border while padding is outside the border area

Answer: A

Q712. What does the z-index property control in CSS?

- A. The stacking order of positioned elements along the depth axis shown
- B. The rotation angle of an element around its central transformation point
- C. The zoom level of the element when displayed in the browser viewport
- D. The horizontal position of an element relative to its parent container

Answer: A

Q713. How does CSS specificity determine which styles are applied?

- A. Only important declarations are considered and all others are ignored
- B. Styles are applied in the order they appear in the HTML source code
- C. Inline styles, IDs, classes, and elements are weighted in that order
- D. The last stylesheet linked in the head always overrides all previous

Answer: C

Q714. What is the CSS box model composed of?

- A. Font, color, background, and shadow properties of text elements
- B. Header, content, sidebar, and footer sections of a webpage layout
- C. Flexbox, grid, float, and position layout mechanisms for styling
- D. Content, padding, border, and margin layers around every element

Answer: D

Q715. What does the position: absolute property do?

- A. Positions element relative to its nearest positioned ancestor element
- B. Positions element relative to the browser viewport scrolling along
- C. Positions element in normal document flow with offset adjustments
- D. Positions element at a fixed spot that ignores scrolling movements

Answer: A

Q716. What is the difference between display: none and visibility: hidden?

- A. display: none removes from flow while visibility: hidden keeps the space
- B. display: none only works on block elements while visibility works on all
- C. display: none hides but keeps space while visibility: hidden removes it
- D. Both properties work identically and there is no difference between them

Answer: A

Q717. How do CSS transitions work?

- A. They animate property changes smoothly over a specified time duration
- B. They only work with JavaScript and cannot be triggered by CSS alone
- C. They require keyframe definitions for every single property animation
- D. They instantly change property values without any animation effect shown

Answer: A

Q718. What is the purpose of the CSS calc() function?

- A. To compute the specificity score of a given CSS selector expression
- B. To count the number of child elements inside a parent container block
- C. To perform mathematical calculations to determine CSS property values
- D. To calculate page load time and display it inside a status bar area

Answer: C

Q719. What does the overflow property control?

- A. The order in which overlapping positioned elements stack on the page
- B. The speed at which CSS transitions animate between two style states
- C. The maximum number of characters shown in a text input field element
- D. How content that exceeds its container dimensions is handled and shown

Answer: D

Q720. What is a CSS pseudo-class?

- A. A CSS property that generates content before or after element content
- B. A keyword added to selectors specifying a special state of an element
- C. A class that is defined in JavaScript rather than in the CSS stylesheet
- D. A method for importing styles from one stylesheet into another one used

Answer: B

Q721. How does the minmax() function work in CSS Grid?

- A. It sets the minimum and maximum font size for responsive text typography
- B. It calculates the minimum and maximum viewport size for media queries
- C. It computes the smallest and largest margin values for element spacing
- D. It defines a size range with minimum and maximum values for grid tracks

Answer: D

Q722. What is the purpose of the grid-template-areas property?

- A. It automatically generates grid lines based on the content size of items
- B. It defines the total number of grid items that can be placed in a grid
- C. It sets background images for specific areas within the grid container
- D. It creates named grid areas for intuitive layout placement of elements

Answer: D

Q723. How does the flex shorthand property work?

- A. It sets the flexibility of the container rather than individual flex items
- B. It combines flex-wrap, flex-flow, and flex-direction into one property
- C. It combines flex-grow, flex-shrink, and flex-basis into one declaration
- D. It controls the visual order of flex items without changing DOM sequence

Answer: C

Q724. What is the difference between auto-fit and auto-fill in CSS Grid?

- A. auto-fill expands items to fill space while auto-fit keeps empty tracks
- B. auto-fill requires explicit row counts while auto-fit calculates them all
- C. auto-fit only works with fixed pixel values while auto-fill uses percents
- D. auto-fit expands items to fill space while auto-fill keeps empty tracks

Answer: D

Q725. How do CSS transforms affect the document flow?

- A. Transforms cause all sibling elements to reposition around the changed one
- B. Transforms visually change elements without affecting document flow at all
- C. Transforms remove the element entirely from the normal document flow
- D. Transforms only work when the element has position absolute or fixed set

Answer: B

Q726. What is the purpose of the clamp() function in CSS?

- A. It clamps scroll position to prevent users from scrolling past content
- B. It limits the number of CSS animations that can run at the same time
- C. It restricts the number of flex items that appear on a single row line
- D. It sets a value that scales between a minimum and maximum with preferred

Answer: D

Q727. How does the order property work in flexbox?

- A. It defines the rendering priority determining which items paint on top
- B. It sets alphabetical sorting order for text content within flex items
- C. It specifies the order in which CSS transitions are applied to each item
- D. It changes the visual order of flex items without altering the DOM order

Answer: D

Q728. What is the aspect-ratio property used for?

- A. To control the animation speed ratio between different keyframe points
- B. To set the ratio of padding to margin for consistent element spacing
- C. To define the ratio between font size and line height in text blocks
- D. To maintain a width-to-height ratio for an element automatically in CSS

Answer: D

Q729. How does the place-items shorthand work in Grid?

- A. It sets the placement algorithm to either sparse or dense packing mode
- B. It combines align-items and justify-items into a single declaration used
- C. It positions grid items at specific pixel coordinates on the web page
- D. It places items outside the grid container in an overflow hidden region

Answer: B

Q730. What is the difference between grid-column and grid-area?

- A. grid-area is deprecated and grid-column is the recommended replacement
- B. grid-area only works with named areas while grid-column works with lines
- C. grid-column sets column placement while grid-area sets full area placement
- D. grid-column is for flexbox while grid-area is exclusively for CSS Grid

Answer: C

Q731. What is the difference between let and var in JavaScript?

- A. let is used for numbers only while var works with all data type values
- B. let cannot be reassigned while var allows reassignment of the variable
- C. let is function-scoped while var is block-scoped in JavaScript code
- D. let is block-scoped while var is function-scoped in JavaScript code

Answer: D

Q732. What is hoisting in JavaScript?

- A. Moving DOM elements to the top of the page during initial rendering
- B. Moving declarations to the top of their scope during the compile phase
- C. Raising the priority of event listeners above other queued callbacks
- D. Uploading JavaScript files to a remote server for production hosting

Answer: B

Q733. What is the difference between == and === in JavaScript?

- A. == coerces types before comparison while === checks type and value both
- B. == is used for strings while === is used for numbers and boolean values
- C. == compares only types while === compares only values of the operands
- D. == is deprecated in modern JavaScript while === is the only valid option

Answer: A

Q734. What is a callback function in JavaScript?

- A. A function that is called automatically when the page finishes loading
- B. A function passed as argument to another function for later execution
- C. A function that calls itself recursively until a condition is satisfied
- D. A function that returns another function as its computed return value

Answer: B

Q735. How does the ternary operator work?

- A. It creates three variables at once using a single declaration statement
- B. It evaluates a condition and returns one of two values based on result
- C. It performs three separate operations on an array simultaneously today
- D. It loops through an array exactly three times for processing elements

Answer: B

Q736. What is destructuring assignment in JavaScript?

- A. Deleting properties from an object permanently from the memory storage
- B. Removing elements from arrays by overwriting them with undefined values
- C. Extracting values from arrays or objects into distinct variables easily
- D. Converting complex objects into simple primitive values automatically

Answer: C

Q737. What does the spread operator do?

- A. It expands an iterable into individual elements in function calls or arrays
- B. It distributes network requests evenly across multiple server endpoints
- C. It removes duplicate values from an array and returns a new unique set
- D. It creates a deep copy of nested objects including all inner references

Answer: A

Q738. What is the purpose of template literals in JavaScript?

- A. To allow embedded expressions and multiline strings using backtick syntax
- B. To define strict type templates for validating function parameter values
- C. To create reusable HTML templates that are rendered on the server side
- D. To generate PDF templates from HTML content for download by site users

Answer: A

Q739. How does the map() array method work?

- A. It filters array elements and returns only those that match a condition
- B. It modifies the original array in place by replacing each element value
- C. It creates a geographical map visualization from array coordinate data
- D. It creates a new array by applying a function to each element of source

Answer: D

Q740. What is the difference between null and undefined?

- A. null is an intentional empty value while undefined means no value assigned
- B. null is used only for objects while undefined is used only for primitives
- C. null triggers an error when accessed while undefined is silently ignored
- D. null is a declared variable with no value while undefined is not declared

Answer: A

Q741. What is the difference between Promise.all and Promise.allSettled?

- A. Promise.all waits for all but allSettled only waits for the first result
- B. Promise.all runs promises sequentially while allSettled runs them parallel
- C. Promise.all rejects on first failure while allSettled waits for all outcomes
- D. Promise.all only works with two promises while allSettled handles any count

Answer: C

Q742. How does event delegation work in JavaScript?

- A. It assigns separate event handlers to every individual child element node
- B. It delegates event processing to a separate web worker thread for speed
- C. It attaches a single handler to a parent to handle events from children
- D. It automatically prevents default browser behavior for all fired events

Answer: C

Q743. What is the purpose of the Symbol primitive type?

- A. To generate Unicode emoji characters for display in user interface text
- B. To create mathematical symbols for complex equation calculations in code
- C. To create unique identifiers that avoid property name collisions in objects
- D. To define currency symbols for formatting monetary values on web pages

Answer: C

Q744. How does the async iterator protocol work with for-await-of?

- A. It limits the iteration count based on available system memory resources
- B. It runs multiple for loops in parallel across different threads at once
- C. It allows asynchronous iteration over streams of data with await support
- D. It converts synchronous iterators into cached versions for faster access

Answer: C

Q745. What is the Proxy object used for in JavaScript?

- A. To create a network proxy for routing HTTP requests through a server
- B. To create backup copies of objects for undo functionality in the editor
- C. To define custom behavior for fundamental object operations like get/set
- D. To convert JavaScript objects into XML format for SOAP API integration

Answer: C

Q746. What is the difference between Object.freeze and Object.seal?

- A. freeze makes objects immutable forever while seal makes them temporary
- B. freeze is for arrays only while seal is for plain objects exclusively used
- C. freeze prevents all changes while seal allows modifying existing properties
- D. freeze works in strict mode only while seal works in any execution mode

Answer: C

Q747. How does the AbortController work with fetch requests?

- A. It converts fetch responses into readable streams for large file handling
- B. It automatically retries failed fetch requests up to three times in a row
- C. It batches multiple fetch requests into a single network call for speed
- D. It provides a way to cancel in-flight fetch requests using abort signals

Answer: D

Q748. What is the purpose of generators in JavaScript?

- A. They automatically generate documentation from JavaScript source code
- B. They compile JavaScript into machine code for better runtime performance
- C. They generate random numbers for use in cryptographic security functions
- D. They create functions that can pause and resume execution using yield

Answer: D

Q749. How does the MutationObserver API work?

- A. It monitors CSS style mutations and prevents unauthorized modifications
- B. It observes network requests and mutates their headers before sending
- C. It tracks variable mutations and logs them for debugging purposes only
- D. It watches for changes to the DOM tree and triggers callbacks for them

Answer: D

Q750. What is a WeakRef and when would you use it?

- A. A weak reference to an object that does not prevent garbage collection
- B. A reference to a CSS variable that resolves at runtime when accessed
- C. A reference to a DOM element that automatically updates when it moves
- D. A reference counted pointer similar to those in C++ or Rust languages

Answer: A

Q751. How does React's reconciliation algorithm work?

- A. It replaces the complete DOM with a new version on each state update call
- B. It diffs the virtual DOM against the previous version and patches changes
- C. It uses web workers to rebuild the DOM tree in a background thread process
- D. It compares the entire DOM tree node by node on every single render cycle

Answer: B

Q752. What is the purpose of React hooks?

- A. To hook into browser APIs that are not available in standard JavaScript
- B. To add state and lifecycle features to functional components without classes
- C. To create HTTP endpoint hooks for RESTful API communication with servers
- D. To connect React components to external CSS stylesheet files for styling

Answer: B

Q753. How does two-way data binding work in Angular?

- A. Binding only works for string values and not numbers or boolean data types
- B. Data flows only from the template to the component class using event calls
- C. Data is bound at compile time and cannot be updated after initial render
- D. Changes in model automatically reflect in view and vice versa in real time

Answer: D

Q754. What is Vue's reactivity system based on?

- A. Manual DOM manipulation with document query selector calls in components
- B. Server-sent events that push data changes from backend to the frontend
- C. Proxy-based observation that tracks dependencies and triggers re-renders
- D. Polling intervals that check for data changes every fixed time interval

Answer: C

Q755. What is the difference between controlled and uncontrolled components in React?

- A. Controlled components are server-rendered while uncontrolled are client-only
- B. Controlled components are class-based while uncontrolled are function-based
- C. Controlled components manage form data via state while uncontrolled use DOM
- D. Controlled components use Redux while uncontrolled use local component state

Answer: C

Q756. What is the purpose of a state management library like Redux?

- A. To manage the state of network connections and retry failed API call requests
- B. To handle database state synchronization between client and server layers
- C. To manage CSS state transitions and animations across all the components
- D. To manage shared application state in a predictable centralized store object

Answer: D

Q757. How does server-side rendering differ from client-side rendering in frameworks?

- A. SSR requires WebSocket connections while CSR uses standard HTTP request calls
- B. SSR only works with Angular while CSR is exclusive to React and Vue frameworks
- C. SSR generates HTML on the server for faster initial load and better SEO results
- D. SSR generates HTML on the client while CSR generates it on the server side

Answer: C

Q758. What is lazy loading in the context of frontend frameworks?

- A. Deferring component or module loading until they are actually needed on page
- B. Loading CSS styles lazily after all JavaScript has finished executing first
- C. Slowing down animations intentionally to create a relaxed user experience
- D. Delaying all network requests until the user explicitly clicks a load button

Answer: A

Q759. What is the purpose of Angular's dependency injection system?

- A. To automatically inject error handling code into every component method call
- B. To inject HTML content from external files into Angular template directives
- C. To inject CSS styles directly into component templates without stylesheets
- D. To provide services and dependencies to components without manual creation

Answer: D

Q760. What are React Server Components and how do they differ from client components?

- A. Server components only work in development mode and are removed in production
- B. Server components run on client with server-like APIs for database access
- C. Server components are deprecated and replaced by client-only rendering now
- D. Server components render on server and send serialized output to the client

Answer: D

Q761. What is the difference between SQL and NoSQL databases?

- A. NoSQL databases cannot handle relational data while SQL handles everything
- B. SQL is only for small datasets while NoSQL is only for large datasets used
- C. SQL databases are always faster than NoSQL for every possible query type
- D. SQL databases use tables with schemas while NoSQL uses flexible data models

Answer: D

Q762. What is the purpose of an ORM in backend development?

- A. To map database records to objects in code without writing raw SQL queries
- B. To manage real-time messaging between connected WebSocket client users
- C. To optimize CSS rendering in server-side rendered pages for performance
- D. To orchestrate multiple microservices into a single deployment pipeline

Answer: A

Q763. How does JWT authentication work?

- A. The client sends username and password with every single request it makes
- B. The server generates a new unique URL for each authenticated user session
- C. The server issues a signed token containing claims that the client stores
- D. The server stores session data in a database and sends a session cookie

Answer: C

Q764. What is the purpose of environment variables in backend applications?

- A. To define CSS custom properties that change based on the user environment
- B. To determine the operating system type for conditional CSS style loading
- C. To store configuration values that change between deployment environments
- D. To set the browser viewport dimensions for responsive testing of layouts

Answer: C

Q765. What is rate limiting and why is it important?

- A. Controlling the speed at which database queries execute on the server side
- B. Setting a maximum file upload size for requests sent to the server endpoint
- C. Limiting the CSS animation frame rate to improve browser performance speed
- D. Restricting the number of API requests a client can make in a time period

Answer: D

Q766. How does connection pooling improve database performance?

- A. It compresses database query results before sending them to the application
- B. It distributes database queries equally across all available server hardware
- C. It reuses existing database connections instead of creating new ones each time
- D. It pools CSS connections to share stylesheets across multiple page views

Answer: C

Q767. What is the purpose of input validation on the server side?

- A. To verify that client-side JavaScript is properly minified before caching
- B. To ensure incoming data meets expected formats and prevents malicious input
- C. To check that image files are in the correct resolution for display on page
- D. To validate that CSS selectors match existing HTML elements in the document

Answer: B

Q768. What is the difference between authentication and authorization?

- A. Authentication verifies identity while authorization checks access permissions
- B. Authentication checks permissions while authorization verifies identity first
- C. Authentication is for APIs only while authorization is for web pages exclusively
- D. Authentication uses tokens while authorization exclusively uses session cookies

Answer: A

Q769. What is GraphQL and how does it differ from REST?

- A. GraphQL requires WebSocket connections while REST uses standard HTTP methods
- B. GraphQL lets clients request exactly the data they need with a single query
- C. GraphQL only supports read operations while REST supports full CRUD actions
- D. GraphQL is a database language while REST is an API architecture style used

Answer: B

Q770. What is the purpose of logging in backend applications?

- A. To measure the length of CSS animations and report their duration in logs
- B. To create visual log-shaped decorations on the user interface of the website
- C. To record application events and errors for monitoring and debugging needs
- D. To generate automatic documentation from source code comment annotations

Answer: C

Q771. How does server-side caching improve application performance?

- A. It caches user passwords on the server to speed up authentication checks
- B. It stores JavaScript bundle files on CDN edge nodes for faster delivery
- C. It caches CSS files in the browser to avoid downloading them every visit
- D. It stores computed results in memory to avoid repeated expensive operations

Answer: D

Q772. What is the difference between stateful and stateless server architectures?

- A. Stateful servers retain client data between requests while stateless do not
- B. Stateful servers are always faster because they remember all previous data
- C. Stateless servers cannot use databases while stateful servers require them
- D. Stateful is for REST APIs only while stateless is for GraphQL APIs exclusively

Answer: A

Q773. How does server-side form validation complement client-side validation?

- A. Server validation runs first and client validation is applied after server
- B. Server validation replaces client validation entirely making it unnecessary
- C. Server validation ensures security since client validation can be bypassed
- D. Server validation is only needed for file uploads and not for text inputs

Answer: C

Q774. What is the purpose of an application server versus a web server?

- A. Application servers are for mobile apps while web servers are for websites only
- B. Web servers are deprecated and application servers have replaced them entirely
- C. Web servers handle HTTP requests while app servers execute business logic also
- D. Application servers only serve static files while web servers handle all logic

Answer: C

Q775. How do server-side redirects differ from client-side redirects?

- A. Server redirects happen via HTTP status codes while client uses JavaScript
- B. Client redirects are more secure because they happen within the browser
- C. Server redirects are slower because they require a full page reload always
- D. Server redirects only work with POST requests while client works with GET

Answer: A

Q776. What is the purpose of a task queue in server-side applications?

- A. To handle time-consuming tasks asynchronously outside the request cycle
- B. To queue CSS animations for smooth rendering on the server-side components
- C. To organize database migration tasks in the order they should be executed
- D. To schedule automated browser tests to run sequentially on a CI pipeline

Answer: A

Q777. How does server-side pagination work for large datasets?

- A. It loads all records into memory then splits them into pages on the server
- B. It caches the entire dataset in the browser and paginates using JavaScript
- C. It fetches only a subset of records per request using offset and limit values
- D. It creates separate database tables for each page of results automatically

Answer: C

Q778. What is the role of a reverse proxy like Nginx in server deployments?

- A. It provides a graphical user interface for managing database tables easily
- B. It converts server-side code into client-side JavaScript for the browser
- C. It reverses the order of HTTP headers to confuse potential attackers today
- D. It sits in front of servers handling load balancing, SSL, and static files

Answer: D

Q779. What is the purpose of database migrations in server-side development?

- A. To move the database server to a different physical location or data center
- B. To manage incremental changes to database schema in a version-controlled way
- C. To migrate data from SQL databases to NoSQL databases for better performance
- D. To create daily backup copies of the database for disaster recovery purposes

Answer: B

Q780. How do background jobs differ from synchronous request handling?

- A. Background jobs process tasks outside the request cycle without blocking it
- B. Background jobs run on the client side while synchronous handlers run on server
- C. Background jobs run immediately within the request cycle blocking the response
- D. Background jobs only handle database operations and not any other task types

Answer: A

Q781. What is database normalization and why is it important?

- A. It normalizes CSS values to consistent units across all stylesheet files
- B. It organizes data to reduce redundancy and improve data integrity in tables
- C. It converts all database text fields to normalized Unicode encoding formats
- D. It equalizes query execution times so all queries run at the same speed

Answer: B

Q782. How do database indexes improve query performance?

- A. They create visual index pages for the database administrator interface
- B. They automatically optimize SQL queries by rewriting them more efficiently
- C. They create data structures that allow the database to find rows faster
- D. They compress database tables to reduce the overall storage requirements

Answer: C

Q783. What is the difference between INNER JOIN and LEFT JOIN?

- A. INNER JOIN returns matching rows while LEFT JOIN includes unmatched left rows
- B. INNER JOIN is faster but less accurate while LEFT JOIN is slower but precise
- C. INNER JOIN returns all rows while LEFT JOIN returns only matching ones
- D. INNER JOIN is for two tables while LEFT JOIN works with three or more tables

Answer: A

Q784. What is a database transaction and what properties does it have?

- A. A financial transaction record stored in the database for accounting use
- B. A scheduled task that runs database maintenance operations periodically
- C. A log entry recording each time a user accesses the database connection
- D. A unit of work with ACID properties ensuring reliability and consistency

Answer: D

Q785. How does connection pooling benefit database-driven web applications?

- A. It distributes connections equally across all tables in the database schema
- B. It pools multiple databases into a single virtual database for unified access
- C. It creates a pool of pre-compiled SQL queries for faster execution speed
- D. It maintains reusable connections reducing overhead of creating new ones each time

Answer: D

Q786. What is the purpose of database views?

- A. To create virtual tables from queries for simplified data access and security
- B. To display database tables in a graphical user interface for administrators
- C. To store compressed backups of database tables for disaster recovery use
- D. To provide real-time visualization charts of database performance metrics

Answer: A

Q787. What is the difference between SQL and NoSQL databases?

- A. SQL databases are free while NoSQL databases always require paid commercial licenses
- B. SQL uses structured schemas and tables while NoSQL uses flexible data models
- C. SQL databases cannot scale while NoSQL databases scale infinitely with ease
- D. SQL is only for small applications while NoSQL is only for enterprise projects

Answer: B

Q788. What is an ORM and how does it simplify database interaction?

- A. It maps database tables to code objects enabling queries without raw SQL usage
- B. It organizes REST methods into a standardized naming convention for APIs
- C. It manages database backups by scheduling them at regular time intervals daily
- D. It monitors database performance and reports optimization recommendations to devs

Answer: A

Q789. What is the purpose of stored procedures in SQL databases?

- A. To save precompiled SQL code on the server for reuse and performance gains
- B. To store JavaScript procedures that run in the browser before page loading
- C. To store CSS procedures for server-side rendering of styled web page content
- D. To archive old database records in compressed format for long-term storage

Answer: A

Q790. How does Redis differ from traditional relational databases?

- A. Redis only supports read operations while relational databases support writes
- B. Redis is an in-memory key-value store optimized for speed and caching needs
- C. Redis requires strict schemas while relational databases are schema-flexible
- D. Redis stores all data on disk while relational databases use in-memory only

Answer: B

Q791. How does CSRF attack work and how can it be prevented?

- A. CSRF intercepts network traffic between client and server to modify data
- B. CSRF brute-forces user passwords by trying common combinations repeatedly
- C. CSRF exploits stored XSS to steal cookies from authenticated user sessions
- D. CSRF tricks authenticated users into making unintended requests using tokens

Answer: D

Q792. What is SQL injection and how is it prevented?

- A. SQL injection inserts malicious SQL through input fields prevented by parameterization
- B. SQL injection overloads the database server with excessive query requests at once
- C. SQL injection exploits weak passwords to gain direct database admin access rights
- D. SQL injection inserts CSS into database queries to alter page styling output

Answer: A

Q793. What is the purpose of Content Security Policy headers?

- A. To restrict which sources of content the browser is allowed to load safely
- B. To define the content type of the HTTP response body sent to the client
- C. To set the content encoding for compressing response data before transfer
- D. To specify the content language for automatic translation of web page text

Answer: A

Q794. How does the SameSite cookie attribute improve security?

- A. It encrypts cookie values so they cannot be read by client-side JavaScript
- B. It forces cookies to expire after a single use preventing session replay attacks
- C. It restricts cookies to same-site requests reducing CSRF attack vulnerability
- D. It limits cookie storage to a maximum of one kilobyte for security purposes

Answer: C

Q795. What is the principle of least privilege in web security?

- A. Giving administrators the highest level of access to all system resources
- B. Providing equal access levels to all users regardless of their actual role
- C. Granting only the minimum permissions necessary to perform required tasks
- D. Restricting all users from accessing any system resources by default only

Answer: C

Q796. How does CORS work and why is it important?

- A. CORS controls which origins can access resources preventing unauthorized access
- B. CORS caches origin responses to reduce the number of server requests needed
- C. CORS encrypts all cross-origin requests to protect data during transmission
- D. CORS compresses resources to reduce bandwidth and improve page load speed

Answer: A

Q797. What is the purpose of input sanitization?

- A. To clean user input by removing or escaping potentially harmful characters
- B. To format input data for visually appealing display in the user interface
- C. To validate that input matches a specific data type before database storage
- D. To compress input data to reduce the payload size of form submission data

Answer: A

Q798. What is a brute force attack?

- A. An attack that tries all possible combinations to guess passwords or keys
- B. An attack that floods the server with traffic to make it unavailable to users
- C. An attack that intercepts data in transit between the client and the server
- D. An attack that exploits a known vulnerability in the server operating system

Answer: A

Q799. How does rate limiting help prevent security attacks?

- A. It limits the size of HTTP response bodies to prevent data exfiltration attacks
- B. It limits the CSS animation frame rate to prevent browser resource exhaustion
- C. It restricts the number of database columns that can be queried simultaneously
- D. It restricts request frequency from a single source to prevent abuse and attacks

Answer: D

Q800. What is the purpose of security headers like X-Frame-Options?

- A. To specify the maximum number of iframes allowed on a single web page view
- B. To set the visual frame and border styling for the web page layout design
- C. To define the frame rate for CSS animations and JavaScript timer intervals
- D. To prevent clickjacking by controlling whether a page can be framed by others

Answer: D

Q801. What are Core Web Vitals and why are they important?

- A. They are Google metrics measuring loading, interactivity, and visual stability
- B. They are CSS properties that control the visual appearance of web page text
- C. They are server health metrics measuring CPU and memory usage of web servers
- D. They are JavaScript functions that validate form data before submission occurs

Answer: A

Q802. How does code splitting improve web application performance?

- A. It splits the database into multiple tables for faster query execution speed
- B. It divides server code into microservices for independent deployment of each
- C. It splits CSS into multiple files that load sequentially one after another
- D. It breaks code into smaller chunks loaded on demand reducing initial bundle size

Answer: D

Q803. What is the critical rendering path?

- A. The sequence of steps the browser takes to convert HTML, CSS, JS to pixels
- B. The path data takes through the network from server to client browser device
- C. The path a user follows through a website to complete a conversion goal task
- D. The route HTTP requests take through load balancers to reach the origin server

Answer: A

Q804. How does tree shaking reduce bundle size?

- A. It removes duplicate database records to reduce storage and query overhead
- B. It prunes old log entries from the server to free up storage disk space use
- C. It eliminates dead code and unused exports from the final JavaScript bundle
- D. It removes unused CSS classes from stylesheets during the build compilation

Answer: C

Q805. What is the purpose of preloading and prefetching resources?

- A. To load critical resources early or fetch future resources in idle time ahead
- B. To download and install browser plugins required by the web page for function
- C. To pre-validate form data on the server before the user submits the form
- D. To preview web pages before navigating to them in the browser tab interface

Answer: A

Q806. How does HTTP caching work with Cache-Control headers?

- A. Cache-Control headers define which HTTP methods are allowed for each resource
- B. Cache-Control headers control the maximum number of concurrent HTTP connections
- C. Cache-Control headers specify how and how long browsers and CDNs cache resources
- D. Cache-Control headers encrypt cached data to prevent unauthorized access today

Answer: C

Q807. What is render-blocking and how can it be avoided?

- A. Database locks that block writes avoided by using optimistic concurrency control patterns
- B. Elements that block user scrolling avoided by removing fixed position CSS properties
- C. Resources that block initial render avoided by async scripts and critical CSS inlining
- D. Server processes that block response avoided by using asynchronous database queries

Answer: C

Q808. How does image format selection affect web performance?

- A. SVG is the best format for photographs while JPEG is best for vector graphics use
- B. PNG is always the smallest format and should be used for all web image content
- C. Modern formats like WebP and AVIF offer better compression than JPEG and PNG today
- D. All image formats perform identically with no difference in file size or quality

Answer: C

Q809. What is the purpose of a service worker for performance optimization?

- A. To compile JavaScript code into machine code for faster execution on the client
- B. To cache resources and serve them offline improving load times on repeat visits
- C. To run CSS animations in a separate thread for smoother visual performance output
- D. To distribute server workload across multiple threads for parallel request handling

Answer: B

Q810. How does DNS prefetching improve page load performance?

- A. It caches the entire web page at the DNS level for instant loading on next visit
- B. It compresses DNS queries to reduce the bandwidth used during name resolution
- C. It prefetches all images on a page before the user scrolls down to view them
- D. It resolves domain names to IP addresses early reducing DNS lookup latency overall

Answer: D

Q811. What is the difference between unit testing and end-to-end testing?

- A. Unit tests are for backend code only while end-to-end tests are for frontend code only
- B. Unit tests verify individual components while E2E tests verify complete user workflows
- C. Unit tests run in production while end-to-end tests run only in development environments
- D. Unit tests are automated while end-to-end tests can only be performed manually today

Answer: B

Q812. What is test-driven development and how does it work?

- A. Tests are driven by user feedback collected through surveys after each deployment
- B. Tests are written after the feature is complete to verify correctness of the code
- C. Tests are written before the code and the code is written to make them pass first
- D. Tests are automatically generated from documentation without developer involvement

Answer: C

Q813. What is mocking in testing and why is it useful?

- A. Creating fake visual mockups of web page designs for client presentation review
- B. Mocking the server response time to test how the frontend handles slow networks
- C. Creating duplicate databases for testing queries without affecting production data
- D. Replacing real dependencies with simulated objects for isolated unit testing work

Answer: D

Q814. How does code coverage measurement help in testing?

- A. It calculates the physical storage space required to store all test result files
- B. It counts the number of developers who have reviewed the code before deployment
- C. It measures the percentage of code executed during tests identifying untested areas
- D. It measures how much of the codebase is covered by documentation comments today

Answer: C

Q815. What is snapshot testing and when is it useful?

- A. Recording network request snapshots for offline testing of API integrations work
- B. Creating snapshots of database state before and after running migration scripts
- C. Taking screenshots of web pages and comparing them manually for visual changes
- D. Capturing component output and comparing against stored reference for regressions

Answer: D

Q816. What is the purpose of continuous integration in testing?

- A. To continuously monitor production servers and restart them when tests fail today
- B. To continuously integrate new CSS styles into the existing stylesheet files daily
- C. To automatically run tests on every code change ensuring quality before merging
- D. To integrate third-party testing tools into the development environment manually

Answer: C

Q817. How does Cypress differ from Selenium for web testing?

- A. Cypress runs in the browser with native access while Selenium uses remote drivers
- B. Cypress only supports unit testing while Selenium supports all types of testing
- C. Cypress requires Python while Selenium only works with Java programming language
- D. Cypress is a server-side testing tool while Selenium tests only client-side code

Answer: A

Q818. What is regression testing?

- A. Testing new features that are being developed for the first time in the sprint
- B. Reducing the number of test cases by removing redundant or obsolete ones today
- C. Verifying that existing functionality still works after code changes are made
- D. Testing the application by reverting to a previous version of the codebase

Answer: C

Q819. What is the testing pyramid and what does it recommend?

- A. Many UI tests at top, fewer integration in middle, fewest unit tests at bottom
- B. Only end-to-end tests are needed because they cover all lower levels automatically
- C. Equal numbers of unit, integration, and end-to-end tests across all three levels
- D. Many unit tests at the base, fewer integration in the middle, fewest E2E on top

Answer: D

Q820. What is the purpose of accessibility testing?

- A. To verify that the website is usable by people with various disabilities needs
- B. To verify that the website source code is accessible through view-source option
- C. To test whether the website can be accessed from different geographic regions
- D. To test how fast the website loads on different network connection speed levels

Answer: A

Q821. What is the difference between continuous integration and continuous deployment?

- A. CI is for frontend code only while CD handles backend deployment pipeline exclusively
- B. CI deploys code to production while CD runs tests and merges code into the main branch
- C. CI requires manual approval while CD runs automatically without any human intervention
- D. CI merges code and runs tests while CD automatically deploys passing code to production

Answer: D

Q822. What is a Docker container and how does it help deployment?

- A. A CSS container element that wraps other elements for layout and styling purposes
- B. A physical container that stores server hardware in a data center facility rack
- C. A lightweight isolated environment that packages an app with all its dependencies
- D. A database container that stores related tables together for organized data access

Answer: C

Q823. What is the purpose of a reverse proxy in deployment?

- A. To reverse engineer the deployment process for rollback to a previous version
- B. To sit before application servers handling load balancing, SSL, and caching tasks
- C. To create a proxy copy of the production database for development testing use
- D. To reverse the order of CSS rules applied to elements for specificity overrides

Answer: B

Q824. What is a deployment pipeline?

- A. A pipeline that transfers database records from staging to production environments
- B. A physical network cable that connects development machines to production servers
- C. An automated process that builds, tests, and deploys code through defined stages
- D. A logging pipeline that streams application logs to a monitoring dashboard view

Answer: C

Q825. How does blue-green deployment reduce downtime?

- A. It colors the deployment logs blue for success and green for errors encountered
- B. It deploys to both environments simultaneously and picks the faster one to serve
- C. It maintains two identical environments switching traffic to reduce deployment risk
- D. It uses blue and green colored servers to visually distinguish environments easily

Answer: C

Q826. What is infrastructure as code and why is it important?

- A. Creating infrastructure diagrams using code for documentation purposes exclusively
- B. Building physical server infrastructure using 3D printing from code specifications
- C. Writing CSS that defines the visual infrastructure layout of web page elements used
- D. Managing infrastructure through code files enabling version control and repeatability

Answer: D

Q827. What is the purpose of environment variables in deployment?

- A. To define the physical environment like temperature where servers are housed today
- B. To set environment-specific font sizes for development versus production display
- C. To store configuration that varies between environments without code changes needed
- D. To set CSS custom properties that change based on the user browser environment

Answer: C

Q828. What is a container registry?

- A. A registry of physical shipping containers used for server hardware delivery tasks
- B. A repository for storing and distributing container images like Docker Hub service
- C. A system that registers new CSS container queries for responsive component design
- D. A database that registers all running containers on a single host machine system

Answer: B

Q829. How does canary deployment work?

- A. It uses canary-colored warning messages to alert users about upcoming changes ahead
- B. It gradually rolls out changes to a small subset of users before full deployment
- C. It deploys to a canary server that only team members can access for final testing
- D. It deploys the entire application to all users simultaneously with no phased rollout

Answer: B

Q830. What is the purpose of health checks in deployed applications?

- A. To monitor the physical health of server hardware like CPU temperature and disk state
- B. To verify that application components are running correctly and able to serve traffic
- C. To check the health of developers working on the application project regularly
- D. To validate that HTML passes W3C health standards for accessibility compliance test

Answer: B

Q831. What is the difference between PUT and PATCH HTTP methods?

- A. PUT is idempotent while PATCH is not and cannot be safely retried on failure
- B. PUT replaces the entire resource while PATCH partially updates specific fields
- C. PUT creates a new resource while PATCH deletes an existing resource from server
- D. PUT is for files only while PATCH works with JSON data responses exclusively

Answer: B

Q832. How does API versioning help maintain backward compatibility?

- A. It tracks how many times each API endpoint has been called for billing usage
- B. It creates version backups of the API database for disaster recovery purposes
- C. It allows multiple API versions to coexist so old clients continue to function
- D. It versions the CSS stylesheets used in API documentation pages for consistency

Answer: C

Q833. What is the purpose of API rate limiting?

- A. To restrict API responses to a fixed number of records per database query
- B. To control request frequency preventing abuse and ensuring fair resource usage
- C. To limit the number of API endpoints that can be created in a single project
- D. To limit the CSS animation frame rate for API loading spinner components

Answer: B

Q834. How does pagination work in REST APIs?

- A. It splits API request payloads across multiple HTTP connections for parallelism
- B. It creates separate HTML pages for each API response sent to the client browser
- C. It automatically paginates database tables into fixed-size partitions for storage
- D. It returns data in smaller chunks using offset, limit, or cursor-based approaches

Answer: D

Q835. What is the purpose of API documentation tools like Swagger?

- A. To automatically generate CSS styles for API response rendering in browsers
- B. To provide interactive documentation for exploring and testing API endpoints
- C. To generate client-side JavaScript code from server-side API handler functions
- D. To create database documentation from SQL schema definitions automatically

Answer: B

Q836. How do WebSockets differ from REST APIs for real-time communication?

- A. WebSockets require API keys while REST APIs use session cookies for authentication
- B. WebSockets only support text data while REST APIs support all content type formats
- C. WebSockets maintain persistent bidirectional connections unlike REST request-response
- D. WebSockets use HTTP request-response while REST uses persistent connections only

Answer: C

Q837. What is the purpose of HATEOAS in REST API design?

- A. To hash API tokens using advanced encryption standards for security purposes
- B. To include hypermedia links in responses enabling clients to discover actions
- C. To hate on APIs that don't follow REST principles by logging warning messages
- D. To handle asynchronous task execution and observe API server health metrics

Answer: B

Q838. What is an API gateway and what functions does it serve?

- A. A single entry point that handles routing, authentication, and rate limiting tasks
- B. A tool that generates API code from visual gateway diagrams designed by teams
- C. A physical gateway device that connects API servers to the internet backbone
- D. A database gateway that translates API calls into SQL queries automatically used

Answer: A

Q839. How does OAuth 2.0 work for API authorization?

- A. It requires users to share their passwords directly with third-party applications
- B. It delegates authorization using access tokens without sharing user credentials
- C. It only works for social media APIs and cannot be used for other API services
- D. It encrypts all API responses using a shared secret key between both parties

Answer: B

Q840. What is the purpose of idempotency in API design?

- A. To ensure that making the same request multiple times produces the same result
- B. To identify duplicate API endpoints and remove them from the server routing table
- C. To verify that API request parameters match the expected data types precisely
- D. To ensure API responses always contain identical formatting and structure layout

Answer: A

Q841. How does server-side rendering differ from static site generation?

- A. SSR generates static files while SSG renders pages dynamically per request
- B. SSR only works with React while SSG works with all frontend frameworks used
- C. SSR and SSG are identical concepts with no practical differences between them
- D. SSR renders pages on each request while SSG pre-builds pages at build time

Answer: D

Q842. What is the purpose of a build tool like Vite or Webpack?

- A. To bundle, transform, and optimize source code for production deployment use
- B. To build physical server infrastructure from configuration code specifications
- C. To build database schemas from visual entity relationship diagram models only
- D. To construct CSS layouts from wireframe sketches using AI image recognition

Answer: A

Q843. What is the purpose of feature flags in modern web development?

- A. To add visual flag icons to features that are new or recently updated for users
- B. To mark CSS features that are not supported in older browsers for fallback use
- C. To enable or disable features dynamically without deploying new code versions
- D. To flag code that contains bugs for prioritized fixing by the development team

Answer: C

Q844. How does edge computing benefit modern web applications?

- A. It sharpens the visual edges of images displayed on the web page for clarity
- B. It caches database queries at the edge of the database cluster for faster reads
- C. It processes requests at network edge locations closer to users reducing latency
- D. It adds decorative edge borders to web page components for visual enhancement

Answer: C

Q845. What is the purpose of a design token in design systems?

- A. A physical token given to designers to access the design tool application suite
- B. A database token that authorizes access to the design system API documentation
- C. A cryptocurrency token used to purchase premium design assets and templates
- D. A named value storing design decisions like colors and spacing for consistency

Answer: D

Q846. How do monorepos benefit large-scale web development teams?

- A. They automatically generate documentation for all projects in the repository
- B. They force all projects to use the same programming language and framework only
- C. They enable code sharing, atomic changes, and unified tooling across projects
- D. They eliminate the need for any version control branching strategies entirely

Answer: C

Q847. What is the difference between a library and a framework?

- A. Libraries are free and open source while frameworks always require paid licenses
- B. A library is larger than a framework and includes more features out of the box
- C. A library is called by your code while a framework calls your code via inversion
- D. Libraries only work in browsers while frameworks work on both server and client

Answer: C

Q848. What is the purpose of a CI/CD pipeline in modern web development?

- A. To create interactive and creative designs for web page user interface layouts
- B. To continuously inspect and clean database records for data quality maintenance
- C. To continuously integrate CSS changes with HTML changes for consistent styling
- D. To automate building, testing, and deploying code changes reliably and quickly

Answer: D

Q849. How does incremental static regeneration work?

- A. It regenerates static pages in the background after a revalidation period expires
- B. It incrementally adds new CSS styles to static pages without rebuilding them all
- C. It regenerates all static pages from scratch on every single user request received
- D. It generates static pages incrementally one at a time during the build process

Answer: A

Q850. What is the purpose of a component library like Shadcn or Material UI?

- A. To store compiled JavaScript components in a shared library for runtime loading
- B. To create a library catalog of all API endpoints for developer documentation use
- C. To provide pre-built accessible UI components for consistent application styling
- D. To compile custom HTML elements into web components for cross-framework sharing

Answer: C

Q851. What is the role of a web framework in development?

- A. It replaces the need for HTML entirely
- B. It provides pre-built tools and structure to speed up development
- C. It is only used for mobile app development
- D. It manages internet service provider connections

Answer: B

Q852. What is the purpose of developer tools in modern browsers?

- A. To create new websites automatically
- B. To inspect, debug, and profile web pages in real time
- C. To replace the need for a code editor
- D. To manage web hosting accounts

Answer: B

Q853. What is a web application compared to a traditional website?

- A. A web application is always built with Python
- B. A web application provides interactive functionality beyond static content
- C. A web application cannot use HTML
- D. A web application runs without a browser

Answer: B

Q854. What is the MEAN stack?

- A. MongoDB, Express, Angular, Node.js
- B. MySQL, Ember, Apache, Nginx
- C. Markdown, ESLint, AWS, Netlify
- D. MongoDB, Electron, Ansible, NPM

Answer: A

Q855. What is cross-browser compatibility?

- A. A tool for compressing images
- B. Ensuring a website works correctly across different web browsers
- C. A method for encrypting web traffic
- D. A framework for building mobile apps

Answer: B

Q856. What is the purpose of a favicon on a website?

- A. To improve server performance
- B. To display a small icon in the browser tab representing the site
- C. To encrypt user data
- D. To validate form inputs

Answer: B

Q857. What does the term 'deployment' mean in web development?

- A. Writing the initial HTML code
- B. Making a website available on a live server for public access
- C. Installing a text editor
- D. Creating a database backup

Answer: B

Q858. What is a progressive web application?

- A. A desktop-only application
- B. A web app that uses modern APIs to deliver native-like experiences
- C. A website that only works in Chrome
- D. A server-side rendering technique

Answer: B

Q859. What is the purpose of semantic versioning in web projects?

- A. To style web pages
- B. To communicate the nature of changes in software releases using major.minor.patch format
- C. To compress JavaScript files
- D. To manage DNS records

Answer: B

Q860. What is the difference between a library and a framework in web development?

- A. They are identical concepts
- B. A library provides specific functions you call, while a framework controls the overall flow of your application
- C. A framework is always smaller than a library
- D. Libraries only work on the server side

Answer: B

Q861. What is the purpose of a load balancer in web architecture?

- A. To compress images on the server
- B. To distribute incoming network traffic across multiple servers
- C. To write JavaScript code
- D. To manage DNS records

Answer: B

Q862. What is the difference between a forward proxy and a reverse proxy?

- A. They are the same thing
- B. A forward proxy acts on behalf of clients while a reverse proxy acts on behalf of servers
- C. Forward proxies are faster
- D. Reverse proxies are only used for caching

Answer: B

Q863. What is the role of caching in web architecture?

- A. To permanently delete old data
- B. To store frequently accessed data closer to the user to reduce latency and server load
- C. To encrypt data in transit
- D. To create new database tables

Answer: B

Q864. What is the role of DNS in web architecture?

- A. To style web pages
- B. To translate human-readable domain names into IP addresses that computers use to locate servers
- C. To compress HTTP responses
- D. To manage database connections

Answer: B

Q865. What is the purpose of the HTTP PATCH method?

- A. To delete a resource entirely
- B. To retrieve all resources
- C. To apply partial modifications to a resource
- D. To create a new resource from scratch

Answer: C

Q866. What is a content delivery network (CDN)?

- A. A tool for writing HTML code
- B. A geographically distributed network of servers that delivers content from the nearest location to the user
- C. A type of programming language
- D. A database management system

Answer: B

Q867. What is the difference between synchronous and asynchronous communication in web architecture?

- A. They are identical approaches
- B. Synchronous blocks until a response is received while asynchronous allows other operations to continue
- C. Synchronous is always faster
- D. Asynchronous cannot be used with HTTP

Answer: B

Q868. What does a status code in the 2xx range indicate?

- A. Client error
- B. Server error
- C. Successful request
- D. Redirect

Answer: C

Q869. What is the role of an API gateway in a distributed system?

- A. To store static files
- B. To act as a single entry point that routes requests to appropriate backend services
- C. To write CSS styles
- D. To manage version control

Answer: B

Q870. What is the purpose of the HTTP Cache-Control header?

- A. To define the page title
- B. To specify caching directives for both requests and responses
- C. To set the content language
- D. To redirect users to a different page

Answer: B

Q871. What is the difference between the <section> and <article> elements?

- A. They are identical elements
- B. A section groups related content while an article represents self-contained, independently distributable content
- C. Section is for navigation only
- D. Article cannot contain headings

Answer: B

Q872. What is the purpose of the autocomplete attribute on form inputs?

- A. To validate the input value
- B. To allow browsers to suggest previously entered values for the field
- C. To make the input read-only
- D. To add placeholder text

Answer: B

Q873. What does the <datalist> element do in HTML5?

- A. Creates a data table
- B. Provides a predefined list of suggestions for an input element
- C. Defines a database connection
- D. Generates a numbered list

Answer: B

Q874. What is the difference between the <script> tag placed in <head> versus at the end of <body>?

- A. There is no difference
- B. Scripts in <head> may block HTML parsing while scripts before </body> allow the page to render first
- C. Scripts in <head> execute slower
- D. Scripts in <body> cannot access the DOM

Answer: B

Q875. What is the purpose of the <main> element in HTML5?

- A. To create a sidebar
- B. To represent the dominant content of the body, unique to the document
- C. To define a footer
- D. To embed external content

Answer: B

Q876. What does the pattern attribute do on an input element?

- A. It sets the input's visual style
- B. It specifies a regular expression that the input value must match for validation
- C. It creates a placeholder text
- D. It disables the input field

Answer: B

Q877. What is the difference between the <link> and <a> tags?

- A. They are interchangeable
- B. <link> defines relationships between the document and external resources while <a> creates clickable hyperlinks
- C. <link> is used for images
- D. <a> is only for email links

Answer: B

Q878. What is the role of the <noscript> element in HTML?

- A. To remove JavaScript from the page
- B. To provide alternative content for users whose browsers do not support or have disabled JavaScript
- C. To add comments to code
- D. To optimize images

Answer: B

Q879. What does the loading attribute on images and iframes control?

- A. The image resolution
- B. Whether the resource is loaded immediately or deferred until it nears the viewport
- C. The image format
- D. The image border style

Answer: B

Q880. What is the purpose of the <output> element in HTML5 forms?

- A. To create a text input
- B. To display the result of a calculation or user action
- C. To submit the form
- D. To define form labels

Answer: B

Q881. What is the difference between relative and absolute units in CSS?

- A. There is no difference
- B. Relative units like em and % scale based on context while absolute units like px have a fixed size
- C. Absolute units are always larger
- D. Relative units only work in flexbox

Answer: B

Q882. What does the position: fixed property do?

- A. Positions the element relative to its parent
- B. Positions the element relative to the browser viewport, staying in place during scrolling
- C. Removes the element from the document flow
- D. Makes the element invisible

Answer: B

Q883. What is the purpose of the CSS opacity property?

- A. To set the element's border width
- B. To control the transparency level of an element
- C. To change the font weight
- D. To set the z-index

Answer: B

Q884. How does the CSS cascade determine which styles are applied?

- A. Styles are applied randomly
- B. Styles are resolved based on specificity, source order, and importance
- C. Only the last stylesheet wins
- D. Only inline styles are applied

Answer: B

Q885. What does the text-decoration property control?

- A. The font size of text
- B. Decorative lines on text such as underline, overline, or line-through
- C. The text alignment
- D. The letter spacing

Answer: B

Q886. What is the purpose of the CSS transform property?

- A. To change an element's color
- B. To apply 2D or 3D transformations like rotate, scale, skew, or translate to an element
- C. To set the element's position
- D. To add a border

Answer: B

Q887. What is the difference between position: sticky and position: fixed?

- A. They behave identically
- B. Sticky toggles between relative and fixed based on scroll position while fixed always stays relative to the viewport
- C. Sticky only works on images
- D. Fixed does not work in modern browsers

Answer: B

Q888. What does the CSS line-height property control?

- A. The width of a line
- B. The vertical space between lines of text
- C. The number of lines visible
- D. The horizontal spacing of characters

Answer: B

Q889. How do CSS pseudo-elements like ::before and ::after work?

- A. They create new HTML elements in the DOM
- B. They insert generated content before or after an element's actual content using CSS alone
- C. They modify JavaScript events
- D. They add attributes to HTML tags

Answer: B

Q890. What is the purpose of the CSS outline property?

- A. To set the background color
- B. To draw a line outside the element's border without affecting layout
- C. To add inner padding
- D. To change the font style

Answer: B

Q891. What is the difference between align-items and align-content in Flexbox?

- A. They are identical properties
- B. align-items aligns items within each line while align-content aligns the lines themselves within the container
- C. align-items only works horizontally
- D. align-content is deprecated

Answer: B

Q892. How does the CSS grid auto-placement algorithm work?

- A. Items are always placed manually
- B. The browser automatically places grid items in the next available cell following row or column order
- C. Items are placed randomly
- D. Auto-placement only works with flexbox

Answer: B

Q893. What does the CSS will-change property do?

- A. Forces an immediate style change
- B. Hints to the browser about which properties will change, allowing it to optimize rendering in advance
- C. Changes the element's content
- D. Prevents any style changes

Answer: B

Q894. How does the CSS repeat() function work in Grid layouts?

- A. It repeats the entire grid layout
- B. It repeats a track pattern a specified number of times, simplifying grid-template definitions
- C. It creates animation loops
- D. It duplicates HTML elements

Answer: B

Q895. What is the difference between a CSS transition and a CSS animation?

- A. They are the same thing
- B. Transitions require a trigger and animate between two states while animations can run independently with multiple keyframes
- C. Transitions are more complex
- D. Animations cannot loop

Answer: B

Q896. What does the CSS filter property allow?

- A. Filtering HTML elements from the DOM
- B. Applying visual effects like blur, brightness, contrast, and grayscale to elements
- C. Filtering network requests
- D. Sorting CSS selectors

Answer: B

Q897. How does the CSS place-items shorthand work?

- A. It positions items using absolute coordinates
- B. It sets both align-items and justify-items in a single declaration
- C. It creates new grid items
- D. It removes items from the layout

Answer: B

Q898. What is the purpose of the CSS shape-outside property?

- A. To clip an element's visible area
- B. To define a shape around which inline content wraps
- C. To create border radius
- D. To define grid areas

Answer: B

Q899. What does the CSS writing-mode property control?

- A. The font family
- B. Whether text flows horizontally or vertically and the direction of block flow
- C. The text color
- D. The font size

Answer: B

Q900. How does the CSS backdrop-filter property differ from filter?

- A. They are identical
- B. backdrop-filter applies effects to the area behind the element while filter applies effects to the element itself
- C. backdrop-filter only works on images
- D. filter is deprecated

Answer: B

Q901. What is the difference between a function declaration and a function expression?

- A. They are identical
- B. Function declarations are hoisted and can be called before their definition while function expressions are not hoisted
- C. Function expressions are faster
- D. Function declarations cannot accept parameters

Answer: B

Q902. What does the filter() method do on an array?

- A. Sorts the array elements
- B. Creates a new array with elements that pass a test provided by a callback function
- C. Removes all elements
- D. Reverses the array order

Answer: B

Q903. What is scope in JavaScript?

- A. The visual appearance of code
- B. The region of code where a variable is accessible and can be referenced
- C. The speed at which code executes
- D. The number of lines in a file

Answer: B

Q904. What is the purpose of the reduce() method on arrays?

- A. To reduce the array's length by one
- B. To execute a reducer function on each element, accumulating a single result value
- C. To delete duplicate elements
- D. To sort elements in descending order

Answer: B

Q905. What is type coercion in JavaScript?

- A. Manually changing a variable's type
- B. The automatic conversion of values from one type to another during operations
- C. A method for creating new data types
- D. A way to validate form inputs

Answer: B

Q906. What is the difference between the forEach() and map() array methods?

- A. They are identical
- B. forEach() executes a function on each element without returning a new array while map() returns a new array of transformed elements
- C. forEach() is faster
- D. map() modifies the original array

Answer: B

Q907. What is the switch statement used for in JavaScript?

- A. Declaring variables
- B. Evaluating an expression against multiple case values and executing the matching block
- C. Creating loops
- D. Defining functions

Answer: B

Q908. What is the purpose of the Object.keys() method?

- A. To lock an object's properties
- B. To return an array of an object's own enumerable property names
- C. To delete all properties from an object
- D. To merge two objects together

Answer: B

Q909. What does the concat() method do with arrays?

- A. Removes elements from an array
- B. Merges two or more arrays into a new array without modifying the originals
- C. Sorts the array
- D. Finds a specific element

Answer: B

Q910. What is short-circuit evaluation in JavaScript?

- A. A way to speed up code execution
- B. When logical operators stop evaluating as soon as the result is determined
- C. A method for handling errors
- D. A type of loop optimization

Answer: B

Q911. What is the purpose of the async iterator protocol in JavaScript?

- A. To iterate over synchronous arrays faster
- B. To enable asynchronous iteration with for-await-of loops over data that arrives over time
- C. To create CSS animations
- D. To manage database cursors

Answer: B

Q912. What is the difference between a shallow copy and a deep copy in JavaScript?

- A. They are the same operation
- B. A shallow copy copies only top-level properties while a deep copy recursively copies all nested objects
- C. Shallow copies are always faster
- D. Deep copies only work with arrays

Answer: B

Q913. How does the nullish coalescing assignment operator (??=) work?

- A. It always assigns the right-hand value
- B. It assigns the right-hand value only if the left-hand variable is null or undefined
- C. It checks for falsy values
- D. It throws an error if the variable is null

Answer: B

Q914. What is the purpose of the queueMicrotask() function?

- A. To create a new thread
- B. To schedule a callback to run as a microtask, executing before the next macrotask
- C. To queue network requests
- D. To manage CSS transitions

Answer: B

Q915. What is the purpose of the Promise.race() method?

- A. To run promises sequentially
- B. To return a promise that resolves or rejects as soon as the first promise in the iterable settles
- C. To cancel all pending promises
- D. To merge promise results

Answer: B

Q916. How do private class fields declared with # differ from underscore convention?

- A. They are the same approach
- B. Private fields with # are truly inaccessible from outside the class while underscore is just a naming convention
- C. Underscore fields are more private
- D. Hash fields are slower

Answer: B

Q917. What is the purpose of the globalThis object?

- A. To create global CSS styles
- B. To provide a standard way to access the global object across different JavaScript environments
- C. To manage global state in React
- D. To define global HTML templates

Answer: B

Q918. What does the Promise.any() method do?

- A. Waits for all promises to reject
- B. Returns a promise that resolves with the first fulfilled promise, ignoring rejections unless all reject
- C. Cancels all promises
- D. Returns all results in order

Answer: B

Q919. What is the purpose of the structuredClone() function?

- A. To clone HTML elements
- B. To create a deep copy of a value using the structured clone algorithm, supporting complex types like Map, Set, and Date
- C. To clone CSS styles
- D. To duplicate event listeners

Answer: B

Q920. What is optional chaining (?.) and how does it prevent errors?

- A. It creates optional function parameters
- B. It safely accesses nested properties by returning undefined instead of throwing an error if a reference is nullish
- C. It chains CSS selectors
- D. It makes all variables optional

Answer: B

Q921. What is the difference between client-side and server-side state management?

- A. They are identical
- B. Client-side state is managed in the browser while server-side state persists data across sessions and users on the server
- C. Client-side state is always faster
- D. Server-side state cannot use databases

Answer: B

Q922. How does the virtual DOM optimization work in React?

- A. It replaces the real DOM entirely
- B. React compares a virtual representation with the previous version and applies only the minimal necessary changes to the real DOM
- C. It creates a copy of the CSS styles
- D. It preloads all images

Answer: B

Q923. What is the purpose of the useRef hook in React?

- A. To manage CSS references
- B. To hold a mutable reference that persists across renders without causing re-renders when changed
- C. To create database references
- D. To reference external APIs

Answer: B

Q924. What is the Composition API in Vue 3 and how does it improve code organization?

- A. It creates CSS compositions
- B. It allows grouping related logic by concern using composable functions instead of scattering it across options
- C. It composes database queries
- D. It manages file compositions

Answer: B

Q925. What is the purpose of code splitting in frontend frameworks?

- A. To split CSS files
- B. To break application code into smaller bundles loaded on demand, improving initial load performance
- C. To split database tables
- D. To divide server instances

Answer: B

Q926. What are React context and when should it be used?

- A. A CSS context property
- B. A way to pass data through the component tree without prop drilling, best for infrequently changing global data
- C. A database context manager
- D. A server execution context

Answer: B

Q927. How does Angular's template-driven forms approach differ from reactive forms?

- A. They are identical approaches
- B. Template-driven forms use directives in templates for simple forms while reactive forms use programmatic control for complex validation
- C. Template-driven forms are always better
- D. Reactive forms cannot validate input

Answer: B

Q928. What is the purpose of error boundaries in React?

- A. To create CSS borders
- B. To catch JavaScript errors in child components and display fallback UI instead of crashing the whole application
- C. To handle network errors
- D. To manage database errors

Answer: B

Q929. What is hydration in the context of server-side rendered applications?

- A. Adding water effects to the UI
- B. The process of attaching event handlers and state to server-rendered HTML on the client side
- C. Compressing server responses
- D. Loading CSS stylesheets

Answer: B

Q930. What is the difference between static site generation (SSG) and server-side rendering (SSR)?

- A. They are identical
- B. SSG generates HTML at build time while SSR generates HTML on each request at runtime
- C. SSG requires more server resources
- D. SSR cannot use caching

Answer: B

Q931. What is the purpose of input validation on the backend?

- A. To style form elements
- B. To ensure incoming data meets expected formats and constraints, preventing malicious or invalid data from being processed
- C. To create HTML forms
- D. To manage CSS classes

Answer: B

Q932. How do JWT tokens work for stateless authentication?

- A. They store session data on the server
- B. They encode user claims into a signed token that the server validates without storing session state
- C. They replace passwords entirely
- D. They only work with SQL databases

Answer: B

Q933. How does middleware chaining work in Express.js?

- A. Middleware functions run in parallel
- B. Each middleware calls next() to pass control to the next function in the chain, allowing sequential processing of requests
- C. Middleware replaces routing
- D. Middleware only works with databases

Answer: B

Q934. What is rate limiting in backend applications?

- A. Limiting CSS animations
- B. Restricting the number of requests a client can make within a time period to prevent abuse
- C. Limiting database size
- D. Restricting the number of HTML elements

Answer: B

Q935. What is the purpose of pagination in API responses?

- A. To style page numbers
- B. To divide large result sets into smaller pages, reducing response size and improving performance
- C. To create PDF documents
- D. To manage page routing

Answer: B

Q936. What is the difference between a relational and a document database?

- A. They store data identically
- B. Relational databases use structured tables with schemas while document databases store flexible JSON-like documents
- C. Relational databases are always faster
- D. Document databases cannot be queried

Answer: B

Q937. What is the purpose of hashing passwords before storing them?

- A. To make passwords shorter
- B. To convert passwords into irreversible fixed-length strings so the original password cannot be recovered if the database is compromised
- C. To encrypt database connections
- D. To compress storage space

Answer: B

Q938. What is the purpose of CORS middleware in a backend application?

- A. To compress responses
- B. To configure which origins, methods, and headers are allowed for cross-origin requests to the API
- C. To create database connections
- D. To manage server logging

Answer: B

Q939. What is the purpose of database seeding?

- A. To delete all data
- B. To populate a database with initial or test data for development or testing purposes
- C. To encrypt database records
- D. To compress database tables

Answer: B

Q940. What is the difference between structured and unstructured logging in backend systems?

- A. They are the same approach
- B. Structured logging outputs logs as parseable data formats like JSON while unstructured logging outputs freeform text
- C. Structured logging is slower
- D. Unstructured logging is more searchable

Answer: B

Q941. What is the purpose of request body parsing in server-side applications?

- A. To parse CSS files
- B. To extract and convert data from the HTTP request body into a usable format like JSON or form data
- C. To parse HTML templates
- D. To parse database queries

Answer: B

Q942. How do server-side sessions maintain user state across requests?

- A. They store all data in the URL
- B. They store a session ID in a cookie and keep session data on the server, associating requests with stored state
- C. They modify HTML files
- D. They use CSS custom properties

Answer: B

Q943. What is the difference between a web server and an application server?

- A. They are identical
- B. A web server handles static content and HTTP while an application server executes business logic and dynamic content
- C. Web servers are faster
- D. Application servers cannot serve HTML

Answer: B

Q944. What is the purpose of request rate limiting middleware?

- A. To limit CSS rendering speed
- B. To restrict the number of requests per client within a time window to prevent abuse and protect server resources
- C. To limit database query speed
- D. To slow down page rendering

Answer: B

Q945. How does server-side caching reduce database load?

- A. It deletes old database records
- B. It stores frequently accessed data in memory so repeated requests are served from cache instead of querying the database
- C. It compresses database files
- D. It indexes all database columns

Answer: B

Q946. How do background job processors like BullMQ work in Node.js applications?

- A. They replace all server routing
- B. They use Redis-backed queues to offload time-consuming tasks to separate worker processes for asynchronous execution
- C. They only process CSS files
- D. They replace database queries

Answer: B

Q947. What is the difference between cookie-based and token-based authentication?

- A. They are identical
- B. Cookie-based auth stores session IDs in cookies managed by the browser while token-based auth sends tokens in request headers
- C. Cookie-based is always more secure
- D. Token-based cannot expire

Answer: B

Q948. What is the purpose of webhook endpoints in server-side applications?

- A. To create CSS hooks
- B. To receive real-time event notifications from external services via HTTP POST requests
- C. To hook into database events
- D. To manage JavaScript event listeners

Answer: B

Q949. What is the purpose of file upload handling in server-side applications?

- A. To upload CSS files
- B. To process multipart form data containing files, validating and storing them securely
- C. To upload database backups
- D. To transfer HTML templates

Answer: B

Q950. What is the role of an ORM like Prisma or Sequelize in server-side Node.js applications?

- A. To render CSS on the server
- B. To provide a type-safe API for database operations, mapping database tables to JavaScript objects
- C. To manage HTTP routing
- D. To compress server responses

Answer: B

Q951. What is the purpose of database indexing and when should indexes be used?

- A. Indexes slow down all queries
- B. Indexes create data structures that speed up read queries on specific columns but add overhead to write operations
- C. Indexes replace primary keys
- D. Indexes only work with MongoDB

Answer: B

Q952. What is database normalization and what problem does it solve?

- A. It normalizes CSS values
- B. It organizes data to minimize redundancy and dependency by dividing large tables into related smaller tables
- C. It normalizes JSON formatting
- D. It standardizes SQL syntax

Answer: B

Q953. What is the difference between a LEFT JOIN and a RIGHT JOIN?

- A. They return the same results
- B. LEFT JOIN returns all rows from the left table with matching right rows, while RIGHT JOIN returns all rows from the right table
- C. LEFT JOIN is faster
- D. RIGHT JOIN is deprecated

Answer: B

Q954. What are ACID properties in database transactions?

- A. A type of database query
- B. Atomicity, Consistency, Isolation, and Durability - guarantees that ensure reliable transaction processing
- C. A chemical database property
- D. A MongoDB-specific feature

Answer: B

Q955. What is the purpose of a composite index in databases?

- A. To compose CSS styles
- B. To index multiple columns together, optimizing queries that filter or sort by those columns in combination
- C. To compose database schemas
- D. To combine multiple databases

Answer: B

Q956. What is the difference between HAVING and WHERE in SQL?

- A. They are interchangeable
- B. WHERE filters rows before grouping while HAVING filters groups after aggregation with GROUP BY
- C. HAVING is faster
- D. WHERE works with aggregate functions

Answer: B

Q957. What is a database trigger?

- A. A CSS event
- B. A stored procedure that automatically executes when a specified event occurs in the database such as INSERT, UPDATE, or DELETE
- C. A JavaScript event listener
- D. An HTML form trigger

Answer: B

Q958. What is the purpose of database connection string parameters like pool size?

- A. To set CSS pool values
- B. To configure how many simultaneous connections the application maintains to the database
- C. To define HTML element pools
- D. To set JavaScript thread pool size

Answer: B

Q959. What is a subquery in SQL?

- A. A CSS sub-selector
- B. A query nested inside another query that provides results used by the outer query
- C. A sub-database
- D. A JavaScript sub-function

Answer: B

Q960. How do database views simplify complex data access?

- A. They replace all tables
- B. They create reusable virtual tables from stored queries, providing abstraction over complex joins and restricting column visibility
- C. They only work with MongoDB
- D. They delete unused data

Answer: B

Q961. What is the purpose of the Secure flag on cookies?

- A. To secure CSS styles
- B. To ensure the cookie is only sent over encrypted HTTPS connections, preventing interception on unencrypted channels
- C. To make cookies larger
- D. To speed up cookie transmission

Answer: B

Q962. How does parameterized queries prevent SQL injection?

- A. They encrypt SQL statements
- B. They separate SQL logic from user data, ensuring user input is treated as data rather than executable SQL code
- C. They make queries faster
- D. They compress query results

Answer: B

Q963. What is the purpose of the X-Content-Type-Options header?

- A. To set the page content type
- B. To prevent browsers from MIME-type sniffing responses away from the declared content type
- C. To compress content
- D. To encrypt content

Answer: B

Q964. What is a cross-site scripting (XSS) stored attack?

- A. A CSS storage technique
- B. An attack where malicious scripts are permanently stored on the server and served to users who view the affected content
- C. A JavaScript storage method
- D. A database optimization

Answer: B

Q965. What is the purpose of multi-factor authentication (MFA)?

- A. To make login faster
- B. To require multiple forms of verification, making unauthorized access significantly harder even if one factor is compromised
- C. To style login pages
- D. To manage multiple user accounts

Answer: B

Q966. What is the purpose of encoding user output in web applications?

- A. To compress HTML
- B. To convert special characters to their safe HTML entities, preventing injected scripts from executing in the browser
- C. To encode CSS styles
- D. To compress JavaScript

Answer: B

Q967. What is session fixation and how is it prevented?

- A. Fixing CSS session styles
- B. An attack where an attacker sets a user's session ID before login; prevented by regenerating the session ID after authentication
- C. A database session repair
- D. A JavaScript debugging technique

Answer: B

Q968. What is the purpose of the Referrer-Policy header?

- A. To set CSS referrer styles
- B. To control how much referrer information is included when navigating from the site, protecting user privacy
- C. To manage database references
- D. To speed up page loads

Answer: B

Q969. What is clickjacking and how is it prevented?

- A. A CSS clicking animation
- B. An attack that tricks users into clicking hidden elements by overlaying transparent frames; prevented with X-Frame-Options or CSP frame-ancestors
- C. A JavaScript click handler
- D. A database click tracking method

Answer: B

Q970. What is the principle of defense in depth?

- A. A CSS depth property
- B. Implementing multiple layers of security controls so that if one layer fails, others still protect the system
- C. A JavaScript nesting technique
- D. A database depth indexing method

Answer: B

Q971. What is the purpose of the font-display CSS property for performance?

- A. To set the font size
- B. To control how custom fonts are displayed during loading, reducing invisible text periods
- C. To display font metadata
- D. To create font animations

Answer: B

Q972. How does HTTP/2 multiplexing improve web performance?

- A. It makes HTTP slower
- B. It allows multiple requests and responses to be sent simultaneously over a single connection, eliminating head-of-line blocking
- C. It replaces HTTPS
- D. It compresses all images

Answer: B

Q973. What is the purpose of critical CSS?

- A. CSS that is hard to write
- B. Inlining the CSS needed for above-the-fold content to eliminate render-blocking stylesheet downloads
- C. Critical CSS errors
- D. CSS for error pages

Answer: B

Q974. What is the Time to First Byte (TTFB) metric?

- A. Time to write the first line of code
- B. The time between the browser requesting a page and receiving the first byte of the response from the server
- C. The time to display the first pixel
- D. The time to first user click

Answer: B

Q975. How does image lazy loading improve performance?

- A. It makes images load in higher quality
- B. It defers loading of off-screen images until the user scrolls near them, reducing initial page load time
- C. It compresses images automatically
- D. It converts all images to SVG

Answer: B

Q976. What is the purpose of preconnect resource hint?

- A. To preconnect CSS styles
- B. To establish early connections (DNS, TCP, TLS) to important third-party domains before they are needed
- C. To connect database pools
- D. To preconnect JavaScript modules

Answer: B

Q977. What is the Cumulative Layout Shift (CLS) metric and why is it important?

- A. A CSS shift property
- B. A Core Web Vital measuring unexpected layout shifts that disrupt user experience during page load
- C. A JavaScript shift operation
- D. A server shift metric

Answer: B

Q978. How does bundling JavaScript files improve performance?

- A. It makes files larger
- B. It combines multiple files into fewer bundles, reducing the number of HTTP requests needed
- C. It encrypts JavaScript
- D. It compresses the server

Answer: B

Q979. What is the purpose of the Largest Contentful Paint (LCP) metric?

- A. To measure the largest CSS file
- B. To measure the time until the largest visible content element is fully rendered, indicating perceived load speed
- C. To measure the largest JavaScript file
- D. To measure database size

Answer: B

Q980. What is the purpose of using a service worker for caching?

- A. To style web pages
- B. To intercept network requests and serve cached responses, enabling offline access and faster repeat visits
- C. To manage CSS workers
- D. To create database workers

Answer: B

Q981. What is the purpose of a mock in testing?

- A. To mock CSS styles
- B. To simulate the behavior of real objects or functions, isolating the code under test from its dependencies
- C. To mock HTML elements
- D. To mock database tables

Answer: B

Q982. What is the difference between a spy and a mock in testing?

- A. They are identical concepts
- B. A spy observes and records calls to a real function while a mock replaces the function entirely with controlled behavior
- C. Spies are faster
- D. Mocks are deprecated

Answer: B

Q983. What is code coverage and what are its limitations?

- A. It measures CSS coverage
- B. It measures the percentage of code executed by tests, but high coverage does not guarantee all edge cases or logic paths are properly tested
- C. It measures database coverage
- D. It has no limitations

Answer: B

Q984. How does snapshot testing work and when is it most useful?

- A. It takes screenshots of the browser
- B. It serializes output to a file and compares future runs against it, most useful for detecting unintended changes in UI components
- C. It creates database snapshots
- D. It only works with React

Answer: B

Q985. What is the purpose of test fixtures?

- A. To fix broken CSS
- B. To set up known test data and state before tests run, ensuring consistent and repeatable test conditions
- C. To fix HTML errors
- D. To fix database bugs

Answer: B

Q986. What is the difference between Cypress and Playwright for end-to-end testing?

- A. They are identical tools
- B. Cypress runs tests in-browser with automatic waiting while Playwright supports multiple browsers and runs outside the browser with better parallel execution
- C. Cypress is always faster
- D. Playwright only supports Chrome

Answer: B

Q987. What is the purpose of test isolation?

- A. To isolate CSS styles
- B. To ensure each test runs independently without being affected by or affecting other tests
- C. To isolate database tables
- D. To isolate server instances

Answer: B

Q988. What is the role of continuous integration in testing?

- A. To integrate CSS continuously
- B. To automatically run tests on every code change, catching bugs early before they reach production
- C. To integrate databases
- D. To integrate HTML templates

Answer: B

Q989. What is the purpose of test doubles and what types exist?

- A. To double CSS styles
- B. To replace real dependencies in tests; types include stubs, mocks, spies, fakes, and dummies
- C. To double database records
- D. To duplicate HTML elements

Answer: B

Q990. What is the purpose of load testing?

- A. To load CSS files
- B. To simulate high traffic to evaluate how the application performs under expected and peak loads
- C. To load database records
- D. To load HTML templates

Answer: B

Q991. What is the purpose of Docker in modern deployment workflows?

- A. To style web pages
- B. To package applications with all dependencies into portable containers that run consistently across environments
- C. To manage CSS variables
- D. To create HTML templates

Answer: B

Q992. What is the difference between a Dockerfile and a docker-compose.yml file?

- A. They are identical files
- B. A Dockerfile defines how to build a single container image while docker-compose.yml orchestrates multiple containers as a service stack
- C. Dockerfile is for CSS
- D. docker-compose is deprecated

Answer: B

Q993. What is the purpose of environment-specific configuration in deployment?

- A. To change CSS per environment
- B. To adjust settings like database URLs, API keys, and feature flags for different environments without code changes
- C. To create environment variables in CSS
- D. To manage HTML per environment

Answer: B

Q994. What is a rollback strategy in deployment?

- A. Rolling back CSS changes
- B. A plan for reverting to a previous stable version of the application when a deployment introduces issues
- C. Rolling back database schemas
- D. Rolling back HTML templates

Answer: B

Q995. What is the purpose of a container registry?

- A. To register CSS containers
- B. To store and distribute Docker container images, providing version management and access control
- C. To register HTML elements
- D. To register database containers

Answer: B

Q996. How does blue-green deployment minimize downtime?

- A. By using blue and green CSS themes
- B. By maintaining two identical production environments and switching traffic from the current (blue) to the new (green) after verification
- C. By deploying only during blue or green light hours
- D. By coloring server logs

Answer: B

Q997. What is the purpose of deployment previews?

- A. To preview CSS changes
- B. To automatically deploy each pull request to a unique URL for review and testing before merging
- C. To preview database migrations
- D. To preview HTML layouts

Answer: B

Q998. What is the purpose of a load balancer in deployment architecture?

- A. To balance CSS loads
- B. To distribute incoming traffic across multiple server instances for reliability and performance
- C. To balance database loads only
- D. To balance JavaScript execution

Answer: B

Q999. What is the purpose of monitoring and alerting in production deployments?

- A. To monitor CSS file sizes
- B. To track application health, performance, and errors, and notify teams when issues are detected
- C. To monitor HTML rendering
- D. To monitor database schemas

Answer: B

Q1000. What is an artifact in the context of deployment?

- A. An ancient CSS technique
- B. A built and versioned package of the application ready for deployment to an environment
- C. A database artifact
- D. An HTML artifact

Answer: B

Q1001. What is the purpose of API versioning and what strategies exist?

- A. To version CSS files
- B. To maintain backward compatibility when making breaking changes; strategies include URL path, query parameter, and header-based versioning
- C. To version HTML files
- D. To version database schemas

Answer: B

Q1002. What is the difference between REST and GraphQL APIs?

- A. They are identical
- B. REST uses fixed endpoints returning predefined data while GraphQL uses a single endpoint where clients specify exactly what data they need
- C. REST is always faster
- D. GraphQL cannot handle mutations

Answer: B

Q1003. What is the purpose of API documentation tools like Swagger/OpenAPI?

- A. To document CSS styles
- B. To provide interactive documentation that describes endpoints, request/response formats, and allows testing APIs directly
- C. To document HTML structures
- D. To document database schemas only

Answer: B

Q1004. What is the purpose of cursor-based pagination compared to offset-based pagination?

- A. To style cursor in CSS
- B. Cursor-based pagination uses an opaque pointer to the last item, avoiding the performance and consistency issues of offset-based pagination on large datasets
- C. To manage database cursors
- D. To paginate CSS styles

Answer: B

Q1005. What is the purpose of HTTP caching headers in API responses?

- A. To cache CSS styles
- B. To control whether and how long API responses can be cached by browsers and intermediaries, reducing server load and latency
- C. To cache HTML pages only
- D. To cache database queries

Answer: B

Q1006. What is the purpose of request validation in API development?

- A. To validate CSS syntax
- B. To verify that incoming API requests contain valid data types, required fields, and acceptable values before processing
- C. To validate HTML structure
- D. To validate database schemas

Answer: B

Q1007. What is the purpose of webhook retry mechanisms?

- A. To retry CSS loading
- B. To automatically reattempt failed webhook deliveries with exponential backoff, ensuring event delivery despite temporary failures
- C. To retry database connections
- D. To retry HTML rendering

Answer: B

Q1008. What is the purpose of API error response standardization?

- A. To standardize CSS errors
- B. To return consistent error formats with status codes, error codes, and messages so clients can handle errors programmatically
- C. To standardize HTML errors
- D. To standardize database errors

Answer: B

Q1009. What is the purpose of API throttling versus rate limiting?

- A. They are identical concepts
- B. Rate limiting blocks requests exceeding a limit while throttling queues or slows them, allowing eventual processing
- C. Throttling is always faster
- D. Rate limiting queues requests

Answer: B

Q1010. How does hypermedia in REST API responses guide client navigation?

- A. It adds CSS styles to responses
- B. It includes links to related resources and available actions, allowing clients to navigate the API without hardcoded URLs
- C. It embeds HTML pages in JSON
- D. It manages database hyperlinks

Answer: B

Q1011. What is the purpose of design tokens in modern design systems?

- A. Tokens for accessing CSS APIs
- B. Atomic design decisions (colors, spacing, typography) stored as platform-agnostic variables that ensure consistency across products
- C. Database access tokens
- D. JavaScript authentication tokens

Answer: B

Q1012. How does monorepo tooling like Turborepo improve development workflows?

- A. It creates CSS monorepos
- B. It manages multiple packages in one repository with intelligent caching, parallel execution, and dependency-aware task orchestration
- C. It only manages databases
- D. It replaces Git

Answer: B

Q1013. How do web components achieve framework-agnostic reusability?

- A. They only work inside React applications
- B. They use browser-native APIs like Custom Elements, Shadow DOM, and HTML Templates to create encapsulated components usable in any framework
- C. They require a special bundler plugin
- D. They depend on a shared CSS library

Answer: B

Q1014. What is the concept of incremental adoption in modern web frameworks?

- A. Installing the entire framework at once
- B. Gradually integrating a framework into an existing application page by page instead of rewriting everything
- C. Adopting only the CSS parts of a framework
- D. Using multiple frameworks simultaneously

Answer: B

Q1015. What is the purpose of TypeScript in modern web development?

- A. To replace JavaScript entirely
- B. To add static type checking to JavaScript, catching type errors at compile time and improving developer experience
- C. To type CSS styles
- D. To type database queries

Answer: B

Q1016. What is the difference between optimistic and pessimistic UI updates?

- A. Optimistic updates are slower but more accurate
- B. Optimistic updates assume success and update the UI immediately before server confirmation, while pessimistic updates wait for the server response
- C. Pessimistic updates never send data to servers
- D. Optimistic updates only work with REST APIs

Answer: B

Q1017. What is the purpose of Bun as a JavaScript runtime?

- A. To bundle CSS files
- B. To provide a fast all-in-one JavaScript runtime, bundler, test runner, and package manager as an alternative to Node.js
- C. To create database bundles
- D. To manage HTML bundles

Answer: B

Q1018. What is the purpose of Web Components standards?

- A. Standard CSS components
- B. A set of browser APIs (Custom Elements, Shadow DOM, HTML Templates) for creating reusable, encapsulated UI components
- C. Standard database components
- D. Standard server components

Answer: B

Q1019. What is the purpose of a build tool like Webpack in modern development?

- A. To build CSS from scratch
- B. To bundle, transform, and optimize JavaScript modules and assets for production deployment
- C. To build database schemas
- D. To build HTML templates

Answer: B

Q1020. What is the purpose of containerization in modern web development?

- A. To contain CSS styles
- B. To package applications with all dependencies into isolated containers that run consistently across any environment
- C. To contain database records
- D. To contain HTML elements

Answer: B

Web Development — Hard

510 questions

Q1021. Which rendering strategy delivers HTML generated at request time from the server?

- A. Static Site Generation
- B. Server-Side Rendering
- C. Client-Side Rendering
- D. Incremental Static Regeneration

Answer: B

Q1022. What is the main advantage of a Single Page Application (SPA)?

- A. It avoids full page reloads by dynamically updating
- B. It does not need to communicate with any APIs
- C. It renders only a single HTML element on screen
- D. It can function with no JavaScript whatsoever

Answer: A

Q1023. What is the JAMstack architecture?

- A. jQuery, Angular, MongoDB
- B. Java, Apache, MySQL stack
- C. JSON, AJAX, MVC
- D. JavaScript, APIs, and Markup

Answer: D

Q1024. Which tool is used for bundling JavaScript modules?

- A. Git
- B. Postman
- C. Parcel
- D. Webpack

Answer: D

Q1025. What is the purpose of a service worker?

- A. To compile TypeScript into JavaScript
- B. To manage and process database queries
- C. To enable offline functionality and sync
- D. To minify and bundle CSS file assets

Answer: C

Q1026. What is Progressive Enhancement?

- A. Starting with a basic experience and adding enhancements for capable ones
- B. Starting with advanced features and removing them for old browsers
- C. Optimizing progressive image loading formats for slower connections
- D. Restricting support exclusively to modern browsers with new features

Answer: A

Q1027. What distinguishes a Progressive Web App (PWA) from a regular web app?

- A. PWAs do not use standard HTML markup or CSS styling
- B. PWAs require React as a mandatory framework dependency
- C. PWAs work offline, can be installed, and send notifications
- D. PWAs only function on mobile devices and tablets

Answer: C

Q1028. In web development, what is hydration?

- A. Applying water-themed CSS styling to elements
- B. Loading and parsing external CSS style sheets
- C. Attaching JavaScript event handlers to server HTML
- D. Compressing and optimizing image file formats

Answer: C

Q1029. What is tree shaking in modern web development?

- A. Balancing binary search trees using JavaScript
- B. Reorganizing the DOM tree for better performance
- C. Clearing the browser cache for fresh content
- D. Removing unused code from the final build output

Answer: D

Q1030. What is the critical rendering path?

- A. The network path from the server to the browser
- B. The route a URL takes through the DNS resolution
- C. The order in which CSS files are loaded and parsed
- D. The sequence of steps the browser takes to render

Answer: D

Q1031. What is the difference between HTTP/1.1 and HTTP/2?

- A. HTTP/2 does not support any form of HTTPS encryption
- B. HTTP/1.1 is significantly faster in performance than HTTP/2
- C. HTTP/2 supports multiplexing requests over one connection
- D. HTTP/2 is text-based while HTTP/1.1 uses binary framing

Answer: C

Q1032. What is CORS in web architecture?

- A. Cross-Origin Resource Sharing, allowing cross-domain requests
- B. A NoSQL document-oriented database for storing data
- C. A lightweight JavaScript library for DOM manipulation
- D. A popular CSS utility-first framework for styling apps

Answer: A

Q1033. What is the purpose of the OPTIONS HTTP method?

- A. To retrieve existing data from a server resource
- B. To update existing data on the specified server
- C. To permanently delete a resource from the server
- D. To describe the communication options for a resource

Answer: D

Q1034. What does the HTTP status code 304 indicate?

- A. Bad request due to client error
- B. Not modified, use the cached version
- C. A permanent redirect to another URL
- D. Internal server processing error

Answer: B

Q1035. What is HTTP/3 based on?

- A. FTP protocol
- B. TCP protocol
- C. WebSocket API
- D. UDP via QUIC

Answer: D

Q1036. What is the Same-Origin Policy?

- A. A security measure restricting cross-origin script access
- B. A policy requiring all files on a single web server
- C. A CSS naming convention for component-scoped styling
- D. A database access rule governing read-write permissions

Answer: A

Q1037. What is a reverse proxy?

- A. A client-side mechanism for caching web assets
- B. A type of VPN for securing remote connections
- C. A proxy system that blocks all incoming traffic
- D. A server that forwards client requests to backends

Answer: D

Q1038. What is content negotiation in HTTP?

- A. Negotiating the pricing for a website project
- B. The process of agreeing on the response format
- C. A handshake protocol for secure connections
- D. A type of compression for reducing file sizes

Answer: B

Q1039. What is the purpose of an ETag header?

- A. To specify the content encoding type
- B. To set and manage session cookies
- C. To encrypt transmitted data in transit
- D. To provide a version identifier for cache

Answer: D

Q1040. What is the difference between stateful and stateless protocols?

- A. Stateful protocols are always significantly faster
- B. Stateless protocols store all data on the server
- C. Stateless protocols do not retain session information
- D. Stateful protocols are unable to use any cookies

Answer: C

Q1041. What is the purpose of the data-* attribute in HTML5?

- A. To define strict data types for form fields
- B. To store custom data accessible via JavaScript
- C. To store CSS data in external stylesheets
- D. To create connections to external databases

Answer: B

Q1042. What is the Shadow DOM?

- A. A hidden HTML element in the page structure
- B. An encapsulated DOM tree that isolates styles
- C. A dark mode feature provided by CSS natively
- D. A deprecated feature from earlier HTML versions

Answer: B

Q1043. What is the purpose of the <template> tag in HTML5?

- A. To create reusable email template layouts
- B. To define HTML content not rendered until activated
- C. To create reusable CSS template style blocks
- D. To import external HTML files into a document

Answer: B

Q1044. Which attribute makes an HTML element editable?

- A. editable='true'
- B. edit='true'
- C. writable='true'
- D. contenteditable='true'

Answer: D

Q1045. What is the purpose of the srcset attribute in ?

- A. To set the image dimensions and size
- B. To provide multiple sources for responsive images
- C. To add a link to the image source code
- D. To set the primary image source URL

Answer: B

Q1046. What is an HTML Web Component?

- A. A standard built-in HTML tag element
- B. A server-side rendering technique for pages
- C. A type of CSS framework for web styling
- D. A reusable custom element with encapsulated code

Answer: D

Q1047. What does the defer attribute do on a <script> tag?

- A. Prevents the script from ever running on page
- B. Downloads script in parallel and runs after parsing
- C. Makes the script load and execute asynchronously
- D. Defers the loading of CSS stylesheets

Answer: B

Q1048. What is the difference between defer and async in script loading?

- A. async preserves execution order; defer does not order them
- B. defer blocks page rendering; async does not block rendering
- C. defer runs after parsing in order; async runs on download
- D. They behave the same in all situations

Answer: C

Q1049. What is ARIA in HTML?

- A. A type of interactive HTML form input element
- B. A client-side JavaScript rendering framework
- C. A CSS animation and transition effects library
- D. Accessible Rich Internet Applications attributes

Answer: D

Q1050. What is the purpose of the <picture> element in HTML5?

- A. To embed inline SVG graphics within the page
- B. To provide multiple sources for responsive images
- C. To create a drawing canvas for vector graphics
- D. To display a photo gallery with thumbnails

Answer: B

Q1051. What is the difference between em and rem units?

- A. em is an absolute unit measured in exact pixels
- B. em is relative to parent font; rem to the root
- C. rem is relative to parent; em is relative to root
- D. They are identical in how they calculate sizing

Answer: B

Q1052. What are CSS custom properties (variables)?

- A. A type of CSS selector for targeting elements
- B. JavaScript variables referenced from within CSS
- C. User-defined values with -- prefix and var() access
- D. Predefined CSS values built into the browser

Answer: C

Q1053. What is the will-change CSS property?

- A. An animation delay property for scheduling effects
- B. A transition property controlling animation timing
- C. A property used to change element content
- D. A hint about which properties will change for optimization

Answer: D

Q1054. How does the CSS calc() function work?

- A. It calculates the total page loading time
- B. It performs math with mixed units in CSS values
- C. It calculates JavaScript expressions in CSS
- D. It counts the number of DOM elements on page

Answer: B

Q1055. What is the stacking context in CSS?

- A. A method of combining multiple CSS stylesheets
- B. A CSS Grid feature for placing items in cells
- C. A method for stacking div elements vertically
- D. A 3D conceptualization of elements along z-axis

Answer: D

Q1056. What does the @supports rule do in CSS?

- A. Provides support for external web fonts
- B. Checks if a browser supports a CSS feature
- C. Enables support for older browser versions
- D. Adds browser support for legacy features

Answer: B

Q1057. What is the difference between :nth-child() and :nth-of-type()?

- A. :nth-child only counts elements sharing the same type
- B. They are identical in their selection behavior
- C. :nth-of-type counts all siblings regardless of their type
- D. :nth-child counts all siblings; :nth-of-type counts same type

Answer: D

Q1058. What is a CSS combinator?

- A. A color combination and palette tool
- B. A CSS framework for rapid prototyping
- C. A character explaining selector relationships
- D. A CSS minification and optimization tool

Answer: C

Q1059. What is the contain property in CSS?

- A. A flexbox property for aligning child items
- B. A property indicating subtree independence for optimization
- C. A property to contain overflowing text content
- D. A text wrapping property for long strings

Answer: B

Q1060. What is the CSS clamp() function?

- A. A function constraining a value between min and max
- B. A function to lock the scroll position on a page
- C. A function to fix element positions in a container
- D. A function to group elements together visually

Answer: A

Q1061. What is CSS Subgrid?

- A. A third-party CSS grid component library
- B. A sub-layout variation of the Flexbox model
- C. A Grid feature letting nested grids adopt parent tracks
- D. A standalone CSS framework for page layouts

Answer: C

Q1062. What is the CSS aspect-ratio property?

- A. A media query feature for responsive design
- B. The ratio of CSS file sizes in a project
- C. A JavaScript API for measuring dimensions
- D. Sets a preferred aspect ratio for an element

Answer: D

Q1063. What is CSS Container Queries?

- A. Docker container related CSS configuration
- B. Media queries designed for flex containers
- C. Queries about the size of CSS containers
- D. Rules applying styles based on container size

Answer: D

Q1064. What is the CSS isolation property?

- A. Removes an element completely from the DOM tree
- B. Creates a new stacking context for the element
- C. Isolates an element from the internet connection
- D. Blocks all external CSS from affecting the element

Answer: B

Q1065. What is the difference between transform and position for moving elements?

- A. transform skips layout recalculation; position triggers it
- B. transform only works within CSS Grid containers
- C. position is faster for rendering than transform
- D. They produce the same visual result always

Answer: A

Q1066. What are CSS Logical Properties?

- A. Properties with conditional logic based on breakpoints
- B. Properties that adapt to writing direction like inline-start
- C. Boolean CSS properties that toggle features on or off
- D. Properties that use logic gates for conditional values

Answer: B

Q1067. What is the prefers-reduced-motion media query?

- A. A query detecting slow network connection speeds
- B. A query specifically targeting mobile touch devices
- C. A query detecting if user prefers less animation
- D. A query for applying print-specific style rules

Answer: C

Q1068. What is CSS Houdini?

- A. A popular CSS framework for responsive layouts
- B. Low-level APIs giving access to the CSS engine
- C. A browser debugging tool for inspecting CSS
- D. A magic trick animation library for CSS effects

Answer: B

Q1069. What is the content-visibility CSS property?

- A. Enables browser to skip rendering off-screen elements
- B. Controls how text content is displayed on screen
- C. An alternative to z-index for controlling layer order
- D. A toggle switching element visibility on and off

Answer: A

Q1070. How does the CSS cascade layer (@layer) work?

- A. It creates z-index layers for positioned elements
- B. It layers multiple background images on a single element
- C. It creates visible visual layers stacked on the page
- D. It defines explicit layers giving control over precedence

Answer: D

Q1071. What is the event loop in JavaScript?

- A. A mechanism handling async callbacks via call stack
- B. An event listener looping through all DOM elements
- C. A standard for loop iterating over event arrays
- D. A DOM traversal method for walking element tree

Answer: A

Q1072. What is the difference between == and === in terms of type coercion?

- A. Both operators perform type coercion
- B. Neither operator performs type coercion
- C. == performs type coercion; === does not
- D. === performs type coercion; == does not

Answer: C

Q1073. What is the Temporal Dead Zone (TDZ)?

- A. A time-related API for scheduling delayed operations
- B. A concept related to memory management and GC
- C. A garbage collection phase reclaiming unused memory
- D. The period between scope entry and let/const declaration

Answer: D

Q1074. What is the difference between call(), apply(), and bind()?

- A. Only bind invokes the function immediately when called
- B. call and apply invoke immediately; bind returns a new function
- C. They are all identical in functionality
- D. call is for arrays; apply is for objects arguments

Answer: B

Q1075. What is a WeakMap in JavaScript?

- A. A collection with weakly referenced object keys for GC
- B. A smaller and more limited version of Map class
- C. A map collection with weak security encryption
- D. A map storing only string keys and string values

Answer: A

Q1076. What is the prototype chain in JavaScript?

- A. A CSS inheritance model for cascading styles
- B. The mechanism objects use to inherit properties
- C. A linked list data structure for sequential data
- D. A blockchain implementation for distributed apps

Answer: B

Q1077. What is tail call optimization in JavaScript?

- A. A DOM rendering optimization for reducing paint operations
- B. A CSS optimization technique for faster style calculations
- C. Optimizing the last element of an array for access
- D. Reusing the stack frame for a function call in tail position

Answer: D

Q1078. What is the difference between Object.freeze() and Object.seal()?

- A. freeze prevents all changes; seal allows modifying values
- B. freeze only prevents deletion of properties
- C. seal prevents all changes including modifications
- D. They are identical in behavior on objects

Answer: A

Q1079. What is a Symbol in JavaScript?

- A. A unique immutable primitive for property identifiers
- B. A string formatting token for template processing
- C. A CSS icon or symbol for decorative elements
- D. A mathematical operator for advanced calculations

Answer: A

Q1080. What is the purpose of generator functions?

- A. To generate HTML markup from template files
- B. To create iterators that pause and resume via yield
- C. To create class instances from constructor functions
- D. To generate random numbers for cryptographic use

Answer: B

Q1081. What is the difference between microtasks and macrotasks?

- A. Microtasks run on a separate background thread
- B. Macrotasks always have higher execution priority
- C. They are identical in execution priority
- D. Microtasks execute before macrotasks in the loop

Answer: D

Q1082. What is a SharedArrayBuffer?

- A. A binary data buffer shared between workers
- B. A database buffer for caching query results
- C. A shared CSS buffer for component styling
- D. An array with elements shared across files

Answer: A

Q1083. What is the Reflect API in JavaScript?

- A. A browser debugging tool for inspecting elements
- B. A library for creating mirror image visual effects
- C. A CSS reflection API for reflecting element visuals
- D. A built-in object with interceptable operation methods

Answer: D

Q1084. What is structural typing in TypeScript?

- A. TypeScript uses nominal typing with explicit declarations
- B. JavaScript has stronger typing than TypeScript overall
- C. They use the identical type system without differences
- D. TypeScript checks compatibility based on type structure

Answer: D

Q1085. What is the AbortController API?

- A. A process manager for handling background server tasks
- B. An error handling mechanism for catching thrown errors
- C. An API to cancel fetch requests and async operations
- D. A method to stop all JavaScript execution immediately

Answer: C

Q1086. What are Decorators in JavaScript/TypeScript?

- A. Functions that modify classes and members via @ syntax
- B. String formatting tools for template processing
- C. CSS decorations like border styles and shadows
- D. HTML attributes added to elements for metadata

Answer: A

Q1087. What is the structuredClone() function?

- A. A function creating deep copies via structured clone
- B. A CSS cloning function for duplicating style rules
- C. A function to clone the DOM structure of elements
- D. A shallow copy method copying only top-level values

Answer: A

Q1088. What is the difference between for...in and for...of?

- A. for...in only works with arrays not objects
- B. for...of iterates over property keys of objects
- C. They are identical in their iteration behavior
- D. for...in iterates keys; for...of iterates values

Answer: D

Q1089. What is a FinalizationRegistry in JavaScript?

- A. An API to register a callback when an object is GC'd
- B. A module registry for tracking installed packages
- C. A service worker registry for managing active workers
- D. A software design pattern for object creation

Answer: A

Q1090. What is the Intl object in JavaScript?

- A. An interface definition for declaring TypeScript contracts
- B. An interval timer for scheduling repeated function calls
- C. An internal object for private variable storage
- D. A namespace for Internationalization with locale formatting

Answer: D

Q1091. What is React's Concurrent Mode?

- A. Parallel CSS processing across multiple browser threads
- B. Multi-threaded JavaScript execution using Web Workers
- C. Running multiple separate React applications at once
- D. Features helping React stay responsive via background rendering

Answer: D

Q1092. What is the purpose of React.memo()?

- A. Creating in-app memo or notification features
- B. A HOC memoizing a component to prevent re-renders
- C. Saving developer notes within the application code
- D. Memory management and garbage collection control

Answer: B

Q1093. What is Angular's Change Detection strategy OnPush?

- A. A Git branching strategy for version control
- B. Detecting CSS property changes in stylesheets
- C. Push notifications sent to mobile device users
- D. A strategy checking only when input references change

Answer: D

Q1094. What is the Composition API in Vue 3?

- A. A music composition tool for creating audio
- B. A CSS composition method for combining styles
- C. A database query API for composing SQL queries
- D. An API organizing component logic using setup()

Answer: D

Q1095. What is code splitting in frontend frameworks?

- A. Splitting CSS files into smaller partial files
- B. Dividing server code into separate microservices
- C. Splitting HTML files across multiple server routes
- D. Breaking the bundle into smaller on-demand chunks

Answer: D

Q1096. What is Server-Side Rendering (SSR) in React/Next.js?

- A. Rendering CSS on the server before page delivery
- B. Running JavaScript only on server, never on client
- C. Generating HTML on the server for each client request
- D. A database rendering technique for cached query results

Answer: C

Q1097. What is React's useCallback hook?

- A. A callback URL handler for authentication flows
- B. An event listener for handling DOM user events
- C. A hook returning a memoized callback function
- D. A state management hook for complex data flows

Answer: C

Q1098. What is the purpose of useMemo in React?

- A. Memoizing expensive computations until deps change
- B. Creating memoized components that never re-render
- C. Memory allocation and management control utilities
- D. Managing in-app memo and notification features

Answer: A

Q1099. What is Angular's Dependency Injection?

- A. A testing technique for isolating component behavior
- B. Importing npm packages into project configuration
- C. A class receiving dependencies from external sources
- D. Injecting CSS dependencies into component styles

Answer: C

Q1100. What is Incremental Static Regeneration (ISR) in Next.js?

- A. Updating static pages after deploy without full rebuild
- B. Regenerating CSS incrementally during development
- C. Incremental database updates during data migration
- D. A version control strategy for incremental releases

Answer: A

Q1101. What is the difference between horizontal and vertical scaling?

- A. Horizontal scaling is always cheaper in every scenario
- B. Vertical adds power to existing servers; horizontal adds servers
- C. Vertical scaling is only applicable to database servers
- D. They are identical in their scaling approach

Answer: B

Q1102. What is a message queue in backend architecture?

- A. A CSS animation queue for scheduling transitions
- B. A database query queue for sequential execution
- C. An async mechanism storing messages for consumers
- D. A chat feature for sending user messages

Answer: C

Q1103. What is GraphQL and how does it differ from REST?

- A. A JavaScript charting tool for rendering bar graphs
- B. A graph database for storing relationship data
- C. A query language where clients specify exact data needed
- D. A CSS graph library for data visualization charts

Answer: C

Q1104. What is the N+1 query problem?

- A. Fetching a list triggers one query plus N for related data
- B. A database naming convention for table schemas
- C. A CSS specificity issue with deeply nested selectors
- D. A JavaScript error caused by off-by-one indexing

Answer: A

Q1105. What is a microservices architecture?

- A. A small lightweight embedded database system
- B. A small application with limited features overall
- C. Independent services communicating via defined APIs
- D. A CSS micro-framework for minimal page styling

Answer: C

Q1106. What is database connection pooling?

- A. A database backup method for disaster recovery plans
- B. Maintaining reusable database connections to reduce overhead
- C. A swimming pool database for aquatic data
- D. A CSS pooling technique for shared style resources

Answer: B

Q1107. What is idempotency in API design?

- A. A security feature for encrypting API payloads
- B. A mathematical concept from pure number theory
- C. A caching mechanism for storing API responses locally
- D. Making the same request multiple times yields same result

Answer: D

Q1108. What is the CAP theorem?

- A. A capping limit on the number of API requests
- B. A CSS theorem about cascade priority order
- C. A JavaScript design pattern for state management
- D. A distributed system can guarantee only two of C, A, P

Answer: D

Q1109. What is event-driven architecture?

- A. A database event log for auditing record changes
- B. CSS event handling through pseudo-class selectors
- C. A React-specific pattern for component lifecycle
- D. A pattern where flow is determined by produced events

Answer: D

Q1110. What is the purpose of a reverse proxy like Nginx?

- A. To reverse engineer API endpoints for testing
- B. To handle load balancing, SSL, caching, and routing
- C. To reverse the order of database query results
- D. To revert code changes to a previous version

Answer: B

Q1111. What is the difference between process-based and event-driven server architectures?

- A. Process-based architectures cannot handle concurrent requests
- B. They are identical in concurrency approach
- C. Event-driven is always slower in handling concurrent requests
- D. Process-based creates threads per request; event-driven uses async I/O

Answer: D

Q1112. What is the purpose of a load balancer?

- A. To balance database queries across shards
- B. To balance CSS style specificity weights
- C. To load JavaScript files in parallel
- D. To distribute traffic across multiple servers

Answer: D

Q1113. What is serverless computing?

- A. A client-side only architecture without any backend logic
- B. Computing without any servers whatsoever
- C. A static site generator for building HTML pages
- D. A cloud model with provider-managed infrastructure on demand

Answer: D

Q1114. What is the difference between monolithic and microservices architecture?

- A. They are identical in application structure
- B. Monolithic is a single unit; microservices are independent
- C. Microservices are always faster in every scenario
- D. Monolithic applications are unable to scale at all

Answer: B

Q1115. What is gRPC?

- A. A CSS framework for responsive web design
- B. A JavaScript library for building reactive interfaces
- C. A high-performance RPC framework using Protocol Buffers
- D. A relational database management system for apps

Answer: C

Q1116. What is the circuit breaker pattern?

- A. A database locking mechanism for transaction isolation levels
- B. An electrical safety feature for server power
- C. A CSS layout pattern for organizing grid-based page elements
- D. A pattern preventing cascading failures by stopping failing requests

Answer: D

Q1117. What is the difference between synchronous and asynchronous processing?

- A. Synchronous processing cannot handle any I/O operations
- B. Synchronous blocks until complete; asynchronous allows other ops
- C. They are identical in execution flow handling
- D. Asynchronous is always slower than synchronous code processing

Answer: B

Q1118. What is server-sent events (SSE)?

- A. A technology for pushing real-time updates over HTTP
- B. Server-side CSS events triggered by style changes
- C. A database trigger that fires on record modifications
- D. A JavaScript event system for handling user interactions

Answer: A

Q1119. What is the purpose of health check endpoints?

- A. Checking only database health and connection status
- B. Checking user health data in medical applications
- C. Checking CSS health for validation errors
- D. Providing a way for load balancers to verify server health

Answer: D

Q1120. What is the Twelve-Factor App methodology?

- A. A database design pattern for normalized tables
- B. A CSS framework following twelve core principles
- C. A methodology for building scalable SaaS apps
- D. A 12-step coding tutorial for learning web dev

Answer: C

Q1121. What is database sharding?

- A. Encrypting data for security and privacy compliance
- B. Compressing tables to reduce disk storage space
- C. Splitting a database into smaller distributed pieces
- D. Breaking a database beyond repair permanently

Answer: C

Q1122. What is the difference between horizontal and vertical partitioning?

- A. Horizontal splits columns; vertical splits rows across servers
- B. Neither approach has any effect on query performance
- C. Horizontal splits rows across servers; vertical splits columns
- D. They are identical in partitioning strategy

Answer: C

Q1123. What is eventual consistency?

- A. A CSS consistency model for cross-browser rendering
- B. Data is always immediately consistent everywhere
- C. All replicas converge to the same value given enough time
- D. Data is never consistent across any of the replicas

Answer: C

Q1124. What is a database migration?

- A. A data backup process for disaster recovery planning
- B. A CSS migration from one framework to another tool
- C. Version-controlled changes to schema that can be rolled back
- D. Moving a database to a new physical data center

Answer: C

Q1125. What is the N+1 query problem and how is it solved?

- A. A JavaScript error caused by off-by-one array access
- B. A CSS specificity issue with deeply nested selectors
- C. A mathematical formula for calculating query cost
- D. N extra queries for related data; solved by eager loading

Answer: D

Q1126. What is a materialized view?

- A. A database object storing query results physically
- B. A CSS view for presenting styled HTML content
- C. A template engine view for generating dynamic pages
- D. A JavaScript view for rendering reactive UI components

Answer: A

Q1127. What is connection pooling in database management?

- A. A swimming pool database for aquatic records
- B. A CSS pooling technique for shared style rule resources
- C. A JavaScript object pool for reusing DOM element references
- D. Maintaining reusable connections to avoid per-request overhead

Answer: D

Q1128. What is a write-ahead log (WAL)?

- A. A CSS log file for tracking style computation results
- B. A blogging technique for writing web content
- C. Changes are written to a log before applying to the DB
- D. A JavaScript console log for outputting debug messages

Answer: C

Q1129. What is database replication?

- A. A backup tool for creating periodic data archive snapshots
- B. A version control system for tracking file change history
- C. Copying and maintaining data across servers for redundancy
- D. Copying CSS files across multiple project directories

Answer: C

Q1130. What is the difference between optimistic and pessimistic locking?

- A. They only apply to NoSQL databases not relational ones
- B. They are identical in concurrency control approach
- C. Optimistic always locks; pessimistic never locks anything
- D. Optimistic checks at commit; pessimistic locks immediately

Answer: D

Q1131. What is a SQL injection attack and how is it prevented?

- A. A CSS vulnerability from untrusted stylesheet loading
- B. A database feature for optimizing query performance
- C. Inserting malicious SQL; prevented by parameterized queries
- D. A JavaScript error from uncaught promise rejections

Answer: C

Q1132. What is the difference between symmetric and asymmetric encryption?

- A. They are identical in their encryption approach
- B. Asymmetric is always faster than symmetric encryption
- C. Symmetric uses one key; asymmetric uses a key pair
- D. Symmetric encryption requires two separate keys

Answer: C

Q1133. What is a man-in-the-middle (MITM) attack?

- A. A database corruption from concurrent write conflicts
- B. An attack intercepting communication between two parties
- C. A network administrator managing server infrastructure
- D. A CSS hack for overriding conflicting style declarations

Answer: B

Q1134. What is the SameSite cookie attribute?

- A. An attribute controlling cookies in cross-site requests
- B. A site name attribute used in HTML anchor tags
- C. A CSS property for styling site-specific page elements
- D. A database attribute for defining column data constraints

Answer: A

Q1135. What is a zero-day vulnerability?

- A. A CSS bug affecting zero-width element rendering
- B. A vulnerability lasting zero days before being fixed
- C. A database error caused by zero-division in queries
- D. A security flaw exploited before the vendor has a patch

Answer: D

Q1136. What is OAuth 2.0?

- A. An authorization framework for limited third-party access
- B. A JavaScript library for building authentication flows
- C. A CSS standard for defining cross-browser specifications
- D. A database protocol for encrypted data transmission

Answer: A

Q1137. What is Subresource Integrity (SRI)?

- A. A database integrity check for verifying data consistency
- B. A CSS property for defining element integrity
- C. A feature verifying fetched resources are not tampered with
- D. A JavaScript framework for building secure web apps

Answer: C

Q1138. What is the purpose of rate limiting in security?

- A. Limiting the speed of CSS transition animations
- B. Restricting request frequency to prevent brute force
- C. Limiting the number of page loads per session
- D. Limiting the number of database queries per session

Answer: B

Q1139. What is X-Frame-Options used for?

- A. A CSS frame property for creating bordered layouts
- B. Preventing iframe embedding to stop clickjacking
- C. A JavaScript frame option for window management
- D. Framing images within decorative CSS borders

Answer: B

Q1140. What is the difference between encryption at rest and in transit?

- A. At rest encryption is only for database systems
- B. At rest encrypts stored data; in transit encrypts transmitted
- C. They are identical in their security approach
- D. In transit encryption is only for local file systems

Answer: B

Q1141. What is the difference between preload, prefetch, and preconnect?

- A. They are identical in resource loading behavior
- B. Prefetch is exclusively used for CSS stylesheet resources only
- C. Preconnect downloads files from the server in advance before needed
- D. Preload fetches current-page resources; prefetch loads future; preconnect opens connections

Answer: D

Q1142. What is the PRPL pattern?

- A. A CSS color pattern for theming web pages
- B. Push, Render, Pre-cache, Lazy-load for delivery
- C. A database pattern for query optimization strategies
- D. A JavaScript design pattern for state management

Answer: B

Q1143. What is the purpose of requestAnimationFrame?

- A. To request data from REST API server endpoints
- B. To request images from a remote CDN server
- C. To schedule animations synced with the repaint cycle
- D. To create CSS animations using keyframe declarations

Answer: C

Q1144. What is the impact of the critical rendering path on performance?

- A. No impact on web application performance at all
- B. It determines how quickly a page becomes visible
- C. It only affects how CSS styles are calculated
- D. It only affects how images are decoded and shown

Answer: B

Q1145. What is HTTP/2 Server Push?

- A. A WebSocket feature for real-time data streaming
- B. A database push operation for replication updates
- C. Proactively sending resources before they are requested
- D. Pushing CSS stylesheets to the client browser

Answer: C

Q1146. What is the difference between synthetic and real user monitoring?

- A. They are identical monitoring approaches
- B. Synthetic uses simulated tests; RUM collects real user data
- C. Synthetic monitoring collects data from actual users
- D. RUM uses simulated automated tests in lab environments

Answer: B

Q1147. What is layout thrashing?

- A. A JavaScript error from undefined variable references
- B. A CSS bug causing layout calculation errors
- C. Forcing repeated layout recalculations by reading/writing DOM
- D. A database deadlock from concurrent transaction conflicts

Answer: C

Q1148. What is the purpose of resource hints in HTML?

- A. To add HTML comments for developer documentation
- B. To create resource files for internationalization support
- C. To inform the browser about resources to preload or prefetch
- D. To add tooltip text to page elements on hover

Answer: C

Q1149. What is the benefit of WebP or AVIF image formats?

- A. Better CSS support across all web browsers
- B. Better database storage efficiency for images
- C. Better JavaScript integration with image APIs
- D. Significantly smaller file sizes than JPEG/PNG

Answer: D

Q1150. What is Time to Interactive (TTI)?

- A. A CSS animation duration for transition effects
- B. The time until the page is fully interactive
- C. A server response time for processing API requests
- D. The time to write the application source code

Answer: B

Q1151. What is the testing pyramid?

- A. A database structure for hierarchical data storage
- B. A pyramid-shaped test data structure for storage
- C. Many unit tests, fewer integration, fewest E2E tests
- D. A CSS shape rendered using clip-path properties

Answer: C

Q1152. What is mutation testing?

- A. Testing DNA sequences in bioinformatics research
- B. Testing code changes before merging into main branch
- C. Database mutation testing for verifying data integrity
- D. Introducing small code changes to verify tests detect them

Answer: D

Q1153. What is the difference between stubs and mocks?

- A. Mocks are simpler and less capable than stub versions
- B. They are identical in their testing approach
- C. Stubs give predetermined responses; mocks verify interactions
- D. Stubs verify that specific method interactions occurred

Answer: C

Q1154. What is visual regression testing?

- A. Testing CSS variables across different components
- B. Testing image quality and resolution across screen sizes
- C. Testing color contrast for accessibility compliance
- D. Comparing screenshots across versions for visual changes

Answer: D

Q1155. What is contract testing in microservices?

- A. Legal testing of software license agreements
- B. CSS contract testing for cross-browser consistency
- C. Testing employment contracts for HR compliance
- D. Verifying services communicate per agreed interfaces

Answer: D

Q1156. What is fuzz testing?

- A. Testing with blurry images for visual quality checks
- B. Providing random invalid data to find vulnerabilities
- C. Testing with fuzzy logic algorithms for AI systems
- D. CSS filter testing for verifying blur effect output

Answer: B

Q1157. What is the purpose of Selenium?

- A. A JavaScript runtime for executing server-side scripts
- B. A framework for automating browser testing interactions
- C. A CSS preprocessor for compiling advanced style syntax
- D. A chemical element found in nature supplements

Answer: B

Q1158. What is Playwright?

- A. A CSS animation tool for creating transition effects
- B. A theater tool for managing stage performances
- C. A modern testing framework with auto-wait and isolation
- D. A database testing tool for verifying query accuracy

Answer: C

Q1159. What is chaos engineering?

- A. A random testing approach without defined test cases
- B. Random coding without any structure or planning
- C. Deliberately introducing failures to test resilience
- D. A messy code style ignoring best practices rules

Answer: C

Q1160. What is the difference between black-box and white-box testing?

- A. Black-box tests without code knowledge; white-box tests with
- B. They are identical in their testing methodology
- C. Black-box testing requires full access to source code
- D. White-box testing ignores internal implementation details

Answer: A

Q1161. What is blue-green deployment?

- A. A strategy using two environments with instant switching
- B. A color-coded database for organizing data categories
- C. Deploying blue and green CSS color themes
- D. A testing framework for comparing two UI versions

Answer: A

Q1162. What is canary deployment?

- A. A testing technique for incremental feature validation
- B. Deploying software for bird tracking applications
- C. A CSS animation strategy for progressive effects
- D. Gradually rolling out to a small subset of users

Answer: D

Q1163. What is Infrastructure as Code (IaC)?

- A. Managing infrastructure through configuration files
- B. A JavaScript pattern for structuring backend code
- C. Writing HTML for server configuration pages
- D. A CSS framework for building server admin interfaces

Answer: A

Q1164. What is Kubernetes?

- A. A NoSQL database for storing application document data
- B. A JavaScript library for building reactive user interfaces
- C. A CSS framework for responsive web design layouts
- D. A container orchestration platform for deployment and scaling

Answer: D

Q1165. What is the difference between horizontal and vertical scaling in deployment?

- A. Vertical adds more server machines to the cluster
- B. They are identical in scaling approach
- C. Horizontal adds more RAM to the current server
- D. Horizontal adds servers; vertical adds resources to existing

Answer: D

Q1166. What is a CDN edge server?

- A. A CDN server near end users for fast delivery
- B. A development server for local test and debug
- C. A database server for write-heavy workloads
- D. A CSS edge property for element border styling

Answer: A

Q1167. What is serverless deployment?

- A. Deploying functions that run on demand in the cloud
- B. Deploying without any server infrastructure at all
- C. A local deployment for development and testing only
- D. A CSS deployment method for updating style sheets

Answer: A

Q1168. What is the purpose of a health check in deployment?

- A. Automated checks verifying app availability for recovery
- B. A code review process for ensuring quality standards
- C. Checking the physical health of development staff
- D. A CSS check for validating style rule correctness

Answer: A

Q1169. What is GitOps?

- A. A CSS framework for building responsive web layouts
- B. A database tool for managing schema version migrations
- C. A Git client application for version control
- D. A framework where Git repos are truth for infrastructure

Answer: D

Q1170. What is the difference between a monorepo and polyrepo?

- A. They are identical in repository management
- B. Polyrepo is exclusively for backend server application code
- C. Monorepo stores all services in one repo; polyrepo uses separate
- D. Monorepo is exclusively for frontend application code only

Answer: C

Q1171. What is GraphQL's N+1 problem and how is it solved?

- A. A math problem related to computational complexity
- B. A REST limitation with fixed endpoint over-fetching
- C. A CSS specificity issue with deeply nested selectors
- D. Nested field queries solved by DataLoader batching

Answer: D

Q1172. What is an API gateway?

- A. A single entry point routing requests to microservices
- B. A JavaScript gateway for module import resolution
- C. A database gateway for managing connection pooling
- D. A CSS gate for controlling style cascade flow

Answer: A

Q1173. What is the difference between idempotent and non-idempotent methods?

- A. They are identical in request handling behavior
- B. Idempotent methods produce same result on repetition; POST may differ
- C. All HTTP methods are non-idempotent in their behavior always
- D. All HTTP methods are idempotent without any exceptions at all

Answer: B

Q1174. What is content negotiation in APIs?

- A. A CSS negotiation for determining style precedence
- B. A database negotiation for connection pool allocation
- C. Negotiating API pricing for commercial usage plans
- D. Client and server agree on response format via headers

Answer: D

Q1175. What is gRPC and when is it preferred over REST?

- A. A high-performance RPC framework using Protocol Buffers
- B. A JavaScript library for real-time data streaming
- C. A database protocol for distributed query execution
- D. A CSS framework for responsive web design layouts

Answer: A

Q1176. What is the purpose of API throttling?

- A. Controlling request rates to prevent abuse and ensure fairness
- B. A CSS technique for limiting animation frame rates on pages
- C. A database optimization for throttling query execution speed
- D. Speeding up API response times with caching

Answer: A

Q1177. What is the difference between polling and SSE?

- A. Polling is more efficient than SSE for real-time data delivery
- B. SSE requires WebSocket protocol to function properly always
- C. They are identical in data delivery approach
- D. Polling makes repeated requests; SSE maintains persistent connection

Answer: D

Q1178. What are API error handling best practices?

- A. Use appropriate status codes, consistent format, and messages
- B. Return 200 for all responses regardless of outcome
- C. Ignore errors and let the client handle all failures
- D. Use CSS error styles to display formatted error pages

Answer: A

Q1179. What is hypermedia-driven API design?

- A. A CSS animation API for creating interactive effects
- B. A multimedia API for playing audio and video
- C. An API where responses include links guiding transitions
- D. A video streaming API for delivering live content

Answer: C

Q1180. What is the Backend for Frontend (BFF) pattern?

- A. A best friend API for social networking features
- B. A CSS pattern for frontend-specific responsive styling
- C. Each frontend has its own backend aggregating services
- D. A database pattern for frontend-optimized query caching

Answer: C

Q1181. What is Islands Architecture?

- A. A database architecture for isolated schema partitioning
- B. An architecture for building island-themed websites
- C. Interactive components hydrated independently in static HTML
- D. A CSS layout technique for island-shaped page elements

Answer: C

Q1182. What is Edge Computing in web development?

- A. A database optimization for edge-case query handling
- B. Computing at the physical edge of a desk surface
- C. A CSS technique for styling elements at container edges
- D. Running code on servers geographically close to users

Answer: D

Q1183. What is the difference between SSR, SSG, and ISR?

- A. They are identical in rendering strategy and output
- B. ISR renders only once and never updates content again
- C. SSR renders per request; SSG at build; ISR updates after deploy
- D. SSG renders per request at the time of each user visit

Answer: C

Q1184. What is Module Federation in Webpack?

- A. A plugin allowing independent builds to share modules
- B. A country federation of web development standards
- C. A database federation distributing queries across nodes
- D. A CSS module system for scoping styles to components

Answer: A

Q1185. What is Streaming SSR?

- A. Streaming CSS stylesheets for progressive loading
- B. Progressively sending HTML chunks as they are rendered
- C. Streaming video content to the end user browser
- D. Streaming database query results for batch processing

Answer: B

Q1186. What are React Server Components?

- A. Components rendering exclusively on the server side
- B. CSS server-side components for pre-rendering styles
- C. Database components for managing query execution
- D. Components that look like physical server hardware

Answer: A

Q1187. What is the purpose of an Abstract Syntax Tree (AST) in web tooling?

- A. A CSS tree layout for hierarchical navigation menus
- B. A tree representation of code used by compilers and linters
- C. A database index structure for optimizing query lookups
- D. A tree visualization for displaying data hierarchies

Answer: B

Q1188. What is Partial Hydration?

- A. Partial CSS loading for progressive style application
- B. Partial database loading for lazy data fetching
- C. Partially loading water into server cooling systems
- D. Selectively hydrating only interactive components

Answer: D

Q1189. What is the concept of Zero-JS pages?

- A. Pages delivered without any visible content at all
- B. Pages with zero interactive features for static content
- C. Blank pages served as placeholder loading screen views
- D. Pages delivered with no JavaScript, relying on HTML/CSS

Answer: D

Q1190. What is Resumability in frameworks like Qwik?

- A. Continuing execution on client from where server left off
- B. A database feature for resuming interrupted transactions
- C. A CSS property for resuming paused animation effects
- D. Pausing a video player for later playback resumption

Answer: A

Q1191. A developer must choose between an SPA and MPA for a content-heavy news site. What is a key drawback of using an SPA?

- A. SPAs generally have worse initial SEO without server rendering
- B. SPAs cannot serve any static assets like images or stylesheets
- C. SPAs require a completely different programming language overall
- D. SPAs are unable to make any asynchronous API calls to servers

Answer: A

Q1192. Which strategy best addresses the challenge of maintaining large-scale CSS in a team environment?

- A. Adopting a methodology like BEM for consistent naming conventions
- B. Writing all styles inline directly on each individual HTML element
- C. Placing every style rule inside a single monolithic CSS file only
- D. Avoiding CSS entirely and using only JavaScript for all styling

Answer: A

Q1193. What is the primary purpose of a service worker in progressive web apps?

- A. To compile TypeScript source files into standard JavaScript code
- B. To create database connections between client and SQL databases
- C. To enable offline functionality and background sync capabilities
- D. To generate server-side rendered HTML pages from template files

Answer: C

Q1194. In a JAMstack architecture, what does the A stand for and what role does it play?

- A. APIs: handles dynamic functionality through reusable interfaces
- B. Authentication: manages user identity verification for all pages
- C. Applications: provides full server-side rendering capabilities
- D. Automation: runs continuous integration pipelines for deployment

Answer: A

Q1195. A team is debating between a monolithic and microservices architecture. Which concern most favors microservices?

- A. The application only serves static content with no dynamic functionality
- B. The application needs independent scaling of different service components
- C. The project has a single developer with no plans to add more team members
- D. The project has very tight deadlines and needs the simplest possible setup

Answer: B

Q1196. What is the main advantage of using WebAssembly alongside JavaScript?

- A. It runs computationally intensive code at near-native speed levels
- B. It provides built-in database functionality without any server need
- C. It eliminates the need for HTML and CSS in modern web applications
- D. It completely replaces JavaScript for all web development tasks

Answer: A

Q1197. Which factor most impacts the choice between SSR and CSR for a web application?

- A. The programming language used for writing automated test scripts
- B. The color scheme and visual design preferences of the stakeholders
- C. The specific brand of web server hardware used for hosting files
- D. The initial load performance and search engine optimization needs

Answer: D

Q1198. What challenge does micro-frontend architecture primarily address?

- A. Eliminating the need for any shared state management in the app
- B. Reducing the total file size of individual CSS stylesheets loaded
- C. Enabling independent development and deployment of UI components
- D. Removing the requirement for build tools in the development flow

Answer: C

Q1199. In a headless CMS architecture, what is the primary role of the front end?

- A. To perform automated backups of the content management system data
- B. To store and manage all the database records for content authors
- C. To consume content via APIs and render it in any presentation layer
- D. To handle user authentication and authorization for CMS admin users

Answer: C

Q1200. Why might a team choose an isomorphic JavaScript approach for their application?

- A. It eliminates the need for testing on multiple browser environments
- B. It shares code between server and client for consistent rendering
- C. It guarantees zero accessibility issues across all device platforms
- D. It removes all server infrastructure requirements for the project

Answer: B

Q1201. In HTTP/2 server push, what is a potential drawback if not implemented carefully?

- A. It can waste bandwidth by pushing resources the client already cached
- B. It completely disables client-side caching for all website resources
- C. It prevents the use of content delivery networks for static assets
- D. It forces the browser to reload the entire page for every navigation

Answer: A

Q1202. What is the primary benefit of HTTP/3 using QUIC over TCP?

- A. QUIC reduces connection setup latency and handles packet loss better
- B. QUIC allows unlimited concurrent connections without any throttling
- C. QUIC replaces DNS resolution entirely with a new naming system used
- D. QUIC eliminates the need for TLS encryption on all connections

Answer: A

Q1203. A site experiences head-of-line blocking. Which protocol upgrade best addresses this?

- A. Switching from HTTPS back to plain HTTP for simpler data transfer
- B. Upgrading from HTTP/1.1 to HTTP/2 which multiplexes streams within
- C. Replacing the web server with a simple FTP file transfer server app
- D. Downgrading from HTTP/2 to HTTP/1.0 for better compatibility range

Answer: B

Q1204. What is the purpose of the HSTS header in web security architecture?

- A. To set the maximum upload file size allowed by the server endpoint
- B. To define which IP addresses are permitted to access the admin panel
- C. To force browsers to only connect via HTTPS for a specified period
- D. To compress response bodies using gzip or brotli encoding methods

Answer: C

Q1205. In a microservices architecture, what problem does an API gateway solve?

- A. It replaces all microservices with a single monolithic application
- B. It eliminates the need for any inter-service communication protocols
- C. It provides a single entry point handling routing and cross-cutting concerns
- D. It automatically generates the front-end UI from backend data models

Answer: C

Q1206. What is the CAP theorem and which two properties can a distributed system guarantee?

- A. Caching, Authentication, Performance — all three must always be met
- B. Concurrency, Accessibility, Portability — only two can be optimized
- C. Compression, Authorization, Persistence — systems must pick one only
- D. Consistency, Availability, Partition tolerance — pick any two of three

Answer: D

Q1207. What is the role of gRPC compared to REST in service-to-service communication?

- A. gRPC uses JSON over HTTP/1.1 while REST uses binary protocol buffers
- B. gRPC uses Protocol Buffers and HTTP/2 for efficient typed communication
- C. gRPC only supports unidirectional calls while REST supports streaming
- D. gRPC requires no schema definition while REST mandates strict schemas

Answer: B

Q1208. What problem does consistent hashing solve in distributed web systems?

- A. It minimizes key redistribution when nodes are added or removed from clusters
- B. It encrypts all data at rest using a consistent algorithm everywhere
- C. It ensures that all web pages are cached for exactly the same duration
- D. It guarantees that all database queries return results in constant time

Answer: A

Q1209. What is the purpose of circuit breaker pattern in distributed architectures?

- A. To physically disconnect failing hardware servers from the data network
- B. To automatically scale up server resources when traffic increases sharply
- C. To encrypt inter-service communication using rotating TLS certificates
- D. To prevent cascading failures by stopping calls to unresponsive services

Answer: D

Q1210. What is eventual consistency and when is it acceptable in web systems?

- A. Data is never consistent and requires manual synchronization by admins
- B. Data consistency is guaranteed only during server maintenance windows
- C. Data is always immediately consistent across all distributed system nodes
- D. Data will become consistent over time and suits high-availability needs

Answer: D

Q1211. A page has multiple forms. How does the form attribute on an input element help?

- A. It prevents the input from being submitted with any form on the page
- B. It applies CSS styles from a specific form to the input field element
- C. It automatically validates the input using the parent form validation
- D. It associates the input with a form it is not nested inside of by ID

Answer: D

Q1212. What is the Shadow DOM and how does it relate to HTML web components?

- A. A caching technique that stores DOM elements in browser memory shadow
- B. A deprecated API for manipulating DOM elements without using JavaScript
- C. An encapsulation mechanism providing scoped styles and DOM for components
- D. A server-side rendering method that generates HTML in a shadow process

Answer: C

Q1213. What is the purpose of the <slot> element in HTML web components?

- A. It assigns a memory slot for caching frequently accessed DOM elements
- B. It marks a position in the DOM where server-rendered content is placed
- C. It creates a placeholder for user-provided content in shadow DOM trees
- D. It defines a time slot for scheduling lazy-loaded resource downloads

Answer: C

Q1214. How does the Content Security Policy meta tag protect against XSS attacks?

- A. It encrypts all HTML content before sending it from server to browser
- B. It restricts which sources of scripts and resources the browser loads
- C. It blocks all JavaScript execution and relies solely on server actions
- D. It automatically sanitizes all user input before inserting into the DOM

Answer: B

Q1215. What accessibility issue arises from using div and span elements for interactive controls?

- A. They cause slower page rendering compared to using native button elements
- B. They cannot have click event listeners attached through JavaScript code
- C. They lack built-in keyboard support, roles, and accessibility semantics
- D. They are invisible to all users including those not using screen readers

Answer: C

Q1216. What is the purpose of the inert attribute introduced in HTML?

- A. It converts a dynamic element into a static image for print stylesheet
- B. It permanently deletes the element and its children from the DOM tree
- C. It creates an animation that slowly fades the element out of the page
- D. It makes an element and descendants non-interactive and hidden from AT

Answer: D

Q1217. How does the <dialog> element improve over custom modal implementations?

- A. It removes the need for any CSS styling on the modal overlay component
- B. It provides native focus trapping, backdrop, and accessibility features
- C. It enables modals to persist across page navigations without JavaScript
- D. It automatically translates modal content into multiple user languages

Answer: B

Q1218. What is the Intersection Observer API commonly used for in HTML pages?

- A. To detect when elements enter or exit the viewport for lazy loading use
- B. To watch for changes in the browser URL hash fragment for navigation
- C. To observe and report CSS syntax errors found within style sheet rules
- D. To monitor server response times and report performance metrics data

Answer: A

Q1219. What is the purpose of the popover attribute in modern HTML?

- A. It enables server-sent events to push notifications to the browser tab
- B. It creates a toggleable popup without JavaScript for tooltip-like behavior
- C. It converts any element into a fixed-position navigation sidebar panel
- D. It defines print-specific styles that appear only during page printing

Answer: B

Q1220. How does the fetchpriority attribute affect resource loading in HTML?

- A. It controls whether the resource is loaded synchronously or not at all
- B. It hints to the browser the relative priority for fetching a resource
- C. It sets the maximum timeout duration for network requests to complete
- D. It determines the order in which CSS rules are applied to the document

Answer: B

Q1221. How does the CSS contain property improve rendering performance?

- A. It prevents any external stylesheets from overriding the element styles
- B. It compresses CSS files automatically during the browser parsing process
- C. It caches the rendered output of an element permanently in the browser
- D. It limits an element's scope so the browser can optimize layout and paint

Answer: D

Q1222. What is the stacking context and how is it created in CSS?

- A. It is the order CSS rules are processed based on their file positions
- B. It is the order in which HTML files are loaded into the browser engine
- C. It is a method for stacking multiple background images on one element
- D. It is an element layer formed by z-index, opacity, or transform properties

Answer: D

Q1223. What is the difference between min-content and max-content sizing?

- A. max-content uses the largest word width while min-content avoids wrapping
- B. min-content forces all content onto one line without any line breaks used
- C. max-content collapses content to zero width and expands on user hover
- D. min-content uses the largest word width while max-content avoids wrapping

Answer: D

Q1224. How does the CSS subgrid feature extend CSS Grid capabilities?

- A. It creates nested grid systems that are completely independent of parent
- B. It automatically converts flexbox layouts into grid layouts for the page
- C. It enables grid items to span across multiple separate grid containers
- D. It lets child grid items inherit track sizing from their parent grid lines

Answer: D

Q1225. What problem does the CSS cascade layer feature (@layer) solve?

- A. It automatically generates responsive breakpoints based on content size
- B. It creates visual layering effects like parallax scrolling on web pages
- C. It provides explicit control over which origin of styles takes precedence
- D. It enables animations that transition between multiple keyframe states

Answer: C

Q1226. How do CSS custom properties differ from preprocessor variables?

- A. Custom properties require JavaScript to read while preprocessor does not
- B. Custom properties only store color values while preprocessor stores any type
- C. Custom properties are resolved at compile time while preprocessor runs live
- D. Custom properties cascade and update at runtime while preprocessor is static

Answer: D

Q1227. What is the purpose of the CSS will-change property and its potential pitfall?

- A. It changes element properties automatically based on user scroll position
- B. It schedules future DOM changes and blocks rendering until they complete
- C. It hints to the browser about upcoming changes but overuse wastes memory
- D. It defines fallback values for properties not supported in older browsers

Answer: C

Q1228. How does the :has() pseudo-class change CSS selector capabilities?

- A. It verifies if a CSS variable has been defined before using it in a rule
- B. It enables parent selection based on the presence of matching child elements
- C. It determines whether the browser supports a given CSS property or not
- D. It checks whether an element has a specific inline style attribute applied

Answer: B

Q1229. What is the CSSOM and how does it relate to the DOM?

- A. The CSSOM is a testing framework for validating CSS syntax and structure
- B. The CSSOM is the CSS object model representing styles paired with the DOM
- C. The CSSOM is a server-side cache for storing precomputed CSS style values
- D. The CSSOM replaces the DOM entirely for pages that use CSS stylesheets

Answer: B

Q1230. How does container query sizing differ from viewport-based media queries?

- A. Container queries are a JavaScript API and not available in pure CSS code
- B. Container queries use the viewport width while media queries use elements
- C. Container queries only work with grid layouts and not flexbox or floats
- D. Container queries respond to the parent container size not the viewport

Answer: D

Q1231. How do CSS container queries change the approach to component-based responsive design?

- A. They remove the need for any CSS Grid or flexbox layout properties entirely
- B. They let components adapt based on their container size rather than viewport
- C. They require JavaScript to detect container dimensions and apply styles
- D. They only work with elements that have a fixed pixel width explicitly set

Answer: B

Q1232. What is the purpose of the @supports rule and how does it enable progressive enhancement?

- A. It verifies that the server supports a specific HTTP protocol version used
- B. It conditionally applies styles based on browser support for CSS features
- C. It checks whether the user's browser supports JavaScript execution enabled
- D. It tests whether external font files have loaded successfully in the page

Answer: B

Q1233. How does the CSS scroll-snap property improve scroll-based user experiences?

- A. It automatically lazy-loads content as the user scrolls down the web page
- B. It creates defined snap points that the viewport locks to while scrolling
- C. It prevents all scrolling and forces users to use navigation buttons only
- D. It changes the scroll speed based on the amount of content on each page

Answer: B

Q1234. What is the difference between implicit and explicit grid tracks in CSS Grid?

- A. Implicit tracks only appear in development mode and vanish in production
- B. Explicit tracks are defined by template properties while implicit are auto
- C. Implicit tracks are defined by the developer while explicit are automatic
- D. Explicit tracks use percentage widths while implicit tracks use pixel only

Answer: B

Q1235. How does the isolation property interact with stacking contexts and blend modes?

- A. It isolates network requests made by elements inside the isolated container
- B. It prevents the element from inheriting any styles from parent containers
- C. It disables all CSS animations within the element to improve performance
- D. It creates a new stacking context limiting blend mode effects to the group

Answer: D

Q1236. What challenges arise when combining CSS Grid and flexbox in complex layouts?

- A. Using both requires doubling the number of media queries for responsiveness
- B. Nested contexts may cause unexpected sizing due to different algorithms used
- C. Combining them automatically disables all CSS transitions and animations
- D. Grid and flexbox cannot be used in the same document or stylesheet at all

Answer: B

Q1237. How does the CSS :is() pseudo-class improve selector maintainability?

- A. It checks if an element exists in the DOM before applying styles to it
- B. It creates conditional styles similar to if-else statements in JavaScript
- C. It validates that CSS property values are within acceptable valid ranges
- D. It groups selectors reducing repetition and uses highest specificity match

Answer: D

Q1238. What is the logical properties model in CSS and why is it important?

- A. It defines logical conditions that determine when styles are applied now
- B. It creates property dependencies where changing one updates others too
- C. It uses flow-relative properties like inline-start for internationalization
- D. It applies mathematical logic to calculate responsive font sizes for text

Answer: C

Q1239. How does the CSS accent-color property simplify form styling?

- A. It applies a color tint to form validation error messages shown to users
- B. It adds a colored border accent around the entire form container element
- C. It sets the accent color for form controls like checkboxes and radio buttons
- D. It changes the text color of all form labels to match the brand palette

Answer: C

Q1240. What is the purpose of the @property rule for CSS custom properties?

- A. It registers custom properties with type checking and initial value support
- B. It creates new CSS properties that override all existing browser defaults
- C. It generates property documentation automatically for developer tooling
- D. It defines JavaScript properties that can be accessed from CSS stylesheets

Answer: A

Q1241. What is a closure and why is it useful in JavaScript?

- A. A function that retains access to its outer scope variables after return
- B. A design pattern for preventing memory leaks in event listener callbacks
- C. A syntax for immediately terminating asynchronous operations mid-flight
- D. A method for closing browser windows programmatically using JavaScript

Answer: A

Q1242. How does the event loop handle microtasks versus macrotasks?

- A. Microtasks execute after current task before the next macrotask is taken
- B. Microtasks and macrotasks are processed in the exact same queue together
- C. Macrotasks always have higher priority and execute before any microtasks
- D. Microtasks are processed after all macrotasks in the queue are completed

Answer: A

Q1243. What is the Temporal Dead Zone for let and const declarations?

- A. The gap between an event being triggered and its handler being executed
- B. The period between scope entry and declaration where access throws error
- C. The time period between page load and when DOMContentLoaded event fires
- D. The delay between a network request being sent and response being received

Answer: B

Q1244. How does prototypal inheritance differ from classical inheritance?

- A. Prototypal objects inherit directly from other objects via prototype chains
- B. Prototypal is only available in strict mode while classical works anywhere
- C. Prototypal inheritance requires TypeScript while classical uses JavaScript
- D. Prototypal uses classes and constructors while classical uses object linking

Answer: A

Q1245. What is the purpose of WeakMap and how does it differ from Map?

- A. WeakMap automatically expires entries after a time while Map keeps forever
- B. WeakMap encrypts its values while Map stores all values as plain text data
- C. WeakMap holds weak references to keys allowing garbage collection of them
- D. WeakMap stores only string keys while Map can store any data type as key

Answer: C

Q1246. How does the JavaScript engine optimize code using hidden classes?

- A. It hides CSS class names from the DOM to improve rendering performance
- B. It compresses class definitions to reduce memory usage in the heap space
- C. It encrypts class methods to prevent reverse engineering of the codebase
- D. It creates internal type representations to speed up property access times

Answer: D

Q1247. What problem does the structured clone algorithm solve that JSON parse/stringify cannot?

- A. It validates data types during cloning and throws errors for mismatches
- B. It encrypts the cloned object data for secure storage in local sessions
- C. It handles circular references, typed arrays, and more complex data types
- D. It compresses the cloned data to use less memory than the JSON approach

Answer: C

Q1248. How does tail call optimization affect recursive functions in JavaScript?

- A. It limits recursion depth to a fixed number regardless of memory available
- B. It caches results of previous recursive calls to speed up the computation
- C. It automatically converts recursive functions into iterative loop versions
- D. It reuses the current stack frame for tail position calls preventing overflow

Answer: D

Q1249. What is the difference between a shallow copy and a deep copy of an object?

- A. Shallow copies only copy top-level properties while deep clones all nested
- B. Shallow copies are faster but create read-only versions of the object data
- C. Deep copies can only be created using third-party libraries not native code
- D. Shallow copies duplicate all nested levels while deep copies only copy top

Answer: A

Q1250. How does optional chaining (?.) handle deeply nested property access safely?

- A. It logs a warning to the console but continues execution with null value
- B. It automatically creates missing nested properties with default values set
- C. It returns undefined instead of throwing when accessing nullish references
- D. It throws a custom error message when a nested property is not found yet

Answer: C

Q1251. How does the JavaScript engine handle memory management and garbage collection?

- A. Developers must manually allocate and free memory using explicit commands
- B. The engine uses mark-and-sweep to automatically reclaim unreachable objects
- C. Memory is allocated once at startup and never freed during page lifetime
- D. The engine writes unused data to disk swap files for later reuse if needed

Answer: B

Q1252. What is the purpose of SharedArrayBuffer and Atomics in JavaScript?

- A. They share CSS stylesheets between multiple browser tabs simultaneously
- B. They automatically split large arrays into smaller chunks for processing
- C. They enable shared memory and atomic operations between web worker threads
- D. They synchronize database transactions across multiple server instances

Answer: C

Q1253. How does the Reflect API complement the Proxy API in JavaScript?

- A. Reflect provides default implementations for Proxy trap operations used
- B. Reflect converts Proxy objects back into normal JavaScript plain objects
- C. Reflect enables Proxy objects to intercept CSS style computations too
- D. Reflect optimizes Proxy performance by caching trap results in memory

Answer: A

Q1254. What is the difference between concurrency and parallelism in JavaScript?

- A. They are identical concepts with no practical difference in any language
- B. Concurrency manages multiple tasks interleaved while parallelism runs simultaneously
- C. Parallelism is single-threaded while concurrency requires multiple threads
- D. Concurrency is only possible in Node.js while parallelism works in browsers

Answer: B

Q1255. How do private class fields (#) differ from closure-based privacy in JavaScript?

- A. Private fields work only in strict mode while closures work in any context
- B. Private fields are only syntactic sugar with no actual encapsulation enforced
- C. Private fields are slower because they require additional proxy wrapper objects
- D. Private fields use hard privacy enforced by the engine unlike closure convention

Answer: D

Q1256. What is the purpose of the FinalizationRegistry in JavaScript?

- A. It manages the order in which CSS animations complete their final frames
- B. It ensures all pending network requests complete before page unload event
- C. It finalizes database transactions and ensures data integrity on commit
- D. It registers callbacks invoked when registered objects are garbage collected

Answer: D

Q1257. How does the import() dynamic import function differ from static import?

- A. Dynamic import returns a Promise and loads modules conditionally at runtime
- B. Dynamic import loads modules at compile time while static loads at runtime
- C. Dynamic import only works with JSON files while static works with all types
- D. Dynamic import is synchronous while static import is always asynchronous

Answer: A

Q1258. What is the Transferable interface and how does it optimize worker communication?

- A. It transfers ownership of data to a worker without copying the memory buffer
- B. It compresses messages between workers to reduce inter-thread bandwidth use
- C. It copies data between workers using a shared clipboard buffer mechanism
- D. It translates data formats between workers running different script versions

Answer: A

Q1259. How does the TC39 proposal process work for new JavaScript features?

- A. Proposals go through stages 0-4 with increasing maturity before inclusion
- B. The ECMA committee implements features first then writes specifications after
- C. Features are voted on by developers through public polls on social media
- D. Features are added by browser vendors independently without coordination

Answer: A

Q1260. What is the Iterator Helpers proposal and what problem does it solve?

- A. It helps iterate over CSS selectors to find matching DOM elements faster
- B. It provides helper functions for converting arrays into linked list types
- C. It adds chainable methods like map and filter directly to iterator objects
- D. It creates automatic pagination helpers for iterating over API result sets

Answer: C

Q1261. How does Svelte's compile-time approach differ from React's runtime approach?

- A. Svelte only works with TypeScript while React supports only plain JavaScript
- B. Svelte uses a larger runtime library while React compiles away its framework
- C. Svelte compiles components to imperative DOM code eliminating virtual DOM need
- D. Svelte requires manual DOM updates while React automates them with diffing

Answer: C

Q1262. What is the islands architecture and which frameworks implement it?

- A. A network architecture where each microservice runs on separate server nodes
- B. A pattern of interactive components in static HTML used by Astro and Fresh
- C. A database sharding pattern where each table is stored on a separate island
- D. A pattern where each page is an isolated island with no shared state at all

Answer: B

Q1263. How does React's Suspense mechanism work for data fetching and code splitting?

- A. It pauses server execution and buffers all response data until completion
- B. It suspends the browser event loop until all pending promises are resolved
- C. It shows fallback content while waiting for lazy components or async data
- D. It automatically caches all fetch responses to prevent redundant API calls

Answer: C

Q1264. What is the purpose of Angular's change detection strategy OnPush?

- A. It only checks the component when its inputs change or events fire within
- B. It enables automatic push notifications from the server to client updates
- C. It pushes all changes to a remote server for persistence before rendering
- D. It forces synchronous rendering of all child components before the parent

Answer: A

Q1265. How does Vue's Composition API improve code organization over the Options API?

- A. It eliminates the need for templates and uses only render functions for views
- B. It compiles Vue components into native mobile applications automatically
- C. It converts Options API components into Composition API at build time process
- D. It enables logic reuse through composable functions grouped by feature concern

Answer: D

Q1266. What is the fiber architecture in React and what problem does it solve?

- A. It provides fiber optic network optimizations for faster data fetching use
- B. It enables incremental rendering allowing React to pause and resume work
- C. It creates a fiber-based threading model for true parallel component rendering
- D. It converts React components into web components for cross-framework usage

Answer: B

Q1267. How does Solid.js achieve fine-grained reactivity without a virtual DOM?

- A. It delegates all DOM updates to web workers for off-main-thread rendering
- B. It requires developers to manually specify which DOM nodes need updating
- C. It uses a virtual DOM internally but markets itself as not having one
- D. It uses signals and reactive primitives that update only affected DOM nodes

Answer: D

Q1268. What are the tradeoffs of using micro-frontends with module federation?

- A. Module federation eliminates all build complexity and has no tradeoffs at all
- B. It enables independent deployment but adds complexity in shared dependency management
- C. It requires all micro-frontends to use the same exact version of every dependency
- D. Module federation only works with React and cannot be used with other frameworks

Answer: B

Q1269. How does streaming SSR improve time-to-first-byte compared to traditional SSR?

- A. It progressively sends HTML chunks as they render without waiting for all data
- B. It splits the HTML into multiple separate HTTP requests sent in parallel order
- C. It sends the complete HTML document only after all data fetching is finished
- D. It compresses the HTML response using streaming compression before any sending

Answer: A

Q1270. What is the concept of signals in modern frontend frameworks like Preact and Angular?

- A. Network signals indicating connection quality used for adaptive content loading
- B. Reactive primitives that track dependencies and update only subscribers directly
- C. Audio signals processed by the Web Audio API for multimedia web applications
- D. Database signals that notify the frontend when backend data changes on server

Answer: B

Q1271. How does database sharding improve scalability for high-traffic applications?

- A. It compresses database tables to fit more records into less storage space
- B. It creates a complete copy of the database on every single server available
- C. It caches all database queries in memory eliminating disk read operations
- D. It distributes data across multiple databases reducing load on each individual

Answer: D

Q1272. What is the saga pattern and when is it used in distributed systems?

- A. A database indexing strategy for optimizing full-text search across multiple tables
- B. A pattern for managing distributed transactions across microservices with compensations
- C. A UI design pattern for creating step-by-step wizard forms in web applications
- D. A testing pattern for writing narrative-style test cases in behavior-driven development

Answer: B

Q1273. How does event sourcing differ from traditional CRUD data storage?

- A. Event sourcing stores state changes as events while CRUD stores current state
- B. Event sourcing is synchronous while CRUD operations are always asynchronous
- C. Event sourcing deletes old data while CRUD keeps complete history of changes
- D. Event sourcing only works with NoSQL while CRUD requires relational databases

Answer: A

Q1274. What is the CQRS pattern and what problem does it solve?

- A. It compresses query results on the server before sending them to clients
- B. It combines all read and write operations into a single optimized data model
- C. It creates a queue for all server requests to process them sequentially only
- D. It separates read and write models for independent optimization and scaling

Answer: D

Q1275. How does a message queue improve backend architecture reliability?

- A. It queues CSS style calculations to prevent layout thrashing in the browser
- B. It stores database query results in a queue for faster repeated access times
- C. It decouples services by buffering messages for asynchronous processing safely
- D. It creates a queue of user interface updates for batch rendering on client

Answer: C

Q1276. What is the difference between horizontal and vertical scaling?

- A. Horizontal only works for databases while vertical only works for web servers
- B. Horizontal adds more servers while vertical adds more resources to one server
- C. Horizontal adds resources to one server while vertical adds more server nodes
- D. Horizontal scaling is free while vertical scaling always requires paid licenses

Answer: B

Q1277. How does the strangler fig pattern help migrate monoliths to microservices?

- A. It immediately replaces the entire monolith with microservices in one deployment
- B. It gradually replaces monolith functionality by routing to new services incrementally
- C. It copies the monolith code into separate repositories without any code changes
- D. It strangles the monolith by reducing its allocated server resources over time

Answer: B

Q1278. What is the purpose of a dead letter queue in message processing?

- A. To create a backup of all messages sent during system maintenance downtime
- B. To queue messages from deactivated user accounts for archival purposes only
- C. To permanently delete messages that have been successfully processed already
- D. To store messages that fail processing for later inspection and retry handling

Answer: D

Q1279. How does the outbox pattern ensure reliable event publishing in microservices?

- A. It stores events in a database table atomically with data then publishes them
- B. It creates an outbox email notification for every event published by service
- C. It sends events directly to the message broker before committing the database
- D. It buffers events in browser local storage until network connectivity returns

Answer: A

Q1280. What is the bulkhead pattern in distributed systems?

- A. A pattern that isolates failures by partitioning resources into separate pools
- B. A pattern for compressing bulk API responses to reduce network bandwidth use
- C. A pattern for creating bulk database insert operations for high throughput
- D. A pattern for generating bulk SSL certificates for multiple domain endpoints

Answer: A

Q1281. How does the N+1 query problem occur and how can it be resolved?

- A. It occurs when a query returns N+1 duplicate records from the database table
- B. It occurs when loading related data triggers a query per item instead of batching
- C. It occurs when N+1 users simultaneously access the same server resource endpoint
- D. It occurs when the database connection pool has exactly N+1 connections open

Answer: B

Q1282. What is the purpose of a write-ahead log in database systems?

- A. To record changes before applying them ensuring durability and crash recovery
- B. To write CSS styles ahead of rendering to prevent layout shift on the page
- C. To prewrite API documentation before implementing the actual endpoint logic
- D. To log all user write operations for billing and usage tracking purposes only

Answer: A

Q1283. How does connection multiplexing work in HTTP/2 server implementations?

- A. It multiplies the server bandwidth by splitting traffic across many networks
- B. It duplicates every request to multiple servers for redundancy and failover
- C. It creates multiple separate TCP connections for each HTTP request sent out
- D. It sends multiple requests and responses over a single TCP connection stream

Answer: D

Q1284. What is the leader election pattern in distributed server systems?

- A. A pattern for selecting which CSS framework the development team should adopt
- B. A pattern where users vote for their preferred server through a web interface
- C. A pattern where the fastest server automatically becomes the primary database
- D. A pattern where one node is chosen to coordinate tasks among distributed nodes

Answer: D

Q1285. How does server-side request forgery (SSRF) attack work and how is it prevented?

- A. SSRF sends forged DNS responses to redirect traffic to malicious web servers
- B. SSRF exploits SQL injection to forge database records in production tables
- C. SSRF tricks a server into making requests to unintended internal resources
- D. SSRF forges client-side cookies to impersonate legitimate authenticated users

Answer: C

Q1286. What is the purpose of graceful shutdown in server applications?

- A. To finish in-progress requests and release resources before stopping the server
- B. To immediately terminate all active connections without completing any requests
- C. To reduce server CPU speed gradually to lower power consumption over time
- D. To send shutdown notifications to all connected users via email before stop

Answer: A

Q1287. How does the sidecar pattern work in server-side architecture?

- A. It deploys a helper process alongside the main service for cross-cutting tasks
- B. It creates a secondary copy of the application for A/B testing user features
- C. It adds a sidebar navigation component to every page of the web application
- D. It places the database alongside the web server on the same physical machine

Answer: A

Q1288. What is back-pressure in server systems and how should it be handled?

- A. It is the physical pressure on server hardware from high temperature levels
- B. It is a database optimization that compresses data under high storage pressure
- C. It is a mechanism to slow producers when consumers cannot keep up with load
- D. It is the CSS pressure applied to buttons to create depth visual effects

Answer: C

Q1289. How does the actor model approach concurrency differently than shared memory?

- A. Actors require operating system level support and cannot run on standard hardware
- B. Actors communicate via message passing with isolated state avoiding shared memory
- C. Actors use a single thread and cannot process multiple messages simultaneously
- D. Actors share a global memory space and use locks for synchronization of access

Answer: B

Q1290. What is the purpose of distributed tracing in microservice architectures?

- A. To track requests across multiple services for debugging and performance analysis
- B. To monitor network cable connections between physical server rack units in DC
- C. To trace CSS rendering performance across multiple browser rendering engines
- D. To trace database query execution plans across multiple table join operations

Answer: A

Q1291. How does database replication improve availability and what are its consistency challenges?

- A. Replication creates copies across servers but may cause stale reads temporarily
- B. Replication guarantees immediate consistency across all replicas without any delay
- C. Replication eliminates the need for backups since data exists on multiple servers
- D. Replication only works with NoSQL databases and not with relational SQL databases

Answer: A

Q1292. What is the write-ahead log and how does it ensure data durability?

- A. It logs all SELECT queries for audit purposes before returning results to clients
- B. It writes database documentation ahead of implementation for planning purposes
- C. It records changes to a log before applying them enabling crash recovery of data
- D. It pre-generates auto-increment IDs ahead of insert operations for performance

Answer: C

Q1293. How does database connection pool sizing affect application performance?

- A. Larger pools always improve performance with no diminishing returns whatsoever
- B. Connection pools should always match the exact number of application server threads
- C. Too few connections cause queuing while too many waste resources and add contention
- D. Pool size has no impact on performance and is purely a configuration preference

Answer: C

Q1294. What is the difference between optimistic and pessimistic locking?

- A. Optimistic is for read operations only while pessimistic is for writes exclusively
- B. Optimistic locking is faster but pessimistic locking uses less memory on the server
- C. Optimistic assumes no conflicts and checks at commit while pessimistic locks upfront
- D. Optimistic locks the resource immediately while pessimistic waits until commit time

Answer: C

Q1295. How do graph databases differ from relational databases for relationship-heavy data?

- A. Graph databases require data to be normalized into third normal form before insertion
- B. Graph databases cannot store any properties on nodes and only support edge connections
- C. Graph databases store data in tables but use graphical user interfaces for queries
- D. Graph databases model relationships as first-class citizens enabling efficient traversal

Answer: D

Q1296. What is the purpose of a materialized view and when should it be used?

- A. It stores precomputed query results physically for fast access on complex queries
- B. It visualizes database schema as a material design diagram for documentation use
- C. It generates a physical backup file of the database view definitions and metadata
- D. It creates a virtual view that recomputes on every access for fresh data always

Answer: A

Q1297. How does database partitioning differ from sharding?

- A. Partitioning distributes data across servers while sharding splits within one database
- B. Partitioning and sharding are identical concepts with no practical difference at all
- C. Partitioning is for NoSQL only while sharding works exclusively with SQL databases
- D. Partitioning splits data within one database while sharding distributes across servers

Answer: D

Q1298. What is the CAP theorem's impact on database selection for distributed systems?

- A. CAP only applies to NoSQL databases and has no relevance to SQL database systems
- B. CAP requires all three properties to be met for any distributed database to function
- C. CAP states you can only guarantee two of consistency, availability, partition tolerance
- D. CAP states distributed systems must choose between consistency and partition tolerance

Answer: C

Q1299. How does a time-series database optimize for temporal data compared to relational databases?

- A. It stores all timestamps as plain text strings for human-readable log file output
- B. It requires data to be inserted in reverse chronological order for index efficiency
- C. It uses time-based partitioning and compression optimized for append-heavy workloads
- D. It only supports queries for the most recent hour of data and archives everything else

Answer: C

Q1300. What is the change data capture pattern and how does it enable event-driven architectures?

- A. It captures network packet changes for monitoring database connection health status
- B. It captures CSS property changes and generates transition animations automatically
- C. It captures UI changes in the browser DOM and sends them to the server for storage
- D. It captures database changes as events enabling downstream systems to react to them

Answer: D

Q1301. How does a timing attack exploit web applications and how is it mitigated?

- A. It measures response time differences to infer secret data using constant-time comparison
- B. It exploits expired TLS certificates during the brief window before renewal occurs
- C. It sends requests at precisely timed intervals to bypass rate limiting protections
- D. It attacks during specific time zones when server administrators are offline

Answer: A

Q1302. What is the difference between symmetric and asymmetric encryption in web security?

- A. Symmetric uses two keys while asymmetric uses a single shared secret key only
- B. Symmetric uses one shared key while asymmetric uses a public-private key pair
- C. Symmetric is more secure than asymmetric in all possible use case scenarios today
- D. Symmetric is for encrypting files while asymmetric is for encrypting databases

Answer: B

Q1303. How does a JWT token compromise affect application security and what mitigations exist?

- A. JWT compromise only affects the single request where the token was intercepted
- B. JWT tokens cannot be compromised because they are encrypted with AES-256 always
- C. JWT compromise requires the attacker to also know the user password to exploit
- D. JWT compromise grants access until expiration mitigated by short TTL and rotation

Answer: D

Q1304. What is the purpose of a Web Application Firewall and how does it differ from a network firewall?

- A. WAF operates at the network layer while network firewall operates at application layer
- B. WAF only protects static websites while network firewall protects dynamic applications
- C. WAF replaces the need for HTTPS encryption while network firewall enhances encryption
- D. WAF protects against application layer attacks while network firewall handles lower layers

Answer: D

Q1305. How does certificate pinning enhance TLS security and what are its drawbacks?

- A. It pins SSL certificates to specific IP addresses for geographic restriction purposes
- B. It pins certificates in DNS records requiring DNSSEC for validation of every connection
- C. It binds a host to specific certificates preventing man-in-middle with CA compromise risk
- D. It permanently pins a certificate preventing any future certificate rotation or updates

Answer: C

Q1306. What is a supply chain attack in web development and how can it be mitigated?

- A. A vulnerability in the CDN supply chain that serves corrupted static asset files
- B. A compromised dependency that injects malicious code mitigated by lockfiles and audits
- C. An attack on the physical supply chain of server hardware during manufacturing
- D. An attack where the attacker buys the domain name of a deprecated npm package

Answer: B

Q1307. How does Subresource Integrity protect against CDN compromises?

- A. It checks that CDN servers have valid SSL certificates before loading any resources
- B. It encrypts all resources loaded from CDNs to prevent eavesdropping during transfer
- C. It creates a backup copy of CDN resources on the origin server for failover support
- D. It verifies resource integrity using cryptographic hashes ensuring files are untampered

Answer: D

Q1308. What is the OAuth 2.0 authorization code flow and why is PKCE important?

- A. OAuth uses basic auth and PKCE adds an extra password layer for security measure
- B. Auth code flow exchanges code for tokens and PKCE prevents authorization code interception
- C. OAuth only works with social login providers and PKCE extends it to email passwords
- D. Auth code flow is deprecated and PKCE is the entirely new protocol that replaced it

Answer: B

Q1309. How does a zero-day vulnerability differ from a known vulnerability in web security?

- A. Zero-day is a vulnerability discovered on the first day the software was released
- B. Zero-day is an unknown exploit with no patch while known vulnerabilities have fixes
- C. Zero-day means the vulnerability has zero impact while known ones have high impact
- D. Zero-day vulnerabilities can only affect server software and not client applications

Answer: B

Q1310. What is the purpose of security response headers like Permissions-Policy?

- A. To set file system permissions for static assets served by the web server only
- B. To control which browser features and APIs a document is allowed to use safely
- C. To define which team members have permission to deploy code to production servers
- D. To manage database user permissions through HTTP headers sent with each request

Answer: B

Q1311. How does the PRPL pattern optimize web application loading performance?

- A. It Parses HTML, Resolves dependencies, Processes CSS, and Loads JavaScript
- B. It Prioritizes above-fold, Reduces payload, Prefetches links, Lowers latency
- C. It Pre-renders, Re-renders, Pre-loads, and Lazy-loads all page components
- D. It Pushes critical resources, Renders route, Pre-caches, and Lazy-loads rest

Answer: D

Q1312. What is the impact of long tasks on web performance and how are they identified?

- A. Long tasks are HTTP requests taking over five seconds to receive a server response
- B. Long tasks are CSS animations exceeding one second that cause janky scrolling
- C. Tasks that write large amounts of data to localStorage causing storage quota errors
- D. Tasks exceeding 50ms block the main thread and are identified via Long Tasks API

Answer: D

Q1313. How does resource prioritization work in the browser and how can developers influence it?

- A. Browsers assign priority based on resource type and developers use fetchpriority hints
- B. Browsers load all resources with equal priority and developers cannot change this
- C. Resource priority is determined solely by the order resources appear in the HTML file
- D. Developers must manually specify download order for every single resource on page

Answer: A

Q1314. What is the purpose of the Performance Observer API?

- A. To observe network performance and automatically switch to lower quality resources
- B. To asynchronously observe performance entries like marks, measures, and paint timing
- C. To observe and report CSS rendering performance for animation smoothness checks
- D. To monitor server CPU and memory performance from the client browser JavaScript

Answer: B

Q1315. How does Brotli compression compare to Gzip for web content delivery?

- A. Brotli only works with HTML files while Gzip supports all content types served
- B. Brotli and Gzip produce identical compression ratios for all web content types
- C. Brotli achieves higher compression ratios than Gzip especially for static content
- D. Brotli requires client-side decompression libraries while Gzip is built into browsers

Answer: C

Q1316. What is layout thrashing and how can it be prevented?

- A. Layout thrashing occurs when too many CSS classes are applied to a single element
- B. It occurs when multiple CSS files conflict with each other causing rendering delays
- C. It occurs when repeated reads and writes to the DOM force synchronous layout recalculations
- D. Layout thrashing happens when the server sends too many layout instructions in response

Answer: C

Q1317. How does the speculation rules API improve navigation performance?

- A. It allows prerendering of pages the user is likely to navigate to using rules set
- B. It guesses user input and pre-fills form fields to reduce time to completion
- C. It predicts server load and automatically scales resources before traffic spikes
- D. It speculates which CSS styles will be needed and pre-compiles them for speed

Answer: A

Q1318. What is the difference between First Contentful Paint and Largest Contentful Paint?

- A. FCP is a server metric while LCP is a client metric and they measure different things
- B. FCP measures when first content renders while LCP measures largest content element render
- C. FCP measures first byte received while LCP measures last byte received from server
- D. FCP only measures text rendering while LCP only measures image rendering on the page

Answer: B

Q1319. How does edge computing improve web application performance?

- A. It runs computation at network edge locations closer to users reducing latency seen
- B. It prioritizes content at the top edge of the page for above-the-fold rendering
- C. It sharpens image edges using advanced algorithms for better visual quality display
- D. It processes data at the edge of the database table for faster query result times

Answer: A

Q1320. What is the Interaction to Next Paint metric and why did it replace First Input Delay?

- A. INP measures overall responsiveness across all interactions not just the first input event
- B. INP measures network latency to the next server while FID measured to the current server
- C. INP only measures touch interactions while FID measured all types of user input events
- D. INP measures the time between two consecutive paint operations on the canvas element

Answer: A

Q1321. How does visual regression testing work and what tools support it?

- A. It manually reviews visual design changes in a design review meeting with stakeholders
- B. It tests CSS regression properties by comparing computed styles programmatically
- C. It runs CSS animations in reverse to test visual consistency during undo operations
- D. It captures and compares screenshots pixel-by-pixel using tools like Percy or Chromatic

Answer: D

Q1322. What is property-based testing and how does it differ from example-based testing?

- A. Property-based only tests object properties while example-based tests entire components
- B. Property-based uses specific examples while example-based uses random test input data
- C. Property-based requires no assertions while example-based requires explicit assertions
- D. Property-based generates random inputs to verify invariants rather than specific examples

Answer: D

Q1323. How does contract testing ensure compatibility between microservices?

- A. It verifies that service interactions conform to agreed-upon API contracts defined
- B. It verifies that all microservices use the same programming language and framework
- C. It ensures all services are deployed in the same data center for low latency access
- D. It tests the legal contracts associated with third-party service license agreements

Answer: A

Q1324. What is mutation testing and how does it evaluate test suite quality?

- A. It introduces small code changes to verify that tests catch defects effectively now
- B. It tests how the application handles mutated or corrupted database records safely
- C. It mutates the test code itself to verify it can be easily maintained over time
- D. It tests the application with different user input mutations for edge case coverage

Answer: A

Q1325. How does chaos engineering apply to web application testing?

- A. It intentionally introduces failures to test system resilience and recovery ability
- B. It generates random database schemas to test ORM compatibility across configurations
- C. It tests the application with randomly generated CSS styles for visual robustness
- D. It creates chaotic user interface layouts to test responsive design breakpoints

Answer: A

Q1326. What is the difference between synthetic and real user monitoring?

- A. Synthetic measures server metrics while RUM measures only client-side rendering speed
- B. Synthetic uses scripted tests in controlled environments while RUM tracks actual users
- C. Synthetic only works in development while RUM only works in staging environments used
- D. Synthetic monitors real users while RUM uses automated scripts for testing performance

Answer: B

Q1327. How does test parallelization improve CI/CD pipeline performance?

- A. It parallelizes code compilation and testing in the same process for efficiency gains
- B. It runs all tests sequentially on multiple servers for consistent result comparison
- C. It creates parallel copies of the database for each test to run in complete isolation
- D. It runs independent tests simultaneously across workers reducing total execution time

Answer: D

Q1328. What is the role of test fixtures and factories in maintaining test data?

- A. Fixtures are physical hardware devices used for hardware-in-the-loop testing only
- B. Fixtures store CSS styling for test result report pages displayed in the browser
- C. Fixtures and factories create consistent reusable test data reducing setup duplication
- D. Factories generate random production data for populating staging environments daily

Answer: C

Q1329. How does fuzz testing help discover security vulnerabilities?

- A. It applies fuzzy logic to determine which test cases should be prioritized first
- B. It feeds random or malformed input to find crashes and unexpected behavior patterns
- C. It tests the application with fuzzy or blurred images to check image processing
- D. It tests fuzzy string matching algorithms for accuracy in search functionality

Answer: B

Q1330. What is the testing trophy pattern and how does it differ from the testing pyramid?

- A. The trophy inverts the pyramid putting the most end-to-end tests at the base level
- B. The trophy eliminates unit tests entirely and focuses only on end-to-end test coverage
- C. The trophy has more integration tests emphasizing confidence per test written effort
- D. The trophy adds a new layer of performance tests that the pyramid does not include

Answer: C

Q1331. How does GitOps differ from traditional CI/CD approaches?

- A. GitOps eliminates the need for any version control system in the deployment process
- B. GitOps only works with GitHub and cannot be used with GitLab or Bitbucket platforms
- C. GitOps requires manual approval for every deployment while CI/CD is fully automated
- D. GitOps uses Git as the single source of truth for declarative infrastructure and apps

Answer: D

Q1332. What is the purpose of a service mesh in container orchestration?

- A. It manages service-to-service communication with observability, security, and routing
- B. It generates a mesh network of CDN nodes for distributed static asset delivery use
- C. It creates a visual mesh overlay of all CSS grid layouts on the deployed web page
- D. It meshes multiple databases together into a single unified query interface for apps

Answer: A

Q1333. How does immutable infrastructure improve deployment reliability?

- A. It replaces servers entirely instead of updating them ensuring consistent clean state
- B. It freezes all application features and prevents any new deployments from occurring
- C. It makes database records immutable so they cannot be updated or deleted by anyone
- D. It prevents any developer from modifying the infrastructure code in the repository

Answer: A

Q1334. What is the purpose of a deployment rollback strategy?

- A. To create a backup of the deployment pipeline configuration for disaster recovery
- B. To gradually roll forward by deploying incrementally to larger user group segments
- C. To roll back CSS changes to a previous design version when stakeholders disagree
- D. To quickly revert to a previous working version when a deployment causes issues

Answer: D

Q1335. How does Kubernetes handle self-healing of deployed applications?

- A. It automatically rewrites application code to fix bugs detected in production use
- B. It heals network connections between services by automatically rerouting all traffic
- C. It monitors pod health and restarts or replaces failed pods to maintain desired state
- D. It repairs corrupted database tables by restoring from the most recent backup file

Answer: C

Q1336. What is the difference between horizontal and vertical pod autoscaling in Kubernetes?

- A. Horizontal only scales CPU while vertical only scales memory allocation for each pod
- B. Horizontal adjusts resources while vertical adds replicas for load distribution work
- C. Horizontal adds more pod replicas while vertical adjusts pod resource limits upward
- D. Horizontal requires manual triggers while vertical scales automatically based on load

Answer: C

Q1337. How does a progressive delivery strategy improve deployment safety?

- A. It progressively increases the server CPU speed during deployment for faster builds
- B. It delivers CSS and JavaScript progressively using chunked transfer encoding only
- C. It deploys all changes at once but progressively enables monitoring after deployment
- D. It gradually exposes changes to users with feature flags, canaries, and observability

Answer: D

Q1338. What is the purpose of chaos engineering in production deployments?

- A. To generate chaotic test data that stress-tests database storage capacity under load
- B. To randomly assign deployment tasks to team members for knowledge sharing purposes
- C. To intentionally inject failures to verify system resilience and recovery mechanisms
- D. To create chaotic deployment schedules that test team response time capabilities

Answer: C

Q1339. How does multi-region deployment improve application availability?

- A. It deploys across geographic regions providing failover and reduced latency globally
- B. It runs multiple instances of the database on the same server for read performance
- C. It deploys the application to multiple folders within a single server for redundancy
- D. It creates multiple copies of the source code repository in different version controls

Answer: A

Q1340. What is the twelve-factor app methodology and how does it influence deployment?

- A. It mandates twelve team members minimum for any cloud deployment project management
- B. It requires twelve separate deployment stages before code can reach production servers
- C. It limits applications to twelve files maximum for simplified deployment management
- D. It defines twelve principles for building scalable, maintainable cloud-native applications

Answer: D

Q1341. How does GraphQL handle the over-fetching and under-fetching problems of REST?

- A. GraphQL automatically paginates responses to prevent over-fetching of large datasets
- B. GraphQL requires multiple round trips but each returns exactly one field per request
- C. GraphQL lets clients specify exactly which fields they need in a single query request
- D. GraphQL caches all possible response combinations to eliminate unnecessary fetching

Answer: C

Q1342. What are the tradeoffs between REST, GraphQL, and gRPC for API design?

- A. gRPC only works between frontend and backend while REST is only for backend services
- B. REST is always the best choice and GraphQL and gRPC offer no advantages over it
- C. REST is simple and cacheable, GraphQL is flexible for clients, gRPC is fast for services
- D. GraphQL is the fastest protocol while REST and gRPC are slower but more user-friendly

Answer: C

Q1343. How does the BFF (Backend for Frontend) pattern optimize API consumption?

- A. It creates dedicated backend services tailored to specific frontend client requirements
- B. It creates a beautiful frontend framework that replaces the need for API calls entirely
- C. It bundles all frontend files and serves them from the backend for faster initial loads
- D. It buffers frontend failures and retries API calls automatically without user awareness

Answer: A

Q1344. What is the purpose of API circuit breakers and how do they improve reliability?

- A. They stop calling failing APIs after threshold breaches preventing cascade failures
- B. They create circular API routes for redundant request handling and load balancing
- C. They break API responses into smaller circuits for parallel processing on the client
- D. They physically disconnect API servers from the network during maintenance windows

Answer: A

Q1345. How does event-driven API design differ from request-response patterns?

- A. Event-driven APIs push events to subscribers asynchronously instead of synchronous calls
- B. Event-driven APIs only support read operations and cannot handle data write operations
- C. Event-driven APIs require clients to poll the server continuously for new events data
- D. Event-driven APIs are limited to WebSocket transport and cannot use HTTP protocol at all

Answer: A

Q1346. What is the purpose of API schema validation and how does it prevent issues?

- A. It validates CSS schemas applied to API response rendering in the browser viewport
- B. It validates request and response structures against defined schemas catching errors early
- C. It validates server configuration files to ensure API routing is correctly configured
- D. It validates database schemas before running API queries to prevent SQL syntax errors

Answer: B

Q1347. How does API versioning through content negotiation work?

- A. Clients specify the desired API version in the URL path like /api/v1/resource endpoint
- B. Clients specify the desired version through Accept headers rather than URL path changes
- C. Servers randomly assign API versions to clients based on their geographic location data
- D. Clients download different API versions and choose which one to install on their device

Answer: B

Q1348. What is the purpose of the saga pattern in managing distributed API transactions?

- A. It tracks the complete saga or history of all API calls for audit compliance purposes
- B. It creates epic narrative documentation for complex API integration workflows only
- C. It generates sequential API call stories for automated testing of integration scenarios
- D. It coordinates long-running distributed transactions with compensating actions for failures

Answer: D

Q1349. How does server-sent events differ from WebSockets for real-time API communication?

- A. SSE requires a dedicated server while WebSockets work on any standard HTTP web server
- B. SSE only supports binary data while WebSockets only support plain text message formats
- C. SSE is bidirectional over HTTP while WebSockets only support server-to-client messages
- D. SSE provides one-way server-to-client streaming over HTTP while WebSockets are bidirectional

Answer: D

Q1350. What is the purpose of API observability and what does it encompass?

- A. It observes API source code changes and generates release notes documentation only
- B. It encompasses logging, metrics, and tracing for understanding API behavior and health
- C. It observes competitor API features and suggests improvements for your own API design
- D. It monitors the visual appearance of API documentation pages for design consistency

Answer: B

Q1351. How does partial hydration improve performance compared to full hydration?

- A. Partial hydration only hydrates interactive components reducing JavaScript sent to client
- B. Partial hydration pre-renders CSS while full hydration renders it at runtime on client
- C. Partial hydration downloads less HTML while full hydration downloads the complete page
- D. Partial hydration splits the database queries while full hydration runs them all at once

Answer: A

Q1352. What is the purpose of React Server Components in the modern web ecosystem?

- A. They are server-side templates that generate static HTML without any React features used
- B. They create server-to-server communication channels for microservice architectures only
- C. They render on the server reducing bundle size while keeping client interactivity where needed
- D. They replace all client components entirely and run everything on the server only

Answer: C

Q1353. How does the module federation pattern enable micro-frontend architectures?

- A. It creates federated databases where each micro-frontend has its own data storage silo
- B. It federates CSS modules across multiple applications for shared styling consistency
- C. It allows applications to share and load modules from other builds at runtime dynamically
- D. It merges all micro-frontend codebases into a single monolithic bundle for deployment

Answer: C

Q1354. What is the purpose of observability in modern web applications?

- A. To observe CSS rendering performance and generate visual reports for stakeholders
- B. To observe user behavior through screen recording for UX research purposes only
- C. To monitor competitor websites and observe their feature changes for benchmarking
- D. To provide insight into system behavior through logs, metrics, and distributed tracing

Answer: D

Q1355. How does the streaming architecture pattern benefit modern web applications?

- A. It streams video content to users using specialized video encoding protocols only
- B. It processes and delivers data incrementally reducing time to first meaningful content
- C. It creates a stream of database backups continuously for disaster recovery purposes
- D. It streams CSS styles progressively so the page styling appears gradually over time

Answer: B

Q1356. What is the difference between build-time and runtime in modern web frameworks?

- A. Build-time only applies to CSS while runtime only applies to JavaScript code execution
- B. Build-time requires Node.js while runtime requires a completely different language runtime
- C. Build-time is slower but more secure while runtime is faster but has security vulnerabilities
- D. Build-time generates optimized output ahead of deployment while runtime executes on request

Answer: D

Q1357. How does the AI-assisted development trend impact modern web practices?

- A. AI development tools are limited to backend development and cannot assist with frontend
- B. AI completely replaces the need for human developers in all web development tasks today
- C. AI tools assist with code generation, review, and debugging while humans provide oversight
- D. AI only works for generating CSS styles and cannot help with JavaScript or HTML coding

Answer: C

Q1358. What is the concept of edge-first architecture in modern web development?

- A. Designing buildings with edge-shaped architecture for modern tech company headquarters
- B. Developing applications that only work on Microsoft Edge browser for optimal performance
- C. Designing applications to run primarily at network edge for minimal latency and global scale
- D. Prioritizing the visual edges and borders of UI elements for a modern design aesthetic

Answer: C

Q1359. How does the concept of composability influence modern web architecture?

- A. It composes CSS animations by chaining multiple keyframe definitions in sequence only
- B. It composes music and sound effects for web applications using the Web Audio API
- C. It creates composite database indexes by combining multiple columns for query speed
- D. It builds systems from interchangeable independent modules that can be freely combined

Answer: D

Q1360. What are the tradeoffs of adopting a serverless architecture for web applications?

- A. Serverless only works for static websites and cannot handle any dynamic content at all
- B. Serverless eliminates all costs since you never pay for idle server time or any resources
- C. Serverless has no tradeoffs and is always the best choice for every web application type
- D. Serverless reduces ops overhead but introduces cold starts and vendor lock-in challenges

Answer: D

Q1361. What is the main trade-off when choosing between a monolithic architecture and a microservices architecture for a web application?

- A. Monoliths are always slower than microservices
- B. Microservices add operational complexity but allow independent scaling and deployment of services
- C. Monoliths cannot use databases
- D. Microservices require a single programming language

Answer: B

Q1362. How does WebAssembly complement JavaScript in modern web development?

- A. It completely replaces JavaScript in all browsers
- B. It allows near-native performance for compute-intensive tasks while JavaScript handles DOM interaction
- C. It is only used for styling web pages
- D. It is a server-side-only technology

Answer: B

Q1363. What problem does the micro-frontend architecture solve in large-scale web development?

- A. It reduces CSS file size
- B. It allows independent teams to develop, deploy, and maintain separate parts of a frontend application
- C. It eliminates the need for a backend
- D. It only works with Angular applications

Answer: B

Q1364. What is the significance of the critical rendering path in web performance?

- A. It determines how the server compiles JavaScript
- B. It is the sequence of steps the browser takes to convert HTML, CSS, and JS into rendered pixels on screen
- C. It only affects mobile devices
- D. It refers to the deployment pipeline

Answer: B

Q1365. What is the purpose of edge computing in the context of modern web applications?

- A. To increase the physical size of data centers
- B. To run computations closer to the end user, reducing latency and improving responsiveness
- C. To replace all client-side JavaScript
- D. To eliminate the need for caching

Answer: B

Q1366. How does the concept of progressive enhancement differ from graceful degradation?

- A. They are the same strategy
- B. Progressive enhancement builds from a baseline experience upward, while graceful degradation starts with full features and falls back
- C. Progressive enhancement only applies to CSS
- D. Graceful degradation does not work in modern browsers

Answer: B

Q1367. What is the role of a build tool like Webpack or Vite in modern web development?

- A. It hosts websites on the internet
- B. It bundles, transforms, and optimizes source files for production deployment
- C. It is used exclusively for database management
- D. It replaces the need for version control

Answer: B

Q1368. Why is accessibility (a11y) considered a fundamental aspect of professional web development?

- A. It only improves search engine rankings
- B. It ensures web content is usable by people with disabilities and often improves usability for all users
- C. It is only required by European law
- D. It slows down website performance

Answer: B

Q1369. What is the difference between Server-Sent Events and WebSockets for real-time communication?

- A. They are identical protocols
- B. SSE is unidirectional from server to client over HTTP, while WebSockets provide full-duplex bidirectional communication
- C. SSE is faster than WebSockets in all cases
- D. WebSockets cannot send text data

Answer: B

Q1370. What is the impact of third-party scripts on web application performance and security?

- A. Third-party scripts have no impact on performance
- B. They can increase page load time, introduce security vulnerabilities, and affect Core Web Vitals
- C. They always improve website speed
- D. They are automatically sandboxed by browsers

Answer: B

Q1371. What is the split-brain problem in distributed web systems?

- A. A CSS rendering issue
- B. When network partitions cause parts of a distributed system to operate independently with conflicting states
- C. A JavaScript memory leak pattern
- D. A browser compatibility issue

Answer: B

Q1372. How does the QUIC protocol improve web performance compared to TCP?

- A. QUIC is slower but more secure than TCP
- B. QUIC eliminates head-of-line blocking and reduces connection establishment latency by combining transport and encryption handshakes
- C. QUIC only works on local networks
- D. QUIC replaces HTTP entirely

Answer: B

Q1373. What is the purpose of the saga pattern in distributed architectures?

- A. To optimize CSS rendering
- B. To manage distributed transactions by breaking them into a sequence of local transactions with compensating actions
- C. To compress network traffic
- D. To handle DNS resolution

Answer: B

Q1374. What is the difference between strong consistency and eventual consistency in distributed systems?

- A. They are the same model
- B. Strong consistency guarantees all nodes see the latest data immediately while eventual consistency allows temporary divergence
- C. Strong consistency is always faster
- D. Eventual consistency prevents data replication

Answer: B

Q1375. What is the purpose of connection pooling in web architecture?

- A. To create new database connections for every request
- B. To maintain a pool of reusable connections to reduce the overhead of establishing new connections
- C. To encrypt all network traffic
- D. To manage CSS class names

Answer: B

Q1376. How does the event-driven architecture pattern benefit web applications?

- A. It makes all operations synchronous
- B. It decouples services through asynchronous event publishing and consumption, improving scalability and resilience
- C. It eliminates the need for databases
- D. It only works with a single server

Answer: B

Q1377. What is the role of a service mesh in modern web architecture?

- A. To create HTML templates
- B. To manage service-to-service communication, providing observability, security, and traffic control
- C. To replace the frontend framework
- D. To store static files

Answer: B

Q1378. What problem does the Command Query Responsibility Segregation (CQRS) pattern address?

- A. CSS specificity conflicts
- B. It separates read and write models to optimize each independently for different performance and scaling requirements
- C. It manages DNS records
- D. It compresses HTTP responses

Answer: B

Q1379. What is the purpose of request idempotency in web architecture?

- A. To make all requests faster
- B. To ensure that making the same request multiple times produces the same result without unintended side effects
- C. To encrypt request payloads
- D. To compress response bodies

Answer: B

Q1380. How does the sidecar proxy pattern work in distributed web architectures?

- A. It replaces the main application entirely
- B. It deploys a helper process alongside each service instance to handle cross-cutting concerns like networking and observability
- C. It is a CSS layout technique
- D. It manages browser cookies

Answer: B

Q1381. How does the <portal> element differ from an <iframe> for embedding content?

- A. They are identical elements
- B. Portals allow seamless navigation to the embedded content and can be activated to become the top-level page
- C. Portals cannot load external URLs
- D. Iframes are deprecated in HTML5

Answer: B

Q1382. What is the purpose of the Declarative Shadow DOM in HTML?

- A. To add CSS animations
- B. To allow server-side rendering of shadow DOM content using HTML-only syntax without JavaScript
- C. To manage form validation
- D. To create responsive images

Answer: B

Q1383. How does the blocking attribute on script and style elements affect rendering?

- A. It has no effect on rendering
- B. It explicitly indicates which rendering operations should be blocked until the resource is processed
- C. It deletes the element from the DOM
- D. It compresses the resource

Answer: B

Q1384. What is the purpose of the rel='modulepreload' link type?

- A. To load CSS modules
- B. To preload JavaScript modules and their dependencies for faster execution when needed
- C. To create module-scoped styles
- D. To define database modules

Answer: B

Q1385. How does the is attribute enable customized built-in elements?

- A. It sets the element's ID
- B. It extends a built-in HTML element with custom behavior by associating it with a custom element class
- C. It changes the element's display property
- D. It removes default browser styling

Answer: B

Q1386. What is the purpose of the ElementInternals API in custom elements?

- A. To style elements with CSS
- B. To allow custom elements to participate in forms, manage accessibility states, and interact with browser internals
- C. To create database connections
- D. To handle routing

Answer: B

Q1387. How does the importmap script type improve module loading in HTML?

- A. It imports CSS modules
- B. It allows developers to control module specifier resolution, mapping bare specifiers to URLs without a build step
- C. It creates image maps
- D. It generates sitemaps

Answer: B

Q1388. What is the purpose of the Sanitizer API in the context of HTML?

- A. To remove all JavaScript from a page
- B. To safely parse and sanitize untrusted HTML strings before inserting them into the DOM, preventing XSS attacks
- C. To compress HTML files
- D. To validate form inputs

Answer: B

Q1389. What role does the Navigation API play in modern single-page applications?

- A. It manages CSS navigation menus
- B. It provides a standardized way to intercept and handle navigation events, replacing History API workarounds
- C. It creates breadcrumb components
- D. It manages database migrations

Answer: B

Q1390. How does the Speculation Rules API improve page navigation performance?

- A. It guesses which CSS to apply
- B. It allows developers to specify rules for prefetching or prerendering future navigations based on link patterns
- C. It creates animated page transitions
- D. It manages service workers

Answer: B

Q1391. How does the CSS paint API allow custom rendering of element backgrounds?

- A. It uses JavaScript to generate images dynamically as CSS backgrounds through registered paint worklets
- B. It only changes text colors
- C. It is a server-side rendering technique
- D. It replaces all CSS with JavaScript

Answer: A

Q1392. What is the difference between logical and physical properties in CSS?

- A. They are identical
- B. Logical properties like inline-start and block-end adapt to writing direction and text flow, while physical properties like left and top do not
- C. Logical properties only work in Firefox
- D. Physical properties are deprecated

Answer: B

Q1393. How does the CSS typed object model (Typed OM) improve performance over traditional CSSOM access?

- A. It has no performance benefit
- B. It provides typed JavaScript objects for CSS values, reducing string parsing overhead and enabling more efficient style manipulation
- C. It replaces CSS entirely
- D. It only works with inline styles

Answer: B

Q1394. What is the purpose of the CSS @scope rule?

- A. To create global styles
- B. To limit the reach of CSS selectors to a specific subtree of the DOM, preventing style leakage
- C. To define animation keyframes
- D. To import external fonts

Answer: B

Q1395. How does the CSS view transitions API work for page transitions?

- A. It uses iframes for transitions
- B. It captures screenshots of old and new states, then animates between them using CSS animations on pseudo-elements
- C. It requires WebGL
- D. It only works with React

Answer: B

Q1396. What is the purpose of CSS anchor positioning?

- A. To create navigation links
- B. To position elements relative to other elements without JavaScript, enabling native tooltip and popover positioning
- C. To set the font weight
- D. To define grid areas

Answer: B

Q1397. How do CSS nesting rules change the way styles are authored?

- A. They have no effect on authoring
- B. They allow selectors to be nested inside parent rules natively, similar to preprocessor nesting, reducing repetition
- C. They replace all existing CSS syntax
- D. They only work with class selectors

Answer: B

Q1398. What is the CSS color-mix() function used for?

- A. To add borders to elements
- B. To blend two colors together in a specified color space, producing a new color
- C. To mix fonts together
- D. To generate random colors

Answer: B

Q1399. How does the CSS scroll-driven animations API differ from scroll-based JavaScript animations?

- A. It is slower than JavaScript
- B. It runs animations on the compositor thread linked to scroll progress, avoiding main-thread JavaScript execution
- C. It only supports opacity changes
- D. It requires a third-party library

Answer: B

Q1400. What is the purpose of the CSS light-dark() function?

- A. To toggle animations
- B. To return one of two colors depending on the computed color-scheme, simplifying dark mode implementation
- C. To adjust screen brightness
- D. To create gradients

Answer: B

Q1401. How does the CSS Containment Level 2 specification improve rendering performance?

- A. It has no performance impact
- B. It allows developers to declare containment boundaries that isolate an element's layout, paint, or style from the rest of the document
- C. It only works with tables
- D. It replaces the box model

Answer: B

Q1402. What is the CSS timeline-scope property used for in scroll-driven animations?

- A. To set animation duration
- B. To extend a scroll timeline's scope to ancestor elements, allowing animations to be driven by scrolling of a descendant
- C. To create CSS variables
- D. To define grid tracks

Answer: B

Q1403. How does the CSS starting-style at-rule solve transition-on-entry problems?

- A. It sets default browser styles
- B. It defines initial styles for elements being inserted into the DOM, enabling transitions from display:none to visible states
- C. It creates startup animations
- D. It initializes CSS variables

Answer: B

Q1404. What is the purpose of the CSS individual transform properties (translate, rotate, scale)?

- A. They replace the transform property entirely
- B. They allow independent control over individual transformations, enabling separate animation timing without affecting other transforms
- C. They only work in 3D space
- D. They are identical to the transform property

Answer: B

Q1405. How does the CSS math function round() improve responsive design?

- A. It rounds element corners
- B. It rounds a value to a specified interval, enabling snap-to-grid-like sizing without JavaScript
- C. It rounds animation durations
- D. It rounds font sizes to integers only

Answer: B

Q1406. What is the relationship between the CSS paint() function and the PaintWorklet API?

- A. They are unrelated features
- B. paint() references a registered PaintWorklet to generate custom images rendered directly by the browser's paint engine
- C. paint() is a JavaScript function
- D. PaintWorklet replaces CSS entirely

Answer: B

Q1407. How does the CSS masonry layout proposal extend CSS Grid?

- A. It replaces CSS Grid entirely
- B. It enables items to pack tightly along one axis while maintaining grid alignment on the other, like a Pinterest-style layout
- C. It only creates circular layouts
- D. It is a flexbox feature

Answer: B

Q1408. What is the purpose of the CSS initial-letter property?

- A. To set the default font
- B. To create decorative drop caps by sizing the first letter of a block to span multiple lines
- C. To initialize CSS variables
- D. To set the first column width

Answer: B

Q1409. How does the @layer rule affect the CSS cascade?

- A. It has no effect on the cascade
- B. It creates explicit cascade layers that control the priority of rule sets, allowing authors to manage specificity conflicts intentionally
- C. It only applies to media queries
- D. It replaces the specificity system

Answer: B

Q1410. What problem does the CSS text-wrap: balance property solve?

- A. It aligns text to the left
- B. It distributes text more evenly across lines in headings, preventing orphans and uneven line lengths
- C. It wraps text around images
- D. It sets text to uppercase

Answer: B

Q1411. How does the JavaScript garbage collector determine which objects to free?

- A. It deletes all objects after a set time
- B. It uses a mark-and-sweep algorithm to identify objects no longer reachable from the root and frees their memory
- C. It only frees variables declared with var
- D. It requires manual memory management

Answer: B

Q1412. What is the difference between a lexical scope and a dynamic scope?

- A. They are the same concept
- B. Lexical scope is determined by where code is written in the source while dynamic scope is determined by the call stack at runtime
- C. Lexical scope is slower
- D. Dynamic scope is used in JavaScript

Answer: B

Q1413. How do labeled statements work with break and continue in JavaScript?

- A. Labels are only for comments
- B. Labels name a statement, allowing break or continue to reference it from within nested loops to control the outer loop
- C. Labels define CSS classes
- D. Labels create new variables

Answer: B

Q1414. What is the purpose of the Proxy and Reflect objects working together?

- A. They are for styling elements
- B. Proxy intercepts operations on objects while Reflect provides default behavior methods that traps can delegate to
- C. They manage CSS animations
- D. They handle file uploads

Answer: B

Q1415. How does the structuredClone() function handle circular references compared to JSON.parse(JSON.stringify())?

- A. Neither handles circular references
- B. structuredClone() correctly preserves circular references while JSON methods throw an error on circular structures
- C. JSON handles circular references better
- D. structuredClone() removes circular references

Answer: B

Q1416. What is the purpose of the Symbol.toPrimitive well-known symbol?

- A. To create CSS symbols
- B. To define how an object is converted to a primitive value, controlling behavior in type coercion contexts
- C. To create HTML symbols
- D. To generate random numbers

Answer: B

Q1417. How does the JavaScript engine optimize property access using inline caches?

- A. It caches CSS properties
- B. It remembers the shape of objects at specific code locations to skip repeated property lookup steps on subsequent accesses
- C. It stores all properties in a database
- D. It uses localStorage for caching

Answer: B

Q1418. What is the difference between Object.create(null) and a regular object literal?

- A. They are identical
- B. Object.create(null) creates an object with no prototype chain, avoiding inherited properties like toString and hasOwnProperty
- C. Object.create(null) is slower
- D. Regular object literals have no prototype

Answer: B

Q1419. How does the for...in loop differ from Object.keys() for iterating over properties?

- A. They are identical
- B. for...in iterates over all enumerable properties including inherited ones while Object.keys() only returns own enumerable properties
- C. for...in is faster
- D. Object.keys() includes inherited properties

Answer: B

Q1420. What is the purpose of the @@iterator (Symbol.iterator) protocol in JavaScript?

- A. To iterate over CSS rules
- B. To define a standard way for objects to produce a sequence of values, making them usable with for...of and spread syntax
- C. To create database iterators
- D. To manage HTTP request sequences

Answer: B

Q1421. How does the WeakRef class work and what is its relationship to garbage collection?

- A. It prevents garbage collection
- B. It holds a weak reference to an object that does not prevent it from being garbage collected, allowing observation without retention
- C. It creates strong references
- D. It manages CSS references

Answer: B

Q1422. What is the purpose of the Atomics object and how does it work with SharedArrayBuffer?

- A. It manages CSS atoms
- B. It provides atomic operations on shared memory locations to prevent race conditions in concurrent multi-threaded JavaScript
- C. It creates atomic CSS classes
- D. It manages DOM atoms

Answer: B

Q1423. How does the using declaration (Explicit Resource Management) improve resource cleanup?

- A. It imports CSS modules
- B. It ensures resources like file handles and database connections are automatically cleaned up via Symbol.dispose when they go out of scope
- C. It creates reusable components
- D. It manages memory allocation

Answer: B

Q1424. What is the difference between Error.cause and traditional error wrapping?

- A. They are identical approaches
- B. Error.cause provides a standardized way to chain errors by attaching the original error as a cause property
- C. Error.cause is deprecated
- D. Traditional wrapping is always better

Answer: B

Q1425. How does the Temporal API improve date and time handling compared to the Date object?

- A. It has no improvements over Date
- B. It provides immutable date-time types, proper time zone support, and eliminates ambiguities present in the Date API
- C. It only works in Node.js
- D. It replaces setTimeout

Answer: B

Q1426. What is the purpose of the Decorator pattern in the TC39 proposal and how does it modify class definitions?

- A. It adds CSS decorations
- B. It allows functions to wrap class elements to add behavior, modify definitions, or add metadata at definition time
- C. It creates decorative HTML elements
- D. It manages font decorations

Answer: B

Q1427. How does the Record and Tuple proposal introduce immutable data structures to JavaScript?

- A. Records are identical to objects
- B. Records and Tuples are deeply immutable versions of objects and arrays that are compared by value rather than by reference
- C. They only work with strings
- D. They replace Map and Set

Answer: B

Q1428. What problem does the Pipeline Operator proposal solve in JavaScript?

- A. It manages network pipes
- B. It improves readability of nested function calls by allowing values to be piped through a series of functions in a left-to-right order
- C. It creates CSS pipes
- D. It handles data streaming

Answer: B

Q1429. How does the ShadowRealm proposal enable secure code isolation in JavaScript?

- A. It creates CSS shadow effects
- B. It provides a mechanism to evaluate code in an isolated global environment with its own set of built-in objects
- C. It manages Shadow DOM
- D. It creates encrypted variables

Answer: B

Q1430. What is the purpose of the AsyncContext proposal in JavaScript?

- A. It manages CSS context
- B. It provides a way to propagate context values through asynchronous operations without explicit parameter passing
- C. It creates database contexts
- D. It manages HTML contexts

Answer: B

Q1431. How does React's compiler (React Forget) optimize re-renders without manual memoization?

- A. It removes all re-renders
- B. It automatically inserts memoization at the compiler level, eliminating the need for useMemo, useCallback, and React.memo
- C. It only optimizes CSS
- D. It replaces the virtual DOM

Answer: B

Q1432. What is the concept of resumability in Qwik and how does it differ from hydration?

- A. They are the same process
- B. Resumability serializes the application state and event handlers to HTML, allowing the client to resume without re-executing component code
- C. Resumability is slower
- D. Hydration is more efficient

Answer: B

Q1433. How does fine-grained reactivity in Solid.js avoid the overhead of virtual DOM diffing?

- A. It uses a faster virtual DOM
- B. It tracks reactive dependencies at the individual expression level, updating only the specific DOM nodes that depend on changed data
- C. It skips all DOM updates
- D. It uses Web Workers for rendering

Answer: B

Q1434. What is the purpose of the React use() hook and how does it change data fetching patterns?

- A. It replaces all other hooks
- B. It allows reading the value of a resource like a Promise or Context during rendering, enabling Suspense-based data fetching
- C. It only fetches CSS resources
- D. It replaces the fetch API

Answer: B

Q1435. How does Angular's signal-based reactivity change its change detection model?

- A. It has no effect on change detection
- B. Signals enable fine-grained reactivity that automatically tracks dependencies and updates only affected components, reducing unnecessary checks
- C. Signals replace all observables
- D. Signals only work with forms

Answer: B

Q1436. What is the purpose of React Server Actions and how do they simplify data mutations?

- A. They manage CSS server-side
- B. They allow defining server-side functions that can be called directly from client components, handling form submissions without manual API routes
- C. They replace all server routes
- D. They only work with databases

Answer: B

Q1437. How does the islands architecture in Astro optimize page performance?

- A. It renders everything on the client
- B. It renders static HTML by default and only hydrates interactive components as isolated islands, minimizing client-side JavaScript
- C. It uses iframes for each component
- D. It eliminates all JavaScript

Answer: B

Q1438. What is the difference between optimistic and pessimistic UI updates in frontend applications?

- A. They are the same strategy
- B. Optimistic updates immediately reflect changes in the UI before server confirmation while pessimistic updates wait for server response
- C. Optimistic updates are always correct
- D. Pessimistic updates are faster

Answer: B

Q1439. How does streaming SSR improve the user experience compared to traditional SSR?

- A. It has no improvement over traditional SSR
- B. It sends HTML in chunks as they become ready, allowing the browser to start rendering before the entire page is generated
- C. It only streams CSS
- D. It requires WebSocket connections

Answer: B

Q1440. What is the purpose of module federation in micro-frontend architectures?

- A. It manages CSS modules
- B. It allows separately built and deployed applications to share code and components at runtime without rebuilding
- C. It merges all JavaScript into one file
- D. It only works with Angular modules

Answer: B

Q1441. How does the repository pattern improve backend architecture?

- A. It replaces all databases
- B. It abstracts data access logic behind an interface, decoupling business logic from specific database implementations
- C. It manages CSS repositories
- D. It creates HTML templates

Answer: B

Q1442. What is the purpose of database connection pooling in high-traffic applications?

- A. To create more databases
- B. To maintain a pool of reusable connections that avoid the overhead of establishing new connections for each request
- C. To pool CSS styles
- D. To merge database schemas

Answer: B

Q1443. How does the event sourcing pattern differ from traditional CRUD storage?

- A. They are identical approaches
- B. Event sourcing stores every state change as an immutable event, allowing complete reconstruction of state, while CRUD overwrites current state
- C. Event sourcing is slower
- D. CRUD stores more historical data

Answer: B

Q1444. What is the purpose of the circuit breaker pattern in backend services?

- A. To manage electrical circuits
- B. To prevent cascading failures by stopping requests to a failing service and returning fallback responses
- C. To break CSS layouts
- D. To interrupt database connections

Answer: B

Q1445. How does idempotency in API design prevent duplicate operations?

- A. It makes all requests faster
- B. It ensures that making the same request multiple times has the same effect as making it once, preventing duplicate side effects
- C. It only applies to GET requests
- D. It replaces authentication

Answer: B

Q1446. What is the purpose of the outbox pattern in microservices?

- A. To manage email outboxes
- B. To reliably publish events by writing them to a database table and processing them asynchronously, ensuring atomicity
- C. To store outgoing CSS styles
- D. To manage outbound network connections

Answer: B

Q1447. How does the CQRS pattern benefit read-heavy backend applications?

- A. It has no benefit for reads
- B. It separates read and write models, allowing the read model to be optimized with denormalized views and separate scaling
- C. It only works with NoSQL databases
- D. It replaces all caching

Answer: B

Q1448. What is the purpose of distributed locking in backend systems?

- A. To lock CSS stylesheets
- B. To coordinate exclusive access to shared resources across multiple service instances to prevent race conditions
- C. To lock database schemas
- D. To prevent code modifications

Answer: B

Q1449. How does the strangler fig pattern facilitate migration from monolith to microservices?

- A. It removes the monolith immediately
- B. It gradually replaces monolith functionality with microservices by routing specific features to new services while keeping the monolith running
- C. It only works with fig trees
- D. It creates a copy of the monolith

Answer: B

Q1450. What is the purpose of a dead letter queue in message-driven backend systems?

- A. To send farewell emails
- B. To store messages that failed processing after maximum retry attempts for later investigation and reprocessing
- C. To delete old messages
- D. To compress message queues

Answer: B

Q1451. How does the cluster module in Node.js improve server performance?

- A. It clusters CSS styles
- B. It forks multiple worker processes to utilize all CPU cores, distributing incoming connections across workers
- C. It creates database clusters
- D. It clusters HTML templates

Answer: B

Q1452. What is the purpose of database query optimization using execution plans?

- A. To plan CSS layouts
- B. To analyze how the database engine processes a query, identifying bottlenecks like full table scans that can be resolved with indexes
- C. To plan server deployments
- D. To optimize HTML rendering

Answer: B

Q1453. How does connection draining ensure zero-downtime deployments?

- A. It drains CSS connections
- B. It allows existing requests to complete while stopping new connections from reaching the old server instance during deployment
- C. It drains database connections permanently
- D. It removes all network connections

Answer: B

Q1454. What is the purpose of request coalescing in server-side caching?

- A. To merge CSS requests
- B. To combine multiple identical concurrent requests into a single backend call, serving all requesters with the same response
- C. To coalesce HTML files
- D. To merge database tables

Answer: B

Q1455. How does server-side request forgery (SSRF) exploit server-side applications?

- A. It forges CSS styles
- B. It tricks the server into making requests to internal resources or services by manipulating user-controlled input used in server requests
- C. It forges HTML elements
- D. It duplicates JavaScript code

Answer: B

Q1456. What is the purpose of structured logging in server-side applications?

- A. To structure CSS files
- B. To output log entries as structured data (JSON) with consistent fields, enabling automated parsing, searching, and alerting
- C. To structure HTML templates
- D. To organize database tables

Answer: B

Q1457. How does graceful shutdown differ from abrupt termination in server applications?

- A. They are identical
- B. Graceful shutdown stops accepting new requests, finishes in-flight requests, closes connections, and releases resources before exiting
- C. Graceful shutdown is faster
- D. Abrupt termination is safer

Answer: B

Q1458. What is the purpose of the back-pressure mechanism in streaming server applications?

- A. To compress network traffic
- B. To signal data producers to slow down when consumers cannot process data fast enough, preventing memory exhaustion
- C. To increase server pressure
- D. To manage CSS pressure

Answer: B

Q1459. How does the worker thread model in Node.js differ from the cluster module for CPU-intensive tasks?

- A. They are identical
- B. Worker threads share memory within a single process for CPU tasks while cluster creates separate processes that share the server port
- C. Worker threads are slower
- D. Cluster uses less memory

Answer: B

Q1460. What is the purpose of rate limiting with sliding window algorithms?

- A. To limit CSS animations per second
- B. To track request counts over a continuously moving time window, providing smoother rate limiting than fixed windows
- C. To limit database queries
- D. To control HTML rendering speed

Answer: B

Q1461. How does Multi-Version Concurrency Control (MVCC) enable concurrent database access?

- A. It locks all tables
- B. It maintains multiple versions of data so readers see a consistent snapshot while writers create new versions without blocking reads
- C. It duplicates the database
- D. It uses CSS versioning

Answer: B

Q1462. What is the purpose of a write-ahead log (WAL) in database crash recovery?

- A. To log CSS changes
- B. To record all changes to a log file before applying them to the database, ensuring recovery by replaying the log after a crash
- C. To write HTML ahead of rendering
- D. To log JavaScript errors

Answer: B

Q1463. How does range partitioning differ from hash partitioning in database systems?

- A. They are identical strategies
- B. Range partitioning splits data by value ranges enabling range queries while hash partitioning distributes data evenly using a hash function
- C. Range partitioning is always faster
- D. Hash partitioning only works with strings

Answer: B

Q1464. What is the N+1 query problem and how do eager loading and batching solve it?

- A. It is a CSS specificity issue
- B. It occurs when fetching related data triggers N additional queries; eager loading and batching reduce this to a constant number of queries
- C. It only happens with MongoDB
- D. It is a JavaScript memory issue

Answer: B

Q1465. What is the purpose of a materialized view and how does it differ from a regular view?

- A. They are the same thing
- B. A materialized view stores precomputed query results physically, providing faster reads at the cost of requiring periodic refresh
- C. Materialized views are slower
- D. Regular views store data physically

Answer: B

Q1466. How does the change data capture (CDC) pattern enable event-driven architectures?

- A. It captures CSS changes
- B. It monitors database transaction logs for changes and publishes them as events, enabling downstream systems to react to data modifications
- C. It captures HTML changes
- D. It captures JavaScript variable changes

Answer: B

Q1467. What is the purpose of query plan caching in database systems?

- A. To cache CSS query results
- B. To store optimized execution plans for previously seen queries, avoiding expensive re-optimization on repeated executions
- C. To cache HTML pages
- D. To cache JavaScript functions

Answer: B

Q1468. How does a graph database model data differently from a relational database?

- A. They model data identically
- B. Graph databases use nodes, edges, and properties to represent and store relationships directly, enabling efficient traversal of connected data
- C. Graph databases cannot store relationships
- D. Relational databases are always better for relationships

Answer: B

Q1469. What is the purpose of connection pool monitoring in production database deployments?

- A. To monitor CSS pool usage
- B. To track pool utilization, wait times, and connection lifecycle to detect issues like pool exhaustion, leaks, or misconfigured sizing
- C. To monitor HTML elements
- D. To track JavaScript memory pools

Answer: B

Q1470. How does an LSM tree-based storage engine differ from a B-tree-based engine?

- A. They are identical
- B. LSM trees buffer writes in memory and flush sorted runs to disk, optimizing write throughput, while B-trees update pages in place, optimizing reads
- C. LSM trees are always slower
- D. B-trees cannot handle concurrent writes

Answer: B

Q1471. How does a Content Security Policy nonce-based approach prevent XSS compared to hash-based CSP?

- A. They are identical approaches
- B. Nonces use a unique random token per request added to allowed scripts, while hashes allow only scripts matching precomputed hash values
- C. Nonces are less secure
- D. Hashes require more server resources

Answer: B

Q1472. What is the purpose of the Permissions-Policy header and how does it reduce attack surface?

- A. It manages CSS permissions
- B. It controls which browser features (camera, microphone, geolocation) can be used by the page and its iframes, reducing exploitable surface
- C. It manages user login permissions
- D. It sets database access permissions

Answer: B

Q1473. How does a timing attack exploit web applications and what is the defense?

- A. It attacks CSS timing functions
- B. It measures response time differences to extract information like valid usernames; constant-time comparison functions are the defense
- C. It times JavaScript execution
- D. It attacks database query timing

Answer: B

Q1474. What is the purpose of certificate transparency logs?

- A. To log CSS certificate changes
- B. To publicly record all issued TLS certificates, enabling domain owners to detect unauthorized certificates issued for their domains
- C. To track HTML changes
- D. To log JavaScript errors

Answer: B

Q1475. How does the PKCE extension improve the OAuth 2.0 authorization code flow for public clients?

- A. It adds CSS styling to OAuth pages
- B. It prevents authorization code interception attacks by binding the code to a cryptographic verifier known only to the client
- C. It compresses OAuth tokens
- D. It speeds up token refresh

Answer: B

Q1476. What is prototype pollution and how can it compromise a Node.js application?

- A. It pollutes CSS prototypes
- B. It modifies Object.prototype through malicious input, potentially adding properties to all objects and bypassing security checks
- C. It pollutes HTML prototypes
- D. It pollutes database prototypes

Answer: B

Q1477. What is the purpose of a Web Application Firewall (WAF) and how does it differ from a network firewall?

- A. They are identical
- B. A WAF inspects HTTP traffic at the application layer for attack patterns like XSS and SQLi while a network firewall filters traffic at the network layer
- C. WAFs are less secure
- D. Network firewalls inspect HTTP content

Answer: B

Q1478. How does token binding prevent token theft in bearer token authentication systems?

- A. It binds CSS tokens to elements
- B. It cryptographically binds tokens to the TLS connection, making stolen tokens unusable from a different TLS session
- C. It binds JavaScript variables
- D. It binds database tokens to queries

Answer: B

Q1479. What is the purpose of Software Composition Analysis (SCA) in web security?

- A. To analyze CSS compositions
- B. To scan project dependencies for known vulnerabilities and license compliance issues in third-party code
- C. To compose HTML elements
- D. To analyze JavaScript compositions

Answer: B

Q1480. How does a credential stuffing attack differ from a brute force attack?

- A. They are identical attacks
- B. Credential stuffing uses previously leaked username-password pairs from data breaches while brute force systematically tries all possible combinations
- C. Brute force uses leaked credentials
- D. Credential stuffing is always faster

Answer: B

Q1481. How does the Interaction to Next Paint (INP) metric improve upon First Input Delay (FID)?

- A. It is the same metric
- B. INP measures responsiveness across all interactions throughout the page lifecycle, not just the first input, providing a more comprehensive view
- C. INP only measures first click
- D. FID is more comprehensive

Answer: B

Q1482. How does the scheduler.yield() API improve long task handling in browsers?

- A. It yields CSS rendering
- B. It allows JavaScript to voluntarily yield control back to the browser during long tasks, preventing input delay while maintaining task priority
- C. It yields database connections
- D. It yields server resources

Answer: B

Q1483. What is the purpose of the PerformanceObserver API for monitoring web performance?

- A. To observe CSS changes
- B. To asynchronously observe and collect performance metrics like LCP, FID, and CLS without polling, enabling real user monitoring
- C. To observe database performance
- D. To monitor server health

Answer: B

Q1484. How does Brotli compression compare to Gzip for reducing transfer sizes?

- A. They achieve identical compression
- B. Brotli typically achieves 15-25% better compression ratios than Gzip for text resources, though at higher compression CPU cost
- C. Gzip always compresses better
- D. Brotli only works with images

Answer: B

Q1485. What is the purpose of the fetchpriority attribute and how does it affect resource loading?

- A. It sets CSS priority
- B. It lets developers hint at the relative priority of resources (high, low, auto), influencing browser fetch scheduling for critical resources
- C. It prioritizes database queries
- D. It manages server priorities

Answer: B

Q1486. How does the speculation rules API enable instant page navigation?

- A. It speculates about CSS styles
- B. It allows prerendering entire pages in the background based on declarative rules, enabling near-instant navigations when the user clicks
- C. It predicts server loads
- D. It speculates database queries

Answer: B

Q1487. What is the impact of main thread long tasks on web performance and how are they identified?

- A. Long tasks have no impact
- B. Tasks exceeding 50ms block the main thread, delaying input processing and rendering; they are identified using the Long Tasks API or Performance profiler
- C. Long tasks improve performance
- D. Only tasks over 1 second matter

Answer: B

Q1488. How does edge computing with edge functions improve web application latency?

- A. It moves computation farther from users
- B. It runs server-side logic at CDN edge locations near users, reducing round-trip time for dynamic content generation
- C. It only serves static files
- D. It replaces all backend servers

Answer: B

Q1489. What is the purpose of priority hints in resource loading and how do they interact with browser heuristics?

- A. They replace browser loading behavior
- B. They supplement browser heuristics by letting developers explicitly adjust the fetch priority of resources like images, scripts, and fetch calls
- C. They have no effect on loading
- D. They only work with CSS files

Answer: B

Q1490. How does the content-visibility CSS property improve rendering performance for long pages?

- A. It hides content permanently
- B. It allows the browser to skip layout and paint for off-screen elements, dramatically reducing initial rendering work for long pages
- C. It only affects text visibility
- D. It replaces lazy loading

Answer: B

Q1491. How does property-based testing complement example-based testing?

- A. It replaces example-based testing
- B. It generates random inputs to verify that properties hold for all cases, discovering edge cases that manually chosen examples miss
- C. It only tests CSS properties
- D. It is slower and less useful

Answer: B

Q1492. What is the testing trophy pattern and how does it prioritize test types?

- A. It is a CSS trophy animation
- B. It emphasizes integration tests as the largest layer, with fewer unit tests, even fewer E2E tests, and static analysis at the base
- C. It is identical to the testing pyramid
- D. It prioritizes unit tests above all

Answer: B

Q1493. How does mutation testing evaluate the quality of a test suite?

- A. It mutates CSS properties
- B. It introduces small code changes (mutations) and checks if tests detect them; surviving mutations indicate gaps in test coverage
- C. It mutates database records
- D. It creates new test files

Answer: B

Q1494. What is contract testing and how does it prevent integration failures in microservices?

- A. Testing legal contracts
- B. It verifies that services adhere to agreed-upon API contracts, catching incompatible changes before deployment without full integration tests
- C. It tests CSS contracts
- D. It manages database contracts

Answer: B

Q1495. How does test sharding across multiple CI workers reduce pipeline duration?

- A. It has no effect on duration
- B. It distributes test files across parallel CI runners, with each runner executing a subset, reducing total wall-clock time proportionally
- C. It only works with unit tests
- D. It requires identical test runners

Answer: B

Q1496. What is the purpose of chaos engineering and how does it apply to web applications?

- A. Creating chaotic CSS layouts
- B. Deliberately introducing failures into production to verify system resilience and identify weaknesses before they cause outages
- C. Creating random test data
- D. Randomizing deployment order

Answer: B

Q1497. How does visual regression testing work at scale?

- A. It compares CSS file sizes
- B. It captures and pixel-compares screenshots of UI components across changes, using AI to filter false positives from legitimate changes
- C. It visually inspects database records
- D. It manually compares page designs

Answer: B

Q1498. What is the purpose of API fuzz testing and how does it discover vulnerabilities?

- A. To make APIs fuzzy
- B. To send malformed, unexpected, or random data to API endpoints to discover crashes, memory leaks, and security vulnerabilities
- C. To add blur effects to APIs
- D. To fuzz CSS values

Answer: B

Q1499. How do test containers improve integration testing reliability?

- A. They contain CSS test styles
- B. They spin up real database and service instances in Docker containers for tests, ensuring consistent environments and avoiding shared state
- C. They contain HTML elements
- D. They compress test files

Answer: B

Q1500. What is the purpose of the testing library philosophy of testing user behavior over implementation details?

- A. It tests CSS behavior
- B. It encourages testing what users see and interact with rather than internal component state, making tests more resilient to refactoring
- C. It only tests API behavior
- D. It avoids testing entirely

Answer: B

Q1501. How does GitOps use Git as the single source of truth for infrastructure and deployments?

- A. It stores CSS in Git
- B. It stores desired infrastructure and application state declaratively in Git, with automated controllers continuously reconciling actual state with the repository
- C. It only manages Git repositories
- D. It replaces CI/CD entirely

Answer: B

Q1502. What is the purpose of a service mesh in container orchestration deployments?

- A. To mesh CSS styles together
- B. To manage service-to-service communication with features like mutual TLS, traffic splitting, retries, and distributed tracing without modifying application code
- C. To create mesh network layouts
- D. To mesh database connections

Answer: B

Q1503. How does immutable infrastructure differ from mutable infrastructure and why is it preferred?

- A. They are identical approaches
- B. Immutable infrastructure replaces entire server instances instead of updating them in place, ensuring consistency and eliminating configuration drift
- C. Immutable infrastructure is more expensive
- D. Mutable infrastructure is always more reliable

Answer: B

Q1504. What is the purpose of canary analysis in progressive delivery?

- A. To analyze bird sounds
- B. To automatically compare metrics between the canary release and the stable version, rolling back if degradation is detected
- C. To analyze CSS canary values
- D. To manage canary database records

Answer: B

Q1505. How does Kubernetes handle rolling updates and what role do readiness probes play?

- A. It updates all pods simultaneously
- B. It gradually replaces old pods with new ones, using readiness probes to ensure new pods are serving traffic before terminating old ones
- C. It only works with Docker
- D. Readiness probes are optional and unused

Answer: B

Q1506. What is the purpose of a deployment feature flag system?

- A. To flag CSS features
- B. To decouple deployment from release by toggling features on or off without redeploying, enabling gradual rollouts and instant rollbacks
- C. To flag database features
- D. To create HTML feature flags

Answer: B

Q1507. How does Infrastructure as Code (IaC) with tools like Terraform improve deployment reliability?

- A. It codes CSS infrastructure
- B. It defines infrastructure declaratively in version-controlled files, enabling reproducible provisioning, change tracking, and peer review
- C. It only works with AWS
- D. It replaces all deployment tools

Answer: B

Q1508. What is the purpose of deployment runbooks and how do they improve incident response?

- A. To run CSS books
- B. To provide step-by-step procedures for deployments and incident recovery, reducing mean time to recovery through documented playbooks
- C. To manage database runbooks
- D. To create HTML runbooks

Answer: B

Q1509. How does multi-region deployment improve application resilience?

- A. It deploys CSS to multiple regions
- B. It runs application instances across geographically separate regions so that regional failures do not cause total outages
- C. It only improves database speed
- D. It requires identical hardware everywhere

Answer: B

Q1510. What is the purpose of observability in production deployments and how does it differ from monitoring?

- A. They are identical concepts
- B. Observability provides the ability to understand internal system state from external outputs (logs, metrics, traces) while monitoring checks predefined conditions
- C. Observability replaces monitoring
- D. Monitoring is more comprehensive

Answer: B

Q1511. How does GraphQL's DataLoader pattern solve the N+1 query problem?

- A. It loads CSS data
- B. It batches multiple individual data requests within a single tick into one bulk query, eliminating redundant database calls
- C. It only loads JavaScript modules
- D. It replaces GraphQL resolvers

Answer: B

Q1512. What is the purpose of API schema validation using JSON Schema or Zod?

- A. To validate CSS schemas
- B. To define and enforce the shape, types, and constraints of API request and response data at runtime, catching errors early
- C. To validate HTML schemas
- D. To validate database schemas only

Answer: B

Q1513. How does content negotiation work in REST APIs and what role does the Accept header play?

- A. It negotiates CSS content
- B. The client sends an Accept header specifying desired response formats (JSON, XML, etc.) and the server returns data in the best matching format
- C. It only works with HTML
- D. It negotiates database connections

Answer: B

Q1514. What is the purpose of API gateway patterns like Backend for Frontend (BFF)?

- A. To style frontend gateways
- B. BFF creates dedicated API gateways for each frontend type, aggregating and tailoring backend service calls to specific client needs
- C. It replaces all backend services
- D. It only works with GraphQL

Answer: B

Q1515. How does gRPC achieve better performance than REST for service-to-service communication?

- A. It uses CSS for styling
- B. It uses HTTP/2, Protocol Buffers for binary serialization, and supports streaming, resulting in smaller payloads and lower latency than JSON over HTTP
- C. It is always slower than REST
- D. It replaces HTTP entirely

Answer: B

Q1516. What is the purpose of idempotency keys in API design and how do they work?

- A. To identify CSS keys
- B. They allow clients to attach a unique key to requests so the server can detect retries and return the original response without re-executing the operation
- C. To create database keys
- D. To generate JavaScript keys

Answer: B

Q1517. How does event-driven API design with event sourcing differ from traditional request-response patterns?

- A. They are identical patterns
- B. Event-driven APIs publish domain events that consumers subscribe to asynchronously, enabling loose coupling and eventual consistency instead of synchronous calls
- C. Event-driven APIs are always slower
- D. They only work with GraphQL

Answer: B

Q1518. What is the purpose of API observability and what metrics should be tracked?

- A. To observe CSS changes
- B. To monitor API health through metrics like request rate, error rate, latency percentiles, and throughput, enabling proactive issue detection
- C. To observe HTML changes
- D. To observe database queries

Answer: B

Q1519. How does the API circuit breaker pattern improve system resilience?

- A. It breaks CSS circuits
- B. It monitors failure rates and opens the circuit to reject requests to a failing service, preventing resource exhaustion and enabling recovery
- C. It breaks database circuits
- D. It disconnects API clients

Answer: B

Q1520. What is the purpose of API contract testing with tools like Pact?

- A. To test CSS contracts
- B. To verify that API providers and consumers agree on request/response formats by testing both sides against a shared contract independently
- C. To test HTML contracts
- D. To test database contracts

Answer: B

Q1521. How does the concept of partial hydration improve performance in modern frameworks?

- A. It partially loads CSS
- B. It hydrates only interactive components on a page while leaving static content as plain HTML, reducing JavaScript payload
- C. It partially loads databases
- D. It replaces full page hydration entirely

Answer: B

Q1522. What is the purpose of the edge-first architecture pattern in modern web applications?

- A. It adds CSS edge effects
- B. It runs application logic at CDN edge locations by default, falling back to origin servers only when necessary, minimizing latency globally
- C. It only processes edge cases
- D. It replaces all server-side logic

Answer: B

Q1523. How does the signals pattern in modern frameworks differ from React's state model?

- A. They are identical patterns
- B. Signals provide fine-grained reactivity by tracking dependencies at the value level, updating only subscribers without re-rendering entire component trees
- C. Signals are slower
- D. React's model is more granular

Answer: B

Q1524. What is the purpose of the Baseline web platform compatibility initiative?

- A. To create CSS baselines
- B. To define a clear set of web features that are interoperable across major browsers, helping developers know what they can safely use
- C. To baseline database performance
- D. To measure JavaScript execution baselines

Answer: B

Q1525. How does the composability pattern influence modern web architecture?

- A. It composes CSS animations
- B. It enables building applications by combining independent, interchangeable modules and services rather than monolithic implementations
- C. It only applies to React components
- D. It replaces all existing patterns

Answer: B

Q1526. What is the purpose of the View Transitions API for multi-page applications?

- A. To create CSS views
- B. It enables smooth animated transitions between pages in traditional multi-page applications, previously only achievable in SPAs
- C. It only works in SPAs
- D. It replaces CSS animations

Answer: B

Q1527. How does AI-assisted development change modern web development workflows?

- A. It replaces all developers
- B. AI tools assist with code generation, debugging, review, and documentation while developers provide direction, review outputs, and handle complex decisions
- C. AI writes all CSS
- D. AI manages all databases

Answer: B

Q1528. What is the purpose of the Interop project for web standards?

- A. To create interoperable CSS
- B. It is a cross-browser collaboration where major browser vendors commit to improving compatibility on specific web features each year
- C. It only affects JavaScript
- D. It manages database interoperability

Answer: B

Q1529. How does the concept of zero-JavaScript pages improve performance in modern frameworks like Astro?

- A. It removes all JavaScript from the internet
- B. Pages ship no client-side JavaScript by default, rendering everything as static HTML and only adding JavaScript for explicitly interactive components
- C. It prevents JavaScript from running
- D. It only works for simple pages

Answer: B

Q1530. What are the key tradeoffs of adopting a serverless architecture for web applications?

- A. There are no tradeoffs
- B. Serverless offers automatic scaling and reduced ops but introduces cold starts, vendor lock-in, execution limits, and challenges with stateful workloads
- C. Serverless is always better
- D. Serverless cannot scale

Answer: B
